The Adjusted R2 value is 0.642, indicating that the variables Influencer (X1), Brand Image (X2), Price (X3), and Product Quality (X4) account for 64.2% of the influence on the purchase decision variable (Y). The remaining 35.8% may be influenced by other variables not included in this study.

From the results of this study, it can be concluded that all independent variables (influencer, brand image, price, and product quality) have a significant simultaneous effect on the dependent variable (purchase decision) for Somethinc skincare products. The results of the multiple linear regression show that the influencer variable has a positive relationship of 0.184 with purchase decisions, the brand image variable has a positive relationship of 0.248 with purchase decisions, the price variable has a positive relationship of 0.421 with purchase decisions, and the product quality variable has a positive relationship of 0.120 with purchase decisions.

Based on the results obtained in this study, it can be seen that the influencer variable was tested partially using a t-test, which showed that the influencer variable had a positive and significant effect on purchasing decisions. These results are in line with the research conducted by Devi, et al., (2024), which found that the presence and role of influencers had a significant impact on consumers' decisions to purchase a product. However, these results are not in line with the research conducted by Syahputra (2024), which shows that influencers play a negative role in influencing purchasing decisions.

Based on the results obtained in this study, it can be seen that the brand image variable has been tested partially using the t-test, and the results show that the brand image variable has a positive and significant effect on purchasing decisions. These results are in line with the research conducted by Hertina & Wulandari, (2022), Sipahutar et al. (2023), Septian and

Firmialy, (2023), and also by Bachtiar et al. (2024) that the results of the study state that brand image has a significant effect on purchasing decisions.

Based on the results obtained in this study, it can be seen that the price variable has been tested partially using a t-test, which shows that the price variable has a positive and significant effect on purchasing decisions.

These results are consistent with the research conducted by Mardiayanti & Andriana (2022) and Hertina & Wulandari (2022), which found that price has a significant positive effect on purchasing decisions. However, they are inconsistent with the research by Bachtiar et al. (2024), which found that the price variable does not have a partial effect on purchasing decisions.

Based on the results obtained in this study, it can be seen that the product quality variable has been tested partially using a t-test, which shows that the product quality variable has a positive and significant effect on purchasing decisions. These results are in line with the research conducted by Montolalu et al. (2021), Mardiayanti & Andriana. (2022), Hertina & Wulandari. (2022), and also Sipahutar et al. (2023) that the results of the study state that price has a significant positive effect on purchasing decisions.

5. Conclusion

This study aims to determine the influence of influencers, brand image, price, and product quality on the purchase decision of Somethinc Skincare. The respondents used in this study were 100 Somethinc Skincare consumers. Based on the data collected and the tests conducted on the problem using a multiple linear regression model, it can be concluded that:

a. There is a simultaneous influence of the variables of influencer, brand image, price, and product quality on the purchase decision of Somethinc Skincare (case study of students in Lowokwaru District, Malang City). The results of the F-test indicate that the purchase decision of Somethinc Skincare (case study of students in Lowokwaru District, Malang City) is influenced by the variables of influencer, brand image, price, and product quality.

b. Meanwhile, based on the t-test results, it is explained that the influencer, brand image, price, and product quality variables have a positive and significant effect on the purchase decision of Somethinc Skincare.

ONLINE COSMETICS PURCHASING STRATEGY: A STUDY OF THE INFLUENCE OF BRAND AWARENESS, PRICE PERCEPTION, AND REVIEWS ON PINKFLASH PRODUCTS AT SHOPEE

Cholifatul Aishyah[1], Budi Wahono[2], Rahmawati[3]

Email : cholifaisyah11@gmail.com

Universitas Islam Malang

Abstract

This study aims to evaluate and explain how brand awareness, price perception, and online customer reviews affect customer decisions to buy pinkflash cosmetic products in shopee e-commerce. The population in this study was female students in Malang city, this study uses a quantitative approach. The sample was determined using the Maholtra formula, resulting in a total of 85 samples. This study uses SPSS 24 for data analysis tools. These include validity, reliability, normality, classical assumptions, hypotheses, multiple linear regressions, and the Adjusted R2 determination coefficient. The results of the study show that brand awareness, price perception, and online customer reviews have a significant simultaneous effect on purchase decisions. However, in non-simultaneous analysis brand awareness does not have a significant effect on purchase decisions, while price perception and online customer reviews play a significant role in purchase decisions.

Keywords: Brand Awareness, Price Perceptions, Online Customer Review, Purchase Decision.

1. Introduction

The aspects of human life have been transformed by the rapid advancement of digital technology, including the trading industry. With the ease of conducting buying and selling transactions electronically, e-commerce has become one of the innovations that are increasingly popular among Indonesians. E-commerce allows customers to shop anytime and anywhere as long as they are connected to the internet (Hidajat & Fahlevi, 2020). Based on this phenomenon, e-commerce platforms such as Shopee, Tokopedia, Lazada, Blibli, and Bukalapak have become an option for people to fulfill their needs. They provide not only ease of shopping, but also offer a more practical and efficient shopping experience. E-commerce transactions continue to increase due to improved logistics and digital payment technology. Shopee is the e-commerce platform with the highest number of visits in Indonesia, outperforming its competitors with more than 2.3 billion visitors by 2023 (databoks.katada.co. id). This indicates that Shopee has become the platform of choice for Indonesians to shop online, especially for cosmetic products which have experienced rapid growth in recent years.

Study by databoks.katadata.co in 2022 showed that the beauty and body care industry recorded a revenue of USD 7.23 billion or around Rp111.83 trillion in 2022. This industry is expected to continue to grow with a compound annual growth rate (CAGR) of 5.81% until 2027. The growing emphasis on self-care and appearance, especially for women, is driving the growth of this sector. As more beauty content is disseminated through social media and other digital platforms, awareness of the importance of better self-care is increasing. Pinkflash, which originated in China and officially launched amid the COVID-19 pandemic, is one of the fastest growing cosmetic brands in Indonesia. Despite being relatively new, Pinkflash has been

licensed by the Indonesian Food and Drug Administration (BPOM) and is gaining good popularity among consumers. Pinkflash cosmetic items include mascara, blush, lip cream, lip gloss, eyebrow, lip matte, eyebrow pencil, eyeliner, and more (suara.com). The successful penetration of Pinkflash into the Indonesian market proves that new cosmetic brands still have great opportunities in this industry, especially with the right marketing strategy.

2. Literature Review

Theory of Planned Behavior (TPB), (Ajzen, 1991) The TPB aims to help understand the factors that influence consumers' decision to purchase cosmetic products in e-commerce. Three main components influence consumer behavior, according to TPB: perceived behavioral control, subjective norms, and attitudes. The aims of this study are to see how variables such as brand awareness, perceived price, and online customer reviews influence consumers' decision to purchase cosmetic products on e-commerce platforms. Based on this, businesses can create better marketing strategies to attract customers' attention and trust. Important stages in the purchase decision process: identifying a problem, searching for information, evaluating alternatives, making a decision about a purchase, and acting after a purchase (Kotler & Keller, 2012). However, element such as competitive pricing, positive online customer reviews, and brand awareness strongly influence customer preferences in e-commerce. Brand awareness, also known as brand consciousness, refers to the extent to which consumers can distinguish a brand in various situations, indicated by their ability to recall and identify the brand before making a decision about what they buy (Kotler & Keller, 2012). Higher the brand awareness of a product, the more likely it is that the product will be chosen by consumers.

Price perception is also very important in purchasing decisions. The value attached to the price of goods or services compared to the benefits obtained is known as price perception, according to (Kotler and Armstrong, 2014). Comparing the price of goods or services compared to the benefits obtained is known as price perception, according to (Kotler and Armstrong, 2014). Therefore, a competitive pricing strategy can increase the attractiveness of the product for e-commerce customers. Besides, online customer reviews are increasingly influential in making purchasing decisions. (Filieri, 2015), online customer reviews consist of different types of reviews: neutral, negative, and positive. Customers create and share these reviews, which indicate the quality of the product, online customer reviews are often the main source for e-commerce customers before deciding to buy a product.

This study is based on previous research gaps. (Robby Fauji et al., 2023) found that price perception has an effect on purchasing decisions, while (Emiliani & Habib, 2024) stated otherwise. Similarly, (Afisa & Muhajirin, 2024) brand awareness has no effect, while (Nabil & Dwiridotjahjono, 2024) found the opposite impact. The difference in results between the four researchers, this study found that the results of price perception have a significant effect on purchasing decisions, while brand awareness has an insignificant effect on purchasing decisions. However, in other words, the variables of price perception and online customer review have a greater influence on purchasing decisions, while the brand awareness variable must be reviewed because it does not affect purchasing decisions.

3. Methodology

The method used in this research is quantitative with the approach of distributing questionnaires or questionnaires as the main instrument in data collection. The quantitative method was chosen because it is based on the philosophy of positivism, which aims to test hypotheses through statistical techniques (Sugiyono, 2019). The data used in this study are primary data, namely information obtained directly from respondents. Data processing was done using SPSS to analyze the relationship between the variables studied.

The population of this study were students in Malang City. This population was chosen because it is relevant to this study of consumer choices when buying cosmetics online (Sugiyono 2019), purposive sampling technique is a sample selection technique based on certain requirements and this technique is suitable for use in this study. The respondents must be active students in Malang City, have purchased Pinkflash cosmetic products at least once on Shopee, and read customer reviews in the comments column before deciding to buy. (Malhotra, 2006) the number of indicators is multiplied by five to produce a sample size. the calculation based on Maholtra's formula, 85 were obtained as the study sample.

The collected data will be analyzed using descriptive and inferential statistical analysis through SPSS 24. Validity and reliability tests will be conducted to ensure that the study instruments can measure the variables accurately and consistently. Also, linear regression analysis will be used to test the relationship between the independent and dependent variables to answer the research hypothesis.

4. Result and Discussion

Brand Awareness, Price Perception, and Online Customer Review variables produce a calculated r value greater than r Table. So that the statement items in this study questionnaire can be declared valid, as shown in table 1.

Table 1. Validity Test Results

Variables	Item	r count	r table (0,05)	Description	Result
Brand Awareness (X1)	X1.1	0,765	0,213	r count > r table	Valid
	X1.2	0,739	0,213	r count > r table	Valid
	X1.3	0,743	0,213	r count > r table	Valid
Price Perception (X2)	X2.1	0,744	0,213	r count > r table	Valid
	X2.2	0.806	0,213	r count > r table	Valid
	X2.3	0,706	0,213	r count > r table	Valid
	X2.4	0,828	0,213	r count > r table	Valid
Online Customer Review (X3)	X3.1	0,816	0,213	r count > r table	Valid
	X3.2	0,786	0,213	r count > r table	Valid
	X3.3	0,670	0,213	r count > r table	Valid
	X3.4	0,783	0,213	r count > r table	Valid
	X3.5	0,721	0,213	r count > r table	Valid
Purchase Decision (Y)	Y1.1	0,758	0,213	r count > r table	Valid
	Y1.2	0,821	0,213	r count > r table	Valid
	Y1.3	0,724	0,213	r count > r table	Valid
	Y1.4	0,767	0,213	r count > r table	Valid
	Y1.5	0,677	0,213	r count > r table	Valid

Source:data processed 2025

Brand Awareness, Price Perception, Online Customer Review, and Purchase Decision variables have Cronbach's Alpha more than 0.6. So that the variable is declared reliable.

Table 2. Reliability Test Results

Variables	*Cronbach's Alpha*	Criteria	Result
Brand Awareness (X1)	0,630	*Cronbach's Alpha* > 0,6	Reliabel
Price Perception (X2)	0,773	*Cronbach's Alpha* > 0,6	Reliabel
Online Customer Review (X3)	0,806	*Cronbach's Alpha* > 0,6	Reliabel
Purchase Decision (Y)	0,806	*Cronbach's Alpha* > 0,6	Reliabel

Source:data processed 2025

(Ghozali, 2017) The aim of normality test is to determine whether the residuals or disturbances in the regression model follow a normal distribution. the normality test applies the Kolmogorov-Smirnov formula with the criteria Asymp. Sig> 0.05, with the test result Asymp. Sig 0.154 so that the test results are normally distributed.

Table 3. Normality Test Results

One-Sample Kolmogorov-Smirnov Test	
	Unstandardized Residual

N		85
Normal Parameters[a,b]	Mean	.0000000
	Std. Deviation	2.51260962
Most Extreme Differences	Absolute	.087
	Positive	.087
	Negative	-.087
Test Statistic		.087
Asymp. Sig. (2-tailed)		.154[c]

Source:data processed 2025

Multicollinearity test has a goal with the intention of ensuring that the regression model has a high or perfect correlation between the independent variables applied. With the criteria Tolerance> 0.1VIF < 10, it is free of multicollinearity. Brand Awareness, Price Perception, and Online Customer Review variables meet the requirements to pass the multicollinearity test, so the variables in table 4 are free of multicollinearity.

Table 4. Multicollinearity Test Results

Variables	*Tolerance*	VIF	Criteria	Result
Brand Awareness (X1)	0,378	2,646	*Tolerance* > 0,1 VIF < 10	Multicollinearity Free
Price Perception (X2)	0,306	3,270	*Tolerance* > 0,1 VIF < 10	Multicollinearity Free
Online Customer Review (X3)	0,352	2,837	*Tolerance* > 0,1 VIF < 10	Multicollinearity Free

Source:data processed 2025

Heteroscedasticity tests regression models have inequality of variance from one residual observation to another, the Glaser test is one of the tools to determine whether heteroscedasticity exists. With criteria If the sig value. > 0.05 then heteroscedasticity does not occur. In table 5 the variables Brand Awareness, Price Perception, and Online Customer Review are free from heteroscedasticity, because the tolerance value exceeds the significance reference value.

Table 5. Heteroscedasticity Test Results

Variables	*Tolerance*	Significance Reference Value α	Result
Brand Awareness (X1)	0,256	>0,05	Heteroscedasticity Free
Price Perception (X2)	0,275	>0,05	Heteroscedasticity Free
Online Customer Review (X3)	0,143	>0,05	Heteroscedasticity Free

Source:data processed 2025

Results of the multiple linear regression test:

a. Constant (α) 1.358, it can be identified that the independent variable and the dependent variable interact directly which has a value of 0%, so that the variables of brand awareness, price perception, and online customer reviews have no component and are considered constant for purchasing decisions.
b. Brand Awareness gets a value of 0.211, it can be stated that the brand awareness variable has a 100% increase, the purchasing decision variable will also increase by 21.1%. With the assumption that the variables of Price Perception and Online Customer Review are constant.
c. Price Perception has a value of 0.356, it can be stated that the price perception variable has a 100% increase, the purchasing decision variable will also increase by 35.6%. Assuming the variables of brand awareness and online customer review are constant.
d. Online Customer Review gets a value of 0.517, it can be stated that the online customer review variable has a 100% increase, the purchasing decision variable will also increase by 51.7%.Assuming the variables of brand awareness and price perception are constant.

The F test is applied to determine whether all independent variables included in the model have a simultaneous or simultaneous role in the dependent variable. Criteria fcount> ftabel, significance (α) of 5%.

Table 6. F Test Results

ANOVA[a]						
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	1052.514	3	350.838	53.587	.000[b]
	Residual	530.309	81	6.547		
	Total	1582.824	84			

a. Dependent Variable: Y1
b. Predictors: (Constant), X3, X1, X2

Source:data processed 2025

Table 6 can be interpreted that the variables Brand Awareness, Price Perception, and Online Customer Review have a simultaneous effect on Purchasing Decisions.

t test (Ghozali, 2011) The aim of this test is to determine the contribution of each independent variable to the dependent variable. The aim of the t-test is to obtain a partial understanding of the consequences. The criteria for the value of t count> t table and relevant t <0.05, it can be stated that partially the independent variable plays a role in the dependent.

Table 7. Results of the t-test

Coefficients[a]						
		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	1.358	1.431		.949	.346
	X1	.211	.179	.123	1.177	.243
	X2	.356	.150	.275	2.367	.020
	X3	.517	.117	.480	4.433	.000

Source:data processed 2025

The t test results above can be interpreted as follows:

a. t count value is smaller than the t table, 1.177 < 1.664 and has a sig. value greater than the level of relevance 0.243> 0.05. It can be stated that the brand awareness variable has an insignificant effect on purchasing decisions.
b. t count value is greater than the t table, 2.367> 1.664 and has a sig. which is smaller than the relevance level of 0.020 <0.05. It can be stated that the price perception variable has a significant role in purchasing decisions.
c. t count value is greater than the t table, 4.433> 1.664 and has a sig. value that is smaller than the relevance level of 0.000 <0.05. It can be stated that the online customer review variable has a significant role in purchasing decisions.

Table 8. Coefficient of Determination Test Results (*Adjusted R^2*)

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.815[a]	.665	.653	2.559

a. Predictors: (Constant), X3, X1, X2

Source:data processed 2025

It concludes that Adjusted R2 is 0.653 in decimal form, 65.3% in percent of the variable brand awareness, price perception, and online customer reviews on purchasing decisions. While the remaining 34.7% is influenced by other variables that are not in this study. It is interpreted that the variables of brand awareness, price perception, and online customer review can be explained by purchasing decisions.

Based on this result, it can be concluded that simultaneously, brand awareness, price perception, and online customer reviews have an effect on purchasing decisions for Pinkflash products at Shopee. However, the individual, only price perceptions and online customer reviews have a significant influence, while brand awareness has an insignificant effect on purchasing decisions. The importance of a competitive pricing strategy, such as discounts or promos to attract buyers. Besides, online customer reviews need to be strengthened by encouraging positive reviews and maintaining product quality. Meanwhile, brand awareness strategies need to be evaluated by increasing product visibility through digital marketing and collaboration with influencers. With these steps, it is expected that purchasing decisions will increase and product competitiveness will be stronger in the e-commerce market.

5. Conclusion

This study indicates that Brand Awareness, Price Perception, and Online Customer Review together influence purchasing decisions for Pinkflash products at Shopee. These three variables are considered by consumers in buying cosmetic products online. Particularly, Brand Awareness does not have a significant effect on purchasing decisions. Consumers are less likely to pay attention to brands when buying Pinkflash products on Shopee, so this factor is not the main determinant. In contrast, Price Perception has a significant effect. Product prices that are considered affordable and according to quality make consumers feel satisfied and confident in making purchases. Online Customer Review also has a significant role. Positive reviews from other users give trust and are one of the main factors influencing purchasing decisions. This study is limited to Shopee e-commerce and only uses three variables. It is recommended that companies focus on pricing strategies and customer reviews.

THE IMPACT OF THE IMPLEMENTATION OF DIGITALIZATION AND TAX ADMINISTRATION SYSTEMS ON TAX COMPLIANCE

Cindy Isnanul Choiriah[1*], Dyah Arini R[2], Arini Fitria Mustapita[3*]

[1,2,3] Accounting Study Program Faculty Economics and Business Islamic University of Malang, Indonesian
*22101082090@unisma.ac.id

Abstract

In the digital era, the government is increasingly encouraging the use of tax technology to improve the efficiency and effectiveness of tax collection. This research was conducted with the aim of analyzing the influence of the implementation of digitization and tax administration systems on the level tax compliance. This study uses quantitative nethods in data collection and analysis. In sampling, a sample of 158 respondents was obtained, the sample in this study was lecturers and employeees of the Islamic University of Malang. In this data analysis, classical assumption techniques, multiple linear regression and coefficient determination tests are used. The results of the research hypothesis show that the digitization system and tax administration have a positive impact on tax compliance. The results of this study are expected to provide a clear picture of the extent to which the digitization system and tax administration affect taxpayer compliance.

Keywords: digitalization system, tax administration, tax compliance

1. Introduction

In this modern era, science and technology continue to develop rapidly. This applies to information and communication technology, which is supported by technological advancements. Its influence is certainly very broad in various aspects of life, one example being taxation. The use of technology in the implementation and utilization of the taxation system is not only used by tax officials but also by taxpayers and the community that requires information about taxation (Nesya Zuhrah et al., 2024).

Digitalization has become a main focus in the environment of the Directorate General of Taxes (DJP) and the Ministry of Finance since 2015. The tax digitalization system easily accesses tax information, forms, and other guidelines through online platforms provided by the Directorate General of Taxes (James & Sawyer, 2018).

Digital tax services can simplify taxpayers in making tax payments and tax reporting. The presence of modern tax technology can facilitate tax administration. Tax administration plays a role in determining the effectiveness of a tax system. An efficient tax administration system can be marked by low collection costs and compliance (Rosdiana, 2012:103).

Tax compliance is an important factor to research, as it aims not only to understand the level of tax compliance but also plays a very significant role for the nation because taxes are one of the main sources of national income. According to (Sari et al., 2022) The benefits of taxes can be felt after taxpayers fulfill their obligations; tax compliance is not just about meeting obligations, but also about how taxpayers can manage their finances transparently and efficiently.

2. Literature review

2.1. Tax compliance

Compliance means obeying a rule, where taxpayer compliance refers to compliance in fulfilling the rights and obligations in paying taxes in accordance with statutory regulations (Rahayu, 2010:138). According to (Rahayu, 2020:189) there are two types of tax compliance, namely formal compliance and material cmpliance.

2.2. Digitalization system

The rapid development of technology has changed industrialization into an era of technology, information and communication. Digitalization is one way to facilitate tax reporting without having to come to the tax office. Digitalization in tax services is a facility provided by the Directorate General of Taxes and the goverment that can be easily eccessed by the public for tax purposes. This makes it easier for taxpayers to access tax services online (Yusnindar, 2024)

2.3. Tax Administration

Tax administration plays a role in determining the effectiveness of a taxation system. The success of a tax administration system is not only the amount of state revenue, but also how the revenue is obtained (Saifudin & Rahmawati, 2020). Administration is a system used in managing tax affairs (Hetiati et al., 2021).

3. Research Method

3.1 Type and location of research

The research conducted uses a quantitative research type. The quantitative method is used to study a specific population or sample with the aim of testing the established hypotheses (Sugiyono, 2022:7). The research location is conducted on Lecturers and Employees of the Islamic University of Malang at Jalan Mayjen Haryono No.193, Dinoyo, Lowokwaru District, Malang City, East Java 65144.

3.2 Populatuon and sample

The population in this study is taxpayers in the city of Malang. The sample in this research is the Taxpayers, Lecturers, and Employees of the Islamic University of Malang. This study uses the Slovin formula, with an error rate of 7%.

3.3 Sources and methods of data collection

The method or information collection used in this study is by giving several questions or statements to the respondents. The source of data or information used is to use primary data obtained directly from respondents in the form of surveys (questionnaires) with a likert size of 5. The answer categories are Strongly Disagree (Score 1), Disagree (Score 2), Neutral or Undecided (Score 3), Agree (Score 4), Strongly Agree (Score 5).

4. Results and discussions

4.1. Test Instruments

1. Validity Test

Tabel 1 Validity Test

Variabel	Item	r Count	r table	Information
Digitalization system	X1.1	0,646	0,131	Valid
	X1.2	0,762	0,131	Valid
	X1.3	0,808	0,131	Valid
	X1.4	0,729	0,131	Valid
	X1.5	0,794	0,131	Valid
	X1.6	0,766	0,131	Valid
Tax Administration	X2.1	0,654	0,131	Valid
	X2.2	0,715	0,131	Valid
	X2.3	0,775	0,131	Valid
	X2.4	0,796	0,131	Valid
	X2.5	0,742	0,131	Valid
Tax Compliance	Y1	0,527	0,131	Valid
	Y2	0,685	0,131	Valid
	Y3	0,731	0,131	Valid
	Y4	0,688	0,131	Valid
	Y5	0,779	0,131	Valid
	Y6	0,752	0,131	Valid
	Y7	0,632	0,131	Valid
	Y8	0,646	0,131	Valid
	Y9	0,568	0,131	Valid

Source: Data processed through SPSS 30, 2025

From the table above, it can be concluded that each statement item used in the questionnaire produces a correlation value greater than the correlation value of the table (r table) which means that each statement is valid.

2. Reliability Test

Table 2 Reliability Test

Variable	*Cronbach's Alpha*	Provisions	Information
Tax Compliance (Y)	0,843	>0,60	Reliabel
Digitalization System (X1)	0.846	>0,60	Reliabel
Tax Administration (X2)	0.790	>0.60	Reliabel

Source: Data processed through SPSS 30, 2025

From the test results if Cronbach's alpha value is greater than 0.6, it can be concluded that the data is reliable and suitable for use in the study.

3. Normality Test

Table 3 Normality Test

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		158
Normal Parameters[a,b]	Mean	.4479290
	Std. Deviation	2.48152077
Most Extreme Differences	Absolute	.070
	Positive	.070
	Negative	-.060
Test Statistic		.070
Asymp. Sig. (2-tailed)[c]		.054
a. Test distribution is Normal.		

Source: Data Processed through SPSS 30, 2025

Based on the above test, the Kolmogorov-Smirnov test data shows that Asymp. A sig of 0.054 > 0.05 proves that the data of this study meets the assumption of normality.

4.2.Classic Assumption Test

1. Multicollinearity Test

Table 4 Multicollinearity Test

Coefficients[a]			
Model		Collinearity Statistics	
		Tolerance	VIF
1	(Constant)		
	Digitalization System	.978	1.022
	Tax Administration	.978	1.022
a. Dependent Variable: Tax Compliance			

Source: Data Processed through SPSS 30, 2025

Based on the above test, the VIF value is 1.022. Thus, it can be concluded that the two independent variables have a VIF value < 10. This shows that there is no multicollinearity in independent variables.

2. Heteroscedasticity Test

Table 5 Heteroscedasticity Test

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.556	.926		2.760	.006
	Digitalization System	.116	.164	.057	.707	.481
	Tax Administration	-.313	.162	-.155	-1.935	.055
a. Dependent Variable:ABS_RES						

Source: Data Processed through SPSS 30, 2025

Based on the table above, the significance value of the X1 variable is 0.481 > 0.05 and the X2 variable has a significance value of 0.055 > 0.05 which means that all variables do not heteroscedasticity because each has a significance value of >0.05.

3. Multiple Linear Regression Analysis

Table 6 Multiple Linear Regression Analysis

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	10.469	1.485		7.047	<,001
	Digitalization System	.809	.263	.211	3.080	.002
	TaxAdministration	1.752	.259	.463	6.763	<,001
a. Dependent Variabel: Tax Compliance						

Source: Data Processed through SPSS 30, 2025

a. The value of constant (a) of 10.469 indicates the influence of the digitization system (X1) and tax administration (X2).
b. The value of the digitization system variable coefficient (X1) is positive which indicates that the digitization system variable has a positive effect on tax compliance.
c. The value of the tax administration variable coefficient (X2) is a positive sign, which indicates that the tax administration variable has a positive effect on tax compliance.

4.3.Hypothesis Test

1. F Test (Simultaneous)

Table 7 F Test Results

ANNOVA[a]						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regresi	308.534	2	154.267	31.361	<,001[b]
	Residual	762.454	155	4.919		
	Total	1070.987	157			
a. Dependent Variable: Tax Compliance						
b. Predictors: (Constant), Digitalization System, Tax Administration						

Source: Data Processed through SPSS 30, 2025

The table is leveled showing a significance value of 0.002 < 0.05. Thus, it shows that the hypothesis (H1) in the study, the digitization system variable (X1), and tax administration (X2) have a simultaneous influence on the tax compliance variable (Y).

2. Determination Coefficient Test (Adjusted R Square)

Table 8 Test Coefficient of Determination (Adjusted R Square)

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.537[a]	.288	.279	2.21789
a. Predictors: (Constant), Digitalization System, Tax Administration				

Source: Data Processed through SPSS 30, 2025

The table above shows that the adjusted R square value is 0.279 which means that the influence of independent variables on dependent variables is 27.9% while 72.1% is influenced by other variables outside the study.

3. T test (Partial)

Table 9 Results of the t-test

Coefficients[a]						
Model		Unstandardized Coeddicients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	10.469	1.485		7.047	<,001
	Digitalization System	.809	.263	.211	3.080	.002

	Tax Administration	1.752	.259	.463	6.763	<,001
a. Dependent Variabel: Tax Compliance						

Source: Data Processed through SPSS 30,2025

a. The t-value of 3.080 and the sig value of 0.001 < 0.05 prove that the digitization system variables have a significant influence on tax compliance.
b. The t-value of 6.763 and the sig value of 0.001 < 0.05 prove that the tax administration variable has a significant influence on tax compliance.

4.4.Research Implication

1. The Influence of Digitalization and Tax Administration Systems on Tax Compliance

Based on the results of the t-test, there is a significant influence between the variables of the digitalization system and tax administration simultaneously on tax compliance. This means that in testing variables, the digitization system and tax administration both have an influence in improving tax compliance.

The digitalization system plays a role in helping services effectively and efficiently, and tax administration plays a role in making it easier for taxpayers quickly and accurately. The digitalization system plays a role as a service that makes it easier for taxpayers and tax administration to be more trusted because taxpayers tend to choose efficiency. So that taxpayers who will make reporting and payments can imagine that accuracy can make it easier for taxpayers. This is supported by research conducted by (Nisaak & Khasanah, 2022) which states that the administrative digitization system has a simultaneous influence on tax compliance.

2. The Influence of Digitalization Systems on Tax Compliance

The results of the study prove that the digitization system variables have a significant effect on tax compliance. This means that the digitalization system plays a role in providing services easily that can be accessed anytime and anywhere. The Directorate General of Taxes provides a new breakthrough in the current digital era in order to provide easier and more efficient services for taxpayers, namely with online-based services.

This research is in accordance with what has been carried out (Yusuf, Eka Riyanti, 2018) the digitalization that has been provided at this time by the government can increase taxpayer compliance in Indonesia. And with this digital tax service, taxpayer compliance will increase, because it is easier in the process of calculating and reporting taxes.

3. The Influence of Tax Administration on Tax Compliance

The results of the study prove that tax administration variables have a significant effect on tax compliance. Tax administration includes several things and stages such as stages, taxpayer registration, tax determination, tax reporting and tax collection (Rosdiana, 2012:103).

Tax reform and administration policies are carried out with the aim of increasing the voluntary compliance of taxpayers to fulfill tax obligations (Surjono, 2016). This research is in line with research conducted by (Zulma, 2020) the influence of tax administration on tax compliance.

5. Conclusion

5.1. Conclusion

Based on the results of the research that has been explained in the discussion, there are the following conclusions:

a. The Digitalization System has a significant effect on Tax Compliance.
b. Tax Administration has a significant effect on Tax Compliance.

5.2.Limitations

The limitations of researchers in conducting research are as follows:

a. This research was only conducted on Lecturers and Employees at the Islamic University of Malang with a sample of 158 respondents.
b. This study only uses two variables: the digitization system and tax administration. This research has not used grand theory.

5.3.Suggestion

After considering the limitations mentioned earlier, the researcher gave the following suggestions:

a. For researchers, it is further suggested that they can expand the scope by adding relevant research objects and can also add sample selection criteria so that the number of samples obtained is more in line with what will be carried out in the research.
b. For the next researcher, it is hoped that it can add other variables related to tax compliance that are influenced by factors other than digitalization and tax administration, such as socialization of the understanding of the digitalization system.
c. For researchers, they can then add grand theories such as tax compliance, attribution theory and technology acceptance model.

Abstract

In the modern era, consumption patterns have undergone significant changes, particularly among young generations, including students in Islamic boarding schools (Pesantren)*. One of the crucial factors influencing consumer behavior is financial management behavior, which plays a vital role in maintaining financial stability. This study aims to identify the partial influence of Islamic financial literacy, financial knowledge, and financial attitude on financial management behavior at* Pondok Pesantren Sabilurrosyad Malang*. This research employs a quantitative method, with data collected using a purposive sampling technique. The sample size was determined using the Slovin formula, resulting in 177 respondents, all of whom are active students. The data were analyzed using multiple linear regression with SPSS 25 software. The findings indicate a significant positive effect of Islamic financial literacy, financial knowledge, and financial attitude on financial management behavior at Pondok Pesantren Sabilurrosyad Malang. Additionally, each of the variables Islamic financial literacy, financial knowledge, and financial attitude has a partial influence on financial management behavior at* Isamic Boarding School Sabilurrosyad Malang.

Keywords: Islamic financial literacy, financial knowledge, financial attitude, financial management behavior.:

1. Introduction

In the modern era, people's consumption patterns have changed drastically with easy access to goods and services that often encourage consumptive behavior and impulse spending. This habit can lead to financial problems, so effective money management is needed to optimize personal finances (Felantika, 2022). Based on a CNN Indonesia report (19 August 2021), data from the OCBC Financial Index shows that the financial behavior index of the younger generation only reaches 37.72 on a scale of 100. This reflects a big challenge for millennials and Gen Z in managing their finances.

Consumptive behavior is closely related to a person's financial management behavior. Financial management behavior is an individual's habit of managing finances, including planning, budgeting, and saving funds (Wijaya, 2024). According to Wardani and Anggadita (2021), consumptive tendencies are more dominant in individuals aged 13 to 21 years, which is a period of identity search and self-development. At this stage, the younger generation, including santri at Isamic Boarding School Malang, are more vulnerable to external influences that can affect the way they manage their finances.

The factor that influences the financial management behavior of a santri or young generation is Islamic financial literacy. Islamic financial literacy is an individual's

understanding of the principles of Islamic finance, including money management, investment, and financial aspects in accordance with Islamic teachings, such as the prohibition of usury, gharar, and maysir, as well as the application of zakat, waqf, and sadaqah (Pratama & Nisa, 2024). Ahyar & Abdullah (2020) emphasized that sharia-based financial literacy not only regulates aspects of Islamic law, but also moral values and integrity. This is reinforced by the findings of Purboningrum & Fathoni (2023) which state that sharia financial literacy has a positive and significant effect on financial management behavior.

In addition to Islamic financial literacy, another factor that plays a role in financial management behavior is financial knowledge. Sandi et al. (2020) define financial knowledge as an individual's ability to understand, analyze, and manage finances effectively to avoid financial problems. This understanding includes aspects of debt management, savings, investment, and spending (Cude et al., 2023). Individuals who have good financial knowledge can make wiser and more responsible financial decisions (Sugiharti & Maula, 2019). Previous research also shows that financial knowledge has a significant influence on financial management behavior (Afriani & Kartika, 2021).

Another factor that contributes to financial management behavior is financial attitude. Financial attitude refers to a person's views, opinions, and assessments of their finances which are reflected in their financial attitudes and behaviors (Marzaweny et al., 2022). A positive financial attitude correlates with an individual's ability to plan and control finances effectively, which ultimately contributes to long-term financial well-being (Dewi et al., 2020). In addition, individuals with a good financial attitude are more likely to avoid consumptive debt and prioritize investment over impulse spending (Yulfiswandi et al., 2022). Several studies also show that a positive financial attitude has a significant influence on financial management behavior (Moko et al., 2022; Budiono, 2022)

Based on the phenomenon in the previous research described above, it can be seen that the aspects are diverse. Therefore, researchers have an interest in conducting further research on Islamic financial literacy, financial knowledge, and financial attitude towards financial management behavior, especially in the Sabilurrosyad Islamic Boarding School in Malang. Thus, this research was conducted with the title "**Realizing Financially Intelligent Santri: The Effect of Sharia Financial Literacy, Knowledge, and Financial Attitudes on Financial Management Behavior (at Santri Islamic Boarding School Sabilurrosyad Malang)**".

2. Literature Review

Theory of Planned Behaviour (TPB) introduced by Ajzen (1991) is one of the characteristics of a person's behavioral reaction to beliefs affecting individual behavior in accepting or rejecting a decision. This theory studies the factors that influence a person's attitude towards behavior, assuming that perceived behavioral control has a motivational effect on individual intentions to act.

Islamic financial literacy is a comprehensive understanding of financial concepts and practices that are in line with Islamic sharia principles, including an understanding of the prohibition of riba (interest), gharar (excessive uncertainty), and maysir (gambling) (Mihajat, 2016). This literacy includes knowledge of Islamic financial products such as mudharabah, musyarakah, murabahah, as well as an understanding of zakat, alms, and waqf as instruments of wealth distribution in Islam (Pratama & Nisa, 2024). According to Ruwaidah (2020), there are several indicators of Islamic financial literacy, namely knowledge, ability, belief.

Lusardi & Streeter (2023) explain that financial knowledge is a set of skills and insights that enable a person to effectively manage their financial resources, from income to expenses,

and understand concepts such as compound interest, inflation, taxation, and portfolio diversification. This knowledge also includes an understanding of financial products such as credit cards, loans, insurance, and various types of investments (Yuniawati et al., 2024). According to Halim (2015), financial knowledge can be measured through several indicators that reflect a person's understanding of certain financial aspects. these indicators are, knowledge of budgeting, knowledge of interest and credit, knowledge of how to open an insurance policy.

Bapat (2020) explains that financial attitude is the tendency of a person's attitude towards financial matters, which influences and facilitates in addressing various financial aspects, including management, budgeting, and making financial decisions for the future. According to Sibagariang & Wulandari (2021), financial attitude refers to a person's sensitivity to financial matters, which can be measured through their opinions or statements. This attitude influences individuals in determining financial behavior, both in management, budgeting, and decisions taken (Budiono, 2020). Mahgfiroh et al., (2020) indicators of measuring financial Attitude, namely, orientation towards finance, debt philosophy, financial security, assessing personal finance.

According to Kholilah & Iramani (2013) financial management behavior is an individual's ability to manage (planning, budgeting, checking, managing, controlling, searching and storing) the costs of daily financial needs. financial management behavior, is the effect of the magnitude of a person's desire to meet his life needs according to the level of income earned. Financial management behavior is a pattern of actions and habits of a person towards managing their financial resources, reflected in the activities of planning, budgeting, examining, managing, controlling, searching for, and storing daily financial funds (Wijaya, 2024). The indicators of financial management behavior according to Mahgfiroh et al., (2020) are as follows, organization, saving, expenditure, debt, investment, money management.

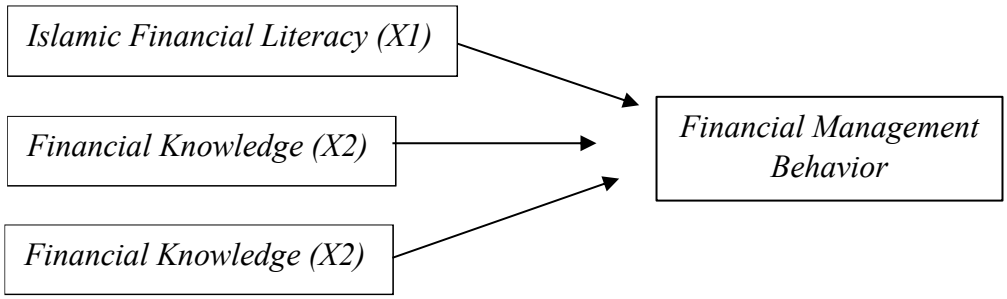

Figure 1 Research Model

H1: *Islamic Financial Literacy* has a significant influence on *Financial Management Behavior* (Study on Santri Pondok Pesantren Sabilurrosyad Malang).
H2: *Financial Knowledge* has a significant effect on *Financial Management Behavior* (Study at Santri Pondok Pesantren Sabilurrosyad Malang).
H3: *Financial Attitude* has a significant effect on *Financial Management Behavior* (Study at Santri Pondok Pesantren Sabilurrosyad Malang).

3. Methodology

The population in this study were students with a total of 426, with those who were active students totaling 319 students at the Sablilurrosyad Islamic Boarding School in Malang. Sampling in the study using purposive sampling technique, to determine the size of the sample

size to be analyzed, the researcher used the Slovin formula and found a sample of 117 respondents.

4. Results and Discussion

The validity test aims to measure how far the level of validity of a questionnaire is. The validity test can be said to be valid if the value of r count> r table (with a sig of 5%), but if r count < r table then the questionnaire is invalid. The validity test results are as follows:

Table 1. Validity Test

Variabel	Item	Item	r Count	r Table	Decision
X_1 (*Islamic Financial Literacy*)	X_1.1	I understand the basic principles of Islamic finance, such as the prohibition of riba.	0,826	0,1476	Valid
	X_1.2	I know the importance of paying zakat as part of Islamic financial management.	0,777	0,1476	Valid
	X_1.3	I feel able to avoid financial products that contain elements riba in money management	0,660	0,1476	Valid
	X_1.4	I believe that financial management in accordance with Islamic principles provides blessings in life.	0,749	0,1476	Valid
X_2 (*Financial Knowledge)*	X_2.1	I believe that financial management in accordance with Islamic principles provides blessings in life.	0,682	0,1476	Valid
	X_2.2	I believe it is important to allocate funds for urgent needs in the budget	0,715	0,1476	Valid
	X_2.3	I believe that choosing credit with low interest can help maintain financial stability	0,763	0,1476	Valid
	X_2.4	I believe that insurance can help reduce financial burden in the event of unexpected risks	0,758	0,1476	Valid
X_3 (*Financial Atittude)*	X_3.1	I believe that managing money wisely can improve the quality of life in the future	0,784	0,1476	Valid
	X_3.2	I always try to set aside some of my income for savings	0,788	0,1476	Valid
	X_3.3	I believe that avoiding unnecessary debt is a wise way to manage personal finances.	0,836	0,1476	Valid
	X_3.4	I feel at ease when I have an emergency fund to deal with unexpected situations.	0,832	0,1476	Valid

	X_3.5	I believe that understanding my personal finances helps me make better decisions.	0,679	0,1476	Valid
Y (*Financial Management Behavior)*	Y.1	I believe keeping track of my income can help me manage my finances better	0,662	0,1476	Valid
	Y.2	I believe keeping track of expenses can help me manage my finances better	0,755	0,1476	Valid
	Y.3	I believe that having savings is the first step towards financial stability	0,770	0,1476	Valid
	Y.4	I believe that managing my expenses well will help me achieve my financial goals	0,693	0,1476	Valid
	Y.5	I believe it is wise to only go into debt for really important needs.	0,552	0,1476	Valid
	Y.6	I feel it is important to understand investments before making a decision	0,574	0,1476	Valid
	Y.7	I believe increasing my knowledge about financial management is a beneficial step for the future	0,556	0,1476	Valid

Source: Data processed by SPSS 2025

This study involved 177 respondents with a significance value of 0.05, so that, the r table value of n = 177, the sample value (n-2) = 177-2 = 175 is 0.1476. Based on the test results that have been carried out, it can be stated that the questionnaire obtained is valid and can be used for research.

Reliability test by paying attention to the *Cronbach's Alpha value,* if the *Cronbach's Alpha* value of the calculation results> 0.7, it can be said that the research variable is reliable, and vice versa, the following data are the results of the reliability test:

Table 2. Reliability Test

Variabel	*Cronbach Alpha*	Nilai Kriteria	Keputusan
X_1	0,738	*Cronbach's Alpha* > 0,7	Reliabel
X_2	0,702	*Cronbach's Alpha* > 0,7	Reliabel
X_3	0,841	*Cronbach's Alpha* > 0,7	Reliabel
Y	0,774	*Cronbach's Alpha* > 0,7	Reliabel

Source:Data processed by SPSS 2025

From the results of the reliability test that has been carried out on all variables in this study, it is declared reliable Cronbach's Alpha is greater than 0.7. The Islamic financial literacy variable has a reliability value of 0.738, financial knwoledge of 0.702, financial atittude of 0.841, and financial management behavior of 0.774. These values indicate that the

questionnaire that has been carried out for measuring the variables has good internal consistency. So that the instruments in this study can be used to analyze further research.

The normality test is used to test whether the variables used have a disturbance or are normally distributed. The following is the data from the normality test:

Table 3. Normality Test

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		177
Normal Parameters[a,b]	Mean	0,0000000
	Std. Deviation	2,10740035
Most Extreme Differences	Absolute	,065
	Positive	,053
	Negative	-,065
Test Statistic		,065
Asymp. Sig. (2-tailed)		.064[c]

Source: Data processed by SPSS 2025

Based on the test results that the normality test using the *Kolmogorov smirnov test* resulted in an *Asymp Sig* value of 0.064> 0.05 so that it can be stated that all data in the study is said to be normal.

The multicollinearity test aims to detect the presence or absence of multicollinearity in a regression model, it can be seen from the tolerance value and VIF value. If the *tolerance* value> 0.10 and VIF < 10 then there is no multicollinearity. The following is the data from the multicollinearity test:

Table 4. Multicollinearity Test

Variable	***Tolerance***	**VIF**	**Passing Condition**	**Description**
Islamic Financial Literacy (X_1)	0,455	2,196	*tolerance* > 0.10 VIF < 10	No multicollinearity
Financial Knowledge (X_2)	0,651	1,535	*tolerance* > 0.10 VIF < 10	No multicollinearity
Financial Atittude (X_3)	0,502	1,992	*tolerance* > 0.10 VIF < 10	No multicollinearity

Source: Data processed by SPSS 2025

Based on the test results, it shows that the *Islamic financial literacy*, *financial knowledge* and *financial attitude* variables are free from multicollinearity, have a *tolerance* value greater than 0.10 and a VIF value smaller than 10, so it can be said that the data in this study pass the specified requirements.

The heteroscedasticity test is used to determine whether in a regression there is an inequality of variance from residuals or observations with one another. The following is the data from the heteroscedasticity test:

Table 5. Heteroscedasticity Test

Variable	*Tolerance*	Significance α	Description
Islamic Financial Literacy (X_1)	0,863	>0,05	Heteroscedasticity free
Financial Knowledge (X_2)	0,190	>0,05	Free of heteroscedasticity
Financial Atittude (X_3)	0,591	>0,05	Free of heteroscedasticity

Source: Data processed by SPSS 2025

Based on the test results, this heteroscedasticity test uses the Glejser test method whose value is seen from sig. *The Islamic financial literacy, financial knowledge,* and *financial attitude* variables are free from heteroscedasticity because they have a sig value greater than 0.05 or 5%, or the *tolerance* value is greater than the significant reference value α.

Multiple linear regression tests are used to test the relationship between two or more variables. The following is the data from the multiple linear regression test

Table 6. Multiple Linear Regression Analysis

Coefficients [a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	5,141	1,632		3,151	,002
	X_1	,384	,115	,242	3,332	,001
	X_2	,335	,089	,228	3,748	,000
	X_3	,553	,092	,417	6,020	,000
a. Dependent Variable: Y1						

Source: Data processed by SPSS 2025

$$Y = 5.141 + 0.384\ X_1 + 0.335\ X_2 + 0.553\ X_3 + e$$

Based on the regression model equation, it can be interpreted as follows:

a. The constant (a) of 5.141 is positive, meaning that when the score of the independent variables *Islamic financial literacy* (X_1), *financial knowledge* (X_2), and *financial attitude* (X_3)) is zero (0), the value of *financial management behavior* (Y) is 5.141.
b. The regression coefficient of the *Islamic financial literacy* variable (X_1) shows a value of 0.384, has a positive effect. With a positive coefficient value, it is said that the *Islamic financial literacy* variable is in the same direction as the *financial management behavior* (Y) variable, meaning that every increase in the *Islamic financial literacy* variable will increase *financial management behavior* (Y) by 0.384. In addition, the significant value (*Sig.)* for the *Islamic financial literacy*

variable is 0.001, which means it is smaller than 0.05, it can be concluded that the *Islamic financial literacy* variable ($X_{1)}$has a significant effect on *financial management behavior* (Y).

c. The regression coefficient of the *financial knowledge* variable (X_2) shows a value of 0.335, has a positive effect. With a positive coefficient value, it is said that the *financial knowledge* variable is in the same direction as the *financial management behavior* (Y) variable, meaning that each increase in the *financial knowledge* variable will increase the *financial management behavior* (Y) by 0.335. In addition, the significant value (*Sig.)* for the *financial knowledge* variable is 0.000, which means it is smaller than 0.05, it can be concluded that the *financial knowledge* variable ($X_{2)}$has a significant effect on *financial management behavior* (Y).

d. The regression coefficient of the *financial attitude* variable (X_3) shows a value of 0.553, has a positive effect. With a positive coefficient value, it is said that the *financial atittude* variable is in the same direction as the *financial management behavior* (Y) variable, meaning that every increase in the *financial attitude* variable will increase the *financial management behavior* (Y) by 0.553. In addition, the significant value (*Sig.)* for the *financial attitude* variable is 0.000, which means it is smaller than 0.05, it can be concluded that the *financial attitude* variable ($X_{3)}$has a significant effect on *financial management behavior* (Y).

The F test is used to determine whether the *independent* and independent variables together affect the *dependent* variable, the following is the F test data or simultaneous test:

Table 7. F test

ANOVA [a]						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1094,886	3	364,962	80,777	,000[b]
	Residual	781,640	173	4,518		
	Total	1876,526	176			
a. Dependent Variable: Y1						
b. Predictors: (Constant), X_3, X_1, $X_{(2)}$						

Source: Data processed by SPSS 2025

Based on the table of F test results, it can be seen that the significant value is 0.000 <0.05 (5%). Thus, based on the hypothesis (H) proposed in this study, the variables *Ismaic financial literacy*), *financial knowledge* ($X_{2)}$, and *financial attitude* ($X_{3)}$, partially affect *financial management behavior* (Y).

The t test is used to determine the effect of each *independent* variable on the *dependent* variable, the following data are the results of the t test or partial test:

Table 8. Test t

Coefficients [a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	5,141	1,632		3,151	,002
	X_1	,384	,115	,242	3,332	,001

	X_2	,335	,089	,228	3,748	,000
	X_3	,553	,092	,417	6,020	,000
a. Dependent Variable: Y1						

Source: Data processed by SPSS 2025

Based on the results of the t test, the sample in this study amounted to 177 so that the following information can be generated:

a. The t test results on the *Islamic financial literacy* variable (X_1) get a significant value of 0.001 <0.05, then Ho is rejected and $H_1$is accepted, meaning that the *independent* variable, namely *Islamic financial literacy*, has a significant effect on the *dependent* variable *financial management behavior* (Y).
b. The t test results on the *financial knowledge* variable (X_2)get a significant value of 0.000 <0.05, then Ho is rejected and $H_2$is accepted, meaning that the *independent* variable, namely *financial knowledge,* has a significant effect on the *dependent* variable *financial management behavior* (Y).

Model Summary [b]				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,764[a]	,583	,576	2,126
a. Predictors: (Constant), X_3, $X_{(2,)\ X(1)}$				

c. The t test results on the *financial attitude* variable (X_3) get a significant value of 0.000 <0.05, then $H_0$is rejected and $H_3$is accepted, meaning that the *independent* variable, namely *financial knowledge,* has a significant effect on the *dependent* variable *financial management behavior* (Y).

The t test is used to determine the effect of each *independent* variable on the *dependent* variable, the following data are the results of the t test or partial test:

Table 9. Coefficient of Determination (*Adjusted* R^2)

Source: Data processed by SPSS 2025

Based on the table, the coefficient of determination (*Adjusted* R^2) of 0.576 indicates that the ability of the *independent* variables*,* namely *Islamic financial literacy, financial knowledge,* and *financial attitude* in explaining the *dependent* variable, namely *financial management behavior,* is 57.6%, while the remaining 42.4% is explained by other variables not included in this research model.

The results showed that the statement "I believe that financial management in accordance with Islamic principles provides blessings in life" had the highest average (4.71), reflecting respondents' belief in the economic and spiritual benefits of Islamic financial principles. The hypothesis results support that the *Islamic financial literacy* variable (X_1)can influence *financial management behavior* (Y), showing a regression coefficient value of 0.384,

which means it is and has a positive effect between *Islamic financial literacy* and *financial management behavior.* Meanwhile, the results of the t test conducted show that the significant value obtained is smaller than the limit value of the significant level, namely 0.001 <0.05, then H $_0$is rejected and H $_1$is accepted, meaning that the *independent* variable, namely *Islamic financial literacy*, has a significant effect on the *dependent* variable *financial management behavior* (Y). In other words, *Islamic financial literacy* is one of the factors of the ability to manage their finances (*financial management behavior).*

In the context of pesantren, Islamic financial literacy is reflected in concrete practices such as the use of Islamic banks, halal investment, and understanding of zakat, waqf, and sadaqah. This finding is in line with the *Theory of Planned Behavior* (Ajzen, 1991), which states that a person's beliefs influence Islamic financial intentions and behavior. Previous research (Fathoni & Purboningrum, 2023; Widyakto et al., 2022; Imari et al., 2023) also supports that *Islamic financial literacy* has a significant effect on financial management *behavior*, making it an important factor in the financial management of students and the younger generation, therefore hypothesis 1 (H_1)is accepted.

The results showed that the statement "I believe it is important to make a budget for better personal financial management" had the highest average (4.55), reflecting respondents' high awareness of the importance of budgets in managing finances. The hypothesis results support that the *financial knowledge* variable (X_2)can influence *financial management behavior* (Y), showing a regression coefficient value of 0.335, which means that it is and has a positive effect between *financial knowledge* and *financial management behavior.* Meanwhile, the results of the t test conducted show that the significant value obtained is smaller than the limit value of the significant level, namely 0.000 <0.05, then H $_0$is rejected and H $_2$is accepted, meaning that the *independent* variable, namely *financial knowledge,* has a significant effect on the *dependent* variable *financial management behavior* (Y). In other words, *financial knowledge* is one of the factors of the ability to manage their finances (*financial management behavior).*

This finding confirms that increasing financial knowledge in the pesantren environment must be an educational priority, in line with the *Theory of Planned Behavior* (Ajzen, 1991) which states that individual behavior control is influenced by perceptions of available resources and opportunities. This result is supported by research by Afriani & Kartika (2021) and Martfiyanto & Nusa (2021), who found that *financial knowledge* has a significant effect on *financial management behavior*. However, in contrast to the research of Moko et al. (2022) which states that financial knowledge does not always have a significant effect on financial behavior. In conclusion, a good understanding of financial knowledge is a key factor in the financial planning of santri and the younger generation, so hypothesis 2 (H_2) is accepted.

The results showed that the statement "I believe that understanding my personal financial condition helps me make better decisions" had the highest average (4.68), confirming that understanding personal finance contributes to making wise financial decisions. The hypothesis results support that the *financial attitude* variable (X3) can influence *financial management behavior* (Y), showing a regression coefficient value of 0.553, which means it is and has a positive effect between *financial attitude* and *financial management behavior.* Meanwhile, the results of the t test conducted show that the significant value obtained is smaller than the limit value of the significant level, namely 0.000 <0.05, then H $_0$is rejected and H $_3$is accepted, meaning that the *independent* variable, namely *financial attitude*, has a significant effect on the *dependent* variable *financial management behavior* (Y). In other words, *financial attitude* is one of the factors of the ability to manage their finances (*financial management behavior).*

This supports the *Theory of Planned Behavior* (Ajzen, 2020), which states that a person's financial attitude affects their financial behavior. Individuals with good financial

attitudes tend to be more cautious in taking risks and more focused on long-term financial goals (Mahgfiroh et al., 2020). This research is in line with the findings of Moko et al. (2022) and Widyakto et al. (2022), which state that *financial attitude* has a significant effect on *financial management behavior*. Therefore, a good understanding of *financial attitude* is an important factor in forming healthy financial habits among santri and the younger generation, so hypothesis 3 (H_3) is accepted.

5. Conclusion

From the discussion that has been presented, the following conclusions can be drawn. *Islamic financial literacy* variables partially have a significant effect on *financial management behavior.* This is indicated by the higher the literacy about Islamic finance owned by students, the more behavior in managing finances. *The financial knwoledge* variable partially has a significant effect on *financial management behavior.* This is shown from, a good understanding of finance will help students make better financial decisions. *The financial atittude* variable partially has a significant effect on *financial management behavior.* This is indicated by a positive financial attitude that can encourage students to manage their finances more responsibly.

The limitations in this study are as follows. The scope of the research was only conducted among students who were active students at Pondok Pesantren Sabilurrosyad Malang, with a total of 319 students and a sample of 177 students so that it could not be generalized as a whole to students at Pondok Pesantren Sabilurrosyad Malang. The limitation in this study is that when distributing questionnaires using *google form,* respondents in filling out questionnaires often do not match the facts experienced by respondents.

From the results of this study, there are several recommendations that can be conveyed as follows. Suggestions for Santri to increase and improve understanding of *Islamic financial literacy, financial knwoledge, financial attitude,* and *financial management behavior* through various sources such as books, educational videos, seminars, or financial training in order to apply financial knowledge in everyday life by making better and disciplined financial planning. Suggestions for Islamic Boarding Schools can provide in-depth knowledge related to Islamic-based financial education to students to increase knowledge of finance in Islam, and provide education to students on the importance of saving for the long term. Suggestions for future research should be further research on other variables such as *locus of control* that can affect the *financial management behavior* of other subjects for students or the younger generation. Researchers can also deepen the analysis related to other factors that may affect *financial management behavior.*

ANALYZE OF NON-PHYSICAL WORK ENVIRONMENT AND ORGANIZATIONAL CULTURE ON TURNOVER INTENTION OF PRODUCTION DEPARTMENT EMPLOYEES AT PT GIWANGKARA KANDANGWESI

Celsa Heriani Putri[1], Khaerul Rizal Abdurahman[2]

[1]Faculty of Economics and Business, General Achmad Yani University

Abstract

A company is established to achieve a predetermined goal. To achieve this goal, the company must be able to face various challenges, both local and global. Therefore, the company needs to pay attention to and maintain competent human resources in order to survive and does not have the desire to leave the company. If human resources in a company are not competent and tend to leave the company, then this can be an obstacle to achieving the company's goals. To ensure that these two factors are met, the company needs to pay attention to the work environment and the alignment between the values held by human resources and the company. The purpose of this study was to determine the non-physical work environment and organizational culture on turnover intention in employees of the production department of PT Giwangkara Kandangwesi. The research method used in this study uses a qualitative method with data collection methods used are interviews, observation and documentation. The validity test of the data used in this study uses a triangulation process. The results of the study showed that based on the responses of informants, the non-physical work environment of the production department is in the less category, the organizational culture is in the weak category and turnover intention is in the high category. Then, this study also shows the results that the non-physical work environment and organizational culture have a major influence on turnover intention. This means that the more the work environment that workers experience is not in accordance with what is expected and the difficulty in implementing the values they adhere to will have an impact on the workers' intention to leave the company.

Keywords: Non-Physical Work Environment, Organizational Culture, Turnover Intention

1. Introduction

The progress of an organization is not solely measured by increasing revenue or profit, but is also determined by the quantity and quality of its human resources. In an era of increasingly tight global competition, companies are required to excel not only in financial aspects, but also in terms of strategic management and development of human resources. Human resources are invaluable assets because of their role as the main driver of all organizational activities, from the planning process, implementation, to work evaluation.

Good quality workforce will create high productivity, sustainable innovation, and be able to respond to challenges and changes that occur in the business environment.Because whether or not a company's goals are achieved depends largely on the workforce it has.Therefore, investment in competency development, increasing work motivation, and creating a conducive work environment are crucial factors in supporting organizational growth and sustainability. Thus, focusing on effective human resource management is a long-term strategy that must be a priority for every organization that wants to grow sustainably and be highly competitive.

One of the main challenges in human resource management is retaining employees who are competent and committed to the organization.With commitment, it will not only benefit employees but also the company as a whole which will drive long-term growth and sustainability. However, many companies face quite high labor turnover rates.

*Labor turnover*has a close relationship with low organizational commitment, when employees have low commitment to the organization they are more likely to leave their jobs which increases turnover rates. Labor turnover and turnover intention are closely related, where turnover intention is an early signal that can help organizations predict future employee turnover rates. Every company needs to monitor labor turnover through turnover intention to prevent or reduce high labor turnover rates. The following is data on the labor turnover rate of the production department.

Table 1.1Production Department Employee Labor Turnover Data

YEAR	MONTH	EARLY EMPLOYEES	ENTER	GO OUT	FINAL NUMBER OF EMPLOYEES
2023	Jan	4	-	-	4
	Feb	4	-	-	4
	Mar	4	-	-	4
	Apr	4	-	-	4
	May	4	2	-	6
	June	6	-	3	3
	July	3	3	-	6
	Ags	6	-	-	6
	September	6	-	-	6
	Oct	6	-	-	6
	Nov	6	-	-	6
	Dec	6	-	-	6

Based on Table 1.1, it shows that there was labor turnover of production employees in 2023, especially in June, 50% of employees left the company. This is a concern for the company which if left unchecked is feared to be detrimental to the company because it can hinder production, make the division of tasks irregular due to reduced employees and make other employees have additional tasks. Therefore, when labor turnover was high in June, the company tried to think about how to improve and retain employees, this was reflected in the next few months where no employees left.

To get workers who have a strong desire to stay, supporting factors are needed, including salary, the work itself, co-workers, superiors, promotions and the work environment **(Marihot, 2009:291)**. According to **(Sedarmayanti, 2011:26)** states that the non-physical work environment is all conditions related to relationships between co-workers, or relationships between superiors and subordinates.

The problem of turnover intention that occurs in the production section is thought to be caused by a fairly high non-physical work environment, this is supported by research conducted by **Agung & Lilik (2009)** the work environment influences employee turnover intention because a good work environment, such as communication, good cooperation, and support from all components of the company will lead to a reduction in employee intensity to leave their jobs.

In an organization, it is very important to have a non-physical work environment, namely conditions that occur in relation to work relationships, both relationships with superiors and relationships with colleagues or subordinates.**(Sedarmayanti, 2011**).The work environment

can play a major role in improving employee performance and commitment and can help to identify factors that lead to job dissatisfaction.**(Westerman & Simmons, 2007)**. Harmonious relationships between employees and good cooperation are needed, especially in such a heavy and highly focused job.

Based on interviews and pre-survey results conducted by researchers on the research object, it is known that the desire of employees to leave their jobs is due to social status that differentiates between production colleagues such as work experience between colleagues. And the lack of smooth communication between fellow colleagues in the production department, which has an impact on the company's turnover intention, especially for employees who are already tied to the company.

Apart from the non-physical work environment, there are several other factors that can influence turnover intention, namely organizational culture. Organizational culture is an important factor in an organization. A strong or positive organizational culture can help employees be more loyal and productive in achieving company goals, while a negative or weak culture can hinder and conflict with company goals. In order to maintain, companies need to build an organizational culture that can make employees committed. According to **Bosomtwe & Obeng (2018)** revealed that stronger perceptions of cultural traits correspond to lower employee turnover intentions, so to reduce turnover intentions, organizational culture must be maintained or improved. The results of the study **Kwakye (2018)** revealed that organizational culture influences turnover intention.

Based on the results of the researcher's interview with the Production Section Coordinator, most of the organizational cultures that have been formed have been implemented, but some have not been implemented. The following is data on the values adopted by the 5S and GWK companies.

Table 1.2Implementation of Organizational Culture in the form of 5S for Production Employees

NO	MARK	INFORMATION
1.	*Seiri*(Summary)	Employees sort and separate unnecessary items
2.	*Seiton*(Neat)	Employees arrange the storage of goods according to their place.
3.	*Sunday*(Clean)	After completing the work, employees clean all items and work area.
4.	*Seiketsu*(Treat)	Employees maintain goods in an orderly, neat and clean manner
5.	*Shitsuke*(Diligent)	Employees carry out all work processes consistently and in a standardized manner

Based on the evaluation of the implementation of the 5S principle in the workplace, all elements of Seiri (Compact), Seiton (Neat), Seiso (Clean), Seiketsu (Maintain), and Shitsuke (Diligent) have not been implemented. This means that currently there is no systematic effort from employees in sorting unnecessary items, arranging the workplace regularly, maintaining the cleanliness of the work area, maintaining good conditions, and carrying out work processes consistently and standardized. This shows the need for initial steps in the form of socializing the 5S concept to all employees, followed by gradual implementation from Seiri to Shitsuke, as well as periodic monitoring to ensure that a clean, tidy, and disciplined work culture can be formed and maintained sustainably.

Table 1.3 Implementation of Organizational Culture in the Form of GWK for Production Employees

NO	MARK	INFORMATION
1.	*God*(Holding firmly to the values of the Almighty God, Allah SWT)	Employees participate in regular study events

NO	MARK	INFORMATION
2.	*Wisdom*(Upholding the values of justice and wisdom)	• Employees can control or solve problems • Employees determine actions without taking the law into their own hands
3.	*Knowledge*(Uphold and appreciate all forms of current science and knowledge)	Employees are not dependent on specific personnel

Based on the implementation data of the company's values, it can be concluded that the three main values, namely God, Wisdom, and Knowledge, have been well implemented by employees. The value of God, which reflects a commitment to divinity and spirituality, can be seen from the active participation of employees in routine study activities as a form of practicing religious values. The value of Wisdom, which emphasizes justice and wisdom, is reflected in the ability of employees to solve problems wisely and make decisions without being authoritarian or taking the law into their own hands. Meanwhile, the value of Knowledge has also been well implemented, where employees demonstrate independence and responsibility in carrying out their duties, without relying on certain individuals. Overall, the implementation of these values reflects a work culture based on ethics, professionalism, and continuous self-development.

Tables 1.2 and 1.3 are some parts of the implementation of organizational culture in the production company, where there are still some cultures that do not run well according to the established culture. From the results of interviews and surveys with the Production Coordinator, the 5S organizational culture has not been implemented even though it has been well socialized to all employees, but there are still some employees who do not implement the 5S organizational culture that has been formed.

2. Literature review

2.1.Non-Physical Work Environment

The work environment is divided into two, namely the physical work environment and the non-physical work environment. According to **Sudaryo (2018)**The physical work environment is all physical conditions that exist around the workplace that can affect employees either directly or indirectly. While the non-physical work environment is all conditions related to relationships between co-workers, or relationships between superiors and subordinates **(Sedarmayanti, 2011)**.

Based on the conditions in the field, researchers will only conduct research on non-physical work environments. According to **Wursanto (2011)**defines a non-physical work environment as something that concerns the psychological aspect of the work environment. Based on this understanding, it is said that a non-physical work environment is also called a psychic work environment, namely the conditions around the workplace that are non-physical. According to **Wursanto (2011)**put forward the dimensions of the non-physical work environment as follows: (1) work atmosphere. (2) good treatment. (3) sense of security. (4) harmonious relationships.

2.2.Organizational culture

Organizational culture includes values that are embraced, followed, and implemented by all individuals who work in it. When organizational culture is implemented well, employees will feel connected to the company's vision and mission, and have a high sense of responsibility to support the success of the organization. According to **(Robbins, 1996:294)**There are 5 functions of organizational culture, (1) culture creates a clear distinction between one organization and another. (2) culture brings a sense of identity to members of the organization. (3) culture facilitates the emergence of commitment to something broader than personal or

individual interests. (4) culture is a social glue that is able to unite the organization by providing appropriate standards for employees to do. (5) culture as a meaning-making and control mechanism that guides and shapes employee attitudes and behavior.

2.3. Turnover Intention

According to **Widya & Purba (2019)** states that turnover intention is a thought, desire or perception of employees who are serious about looking for a new job elsewhere with free will and accompanied by psychological motives to leave their current work environment due to dissatisfaction with current work conditions.

The occurrence of turnover intention can be seen from the reasons an employee leaves his job or quits his job. This is supported by the statement **Kartono (2017)** There are 3 indicators to determine the desire of employees to move, namely:

1) *Intention To Quit*(Intention to leave) Employees intend to leave when they get a better job and will end it later with the employee's decision to stay or leave the job.
2) *Job Search*(Job search) Reflects the individual's desire to find work in another organization. If employees have started to think about leaving work often, employees will try to find work outside the company that feels better.
3) Thinking Of Quit (Thinking about leaving) Reflects people thinking about working or staying in the work environment. Starting with job dissatisfaction felt by employees, then employees start thinking about leaving their current workplace.

3. Methodology

The type of research used in this study is descriptive research. Descriptive research is a research method that attempts to describe and interpret objects according to what they are. This study aims to systematically describe the facts and characteristics of the objects or subjects studied precisely, while the type of research used is qualitative. Qualitative research is a research procedure that produces descriptive data in the form of speech or writing and the behavior of people observed. This qualitative approach is expected to be able to produce an in-depth description of speech, writing, and or behavior that can be observed from an individual, group, community, and or certain organization. The informants taken from this study were production employees. All informants are permanent employees, consisting of 1 head of production and 6 production employees. The primary data used by the researcher are the results of interviews with the seven informants and the secondary data used by the researcher is employee turnover data.

5.5. Theoretical framework

The problem of turnover intention that occurs in the production department is thought to be caused by a fairly high non-physical work environment, this is supported by research conducted by **Agung & Lilik (2009)** the work environment influences employee turnover intention because a good work environment, such as communication, good cooperation, and support from all components of the company will lead to a reduction in employee intensity to leave their jobs.

It is very important for an organization to have a non-physical work environment, namely conditions that occur in relation to work relationships, both relationships with superiors and relationships with colleagues or subordinates.**(Sedarmayanti, 2011)**.The work environment can play a major role in improving employee performance and commitment and can help to identify factors that lead to job dissatisfaction.**(Westerman & Simmons, 2007)**. Harmonious relationships between employees and good cooperation are needed, especially in such a heavy and highly focused job.

Apart from the non-physical work environment, there are several other factors that can influence turnover intention, namely organizational culture. Organizational culture is an important factor in an organization. A strong or positive organizational culture can help employees be more loyal and productive in achieving company goals, while a negative or weak culture can hinder and conflict with company goals. In order to maintain, companies need to build an organizational culture that can make employees committed. According to**Bosomtwe & Obeng (2018)**revealed that stronger perceptions of cultural traits correspond to lower employee turnover intentions, so to reduce turnover intentions, organizational culture must be maintained or improved. The results of the study **Kwakye (2018)** revealed that organizational culture influences turnover intention.

5.6. Conceptual framework

According to **Sugiyono (2018:18)** states that research variables are defined as attributes, characteristics or values of people, objects or activities that have certain variations that are determined by the researcher and then studied and then conclusions are drawn.

In this study there are three variables, namely two dependent or independent variables, namely non-physical environment and organizational culture and one independent or dependent variable, namely turnover intention. Based on these variables, it will then be developed into a concept of variables, sub-variables and measurement scales which are then used as the basis or guideline in interviews asked by the author to data sources or informants in this study. The following is a table of operational variables that can be seen in the following table:

Table 3.1 Operationalization of Variables

VARIABLES	SUB VARIABLES	SCALE MEASURING
Non-Physical Work Environment (X1) Conditions related to social relations in a company that can have an impact on the comfort of the environment in a company, especially relations between employees and relations with management.	Working Atmosphere	Qualitative
	Good treatment	Qualitative
	Harmonious relationship	Qualitative
Organizational Culture (X2) Characteristics or habits that exist in an organization and become guidelines for the organization in behaving and acting in order to solve problems that arise that can differentiate one organization from another.	Innovation and risk taking	Qualitative
	Pay attention to detail	Qualitative
	Result orientation	Qualitative
	Team orientation	Qualitative
	Aggressiveness	Qualitative
	Stability	Qualitative
***Turnover Intention*(Y)** The employee's desire to quit or resign voluntarily because they already have other job alternatives.	*Intention To Quit*(intention to leave)	Qualitative
	Intention to search for alternatives(looking for alternative jobs)	Qualitative
	Thinking Of Quit(thinking out)	Qualitative

5.7. Instrumentation

According to **Denzin & Lincoln (1998)**, there are several data triangulation techniques, including: source, technique, and theory triangulation. Source triangulation is done by comparing information from various sources or documents to test data consistency. Technique triangulation uses several data collection methods such as observation, interviews, and documentation on the same source to test the validity of the data. Theory triangulation compares the data obtained with various relevant theories to strengthen the research findings. Based on this, researchers use triangulation techniques to test the validity and reliability of data in a study on the influence of non-physical work environments and organizational culture on the turnover intention of production employees.

Figure 1. Research paradigm:Paradigm of Implementation of Non-Physical Work Environment and Organizational Culture on Turnover Intention of Production Employees

6. Results and Discussion

4.1 Non-Physical Work Environment

No	Sub Variables	Number of Informants
1.	Working atmosphere	7 Informants
2.	Good treatment	7 Informants
3.	Harmonious relationship	7 Informants

Based on the results of the researcher's observations, a family atmosphere in the work environment is considered important in creating a positive work climate, but has not been fully formed due to the dominance of individual work patterns that limit social interaction between employees. In addition, the majority of employees feel uncomfortable working because of the high pressure of achieving targets and the piecework pay system which is considered not comparable to the workload, thus reducing motivation and job satisfaction. Although there are some employees who are able to adapt and feel comfortable, it shows that the level of comfort is influenced by the individual's ability to accept and adapt to the applicable work system.

It can be concluded that aspects of good treatment in the work environment, which include appreciation, fairness, and social support, have not been fully realized. Appreciation from superiors tends to be verbal and inconsistent, without being followed by concrete rewards, thus potentially reducing work motivation. In addition, there are differences in perceptions regarding fairness in the workplace, where some employees feel unequal treatment from superiors, which

can cause jealousy and dissatisfaction. Support between coworkers also shows a divided condition, some feel that there is concern, while others consider solidarity to be still low due to the dominance of individualistic work patterns. These findings indicate that good treatment in the workplace still needs to be strengthened in order to create a fairer, more supportive, and more motivating work environment.

Based on the researcher's observations, what happened in the field was in accordance with what was conveyed by the informant regarding the lack of a harmonious working relationship as a whole. During the observation, the researcher found several small moments of tension that arose due to miscommunication, especially when the pressure of production targets increased. Some employees seemed reluctant to coordinate intensively with colleagues from other divisions, which could be an indication of a distance in communication between divisions.

4.2 Organizational culture

No	Sub Variables	Number of Informants
1.	Innovation and risk taking	7 Informants
2.	Pay attention to detail	7 Informants
3.	Team orientation	7 Informants
4.	Result orientation	7 Informants
5.	Aggressiveness	7 Informants
6.	Stability	7 Informants

Based on the results of the researcher's observations, it is known that the characteristics of work that are routine and very tied to Standard Operating Procedures (SOP) limit the space for employees to innovate and express creative ideas. Although the company provides opportunities for employees to convey ideas, and there is initiative from employees to propose improvements, the lack of support from management and a rigid work system are the main obstacles. This condition causes creative contributions from employees to be rarely realized, which ultimately has an impact on stagnation in the development of work processes in the production department.

Based on the results of the researcher's observations, attention to detail is a crucial aspect in carrying out production work, because it directly affects product quality and the company's reputation. All informants emphasized the importance of accuracy to ensure that each product unit meets specifications and is marketable, considering that small errors such as sewing defects or pattern mismatches can have a major impact on customer satisfaction. To support this, the company has implemented a strict quality control mechanism, including a special section that carries out post-production product inspections, as well as corrective procedures to repair or sort products that do not meet standards. This system not only ensures quality consistency, but also functions as a preventive measure through evaluation of errors that occur.

Based on the results of the researcher's observations, teamwork in general is running quite well, but not yet optimally. Although all employees are aware of the importance of collaboration, there are still obstacles such as delays in delivering information, lack of active participation from some members, and imbalances in workload that cause feelings of unfairness. The work system that emphasizes individual responsibility also limits flexibility in helping coworkers when needed. However, some informants considered that teamwork had been effective thanks to the clear division of tasks and the willingness to help each other. This

difference shows that the effectiveness of teamwork is highly dependent on coordination, communication, and a sense of collective responsibility in carrying out tasks together.

Based on the results of the researcher's observations, all employees are more motivated when performance is assessed based on the final result, because it is considered capable of increasing focus and work enthusiasm in achieving targets. However, the implementation of work must still refer strictly to the applicable Standard Operating Procedure (SOP), so that the orientation of results cannot be separated from compliance with procedures that guarantee product quality and consistency. Employees also expressed that they do not have full freedom in determining work methods, because the entire process has been standardized by the company. Even when the alternative methods used by employees are considered efficient and produce quality products, superiors still ask for adjustments to the SOP to ensure uniformity and prevent potential errors in the next stage.

Based on the results of observations conducted in the field, it was found that the statements conveyed by the informants were proven to be in accordance with reality. Researchers saw that employees had a strong drive to complete tasks quickly and efficiently as a response to the piecework salary system, where the more units produced, the greater the income earned. This was also reflected in the high focus on work, minimal free time outside of official break hours, and interactions that were limited to technical and operational matters.

Based on the results of the researcher's observations, the implementation of rules and policies in the field still shows instability and is inconsistent, which causes excessive flexibility and uncertainty for employees in carrying out their duties. However, when rules and work targets are applied clearly and measurably, this can improve employee discipline, efficiency, and work focus. Thus, consistency in the application of rules is very important to create a structured work environment, without eliminating adaptive capabilities in facing operational challenges.

4.3 *Turnover Intention*

5 No	Sub Variables	Number of Informants
1.	Intention to leave	7 Informants
2.	Looking for alternative employment	7 Informants
3.	Thinking out	7 Informants

That the intention to leave the company is influenced by two main factors, namely disharmonious working relationships and high work pressure. Informants stated that disharmony with superiors or coworkers creates an uncomfortable working environment, which reduces motivation and triggers the desire to find a psychologically healthier workplace. Informants also revealed that work pressure, especially from daily targets and fast work rhythms, causes physical and mental fatigue. However, some employees show a professional attitude and are able to manage work pressure positively, by making it a motivation to improve performance. This shows that the response to working conditions is greatly influenced by psychological factors and the ability to adapt to each individual.

It was found that most employees were willing to change jobs if they got a better offer, with the main considerations being a significant salary increase and the suitability of the job to their skills. However, some informants chose to stay because of comfort, loyalty, and job stability. In searching for job information, some actively used social media, while others did

not, indicating differences in preferences in job search strategies. This reflects that the decision to change jobs is influenced by individual needs and priorities.

Based on the results of the researcher's observations, employee job satisfaction in the production department is divided between those who are satisfied because the job matches their skills even though their income is not yet optimal, and those who are dissatisfied due to the lack of career development opportunities, inappropriate salaries, and minimal work environment support. Disharmonious relationships with superiors and coworkers are also the main factors that drive the intention of most employees to consider leaving the company, although some informants maintain their professional commitment despite facing interpersonal conflicts. This shows that employees' decisions to stay or leave their jobs are influenced by a combination of internal factors such as satisfaction and commitment, as well as external factors in the form of the quality of social relationships in the work environment.

4.4 The impact of non-physical work environment on turnover intention

The non-physical work environment is an important element that influences employee comfort, motivation, and attachment to the company. However, the dominance of individualistic work patterns and disharmony in the relationship between employees and superiors hinder the creation of a positive work climate and trigger turnover intention. Miscommunication, lack of coordination, and high work pressure, coupled with an unbalanced piecework pay system, worsen employee perceptions of the work environment. Injustice and inconsistent appreciation lead to dissatisfaction and jealousy. Although some employees are able to adapt, the majority are negatively affected and tend to look for more promising alternative jobs. These findings emphasize the need to improve the non-physical work environment, especially in interpersonal relationships, fairness, and recognition, to reduce turnover intention and increase employee retention.

This finding is in line with research **Ainiyyah (2019)**, and theory **Mobley (1986)**which emphasizes that the work environment, including its non-physical aspects such as interpersonal relationships and job satisfaction, influences employee turnover intentions. A supportive non-physical work environment, such as good relationships between employees and social support, can increase employee retention.

4.5 The impact of organizational culture on turnover intention

The organizational culture in the production department reflects the values and norms that guide employee behavior, provide structure, and influence their comfort level and motivation in working. Weaknesses in the organizational culture in the production department are work routines and strict adherence to Standard Operating Procedures (SOPs) that have a negative impact on employee turnover intention. Restrictions on innovation space, minimal support, and rigid work systems reduce work engagement and motivation. Inflexibility and suboptimal teamwork dynamics trigger frustration, interpersonal conflict, and perceptions of unfairness, thus increasing employee intentions to leave. In addition, instability of rules and high work pressure, especially the piecework pay system, increase work stress and turnover intention.

7. Conclusion

Based on research on the analysis of non-physical work environment and organizational culture on turnover intention. The results showed that the non-physical work environment has a greater impact on employee turnover in the production department compared to organizational culture. The conclusions from the sub-variables studied in this study include the following:

a. The results of this study state that the non-physical work environment has an impact on the turnover intention of production employees. Companies are advised to make improvements to aspects of the non-physical work environment in order to reduce turnover intention and increase employee retention. First, it is necessary to strengthen interpersonal relationships through activities that encourage social interaction, such as team building programs, effective communication training, and cross-division discussion forums. Second, companies need to increase sensitivity to perceptions of fairness in the workplace, by implementing a more transparent, consistent, and performance-based reward and recognition system. Third, it is important for companies to create a more collaborative and supportive work culture, by strengthening social support from superiors and coworkers. Finally, periodic evaluations of the piecework payroll system and workload need to be carried out to ensure balance and reduce psychological stress that can reduce job satisfaction.
b. The results of this study state that organizational culture has an impact on the turnover intention of production employees. A rigid organizational culture in the production department, companies need to make adjustments to the work structure and values adopted. First, flexibility in the implementation of SOPs needs to be increased to provide space for employee innovation and initiative. Second, companies are expected to be more active in providing support, both morally and operationally, to increase motivation and work involvement. Third, there needs to be an evaluation of the teamwork system, by emphasizing equal distribution of workload, effective communication, and constructive conflict resolution. In addition, companies are also advised to review the piecework payroll system and work target pressure to be more balanced and fair.
c. The results of this study state that high turnover intention has a negative impact on the company because it reduces productivity and increases recruitment costs. The intention to leave is triggered by disharmonious working relationships and high work pressure, although some employees remain because of loyalty. It is recommended that companies improve the quality of working relationships through better communication, evaluate the work target system to be more realistic, provide career development opportunities, improve employee welfare, and create a supportive work environment to reduce turnover intentions and increase employee loyalty.
d. The results of this study indicate that the work environment and organizational culture are in the less than good category because they have not been able to create a healthy, fair, and supportive work climate, thus triggering high employee intentions to leave the company.

COMPETENCE OF SQUADRON 12/AJY PERSONNEL TO SUPPORT THE SUCCESS OF DISASTER RESPONSE OPERATIONS USING HELICOPTERS

[1]Dedi Sepriyansah, [2]Elis Dwiana Ratnamurni

Universitas Jenderal Achmad Yani

dedisepriyansyah_2360261007@mm.unjani.ac.id
elis.dwiana@lecture.unjani.ac.id

Abstract

Disaster response is a vital aspect for vulnerable countries like Indonesia. This study aims to evaluate the competence of personnel from Squadron 12/Amur Jaya Yudha (AJY) in disaster response operations using helicopters. Personnel competence, supported by training and experience, is a key factor in the success of operations. A descriptive qualitative method was used, involving interviews, observations, and document analysis. The results show that the crew of the Bell 412 helicopter possesses adequate competence but faces challenges such as a lack of training and the absence of joint exercises with related agencies. Personnel readiness in decision-making under pressure or emergency situations is crucial for operational effectiveness. Although the main equipment is ready, insufficient personnel readiness can hinder the mission. The study recommends enhancing training in response to disaster management, including emergency medical response and logistical support for critical situations. By addressing these challenges, Squadron 12/AJY is expected to improve disaster operation effectiveness. These findings can serve as a reference for the Indonesian Army in formulating better disaster response strategies. Future research could focus on technology and innovation in disaster management

Keywords: Personnel competence, Disaster response, Squadron 12/AJY, helicopter, Indonesian Army

1. Introduction

Disaster response is one of the important aspects of ensuring the safety and well-being of the community, especially in countries vulnerable to natural disasters like Indonesia. Indonesia, located in the Ring of Fire, frequently experiences various types of natural disasters, including earthquakes, tsunamis, floods, and landslides. According to data from the National Disaster Management Agency (BNPB), Indonesia experiences thousands of disaster events each year, resulting in significant economic losses and profound social impacts. Therefore, preparedness in facing disasters becomes crucial.

The Indonesian National Army (TNI AD) plays a strategic role in disaster response, particularly through aviation units such as Squadron 12/Amur Jaya Yudha (AJY). This squadron serves as one of the essential elements in the operational aviation of the TNI AD, tasked with providing logistical support, evacuation, and humanitarian assistance in emergency situations. In this context, personnel competence is a key factor influencing the success of disaster response operations.

Personnel competence includes the knowledge, skills, and attitudes necessary to effectively carry out disaster response tasks. Trained and experienced personnel will be better equipped to handle emergency situations, make appropriate decisions, and coordinate with

various stakeholders. On the other hand, the readiness of military equipment, especially helicopters, is crucial to ensure that disaster response operations can be conducted quickly and efficiently. Helicopters have the capability to reach remote areas that are difficult to access by ground vehicles, thereby providing rapid logistical support and evacuation.

In this study, the author will explore personnel competence in supporting the success of disaster response operations at Squadron 12/AJY. This research aims to contribute to the development of more effective and efficient disaster response strategies, as well as provide recommendations for the Indonesian Army to enhance its operational capacity.

This study will also discuss various challenges faced by the Indonesian Army in disaster response, including resource limitations, inter-agency coordination, and the need for ongoing training for personnel. By understanding these factors, it is hoped that solutions can be found to enhance the effectiveness of disaster response in Indonesia.

Through a qualitative approach, this study will involve in-depth interviews with personnel from Squadron 12/AJY, direct observations of disaster response operations, and analysis of related documents. In this way, the researcher hopes to uncover more in-depth information regarding the readiness of military equipment and personnel competence in the context of disaster response

Overall, this study is expected to provide better insights into the importance of personnel competence in disaster response. Thus, the results of this research are anticipated to serve as a reference for decision-makers in the Indonesian Army and other related agencies in formulating more effective and efficient disaster response strategies.

Natural disasters occurring in Indonesia often have significant impacts on people's lives. In recent years, the number of natural disaster events in Indonesia has shown an increasing trend, with various types of disasters occurring simultaneously. This demands better preparedness from all parties, including the Indonesian Army, in facing and addressing disasters. Below is data on natural disasters in Indonesia.

Tabel 1 Data on Disaster Incidents in Indonesia

No	Disaster Incidents	2021	2022	2023	2024
1	Earthquake	62	51	70	40
2	Forest Fire	579	270	2.154	189
3	Volcanic Eruption	1	1	6	6
4	Flood	1.806	1.540	1.265	834
5	Drought	21	4	1.039	32
6	Landside	1.321	635	608	100
	TOTAL	3.790	2.501	4.534	1.201

Sumber: *Data Information Document of the National Disaster Management Agency at http://bnpb.cloud/dibi/ Tahun 2024.*

Squadron 12/AJY, as one of the aviation units of the Indonesian Army, plays an important role in supporting disaster response operations. By using helicopters, this squadron can provide logistical assistance, conduct evacuations, and offer medical support to communities affected by disasters. However, to carry out these tasks effectively, adequate and optimal personnel competence is required.

Personnel competence in the context of disaster response encompasses various aspects, including technical skills in operating helicopters, the ability to work under pressure or in emergency situations, as well as the capability to coordinate with various agencies and other organizations.

Therefore, this study aims to explore personnel competence in supporting the success of disaster response operations at Squadron 12/AJY. By understanding the factors that influence

this aspect, it is hoped that solutions can be found to enhance the effectiveness of disaster response in Indonesia.

Squadron 12/Amur Jaya Yudha, abbreviated as Squadron 12/AJY, is an air squadron under the supervision of the Army Aviation Center (Puspenerbad) and is based at Gatot Subroto Airport, Way Tuba, Way Kanan, Lampung. The main tasks of Squadron 12/AJY include conducting combat intelligence, maneuvers, fire support, and protection using military equipment in the form of attack helicopters, namely the AS 550 C3e Fennec Helicopter and the BO-105 Helicopter, as well as assault helicopters, specifically the Bell 412 Helicopter along with its equipment, to support the primary duties of Puspenerbad. The following will provide an overview of the military equipment strength of Squadron 12/AJY Puspenerbad in general to support flight operations.

The main objective of this study is to enhance the success indicators of disaster response operations using helicopters from Squadron 12/AJY through personnel competence. Specifically, this research aims to:

1) Analyze the effectiveness of existing training programs in improving personnel competence at Squadron 12/AJY.
2) Identify competencies that need to be enhanced or added to address future disaster response challenges.
3) Understand personnel perceptions regarding the importance of competence in supporting flight safety and operational success at Squadron 12/AJY.
4) Identify factors that may hinder the success of disaster response operations.

This research is expected to make a significant contribution to the development of disaster response strategies in Indonesia. By exploring personnel competence, this study can provide better insights into the factors that influence the success of disaster response operations. The results of this research are anticipated to serve as a reference for decision-makers in the Indonesian Army and other related agencies in formulating more effective and efficient disaster response strategies.

This research will not only benefit the Indonesian Army but also the communities affected by disasters. By enhancing preparedness and competence in disaster response, it is hoped that the negative impacts caused by disasters can be reduced and that community resilience in facing emergency situations can be improved.

In facing the increasingly complex challenges of disaster response, it is important for the Indonesian Army, particularly Squadron 12/AJY, to enhance personnel competence readiness. This research aims to explore this aspect and provide useful recommendations for the development of more effective disaster response strategies. Thus, it is hoped that this study can make a tangible contribution to improving the capacity of the Indonesian Army in facing disasters and protecting the community.

2. Literature Review

In an effort to enhance the success of disaster response operations in Indonesia, various aspects have become the focus of research, particularly personnel competence. This section discusses the literature review related to these two aspects and their relevance in the context of disaster response with helicopter support at Squadron 12/Amur Jaya Yudha (AJY).

2.1 Theoretical Foundation on Competence

Personnel competence in the military and disaster context is based on a theory that combines aspects of knowledge, skills, and work attitudes, as explained by Wibowo (2016). Spencer (2007) adds dimensions of competence that include motives, traits, self-concept, knowledge, and skills, all of which play a role in determining personnel effectiveness in the

field. Krisnandi & Saputra (2021) state that competence is an individual's ability to perform at a satisfactory level in the workplace, including the ability to transfer and apply those skills and knowledge in new situations and enhance agreed-upon benefits. Setyo Widodo & Yandi (2022) assert that competence is performance focused on achieving goals comprehensively towards the desired condition.

Furthermore, competence is also an important component in building a strong work ethic to optimize employee performance. Meanwhile, Rehardiningtyas et al. (2022) add that competence is the motivation that drives individuals to apply their best performance in their work. Etymologically, competence is defined as a behavioral dimension that reflects the expertise or excellence of a leader or staff, encompassing skills, knowledge, and good behavior.

2.2 Personnel Competence in Disaster Response Operations

Personnel competence is a crucial variable that significantly determines the success of disaster response missions involving military equipment (Wibowo, 2016). Competent personnel are those who possess the necessary knowledge, skills, and professional attitudes to perform tasks effectively, especially in the context of high operational pressure such as disasters (Rahmat, 2019). Competence encompasses technical aspects, decision-making, communication, and the ability to adapt in emergency situations.

McClelland (2017) defines competence as the fundamental characteristics that determine an individual's performance, while Wibowo (2016) emphasizes that competence includes the skills, knowledge, and attitudes that support task execution. The dimensions of competence according to Spencer (2007) include motives, traits, self-concept, knowledge, and skills, all of which play a role in determining personnel effectiveness in the field.

In applied research, Amarullah et al. (2023) state that personnel with continuous training and operational experience will be better prepared to face crisis situations and able to reduce fatal risks. Specialized training, such as the use of medical equipment in the Rubber Bell-412 helicopter or NVG flight simulators, greatly enhances the technical capabilities of pilots and helicopter crews to carry out disaster response tasks in various terrain and weather conditions (Machmiyana et al., 2023). This technical ability needs to be combined with emergency management skills and effective communication under pressure.

In addition to pilots, technicians and other supporting personnel also need to possess adequate competence to ensure the maintenance and operational readiness of military equipment can be consistently upheld (Ilmiah et al., 2024). Medical personnel must also be competent in providing medical care during evacuations using rescue helicopters, adapting to challenging flight environments.

2.3 Training and Development of Personnel Competence

Training is a crucial aspect in maintaining and enhancing personnel competence. Poluakan et al. (2019) emphasize that continuous training and disaster simulation strengthen personnel readiness to face real conditions. Systematic programmed training should include mastery of helicopter technical skills, crisis management, rapid decision-making, and team communication.

The study by Machmiyana et al. (2023) also underscores the importance of simulation-based training and the use of technology such as flight simulators to prepare personnel for night flying and adverse weather conditions. Additionally, official certification of technical and medical competencies becomes a primary standard to ensure readiness for disaster response operations.

Barriers to competence enhancement, such as budget limitations, task density, and inadequate training facilities, must be identified and addressed through careful planning and

management support (Sridaryono, 2019). Training should be able to accommodate dynamic needs so that personnel are prepared to face challenges in military operations other than war (MOOTW).

2.4 Previous Studies and Research Relevance

Several previous studies have examined the capacity of the Indonesian Army (TNI AD) in disaster response. Reza Nur Patria (2013) found that personnel readiness and military equipment significantly affect the effectiveness of disaster response; however, there are obstacles such as budget limitations and communication issues. A study by Bonggosna H.P. Sagala et al. (2023) highlights the importance of logistical support, including personnel preparation and the use of aviation resources in emergency response operations.

Research by Kaisar Bagus Purnawijaya Rhynaldie (2023) emphasizes that the involvement of the TNI AD in disaster response has a positive impact on regional resilience, particularly through collaboration with related agencies. This study supports the importance of synergy, which is the focus of this presentation's research, especially in the context of Squadron 12/AJY, which has advantages in personnel and helicopter military equipment.

2.5 The Role of Technology in Disaster Response

The development of information and communication technology (ICT) also plays a crucial role in enhancing the effectiveness of disaster response. According to research by Ilmiah et al. (2024), the use of technology in disaster management can improve coordination among agencies, accelerate decision-making, and facilitate better communication in the field. Technologies such as geographic information systems (GIS) and mobile applications for disaster monitoring can assist in real-time data collection and situation analysis, thereby facilitating quick and accurate decision-making. This is particularly important in the context of disaster response in Indonesia, where response time can be a determining factor in saving lives.

2.6 Challenges in Disaster Response

Despite various efforts to enhance the readiness of military equipment and personnel competence, challenges remain. According to Zwell (2013), several factors that influence personnel competence include individual beliefs and values, skills, experience, personality characteristics, and motivation. In the context of the Indonesian Army (TNI AD), these challenges can be exacerbated by budget limitations, a lack of training facilities, and the need to adapt to new technologies.

Sridaryono (2019) also notes that emotional barriers, such as fear of making mistakes or pressure from emergency situations, can limit personnel's ability to function optimally. Therefore, it is important to create an environment that supports the development of competence and personnel readiness, including through continuous training and psychological support.

2.7 Recommendations for Enhancing Readiness and Competence

Based on this literature review, several recommendations can be proposed to enhance the readiness of military equipment and personnel competence in disaster response:

a. Continuous Training. A structured and ongoing training program should be implemented to ensure that personnel are always prepared to face new challenges. This training should include simulations of emergency situations and the use of the latest technology.
b. Strengthening Logistics Management. An efficient logistics management system should be developed to ensure the availability of military equipment and other resources in emergency situations. This includes the procurement of spare parts, routine maintenance, and timely distribution.

c. Cross-Sector Collaboration. Building strong partnerships between the Indonesian Army (TNI AD), the National Disaster Management Agency (BNPB), and non-governmental organizations can enhance the effectiveness of disaster response. This collaboration should include the exchange of information and resources.
d. Technology Implementation. Utilizing information and communication technology to improve coordination and response in disaster management. The use of mobile applications and geographic information systems can assist in making faster and more accurate decisions.
e. Psychological Support. Providing psychological support to personnel to help them cope with the pressure and stress faced in emergency situations. This can enhance their performance and effectiveness in disaster response operations.

Through this literature review, it can be concluded that personnel competence is a crucial aspect of disaster response. By addressing the existing challenges and implementing the proposed recommendations, it is hoped that the TNI AD, particularly Squadron 12/AJY, can improve its operational effectiveness in disaster response in Indonesia.

3. Metodologi

This research employs a qualitative approach with a focus on in-depth exploration of the competence of personnel from Squadron 12/Amur Jaya Yudha (AJY) in supporting the success of disaster response operations using helicopters. The methodology applied aims to obtain a comprehensive picture of the phenomena occurring concerning the variables being studied.

3.1 Types of Research

The type of research used is descriptive qualitative research. This approach was chosen because it allows the researcher to explore the experiences, views, and perceptions of personnel regarding competence in the context of disaster response in depth (Creswell, 2014). Qualitative research provides the flexibility to understand social and dynamic situations that are difficult to measure with quantitative methods. Furthermore, this method is suitable for the development of theories centered on the context and complexities of military and disaster operations.

3.2 Location and Time of Research

The research location is Squadron 12/AJY Puspenerbad, based at Gatot Subroto Airport, Way Tuba, Way Kanan, Lampung. This squadron was chosen because it has a strategic role and personnel directly involved in disaster response operations using helicopters. The research was conducted over three months, from May to July 2025, covering the stages of data collection, analysis, and report preparation according to the outlined schedule."

3.3 Research Subjects

The subjects of the research consist of personnel actively involved in the operations and maintenance of helicopters in Squadron 12/AJY, including pilots, technicians, support personnel, and relevant officials. The selection of subjects was conducted purposively, considering their involvement and knowledge regarding personnel competence in disaster response (Gunawan, 2022). The main informants include the Squadron Commander, the Head of Operations Section, the Flight Commander, and flying personnel as well as technicians who have direct experience in operations.

3.4 The data collection methods

The data collection methods were carried out through three main techniques: in-depth interviews, participatory observation, and document analysis.

a. In-Depth Interviews. Conducted in a semi-structured manner with a flexible interview guide to allow informants to share their experiences, perceptions, and challenges related to personnel competence (Kvale, 2007). This technique is relevant for obtaining rich and detailed qualitative data regarding work attitudes, training, and operational experiences. The interviews included questions about the training attended, technical skills, decision-making processes in the field, as well as relationships among personnel and military equipment elements.

b. Participatory Observation. The researcher conducted direct observations of the operational activities of Squadron 12/AJY, including disaster response training, helicopter maintenance, and coordination among personnel (Hakim & Hasan, 2025). Observations provide the actual context of work practices and interactions in real situations, thus the results serve as data that reinforce the findings from the interviews.

c. Document Analysis. Document studies included statistical data, operational reports, standard procedures, and policies related to disaster response and the management of military equipment at Puspenerbad (BNPB, 2024). Documents serve as an important source of secondary data to provide chronology, an overview, and validation of primary data.

3.5 Operationalization of Variables

This research operationalizes the variable of personnel competence. This variable is described through indicators that focus on data collection. Personnel competence is measured based on indicators such as training attended, operational experience, certification status, technical and non-technical skills (communication, decision-making, emergency management), as well as work attitudes in the field (Wibowo, 2016). Additionally, indicators of teamwork and collaboration with other agencies are also included in the measurement of competence. The data collected from these variables are expected to explain personnel competence in enhancing the effectiveness of disaster response operations.

3.6 Research Design

This research applies a multiple case study design, focusing on several units within Squadron 12/AJY that have different characteristics and responsibilities in disaster management (Assyakurrohim et al., 2021). The multiple case study approach was chosen to broaden perspectives and compare best practices among units, thereby providing a more comprehensive and valid picture of the phenomena of readiness and competence.

The case study approach allows the researcher to understand the unique social, cultural, and operational contexts of each unit, which will later be analyzed thematically to identify patterns and relationships among variables (Creswell, 2014).

3.7 Data Collection Procedures

Data collection was conducted in stages, from preparation to data processing:

a. Research Preparation. This includes the development of research instruments such as interview guides and observation sheets, as well as conducting a literature review to strengthen the conceptual and theoretical framework (Ramadhan, 2021).

b. Implementation of Interviews and Observations. This was carried out with a flexible and participatory approach. Semi-structured interviews were directed to explore the experiences and perceptions of informants, focusing on the readiness of military equipment and personnel competence. Observations were conducted during operations and training (Hakim & Hasan, 2025).

c. Collection and Analysis of Documents. Documents such as operational reports, standard procedures, and supporting statistical data were collected to enhance the validity of the findings.

d. Recording and Notetaking. All interview data were recorded with the informants' consent, and field notes were made during observations to support data analysis (Kvale, 2007).

3.8 Data Analysis Techniques

The data collected were analyzed using thematic analysis techniques, which involve the processes of coding and grouping data based on key themes that emerge from interviews, observations, and documents (Flick, 2018).

a. Data Coding. The data were broken down into units of meaning and coded to identify important elements related to the variables of military equipment readiness and personnel competence.

b. Theme Grouping. The codes were grouped into themes that reflect patterns or relationships within the data. These themes represent the experiences and perceptions of informants as well as the observed operational conditions.

c. Data Interpretation. The researcher linked the results of the thematic analysis to theories and research objectives to provide a deeper understanding of the influence of competence in the context of disaster management.

3.9 Techniques for Testing Data Validity and Reliability

To ensure the credibility and validity of the data, this study employs several testing techniques as follows:

a. Member Check. Initial findings are returned to informants to obtain feedback on the accuracy and relevance of the data (Flick, 2018). This step ensures that the interpretation results align with the subjects' experiences.

b. Data Triangulation. This involves combining data from various sources, methods, and times to check the consistency of the information obtained (Denzin, 2017). Triangulation of techniques is performed by pairing the results of interviews, observations, and documents.

c. Credibility Testing. This involves a thorough examination of data consistency and the analysis process to avoid the researcher’s subjective bias (Creswell, 2014).

d. Audit Trail. The researcher documents the entire process of data collection and analysis to ensure traceability and transparency in the research (Gunawan, 2022).

3.10 Research Ethics

In the implementation of the research, ethical aspects are a top priority. Each informant is provided with an explanation of the research objectives and assured of the confidentiality of their identity and the data provided. The data collection process is conducted with voluntary consent and respect for the respondents' privacy rights (Priadana & Sunarsih, 2021). The researcher also maintains a reflective attitude in interactions with informants to avoid bias and uphold professionalism.

4. Result and Discussion

From the results of in-depth interviews with informants, field observations, and various supporting document studies, a comprehensive picture of the conditions and challenges faced regarding the competence of personnel in Squadron 12/Amur Jaya Yudha (AJY) in supporting the success of disaster response operations using helicopters in Indonesia was obtained. Based

on the experiences of the informants in conducting operations using helicopters, the following results were obtained:

Lieutenant Colonel Cpn Ferry Eko Saputra, as the Commander of Squadron 12/AJY, explained that the competence of Squadron 12/AJY personnel plays a crucial role in supporting the success of operations. Based on his experience, disaster response operations are quite similar to military operations in support of troops. However, they cannot be equated directly as they have different objectives. From the interview, it was stated that personnel of Squadron 12/AJY need to conduct routine training, both technical and non-technical, as this greatly helps them improve their capabilities in facing the challenges of operational fields with time constraints and emergency situations. The challenge faced is the absence of a specific program that regulates or underpins disaster response operation training activities.

Lieutenant Colonel Ferry Eko Saputra also explained the necessity of training using flight simulators for pilots and helicopter crews, as it enhances pilot readiness for night missions and difficult terrains. Technical or maintenance personnel also receive intensive training to expedite the identification and repair of damage by utilizing the latest technology and supporting tools, whether for evacuation or other supporting equipment.

Specifically, the interview results revealed the dimensions of attitude and communication within the team that significantly influence the performance of Squadron 12/AJY personnel. Personnel with effective communication skills and a professional work attitude are able to execute coordination well in critical situations. This expertise is essential to optimize operations involving multiple units and related agencies.

Major Cpn Henryko Siregar, as the Head of Operations Section of Squadron 12/AJY, explained that training should not only focus on the technical aspects of helicopter operation but also on other training such as crew communication, conflict management, and decision-making under pressure. This combination of training is considered essential for readiness to face the complexities of unpredictable disaster response operations. Squadron 12/AJY can apply this in every mission, not just in disaster response operations.

The Maintenance Flight Commander of Squadron 12/AJY, Captain Cpn Siburian, focuses more on the personnel's ability to prepare the readiness of defense equipment to support disaster response operations. This is because helicopters are a crucial component in these operations. Personnel responsible for the readiness of defense equipment must be competent and ready to respond to emergencies, especially in disaster situations. He emphasized the need for enhanced specialized training in emergency medical care and the management of defense equipment readiness to anticipate broader critical situations.

Additionally, Captain Cpn Hario Istiqlal, as the Operational Flight Commander of Squadron 12/AJY, has a positive perception of the importance of personnel competence as a key factor in operational success, stating that technical capabilities must function well to achieve operational objectives. Personnel also acknowledge the role of training and field experience as essential elements in enhancing confidence and work effectiveness. Communication among team members and synergy with other agencies are also considered equally important supporting factors. However, the challenges faced by Squadron 12/AJY personnel include limited resources, rapid technological changes that do not align with the technology at Squadron 12/AJY, and psychological aspects of working in emergency situations. Nevertheless, high motivation and a commitment to continuous learning are key to overcoming these obstacles.

The Commander of Squadron 12/AJY identified various barriers affecting personnel competence during disaster response operations. Some of the main challenges faced include budget limitations, training that is not focused on disaster response operations, and the limited availability of training facilities at Squadron 12/AJY.

Furthermore, the difficult terrain in operational areas and extreme weather changes often exacerbate technical and operational challenges. Personnel must be able to adapt to these situations, but the lack of experience in certain conditions remains a barrier that must be continuously addressed through training and simulations.

The aspect of coordination among agencies, both within the Indonesian Army (TNI AD) and with the National Disaster Management Agency (BNPB) and non-governmental organizations, is also an important concern. Suboptimal coordination can lead to miscommunication and potential overlaps in tasks, thereby reducing the effectiveness of emergency responses.

5. Conclusion

This research has explored the competencies of personnel in Squadron 12/Amur Jaya Yudha (AJY) in supporting the success of disaster response operations using helicopters. Personnel competence has proven to be a crucial element in the success of disaster response operations. Continuous training and extensive operational experience enable personnel to better face emergency situations. This study found that trained personnel not only possess adequate technical skills but also the ability to adapt and make quick decisions in high-pressure situations. This indicates that the development of personnel competence should be a priority in efforts to enhance the effectiveness of disaster response.

It is important to develop integrated training programs that align with the readiness of defense equipment, so personnel can maximize the use of available tools. This research also highlights the importance of collaboration between the Indonesian Army (TNI AD), the National Disaster Management Agency (BNPB), and non-governmental organizations in disaster response. Good coordination among various parties can enhance response effectiveness and ensure that all resources are utilized optimally.

The challenges faced in disaster response, such as budget limitations, lack of training facilities, and the psychological pressure experienced by personnel, must be identified and addressed. Psychological support for personnel is also an important aspect that needs attention to maintain their performance in emergency situations. This study recommends the need for enhanced specialized training in emergency medical care and field logistics management to anticipate critical situations that may arise.

Overall, this research provides better insights into the importance of personnel competence readiness in disaster response. By addressing existing challenges and implementing the proposed recommendations, it is hoped that the TNI AD, particularly Squadron 12/AJY, can improve its operational effectiveness in disaster response in Indonesia. The findings of this study are expected to serve as a reference for decision-makers in the TNI AD and other related agencies in formulating more effective and efficient disaster response strategies.

This research not only benefits the Indonesian Army (TNI AD) but also the communities affected by disasters. Enhancing readiness and competence in disaster response is expected to reduce the negative impacts caused by disasters and improve community resilience in facing emergency situations. This research also opens opportunities for further studies on other aspects that can support the success of disaster response operations, including the development of technology and innovation in disaster management.

The references used in this research include various relevant sources, including journals, books, and official documents from the National Disaster Management Agency (BNPB) and other related agencies. Therefore, this research is expected to make a significant contribution to the development of knowledge in the fields of human resource management and disaster response, as well as serve as a reference for researchers and practitioners in formulating better strategies to face future disaster challenges.

Through a comprehensive and systematic approach, this research aims to provide a clear picture of the competencies of personnel in Squadron 12/AJY, as well as the challenges faced in disaster response. Thus, it is hoped that this research can be a starting point in efforts to enhance the capacity of the TNI AD in facing disasters and protecting the community.

With all the findings and recommendations produced, this research is expected to have a positive impact on the development of more effective and efficient disaster response strategies in Indonesia, as well as improve collaboration among various agencies in addressing increasingly complex disaster challenges.

THE INFLUENCE OF ENVIRONMENTAL, SOCIAL, AND GOVERNANCE (ESG), CASH HOLDING, AND RETENTION RATIO ON FIRM VALUE: THE MODERATING ROLE OF FIRM SIZE IN INDONESIA'S ENERGY SECTOR (2019-2023).

Evia Sundari[1,*], V. Santi Paramita[1]

[1]College of Management, University of Jenderal Achmad Yani, Cimahi, Indonesia

Abstract

The increasing awareness of investors regarding a business's sustainability encourages companies, especially in the energy sector, which plays a crucial role in the transition towards sustainable development, to adopt strategies that enhance firm value. This research aims to analyze the influence of ESG, cash holding, and retention ratio on company value and the role of firm size as a moderating factor in the energy sector from 2019–2023. This research uses a quantitative descriptive causal approach. The population in this research is 83 companies in the energy sector in Indonesia from 2019 to 2023. The sample in this study was taken using the purposive sampling method, resulting in a total sample of 12 companies. The analysis method used is panel data regression and Moderated Regression Analysis (MRA) using the Eviews 12 application. The results showed that partial cash holding has a positive influence, but ESG and retention ratio do not influence Firm value. Firm size cannot moderate the influence of ESG, cash holding, and retention ratio on Firm value. Besides that, ESG, cash holding, and retention ratio simultaneously influence the Firm value of companies in the energy sector.

Keywords: Environmental, social, governance (ESG); Cash holding; Retention ratio; Firm value; Firm size.

1. Introduction

As competition in business, both in Indonesia and globally, increases, it encourages companies to pay more attention to social and environmental responsibilities. Stakeholder trust tends to grow when companies demonstrate commitment to environmental, social, and governance (ESG) values. In a PwC survey (2022), 79% of investors deemed ESG important in investment decision-making. ESG certification has also been proven to reduce capital costs by 1.2% and increase firm value by up to 31.9% (Wong et al., 2020). However, according to the IBCSD survey, Indonesia was ranked 36th out of 47 capital markets worldwide in the ESG Index in 2021. The level of ESG transparency among companies in Indonesia is still considered low, with disclosures recorded at below 50% (Ika Ramdhani, 2022). This is supported by the evidence that according to the Indonesia Business Council for Sustainable Development (IBCSD) survey, 40% of companies in Indonesia still lack an understanding of the importance of implementing ESG (Defitri, 2023). Although investors increasingly recognise the importance of ESG, its implementation and transparency still face various challenges. The government has issued regulations related to sustainability through POJK No. 51/POJK.03/2017, and 79 companies have implemented ESG principles to date. A 2022 survey showed that the energy sector's implementation or consideration of ESG programs is primarily driven by investor pressure (44%) and regulation (40%) (Statista, 2022).

Environmental, social, and governance (ESG) factors can increase or decrease a firm's value. In Indonesia, the preparation of sustainability reports refers to the Global Reporting Initiative (GRI) standards because they are considered the most comprehensive in reporting

economic, environmental, and social impacts (Purwaningsih, 2023). The research results (Cahyani & Maryanti, 2024), (Rahelliamelinda & Handoko, 2024), (Aydoğmuş et al., 2022), (Abdi & Càmara, 2022), and (M. F. Utomo & Rini, 2023) found that ESG has a positive influence on firm value. Meanwhile, the results from research (Christy, 2023), (Jeanice & Kim, 2023), (Kartika et al., 2023) and (Aouadi & & Marsat, 2018) found that ESG does not influence firm value.

Another factor that can influence a firm's value is cash holding. Research results (Halim, 2022), (Roza & Mashuri, 2023), (Jaradat et al., 2021), (Emanuel et al., 2022), (Ruth, 2023), and (Anandita & Septiani, 2023) found that cash holding influence firm value. However, the findings from (Lestari, 2024) found that the cash holding does not influence firm value.

The next factor that influence the firm's value is the Retention Ratio. (Prayogo et al., 2023) and (Olivia et al., 2025) found that the retention ratio has an adverse influence on firm value. Meanwhile, research by (Permata Sari & Kadarningsih, 2024) and (Cahyani & Maryanti, 2024) found that the retention ratio does not influence firm value.

Firm size can moderate the influence of ESG on firm value in line with the research conducted by (Prayogo et al., 2023) and (Cahyani & Maryanti, 2024). Meanwhile, the reserach by (Junardi, 2019) and (Aurora L et al., 2021) found that firm size is unable to moderate the influence of ESG on firm value. Furthermore, the influence of cash holding on firm value can be moderated by firm size in accordance with the research conducted by (Ruth, 2023). However, this contradicts the findings of (Cahyani & Maryanti, 2024), which state that firm size is unable to moderate the influence of cash holding on firm value. The next factor is the influence of retention ratio on firm value, which can also be moderated by firm size in accordance with the research conducted by (Prayogo et al., 2023) and (Cahyani & Maryanti, 2024).

The background of the research shows differences in findings from previous studies, indicating that contributions to theory development have not been fully objective and general in nature. Therefore, this research aims to examine the effect of ESG, Cash Holding, and Retention Ratio on firm value. Additionally, this study also analyzes the moderating role of firm size in that relationship. The research focuses on companies operating in the energy sector from 2019-2023.

2. Literature review

2.1.Signalling Theory

Signalling Theory, according to Brigham & Houston (2011), is the behaviour of a Firm's management in providing information or cues to shareholders about how management views the firm's prospects in the future. Signalling theory aims to reduce the information asymmetry between internal and external parties of the firm. When information is announced to the public, market participants will assess whether it brings good or bad news for investors, ultimately affecting their investment decisions (F. W. Aditama, 2022).

2.2.Agency Theory

The Agency Theory, according to Jensen & Meckling (1976), is the existence of an agency contract between one or more principals as owners that involves an agent in providing services for decision-making in managing the firm.

2.3. Stakeholder Theory

Stakeholder theory is an approach in organizational management and business ethics that emphasizes the importance of considering the interests of all parties involved or affected by the company's activities (Freeman, 1984).

2.4. Firm Value

The value of a Firm is the investors' perception of its success level, which is closely related to its stock price. A high stock price will elevate the firm's value and increase investor confidence (Amelia & Anhar, 2019). The firm value, which connects stock market price with earnings and assets, reflects investors' outlook on the firm's prospects in the future (Suhendar & Paramita, 2024). According to Rahayu (2022), The firm value proxied by Tobin's Q can be calculated using the following formula:

$$\text{Tobin's Q} = \frac{\text{Market Value of Shares} + \text{Total Liabilities}}{\text{Total Asset}}$$

2.5. Firm Size

According to Sawir (2015:101), the size of a firm is a scale that determines the magnitude of the Firm, which can be seen from equity value, sales value, number of employees, and total asset value, which are context variables that measure the demands for services or products of the organization. According to Jogiyanto (2010), the formula that can be used to calculate firm size is as follows:

$$\text{Firm size} = \text{Logarithm Natural (Total asset)}$$

2.6. Environmental, Social, Governance (ESG)

ESG is a structure where a Firm considers environmental, social, and governance aspects when conducting its business responsibly to create a sustainable business. Investors usually use ESG to measure the management risks present in the Firm using ESG reports, ESG becomes one of the basic principles that companies must take into account to ensure their business success in the future (Utomo, 2024). According to Noviyanto et al. (2024), the formula that can be used to calculate ESG is as follows:

.
$$\text{ESG Disclosure} = \frac{\text{Sum of company's disclosure item}}{\textit{Total Maximum Disclosure}}$$

2.7.Cash Holding

According to Gill & Shah (2012), cash holding refers to the cash funds that the Firm has or is available for investment in the form of physical assets that are to be distributed to investors. Companies must increase cash reserves to ensure positive cash flow and support sales and revenue growth. Optimal cash management can help reduce the risk of financial difficulties and ensure that the Company's operations proceed as planned (Aviyanti & Isbanah, 2019). According to Rahayu (2022), the formula that can be used to calculate Cash Holding is as follows:

$$\text{Cash Holding} = \frac{\text{Cash and Cash Equivalents}}{\text{Total Asset}}$$

2.8. Retention Ratio

The retention ratio is the percentage of profits not distributed to investors as dividends. Companies often use retained earnings to reinvest in their operations and develop the business (Qodary & Tambun, 2021). The retention ratio illustrates the extent to which a company's income is kept for growth and expansion purposes, compared to the amount distributed to investors in the form of dividends (Safira & Dillak, 2021). According to Prayogo et al. (2023), the formula that can be used to calculate the retention ratio is as follows:

Retention Ratio = 1 – Dividend Payout Ratio

3. Hypothesis Formulation and Research Framwork

3.1.The Influence of ESG on Firm Value

ESG signals to investors that the company is focused on increasing shareholder wealth and contributing to the community's welfare around its operating environment. This makes ESG good news for investors, as it can affect stock trading volume and ultimately increase the firm's value (Sibarani, 2023) This theory is available from research conducted by (Cahyani & Maryanti, 2024), (Rahelliamelinda & Handoko, 2024), (Aydoğmuş et al., 2022), (Abdi & Càmara, 2022), and (M. F. Utomo & Rini, 2023).

H1 : ESG has a positive influence on Firm value

3.2.The Influence of Cash Holding Ratio on Firm Value

A company with a large amount of cash can finance its operational and investment needs independently without relying on external funding. The ideal cash balance is achieved when the excess cash available can cover existing deficits, allowing management to set a cash level close to optimal and create financial stability for the company. This stability makes investors more interested in investing because they see the company has good prospects and lower risks. Consequently, investors' perception of the company's success will improve, which ultimately positively influences the firm value (Edi & Fernando, 2021). This theory is available from research conducted by (Halim, 2022), (Roza & Mashuri, 2023), (Jaradat et al., 2021), (Emanuel et al., 2022), (Ruth, 2023), and (Anandita & Septiani, 2023).

H2 : Cash holding has a positive influence on Firm value

3.3.The Influence of Retention Ratio on Firm Value

The retention ratio reflects the portion of profits not distributed as dividends but reinvested for the company's development. Although this strategy can increase retained earnings, a high retention ratio may lower investor expectations for dividends, ultimately affecting stock prices and firm value (Aryanti, 2021; Qodary and Tambun, 2021). Based on stakeholder theory, firms must benefit stakeholder. The company can attract investor interest in its shares by lowering the retention ratio and increasing the dividend payout ratio (Permata Sari & Kadarningsih, 2024). This theory is available from research conducted by (Prayogo et al., 2023) and (Permata Sari & Kadarningsih, 2024).

H3 : Retention ratio has a negative influence on the Firm value

3.4.The Influence of Firm Size Moderating ESG on Firm Value

Firm Size can strengthen the influence of ESG on firm value because large companies have the resources and capabilities to implement ESG effectively. In addition, large companies also have highly sustainable capabilities (Prayogo et al., 2023). In other words, the larger a company, the greater the financial resources it has to implement the principles of Environmental, Social, and Governance (ESG). With effective implementation of ESG, companies can increase their firm value by improving their reputation, operational efficiency, and business sustainability. This theory is available from research conducted by (Prayogo et al., 2023) and (Cahyani & Maryanti, 2024).

H4 : Firm size can moderate ESG on the Firm value

3.5.The Influence of Firm Size Moderating Cash Holding Ratio on Firm Value

Cash holding can be used for various purposes, such as distributing dividends to shareholders, buying back company shares, investing, or saving for future needs. The larger the Firm, the greater the cash holding. Large companies can more easily take advantage of profitable investment opportunities with increased cash holding. When a company makes a profit, it will allocate part of its profits to investors as dividends. This positively impacts investors, which can ultimately increase the firm's value (Cahyani & Maryanti, 2024). This theory is available from research conducted by (Ruth, 2023).

H5 : Firm size can moderate Cash holding on the Firm value

3.6.The Influence of Firm Size Moderating Retention Ratio on Firm Value

Firm size can strengthen the retention ratio's influence on firm value, as it is considered a quasi-moderator (Prayogo et al., 2023). Large companies usually find it easier to obtain funding from the capital market because they have a good reputation. This funding allows the company to pay dividends to investors, allowing it greater flexibility (Lilis & Suryanto, 2017). However, large companies tend to have higher debt levels, so allocating debt payments can reduce the company's ability to distribute dividends. Delays or dividend reductions can decrease investor interest, ultimately negatively impacting the company's value (Qodary and Tambun, 2021). This theory is available from research conducted by (Prayogo et al., 2023) and (Cahyani & Maryanti, 2024).

H6 : Firm size can moderate Retention ratio on the Firm value

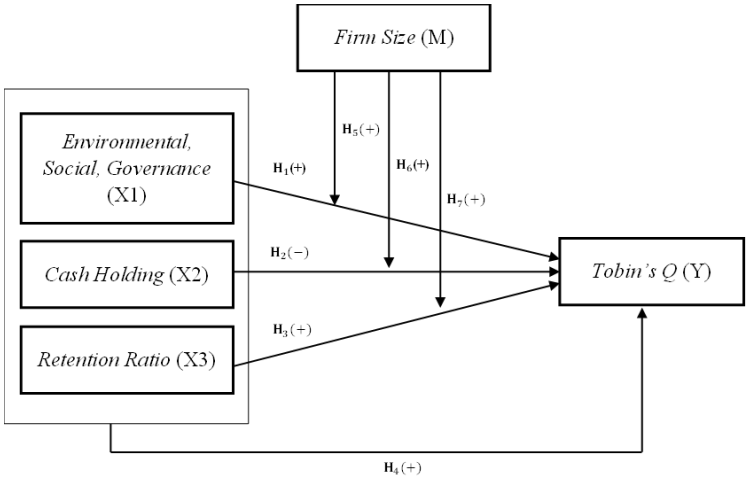

Figure 3. 1 Research Framwork

4. Methodology

This research uses a quantitative descriptive causal approach. The research population comprises 83 energy sector companies listed on the Indonesia Stock Exchange (IDX) from 2019 to 2023. The sample was selected using purposive sampling techniques with criteria of companies that consistently publish annual financial statements, sustainability reports, and GRI reports based on GRI 2016 and GRI 2021 standards during that period, resulting in 12 companies as the sample. Data were actively collected through document analysis of financial statements and the sustainability report. Statistical analysis was conducted with the help of Eviews version 12 software. The data used is panel data, a combination of time series and cross-sectional data.

5. Results and Discussions

5.1.Selection of Analysis Methods

Three models have been obtained using panel data regression: the Chow test, the Hausman test, and the LM test. Below are the results of the estimation for the three panel data regression models:

Table 4. 1 Results of the analysis method selection test

Models	Test Summary	Prob.	Summary
Chow test	Cross-section Chi-square	0,0000 < 0,05	FEM
Hausman test	Cross-section random	0,5521 > 0,05	REM
Lagrange multiplier test	Breusch-Pagan	0,0002 < 0,05	REM

Source: Result processing data Eviews 12, 2025

Based on Table 4.1, The selection of the best model in this research is random effect model.

5.2.Test of Classical Assumptions

According to Septianingsih (2022), the heteroskedasticity test is not mandatory in the classical assumption tests because the selected model estimation is the random effect model.

Table 4. 2 Results of the classical assumption test

Test of Classical Assumptions	Method	Criteria	Sig.	Summary
Normality Test	Jarque-Bera	>0,05	0,5076	Normally distributed
Multicollinearity Test	Correlation Between Variables	<0,8	X1_ESG and X2_CH = 0,2712 X1_ESG and X3_RR = 0,0398 X1_ESG and Z_FS = 0,3183 X2_CH and X3_RR = 0,0895 X2_CH and Z_FS = 0,1116 X3_RR and Z_FS = 0,2059	No multicollinearity occurs
Autocorrelation Test	Durbin Watson	-2<D-W<+2	1,0192	No autocorrelation occurs

Source: Result processing data Eviews 12, 2025

Based on Table 4.2, the regression model is known to have passed the classical assumption test.

5.3.Panel Data Regression

Table 4. 3 Results of the panel data regression test

Variable	Coefficient	Std. Error	T-statistic	Prob.
C	0,314858	0,1282587	0,245678	0,8068
X1	0,077140	0,123404	0,625098	0,5345
X2	1,064621	0,246581	4,317521	0,0001
X3	0,108877	0,208667	0,521776	0,6039
Z	0,010713	0,042525	0,251916	0,8020
R-squared	0,314621			
Adj-R-Square	0,264775			
F-statistic	6,311879			
Prob (F-statistic)	0,000297			

Source: Result processing data Eviews 12, 2025

Based on Table 4.3 above, the regression equation of the panel data is as follows:

$$\text{Firm Value} = 0{,}31485 + 0.07714\text{ESG} + 1.06462\text{CH} + 0.10887\text{RR} + 0{,}01071\text{FS} + \varepsilon_{it}$$

Based on the equation model above, it can be interpreted as follows:

1) The constant value of 0.31485 shows the Firm value when all independent variables are zero.
2) The ESG coefficient of 0.07714 means a 1% increase in ESG decreases Firm value by 0.07714.
3) The cash holding coefficient of 1.06462 indicates that a 1% increase in cash holding reduces Firm value by 1.06462.
4) The retention ratio coefficient of 0.10887 signifies that a 1% increase in the retention ratio lowers Firm value by 0.10887, and vice versa.
5) The Firm size coefficient of 0.01071 suggests that a 1% increase in Firm size decreases Firm value by 0.01071.

5.4. Coefficient of Determination

The adjusted R-squared value of 0.26477 indicates that the ESG variables, cash holding, and retention ratio, along with the moderating interaction with firm size, can explain 26.48% of the variation in firm value. In comparison, the remaining 73.52% is influenced by other variables outside the model.

5.5.Hypothesis Testing

1. Partial test (T-test)

Based on Table 4.3, the influence of independent variables on the dependent variable is evident from their p-values. The results of the panel data regression above show that:

1) The p-value of ESG is 0.5345 with a coefficient of 0.077140, which means the p-value (0.5345 > 0.05). Therefore, the environment, social, and governance do not influence Firm value.
2) The p-value of CH is 0.0001 with a coefficient of 1.064621, which means the p-value (0.0001 < 0.05). Therefore, it can be concluded that, partially, cash holding has a positive influence on Firm value.
3) The p-value of RR is 0.6039 with a coefficient of 0.108877, which means the p-value for (0.6039 > 0.05). Therefore, it can be concluded that, partially, the retention ratio does not influence Firm value.

2. Simultaneous test (F-test)

Based on Table 4.3, it can be seen that the prob value (F-statistic) is 0.000297 < 0.05, which means that collectively, environmental, social, governance, cash holding, and retention ratio influence the dependent variable, Firm value.

3. Moderated Regression Analysis (MRA)

Table 4. 4 Moderated regression analysis test results

		Coefficient	Std. Error	t-Statistic	Prob.
ESG					
Equation 2	FS	0,009536	0,046210	0,206357	0,8372
Equation 3	ESG*FS	-0,118408	0,159169	-0,743917	0,4600
Cash Holding					
Equation 2	FS	0,022129	0,039096	0,566000	0,5736
Equation 3	CH*FS	0,078565	0,328014	0,239517	0,8116
Retention Ratio					
Equation 2	FS	0,029756	0,044415	0,669958	0,5056
Equation 3	RR*FS	0,025975	0,291027	0,089253	0,9292

Source: Result processing data Eviews 12, 2025

The results of the tests show that the size of the firm does not have a significant influence on the overall model, both in its interaction with ESG (p = 0.8372), cash holding (p = 0.5736), and retention ratio (p = 0.5056), as all probability values exceed 0.05. The interaction between firm size and each independent variable is also not significant, with p-values of 0.4600, 0.8116, and 0.9292, respectively. Thus, firm size as a moderating homologiser cannot moderate the relationship between ESG, cash holding, and retention ratio on firm value.

The Influence of ESG on Firm Value

The results of the analysis indicate that ESG does not influence Firm value. This suggests that shareholders perceive allocating resources for implementing and disclosing environmental practices as less aligned with efforts to enhance corporate value maximally (Buallay & Al-Ajmi, 2020). Because social practices and disclosures are not the primary priority in increasing Firm value (Tobin's Q), companies rely more on profits, liquidity, and sales as benchmarks for enhancing Firm value (Maama, 2021). This is supported by research conducted by (Christy, 2023), (Jeanice & Kim, 2023), (Kartika et al., 2023), and (Aouadi & & Marsat, 2018).

The Influence of Cash Holding Ratio on Firm Value

The results of the analysis show that cash holding has a positive influence on Firm value. This research finding aligns with agency theory, where the manager's position as an agent must be responsible for maximizing shareholder welfare by producing good performance so that the Firm's value can increase (Halim, 2022). This influence can be explained by the amount of cash, which reflects the Firm's liquidity level and its ability to sustain operational continuity in the face of uncertain economic conditions (Bayu & Septiani, 2015; Halim, 2022). This ability reflects the Firm's positive performance, which can enhance investor confidence. Increased investor interest in the Firm is likely to drive up stock prices, which ultimately reflects an increase in the Firm's value (Ruth, 2023). This is supported by research conducted by (Halim,

2022), (Roza & Mashuri, 2023), (Jaradat et al., 2021), (Emanuel et al., 2022), (Ruth, 2023), and (Anandita & Septiani, 2023).

The Influence of Retention Ratio on Firm Value

The results of the testing analysis indicate that the retention ratio does not influence firm value. This is because in investing, shareholders gain profits not only through dividend payouts but also through capital gains. Even without dividend distribution, investors still believe retained earnings will be used optimally to improve the company's operational performance (Cahyani & Maryanti, 2024). This is supported by research conducted by (Permata Sari & Kadarningsih, 2024).

The Influence of Firm Size Moderating ESG on Firm Value

The results of the MRA test indicate that firm size cannot moderate the influence of ESG on firm value. This occurs because not all large or small companies allocate their assets significantly for ESG , as company assets are also used for other purposes, such as investments, debt payments, and operations (Wulandari & Febriantina, 2024). This is supported by research conducted by (Junardi, 2019) dan (Aurora L et al., 2021).

The Influence of Firm Size Moderating Cash Holding Ratio on Firm Value

The results of the MRA test indicate that Firm size does not moderate the influence of cash holding on Firm value. This shows that the effectiveness of cash holding in creating additional value is determined by its management and allocation, not by the size of the Firm. Large and small companies have the same opportunities to utilize cash for financial flexibility, reduce bankruptcy risk, or seize investment opportunities (Cahyani & Maryanti, 2024). This is supported by research conducted by (Cahyani & Maryanti, 2024).

The Influence of Firm Size Moderating Retention Ratio on Firm Value

The results of the MRA test indicate that firm size cannot moderate the influence of the retention ratio on firm value. This is because the amount of dividends (low retention) distributed to shareholders is not influenced by a firm's size. Therefore, firm size cannot strengthen or weaken the effect of the retention ratio on firm value. Hence, the difference in firm size is not strong enough to affect the relationship between retention ratio and firm value. This is not in line with the research conducted by (Prayogo et al., 2023), which states that firm size can moderate the influence of retention ratio on firm value.

6. Conclusion

Based on the analysis's results, this study concludes that ESG and retention ratio partially do not influence firm value, while cash holding has a positive influence. However, ESG, cash holding, and retention ratio influence firm value simultaneously. Furthermore, firm size cannot moderate the relationship of the three variables to firm value. These results indicate that investors focus more on the firm's liquidity than ESG, retained earnings policies, or firm size.

Due to the data limitations in this study, it is recommended that future research add more relevant independent variables, involve various corporate sectors, and extend the research period to broaden the scope and increase the sample size. For companies, increasing cash holding can be considered a strategy to maintain and sustain the firm's value.

ANALYSIS OF DIGITAL ADVERTISING AND LOCATION ON BUYING INTERTEST IN ANAMI COFFEE

Aldy Rizki Ghiffari[1,*], Sri Hidajati Ramdani [1], Abel Gandhy [1]

[1] Management, Faculty of Economics & Business, Pakuan University, Bogor

Abstract

Changes in the digital era have had a significant impact on marketing strategies, especially through the emergence of digital marketing. Digital marketing, which involves promoting a product or brand through digital media and the internet, allows companies to reach a wider and more specific audience compared to traditional methods. Having a strategic location and easy to reach by consumers so that with this strategic location, it is hoped that business owners can increase consumer buying interest. This study aims to analyze digital advertising and location of Anami Coffee. The research method used is quantitative with an associative type of research. Data was obtained from the distribution of questionnaires to 100 respondents. The number of samples was determined using the slovin formula with the method of drawing non-probability sampling samples based on certain criteria. The data analysis method used is multiple linear regression. The object of this study is digital advertising variables with informative persuasive advertising, persuasive advertising, reminder advertising, and reinforcement advertising indicators. Location variables with indicators of accessibility, visibility, traffic, parking facilities, expansion, and competition. Buying interest variables with indicators of transactional interest, refractory interest, preferential interest, and exploratory interest. The results of the study with multiple linear regression tests showed that digital advertising and location had a positive and significant influence on buying interest.

Keywords: Marteking Mix, Promotions, Digital Advertising, Location, Buying Interest

1. Introduction

Changes in the digital era also affect marketing. With the emergence of digital, digital marketing or digital marketing was created. Digital marketing is a marketing or promotion activity of a brand or product using digital media or the internet (Scott, 2022). Marketing a brand or product on digital media or the internet can be done, one of which is by making digital advertisements. Digital advertising is advertising that is intended to be broadcast digitally over the Internet usually placed on Google, Facebook, Instagram, and other sites (Shiju, 2022). By utilizing internet media, business people can reach consumers more widely. Businesses in every sector are indispensable in taking advantage of technological advances for survival and in competition between other business people. (Halim et al., 2023)

Buying interest is a form of consumer plan to buy a product implemented by a company or MSME (Billa & Wardani, 2023). Buying interest is something related to the visitor's plan to buy or consume a certain product, as well as a coffeeshop in creating a good relationship with its customers so that in addition to being able to create visitor interest is also able to create loyalty for customers and even does not rule out the possibility that customers will be involved in promoting to others to visit the coffeeshop (Setiawan, 2018).

In today's digital era, marketing through online platforms is increasingly becoming the main strategy for various businesses, including coffeeshops. Coffee is one of the leading commodities in Indonesia. According to data from the United States Department of Agriculture

(USDA), Indonesia is listed as the 3rd largest coffee-producing country in the world in 2022/2023 which has produced 11.85 million bags of coffee with details of 1.3 million bags of arabica coffee and 10.5 million bags of robusta coffee. (USDA, 2023).

The high level of coffee consumption in Indonesia has a positive impact on the growth of the coffee industry in Indonesia (Setyokuncoro et al., 2022). The coffee shop business in Indonesia, especially in Bogor City, continues to experience quite rapid development (Setyokuncoro et al., 2022). This is marked by the emergence of new coffee shops with various interesting concepts. According to data from the Tourism and Culture Office, there are 986 restaurants, restaurants, and café businesses in Bogor City in 2022 (DISPARBUD, 2023). This data is a reference that business competition in the coffee beverage industry in Bogor City is getting tighter.

Anami Coffee is one of the coffee shops located in Bogor City, precisely on Jalan Ahmad Yani No. 15, Tanah Sareal. Anami Coffee is one of the coffeeshops that uses Instagram social media as a marketing tool, namely @anamicoffee.

The results of observations and interviews conducted by the researcher to the Head of Marketing of Anami Coffee revealed that Anami uses Instagram as a platform to display its digital ads because it wants to be known as a serious but relaxed coffeeshop. Instagram is the choice because the form of content on Instagram is considered more serious than other social media. This is in line with the segments and target markets of Anami Coffee, namely coffee lovers and children of Generation Z.

Because Anami has a better selling value than its competitors, especially in terms of advertising. Based on the description above, the author wants to research "Analysis of Digital Advertising and Location on Buying Interest in Anami Coffee". As the title of the thesis, it is expected to provide information about the influence of promotional strategies and the author's efforts in helping companies to market their products from the results of this research.

2. Literature review

2.1.Marketing Mix

According to Kotler & Keller (2016) There are 4 elements of marketing or commonly called marketing mix (marketing mix) is a general expression of strategies used in marketing to determine and offer products or services that are often associated with the way of these 4 elements, namely Price, Product, Promotion and Place.

1. Product is everything that is offered to the public to see, hold, buy or consume. Actually, customers do not buy goods or services, but buy the benefits of something offered.
2. Price is the amount of money that consumers pay to buy a product or replace something that belongs to the product. Prices include last price, discount, allowance, payment period, credit terms, and retail price. Price is the main factor determining the position and must be decided according to the target market, product and service mix, and competition.
3. Place is a company's various activities to make the products produced/sold affordable and available to the target market. Places include channels, coverage, assortments, locations, inventory, and transportation.
4. Promotion is a variety of company activities to communicate and introduce products to the target market. Promotional variables include, among others, sales promotion, advertising, sales force, public relations, and direct marketing.

2.2.Promotion

According to Hasan, (2013), promotion is a marketing function that focuses on persuasively communicating marketing programs to target customers or potential customers to encourage the creation of transactions between companies and customers.

According to Saleh & Said (2019), promotion is the most important activity that plays an active role in introducing, informing and reminding the benefits of a product in order to motivate buyers to shop for advertised goods.

According to Kotler & Keller (2016), promotions are elements used to inform the market about new products or services offered by a company through advertising, personal sales, sales promotions, and publications.

In these cases, the promotion is expected to make the market interested in buying, receiving, or remaining loyal to the product offered by the individual, wholesale provider of goods or services. In principle, although this promotion is usually carried out by the seller or manufacturer, the buyer or prospective buyer sometimes also unconsciously also conducts promotions, for example, after buying a product in the form of goods or services and feeling satisfied in using it, the buyer then tells the good or the advantages of the goods or services to others. Promotion involves informing, influencing, and persuading target customers and reminding them of the company and its marketing mix.

2.3. Digital Advertising

According to Shiju (2022), digital advertising is advertising that is meant to be broadcast digitally over the Internet usually placed on Google, Facebook, Instagram, and other sites.

According to Chaffey & Ellis-Chadwick (2019), digital advertising includes various forms such as banner ads, email marketing, video ads, to paid ads on social media with the advantage of personalization and sharper market segmentation.

According to Kotler & Keller (2016), digital advertising is a form of promotion that uses internet-based media to reach customers directly and personally, such as through websites, social media, search engines, emails, and other digital applications.

Based on some of the definitions above, researchers conclude that digital advertising is a form of promotion that is disseminated through internet-based media, such as websites, social media, search engines, emails, and other digital applications, with the aim of reaching consumers directly and personally.

2.4. Location

According to Kotler & Keller (2016), location is everything that indicates various business activities to make products easily available to customers and always available to customers.

According to Tjiptono (2019), a business location is where the company operates or where the company conducts activities to produce goods and services that are important to its economic aspect.

According to Lupiyoadi (2013), location is also said to be a decision made by the company in relation to where its operations and staff will be placed.

Based on some of the definitions above, the researcher concluded that location is a strategic decision of the company that includes the place of operation and business activities to ensure that the product is easily accessible and always available to customers, as well as considering economic aspects.

2.5. Buying Interest

According to Kotler (2016), the consumer's buying interest is something that arises after receiving a stimulus from the product he sees, from there arises an interest in trying the product until finally there is a desire to buy in order to have it.

According to Suyono & Sukmawati (2012)Buying interest is the stage where consumers form their choice among several brands that are included in the device of choice. Then in the end make a purchase on an alternative that he likes the most or the process that the consumer goes through to buy a good or service based on various considerations.

According to Hasan (2013), buying interest is the tendency of consumers to buy a brand or take actions related to purchases that are measured by the level of likelihood of consumers making purchases.

Based on some of the definitions above, researchers conclude that buying interest is the process of consumers wanting to buy a good or service based on their choice among several brands that are their choices.

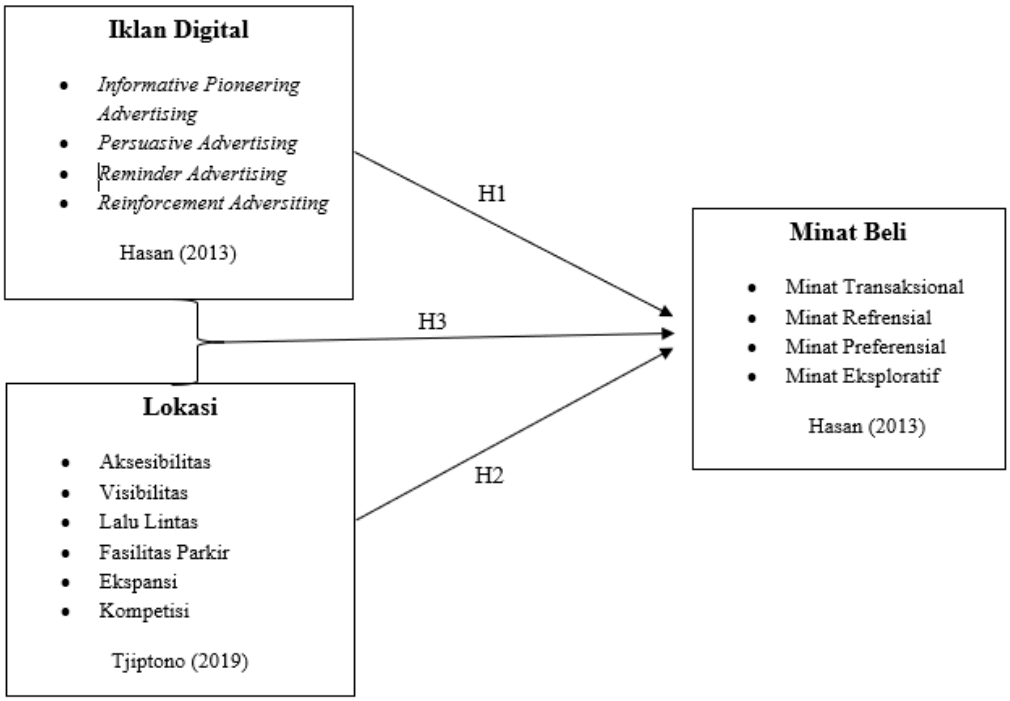

Figure 5. Thinking Frame Images

Based on the theoretical research framework and previous research, a hypothesis can be formulated which is a provisional conjecture in testing a research, namely:

H_1 : Anami Coffee's digital advertising has an effect on consumer buying interest.

H_2: The location of Anami Coffee affects consumers' buying interest.

H_3: Digital advertising and Anami Coffee's location affect consumer buying interest.

3. Methodology

The type of research used in this study is associative research that aims to prove the causal relationship or the relationship of influencing and being influenced by the variables being

studied by testing hypotheses which are generally studies that explain phenomena in the form of relationships between variables.

In this study, the objects used include variable Digital Advertising with indicators of informative advertising, persuasive advertising, reminder advertising, and reinforcement advertising. Location variables include accessibility, visibility, traffic, parking facilities, expansion, and competition. As well as buying interest variables which include transactional interest, reference interest, preferential interest, and exploratory interest.

The unit of analysis used is individual, where the source of research data comes from the responses of each individual/person. The individual in question is a consumer of Anami Coffee. The location of the research was conducted at Anami Coffee which is located on Jalan Ahmad Yani No. 15, Tanah Sareal.

The type of data studied in this study is quantitative data, which is in the form of numbers or numbers, allowing it to be processed numerically. The data sources used in this study use two data sources, namely primary and secondary data. Data processing is carried out in a way that has been collected, processed, and presented in the form of a table with multiple linear regression analysis, hypothesis and determination coefficient tests through research instrument tests such as validity tests and reality tests, classical assumption tests, and descriptive analysis. Meanwhile, the activities in data analysis are grouping data based on variables and types of respondents, tabulating data based on the variables of all respondents, presenting data for each variable studied, and conducting calculations to test the hypotheses that have been proposed.

4. Results and discussions

4.1. Respondent Characteristics

In this study, the author used a questionnaire with the help of Google Form by distributing it to Instagram followers @anamicoffee to get the necessary data by involving 100 respondents as a research sample. The description of the respondents used in this study is age, gender and have followed Anami Coffee's Instagram.

4.2. Descriptive Analysis

Table 22. Descriptive Analysis Results

Variable	Average	Information
Digital Advertising	81,8%	Excellent
Location	81,5%	Excellent
Buying Interest	81,2%	Excellent

Based on these results, it can be concluded that Digital Advertising, Location, and buying interest are very good but need to improve things that are still lacking based on the assessment of respondents.

4.3.Instrument's Validity Test

Table 23. Digital Advertising Validity Test

Yes	R count	R Table (5%) N=30	Information	Conclusion
1	0,552	0,361	R calculates > Rtable	Valid
2	0,571	0,361	R calculates > Rtable	Valid
3	0,618	0,361	R calculates > Rtable	Valid
4	0,657	0,361	R calculates > Rtable	Valid
5	0,612	0,361	R calculates > Rtable	Valid

6	0,681	0,361	R calculates > Rtable	Valid
7	0,592	0,361	R calculates > Rtable	Valid
8	0,575	0,361	R calculates > Rtable	Valid

Based on the results of the table above the statement of Digital Advertising Variables, the results of all statements in the digital advertising totaling 8 statements are said to be Valid, because the r value is calculated > r of the table.

Table 24. Location Validity Test

Yes	R count	R Table (5%) N=30	Information	Conclusion
1	0,617	0,361	R calculates > Rtable	Valid
2	0,586	0,361	R calculates > Rtable	Valid
3	0,368	0,361	R calculates > Rtable	Valid
4	0,575	0,361	R calculates > Rtable	Valid
5	0,537	0,361	R calculates > Rtable	Valid
6	0,519	0,361	R calculates > Rtable	Valid
7	0,482	0,361	R calculates > Rtable	Valid

Based on the results of the table above the Location Variable statement, the results of all statements in the location totaling 7 statements are said to be Valid, because the r value is calculated > r of the table.

Table 25. Buying Interest Validity Test

Yes	R count	R Table (5%) N=30	Information	Conclusion
1	0,766	0,361	R calculates > Rtable	Valid
2	0,785	0,361	R calculates > Rtable	Valid
3	0,746	0,361	R calculates > Rtable	Valid
4	0,718	0,361	R calculates > Rtable	Valid
5	0,774	0,361	R calculates > Rtable	Valid
6	0,720	0,361	R calculates > Rtable	Valid

Based on the results of the table above the Buying Interest Variable statement, the results of all statements in the Purchase Interest totaling 6 statements are said to be Valid, because the r value is calculated > r table.

4.4.Instrument's Reliability Test

Table 26. Reliability Test

Variable	Cronbach's Alpha	Information
Digital Advertising	0,928	Realistic

Location	0,917	Realistic
Buying Interest	0,894	Realistic

The results of the reliability test on the variables of digital advertising, location, and buying interest showed a Cronbach Alpha value of > 0.60 so that it could be declared reliable because it had a Cronbach Alpha value of > 0.60.

4.5.Classic Assumption Test

Table 27. Normality Test

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		100
Normal Parameters[a,b]	Mean	.0000000
	Std. Deviation	1.54101775
Most Extreme Differences	Absolute	.100
	Positive	.058
	Negative	-.100
Test Statistic		.104
Asymp. Sig. (2-tailed)		.010c
a. Test distribution is Normal.		

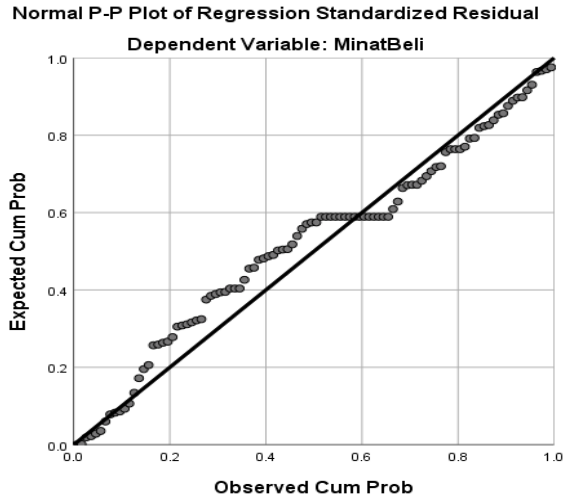
Based on the results of the normality test using the residual standard above, the significance value of Kolmogorof-Smirnov was obtained which was 0.010. Sig Number. The Kolmogorof-Smirnov was higher than the significance level of 5% (0.05) or 0.010>0.05. This gives an idea that the data of the two variables are normally distributed.

Table 28. Multicollinearity Test

Coefficient								
Type	Unstandardized Coefficients		Standardized Coefficients	t		Sig.	Collinearity Statistics	
	B	Std. Error	Beta				Tolerance	VIF
1	(Constant)	2.687	1.366		1.967	.052		
	Digital Advertising	.360	.038	.570	9.499	.000	.789	1.267
	Location	.338	.048	.423	7.058	.000	.789	1.267
a. Dependent Variable: Buying Interest								

Based on the results of the multicollinearity test in table 4.29 above, it can be concluded that there is no multicollinearity between free variables because the tolerance value for digital advertising and location is greater than 0.10 each. Likewise, the VIF value of each is less than 10.

Figure 6. Heteroskedaticity Test



Based on the Normal output of the P-Plot above, it can be seen that the dots are spread out and do not form a definite clear pattern. So it can be concluded that there is no heteroscedasticity problem.

4.6. Multiple Linear Regression Test

Table 29. Multiple Linear Regression Test

Coefficient						
Type		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.687	1.366		1.967	.052
	Digital Advertising	.360	.038	.570	9.499	.000
	Location	.338	.048	.423	7.058	.000
a. Dependent Variable: Buying Interest						

The table above shows that the value of the constant coefficient is 2.687, the digital advertising coefficient is 0.360 and the location coefficient is 0.338. So that the regression equation Y = 2.687 + 0.360X1 + 0.338X2 + e is obtained. Based on the above equation, it is known that the value of the constant is 2.687. Systematically, this constant value states that when the digital ad and location together are valued at 0, then the buying interest has a value of 2.687.

4.7.Hypothesis Test

Table 30. T Test

Coefficient				
Unstandardized Coefficients		Standardized Coefficients		
B	Std. Error	Beta	t	Sig.
2.687	1.366		1.967	.052
.360	.038	.570	9.499	.000
.338	.048	.423	7.058	.000
a. Dependent Variable: Buying Interest				

Based on the Coefficiens table of t-value calculated 9.499 which means t calculates > t table (9.499 > 1.661) with a significant t of 0.000 because the significance t is less than 10% (0.000 < 0.1) so that H1 is accepted, it can be concluded that partially the variable of digital advertising affects buying interest.

Based on the Coefficiens table, the value of t is calculated as 7.058 which means that t calculates > t of the table (7.058 > 1.661) with a significant t of 0.000 because the significance of t is less than 10% (0.000 < 0.1) so that H2 is accepted, then it can be concluded that partially the location variable affects the buying interest.

From the calculated value, the two variables are received or have a significant effect. The digital advertising variable was declared the most related to buying interest, with a calculated t-value of 9.499

Table 31. F Test

ANOVA[a]						
Type		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	601.296	2	300.648	127.714	.000b
	Residual	228.344	97	2.354		
	Total	829.640	99			
a. Dependent Variable: Buying Interest						
b. Predictors: (Constant), Location, Digital Ads						

The results of the hypothesis test show that it is known that the calculated F is 127.714, while the F value of the table for the real level (a) is 5% and df1 = k = 2 while df2 = n-k is 100 – 2 = 98 is 3.09. In other words, F calculates > F table, which is 127.714 > 3.09 so that it can be concluded that the variables of digital advertising and location have a simultaneous effect on buying interest.

Based on the results of the F test, it is also known that the significance value that appears is 0.000 which means F (0.000 < 0.05), which shows that there is a strong significance occurring in the independent variable against the bound variable. Therefore, the conclusion is that digital advertising and location have a simultaneous effect on buying interest.

Table 32. Coefficients Determination

Model Summary[b]				
Type	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.851a	.725	.719	1.53430
a. Predictors: (Constant), Location, Digital Ads				
b. Dependent Variable: Buying Interest				

Based on the table above, the Adjust R Square value is 0.719. This means that 71.9% of the buying interest variables were influenced by digital advertising and location variables, while the remaining 29.1% were influenced by other variables that were not included in the study.

5. Conclusion

Based on the results of the research and discussion that has been explained earlier, it can be concluded that:

Digital advertising has a partial and significant effect on buying interest, in this case it shows that digital advertising is able to increase consumer buying interest from Anami Coffee. Based on the average table of respondents' responses regarding the digital advertising variable , which is 81.8%, the value is on the likert scale (81-100%), so it can be said that digital advertising on Anami Coffee is in the very good category. This condition illustrates that in general, respondents agree that the importance of digital advertising to buying interest in Anami Coffee.

The location has a partial and significant effect on buying interest, in this case it shows that the location is able to increase consumer buying interest from Anami Coffee. Based on the average table of respondents' responses regarding the location variable, which is 81.5%, the value is on the likert scale (81-100%), so it can be said that the location of Anami Coffee is in the very good category. This condition illustrates that in general, respondents agree that location affects buying interest in Anami Coffee.

Digital advertising and location on buying interest in Anami Coffee have a simultaneous effect. From the tests that have been carried out, it is found that the F calculation is 127.714, while the F value of the table for the real level (a) is 5% and df1 = k = 2 while df2 = n-k which is 100 – 2 = 98 is 3.09. In other words, F calculates > F of the table, which is 127.714 > 3.09 with a significance value that appears of 0.000 which means F (0.000 < 0.05) so that it can be concluded that the variables of digital advertising and location have a simultaneous effect on buying interest.

Universitas Trunojoyo Madura, Indonesia

Abstract

This study aims to examine the influence of parasocial relationships and influencer marketing on consumer behavior in the digital age. The method used is a Systematic Literature Review (SLR), with 23 full-text articles selected as the main references after an initial selection process based on relevance and availability of full texts. The analysis results indicate that parasocial relationships foster emotional closeness between consumers and influencers, thereby encouraging a tendency to emulate lifestyles and follow product recommendations. Additionally, influencer marketing has been proven to have a significant influence on consumer decision-making. These findings confirm that one-way interactions established through social media can shape public perception and consumption behavior.

Keywords: parasocial, influencer marketing, social media influencers, consumer behavior, purchase intention, impulsive buying, e-commerce

1. Introduction

The emergence of social media platforms such as Instagram, TikTok, and YouTube has changed the way consumers interact with brands and public figures. In today's era, which is dominated by digital marketing through influencers, traditional marketing is beginning to lose its relevance (Weiger et al., 2025). Influencers build a large following (Tyrväinen & Karjaluoto, 2025) and engage with them on a personal level (Al Sulaiti et al., 2024; Cabeza-Ramírez et al., 2022). This phenomenon indirectly leads to an emotional approach through the formation of parasocial relationships (PSR), which are one-sided, non-reciprocal relationships between consumers and influencer marketers (Horton & and Richard Wohl, 1956). This creates the perception that influencers are trustworthy individuals capable of promoting a brand or service.

Several studies indicate that PSR can significantly influence consumer behavior, particularly in terms of increased trust, emotional attachment, and the desire to emulate influencers. At the same time, influencer marketing has emerged as one of the most effective digital marketing strategies due to its ability to build authenticity, credibility, and intimacy in communication with consumers (Tyrväinen & Karjaluoto, 2025; Weiger et al., 2025).

Despite the growing interest in these areas, there remains a lack of comprehensive synthesis on how PSR and influencer marketing collectively shape consumer behavior. This study aims to address this gap by conducting a systematic literature review (SLR) of 23 academic articles that examine how both influence purchasing behavior, consumer loyalty, and impulsive purchasing tendencies.

The purpose of this literature review is to identify dominant themes, consistent findings, and theoretical contributions, as well as to uncover gaps and propose directions for future research.

2. Literature Review

2.1. Parasosocial Relationships

Parasosocial relationships refer to one-sided emotional relationships formed by individuals with media figures or public figures. Horton & and Richard Wohl, (1956) were the first to conceptualize this phenomenon, explaining that audiences can feel personally connected (Conde & Casais, 2023; Jin & Ryu, 2020) to media figures even without two-way interaction (S. Yuan & Lou, 2020). In the context of social media, PSR is strengthened through continuous exposure and the perception of authenticity from influencers (S. Yuan & Lou, 2020).

Some researchers emphasize the impact of PSR on consumer trust and purchase intent. Sokolova & Kefi, (2020) and C. L. Yuan et al., (2016) found that the emotional bonds developed through PSR enhance consumers' acceptance of influencer recommendations. This relationship enhances psychological closeness, which acts as a persuasive tool in marketing communication.

2.2 Influencer Marketing

Influencer marketing is a marketing strategy that uses social media figures with significant influence over their followers to promote products or services. Influencer credibility (Cheah et al., 2024; Weinlich & Semerádová, 2022), comprising trust, expertise, and appeal, is a critical factor in the success of this strategy (Gundová & Cvoligová, 2019; R.A.S.D.Rathnayake & V.G.P. Lakshika, 2023; Syed et al., 2023). Influencers use an emotional approach so that their audience or followers feel they have a close relationship with the influencer (Nadroo et al., 2024). This allows followers to follow the influencer's daily life in real time without an actual relationship.

2.3. Consumer Consumption Behavior

Consumer consumption behavior is an individual's tendency to make purchases that are often influenced by emotional and social factors. In the digital age, the emergence of influencers and the formation of PSR can reinforce this consumer consumption behavior. Consumers do not only buy goods because of necessity but also because of recommendations from public figures or influencers they trust.

Nabirasool et al., (2024) and Spörl-Wang et al., (2025) show that consistent engagement with influencers through social media can form repetitive consumption habits and impulsive behavior (Barta et al., 2023; Xiang et al., 2016). This can be interpreted as PSR and influencer marketing being a combination that can significantly shape consumers' lifestyles and shopping habits.

3. Methodology

A systematic literature review (SLR) was chosen as the research method in this study by reviewing specific topics that had been identified, classified in a structured manner, assessed, summarized, and selected using PRISMA (Preferred Reporting Items for Systematic Reviews) based on predetermined criteria. Data sources were derived from journals with ISSN or E-ISSN, serving as primary data for this study, ensuring that the information used has a traceable and academically recognized basis through valid and verified sources.

The review method used in this study involved searching the literature from the Elsevier, Sciendirect, and Research Gate databases, using a combination of keywords such as parasocial, influencer marketing, social media influencers, consumer behavior, purchase intention, impulsive buying, and e-commerce. The stages of searching the literature are as follows:

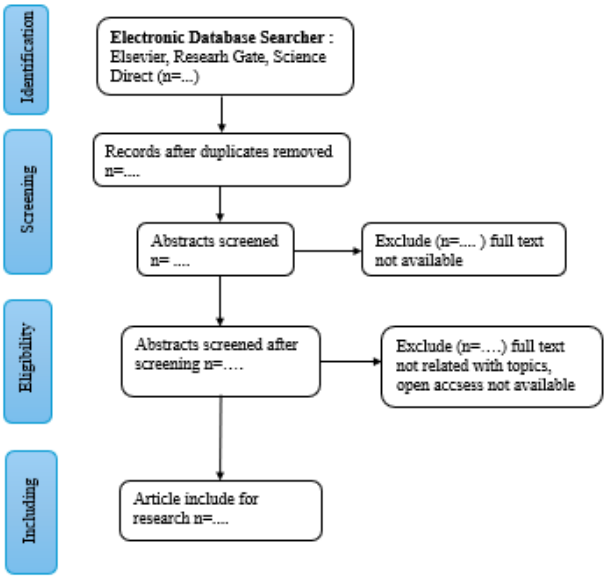

Figure 1: Prism (Recommended Reporting Items for Systematic Reviews) before screening method

Research using the SLR method is guided by research questions. Research questions are formulated to ensure that the systematic review remains focused on the topic. To make the research questions more systematic, the author uses the PICOC approach introduced by Sackett et al. (1996), which has been widely used in research.

Table 1: PICOC

Population	Social media consumers targeted by PSR and influencer marketing
Intervention	Parasocial relationships and influencer marketing
Comparison	n/a
Outcome	Consumer consumption behavior and loyalty
Context	The digital age and social media

Table 2: Research Question

RQ 1	How does parasocial relationships influence consumer behavior?
RQ 2	How does influencer credibility shape consumer desire?
RQ 3	Can parasocial relationships and influencer marketing simultaneously increase consumer behavior?
RQ 4	How do influencer marketing and parasocial relationships influence consumer loyalty?

4. Results and Discussion

4.1 Research Results

The article search and selection process was conducted following the PRISMA flow. Literature search was conducted using a combination of keywords in the publication year range of 2016 to 2025. From the search results, a total of 327 articles were obtained. After an initial screening based on the title, 296 articles were deemed relevant to the topic. A second screening

was then conducted based on the abstract, resulting in 108 articles that met the criteria. However, only 23 articles were available in full paper format and were used for further analysis.

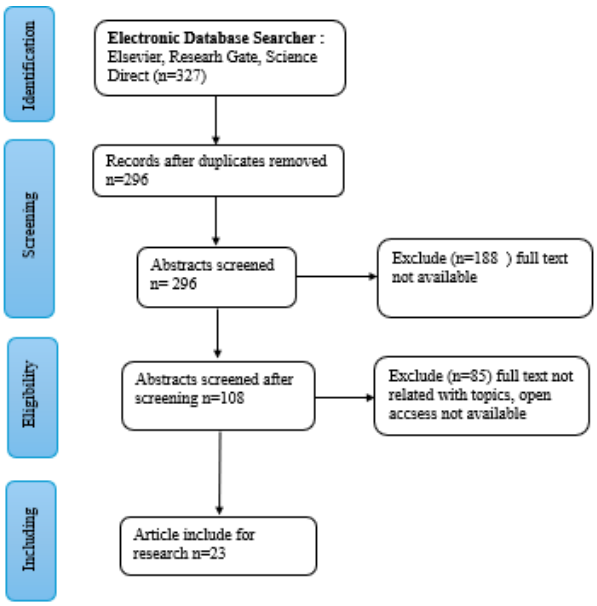

Figure *2: Prism (Recommended Reporting Items for Systematic Reviews) after screening method*

The final results of 23 articles can be seen in the search results table, to facilitate the review of the journals obtained.

Table 1: Year of Publication of Reviewed Articles

No.	Year of publication	Number
1.	2016	2
2.	2017	0
3.	2018	0
4.	2019	1
5.	2020	3
6.	2021	0
7.	2022	5
8.	2023	4
9.	2024	5
10.	2025	3

It can be concluded that research on this topic has increased significantly in recent years, particularly from 2022 to 2025. This shows that issues related to influencer marketing and parasocial relationships are increasingly becoming the subject of contemporary research.

4.2 Discussion

a. Discussion of RQ1: How does parasocial relationships influence consumer behavior?

Parasocial relationships (PSR) play an important role in forming emotional closeness between influencers and consumers. PSR is formed through continuous exposure to content and the audience's perception of authenticity (S. Yuan & Lou, 2020). Research by Sokolova & Kefi, (2020) and C. L. Yuan et al., (2016) show that PSR can increase trust and acceptance of influencer recommendations. This closeness encourages purchase intent and impulsive buying, as consumers feel a personal connection with influencers even without reciprocal interaction.

Not only does it encourage impulsive purchasing decisions, but parasocial relationships also create long-term bonds between consumers and brands.

b. Discussion of RQ2: How does the credibility of influencers shape consumer consumption desires?

The credibility of influencers is key to the effectiveness of digital marketing. This credibility encompasses the dimensions of expertise, trustworthiness, and attractiveness (Gundová & Cvoligová, 2019; R.A.S.D.Rathnayake & V.G.P. Lakshika, 2023). When influencers are perceived as authentic and possess relevant knowledge, consumers are more likely to accept the information conveyed. Cartwright et al., (2022) even noted the impact of influencer credibility in a B2B context, indicating that the impact is not limited to individual consumers but also extends to organizations. The credibility possessed by influencers, whether in terms of expertise, honesty, or appeal, further strengthens this influence. In line with Leite et al., (2024), who found that perceptions of influencer competence also strengthen their credibility in building consumer loyalty through emotional closeness. When these emotional and cognitive elements work together, the effect is not limited to encouraging a one-time purchase but also forms a pattern of repeated consumption and interest in the brand.

c. Discussion of RQ3: Can parasocial relationships and influencer marketing simultaneously increase consumer consumption behavior?

A review of 23 articles shows that the combination of PSR and influencer marketing has a stronger impact on consumer consumption behavior than either one alone. PSR builds emotional trust, while influencer marketing targets the cognitive aspects of decision-making (Nabirasool et al., 2024; Spörl-Wang et al., 2025)). When combined, consumption drives increase not only in the form of impulsive purchases but also in long-term brand loyalty.

However, some studies also reveal risks such as over-endorsement, which can reduce the authenticity of influencers (Cheah et al., 2024). In addition, content that evokes positive emotions, such as rumors and attractive visuals, has been proven to strengthen the effectiveness of this combination in attracting consumers (Barta et al., 2023).

d. Discussion of RQ4: How do influencer marketing and parasocial relationships affect consumer loyalty?

Based on the analyzed literature, emotional engagement resulting from continuous exposure to influencer content not only impacts immediate purchases but also shapes consumer loyalty toward a brand. Consumers who are emotionally connected are more likely to repeatedly recommend a brand ((Spörl-Wang et al., 2025; Tyrväinen & Karjaluoto, 2025) which in turn strengthens the relationship between consumers and a brand (Nabirasool et al., 2024; Spörl-Wang et al., 2025). This implies that influencer marketing is not merely a fleeting trend or a temporary promotional tool, but a strategy that can foster sustainable relationships between consumers and brands.

5. Conclusion

The results of the literature review indicate that in an increasingly digital era, the role of parasocial relationships and influencer marketing has a significant impact on consumer behavior and loyalty. The trust that grows through parasocial relationships makes consumers more open to marketing messages conveyed by influencers. Furthermore, continuous emotional engagement has the potential to foster consumer loyalty, where consumers are not merely passive users but also voluntarily participate in promoting products.

GREEN ENTREPRENEURSHIP IN COASTAL ECOTOURISM: STRATEGIC INNOVATIONS FOR SUSTAINABLE LOCAL DEVELOPMENT IN INDONESIA

Dimas F A[1],M Giga Ali S[2],Fika N[3]And Darul I [4]
[1,2,3,4]Entrepreneurship, Faculty of Economics and Business,

Universitas Trunojoyo Madura, Indonesia

Abstract

This study examines the integration of green entrepreneurship and coastal mangrove ecotourism as an innovative strategy for sustainable local economic development in Gresik, Indonesia. Using a qualitative descriptive approach, data were collected from key informants, including ecotourism managers, local micro, small, and medium enterprises (MSMEs), village authorities, and visitors in the Banyuurip mangrove area, Ujungpangkah. Findings indicate that green entrepreneurship initiatives increase community income, enhance environmental awareness, and drive innovation through locally sourced products such as mangrove crafts, seafood cuisine, and ecotourism services. The success of these initiatives is driven by multi-stakeholder collaboration involving communities, local governments, academics, and the private sector. This collaborative ecosystem supports transforming the mangrove area into an education- and conservation-based tourism destination. This study contributes to the discourse on sustainable development by demonstrating how coastal ecotourism can serve as a platform for an inclusive, resilient, and environmentally conscious local economy.

Keywords: Coastal Ecotourism, Community Empowerment, Green Entrepreneurship, Sustainable Local Development

1. Introduction

Indonesia, as an archipelagic country with the second longest coastline in the world, has great potential in developing coastal ecotourism. Coastal areas not only contain high biodiversity, but also serve as a source of livelihood for millions of local communities. However, pressures from environmentally unfriendly development, exploitation of natural resources, and climate change pose major challenges to the sustainability of coastal ecosystems. In this context, the emergence of green entrepreneurship offers a strategic approach that integrates environmental sustainability values with local economic development. Green entrepreneurship in coastal ecotourism emphasizes the principles of environmentally conscious, innovative, and local potential-based businesses. One example can be found in the Banyuurip mangrove area, Ujungpangkah, Gresik, East Java. This area has high ecological potential but has previously been underutilized. Through a green entrepreneurship approach, the area began to be developed as an educational and conservative tourist destination, involving the local community as the main actors.

This study aims to explore the integration of green entrepreneurship and coastal ecotourism as an innovative strategy for sustainable local economic development. Using a qualitative descriptive approach, this study involved various stakeholders such as tourism managers, MSMEs, village governments, and visitors. The results show that green entrepreneurship initiatives not only increase community income but also encourage environmental awareness and innovation of local natural resource-based products, such as mangrove crafts, seafood-based cuisine, and ecotourism tour services.

2. Literature review

2.1 Environmental Issues and Green Entrepreneurship

This literature review stems from concerns about environmental damage caused by exploitative and unsustainable conventional economic practices (Suparmoko, 2018). Economic activities that are solely profit-oriented often neglect social and ecological impacts, leading to the degradation of natural resources, particularly in coastal areas vulnerable to ecological changes. This situation calls for the emergence of a new entrepreneurial approach that is more responsible toward the environment and society.

2.2 Coastal Ecotourism as a Space for Implementation

Coastal ecotourism is viewed as a concrete space for the implementation of green entrepreneurship. Environmental conservation practices in ecotourism are integrated with local economic activities that are educational and recreational in nature. Beyond being a tourist destination, coastal ecotourism empowers local communities through the utilization of natural resources such as mangrove forests, coral reefs, and marine products (Handayani & Rudiarto, 2017). This demonstrates the synergy between environmental protection and the strengthening of the local economy.

2.3 Collaboration and Social Innovation in Community Empowerment

The success of green entrepreneurship implementation in ecotourism heavily depends on multi-stakeholder collaboration. Governments, academics, businesses, and local communities must work together to build a participatory and inclusive green entrepreneurship ecosystem (Kemenparekraf, 2021; Wibowo & Nugroho, 2020). In this context, social innovation plays a crucial role as an empowerment approach, encompassing training, market access, and strengthening local capacity. Social innovation acts as a catalyst in bridging the concept of green entrepreneurship with the realities of coastal communities.

2.4 Interrelationship Between Concepts and Research Relevance

There is a functional relationship between the three main concepts: green entrepreneurship, coastal ecotourism, and social innovation. Green entrepreneurship serves as the foundation of values, coastal ecotourism as the implementation space, and social innovation as the strategy for implementation and empowerment. Together, they form a mutually supportive system to create inclusive and sustainable local development.

3. Methodology

This study uses a qualitative descriptive approach to explore the integration of green entrepreneurship and coastal ecotourism as an innovative strategy in developing a sustainable local economy in the Banyuurip mangrove area, Ujungpangkah, Gresik, Indonesia. This approach was chosen because it allows researchers to deeply understand the social, economic, and environmental phenomena that occur at the research location.

3.1 Research Approach and Type

This study uses a descriptive qualitative approach, with the aim of gaining an in-depth understanding of green entrepreneurship practices in community-based coastal ecotourism in the Gresik Regency. A qualitative approach was chosen because it is able to describe social phenomena in a contextual manner, particularly in exploring the perspectives and experiences of business actors, local governments, and tourists regarding environmentally-based ecotourism activities.

3.2 Research Location

The research was conducted in coastal villages in Gresik Regency, East Java, which have potential and activities in mangrove-based ecotourism. This location was chosen purposively because it has local initiatives in developing ecotourism based on green entrepreneurship principles.

3.3 Research Informants

Informants were selected using purposive sampling techniques, with the following criteria:

- Local business operators involved in ecotourism activities,
- Representatives from the village government or tourism office who understand coastal tourism development programs,
- Tourists who have visited the ecotourism destination.

The number of informants in this study was 9 people, consisting of:

- 4 local business operators,
- 3 representatives from the village government and related agencies,
- 2 tourists.

3.4 Data Collection Techniques

Data was collected using the following techniques:

- In-depth interviews with key informants to obtain comprehensive qualitative data,
- Participatory observation, conducted during field visits to tourism activities and conservation efforts,
- Documentary study, involving the review of policy documents, activity reports, or relevant local media.

3.5 Data Analysis Techniques

Data analysis was conducted using interactive analysis techniques (Miles & Huberman), which included three main stages:

- Data reduction – selecting, simplifying, and focusing on data relevant to the research objectives;
- Data presentation – organizing data in the form of narratives, tables, or thematic visualizations;
- Drawing conclusions and verification – identifying patterns, relationships, and meanings from the analyzed data.

3.6 Data Validation Techniques

To ensure data validity, the triangulation method is used, which includes:

- Source triangulation, by comparing information from business operators, government, and tourists;
- Technique triangulation, which is comparing the results of interviews, observations, and documentation.

4. Result and Discussions

Field findings show that green entrepreneurship practices in coastal ecotourism in Gresik not only promote environmental conservation but also have a positive impact on strengthening the local economy. This is in line with the findings of Fauzi & Anna (2020), who state that green entrepreneurship is able to internalize sustainability values in community-based business activities.

Furthermore, a collaborative approach between the community, village government, and tourism stakeholders is a key factor in the success of sustainable ecotourism. This cross-sector collaboration is also mentioned in the study by Wibowo & Nugroho (2020), which emphasizes the importance of synergies among actors in developing social innovations to drive participatory local economic transformation.

The practices identified also demonstrate social innovation, ranging from skill training, community-based tourism management, to the diversification of marine and mangrove-based processed products. These findings reinforce the theory that green entrepreneurship requires mentoring and social innovation to sustain itself economically and socially. This also supports the study by Handayani & Rudiarto (2017) on the importance of a community-based approach in managing conservation-based ecotourism.

From a sustainability perspective, the application of green entrepreneurship principles in coastal tourism activities in Gresik reflects local good governance practices. By involving the community as the main actors, there is a process of collective learning and capacity building among residents in the sustainable management of natural resources. This aligns with the participatory development approach discussed by Huda & Santosa (2019), where development is no longer top-down but community-based.

Thus, this discussion reinforces the argument that the success of green ecotourism is not only determined by the uniqueness of the environment but also by the presence of adaptive social institutional structures, market networks, and local innovation capacity. This is the essence of the integration between green entrepreneurship, social innovation, and coastal community empowerment.

4.1 Challenges in Implementing Green Entrepreneurship

a) Limited infrastructure and facilities

Although the community feels the economic benefits, limitations in supporting facilities—such as access to boardwalks in mangrove areas, sanitation, and product processing facilities—remain significant obstacles. This is similar to the challenges faced by mangrove ecotourism in other coastal areas of Indonesia, such as Bali, Sulawesi, and Kalimantan, where a lack of facilities and promotion also reduces the potential for sustainable ecotourism.

b) Stakeholder conflicts

The success of this collaborative narrative could be threatened by role conflicts and the distribution of benefits at the local level. A study in Kulon Progo revealed differing interests among tourism managers, village governments, and residents regarding infrastructure management, economic income, and profit sharing.

c) Limited access to funding and technology

Local SME actors often face challenges in accessing capital, training, and digital marketing—as found in Sei Nagalawan, North Sumatra, where weak government support and low digital technology adoption are major barriers.

4.2 Comparison with Similar Studies

Location	Positive Findings	Similar Challenges

Kulon Progo, Yogyakarta	Intergroup conflict and distribution of benefits	Local conflicts and competition over management are similar to those in Banyuurip.
Sei Nagalawan, North Sumatra	Positive: economic growth and improved welfare	Negative: technological limitations and government support are also felt
Cengkrong, Trenggalek (East Java)	Mangrove conservation is actively underway	Limited infrastructure and limited participation of the entire community
Makassar, South Sulawesi	Ecopreneurship strategies through training and productive innovation	Capital and human resources are obstacles to expanding the scale of the business.

4.3 Lessons Learned and Strategic Recommendations

a) Improvement of integrated infrastructure

There is a need to develop access roads, seafood/craft processing centers, and environmentally friendly sanitation—similar to the recommendations in Nusantara.

b) Implementation of local conflict resolution mechanisms

Learning from Kulon Progo, organize multi-stakeholder forums and joint governance to avoid domination by certain groups.

c) Strengthening access to financing and technology

Facilitate access to micro-SME loans and digital marketing, in line with findings from Sei Nagalawan.

d) Monetizing ecosystems through conservation-driven tourism

Develop educational mangrove tourism packages plus processed products while preserving biodiversity, in line with strategies in Cengkrong and Makassar.

e) Adaptive monitoring and evaluation systems

Implement continuous monitoring so that mitigation conflicts and conservation needs can be monitored (similar to the system in Yogyakarta).

5. Conclusion

This study reveals that the integration of green entrepreneurship in the development of mangrove ecotourism in Banyuurip, Ujungpangkah, Gresik, contributes significantly to sustainable local economic development. By applying principles of environmentally friendly entrepreneurship, local communities have not only successfully increased their income but also experienced heightened awareness and concern for the conservation of mangrove ecosystems as the primary resource in ecotourism development.

Innovative products based on local resources, such as handicrafts made from mangrove materials, seafood cuisine, and educational tour guide services, have become key instruments in driving economic value while maintaining environmental sustainability.

The success of this initiative is attributed to the multi-stakeholder collaboration between local communities, SMEs, village governments, academics, and the private sector. This collaboration promotes inclusive training, financing, marketing, and knowledge transfer. Active community participation in conservation and utilization of coastal resources demonstrates that green ecotourism can strengthen socio-economic resilience while fostering sustainable environmental awareness (Santoso & Rahayu, 2019; Kurniawan et al., 2020).

5.1. Research Implications

1. Theoretical Implications

This study reinforces the theory that the integration of green entrepreneurship and social innovation is an effective mechanism for achieving community-based sustainable development. These findings expand the literature's understanding of the role of green entrepreneurship in the context of participatory and inclusive natural resource management (Huda & Santosa, 2019).

2. Practical Implications

These findings can serve as a reference for SMEs and ecotourism managers in developing sustainable business models based on local potential. Practices such as training in environmentally friendly production, strengthening marketing networks, and involving communities in environmental conservation need to be replicated to strengthen coastal economic empowerment (Wibowo & Nugroho, 2020).

3. Policy Implications

From a policy perspective, this study recommends the need for policies based on local ecosystems that support green entrepreneurship incentives and community-based ecotourism development. Local governments and relevant ministries are advised to facilitate funding, training, and legal recognition of local products within the sustainable tourism supply chain (Kemenparekraf, 2021).

4. Suggestions for Further Research

Further research is recommended to examine the long-term impacts of green entrepreneurship integration on household economic resilience, ecosystem conservation, and socio-cultural balance in coastal areas. Comparative studies between regions will also enrich these findings, particularly in other coastal areas such as Marunda or Sebangau National Park.

COMPARISON OF THE INFLUENCE OF MARKETING MIX ON ONLINE PURCHASE DECISIONS IN MARKETPLACES AND SOCIAL COMMERCE AMONG MILLENNIALS

Deveni Aziz Gumelar[1], Gia Rizky[2]

[1]Undergraduate Program in Management, Faculty of Business and Humanities, Universitas Teknologi Yogyakarta
[2] Undergraduate Program in Management, Faculty of Business and Humanities, Universitas Teknologi Yogyakarta

Abstract

This study aimed to analyze the influence of the 7P marketing mix on online purchase decisions among the millennial generation and to compare online purchase decisions between marketplace and social commerce platforms. The research was based on the rapid growth of e-commerce, in which millennials were the most dominant group engaging in online shopping activities. A quantitative research method was used, employing purposive sampling with a total of 243 respondents. Data were collected through a questionnaire distributed via Google Forms, which had been tested for validity and reliability. The data analysis included descriptive statistics, instrument testing validity and reliability test, classical assumption tests normality, linearity, heteroscedasticity, and multicollinearity, multiple linear regression analysis, hypothesis testing t-test, F-test, and independent sample t-test, and the coefficient of determination. The results show that, partially, the marketing mix variables product, promotion, people, process, and physical evidence had a positive and significant effect on online purchase decisions. However, the variables price and place had a negative effect. Simultaneously, all elements of the 7P marketing mix product, price, place, promotion, people, process, and physical evidence had a positive and significant influence on online purchase decisions. Furthermore, the study found no significant difference in online purchase decisions between marketplace and social commerce platforms. Future studies may further examine other factors that influence online purchase decisions.

Keywords: *marketing mix, online purchase decision, marketplace, s-commerce*

1. Introduction

Technological and informational advancements have significantly transformed social, economic, and cultural domains (Shoimah, 2020). The internet has facilitated broad and easy access for individuals and businesses to connect, evolving from a communication tool into a platform for commercial transactions (Nasution et al., 2020). This shift has led to increasingly complex consumer behavior in the digital era. According to Ramesh (2022), digitalization has profoundly altered how individuals engage in commercial activities, shaping consumption patterns, product preferences, and purchasing decisions. Businesses have adapted by leveraging technology to operate online, introducing global e-commerce systems (Vera Maria et al., 2024).

Consumers now enjoy the convenience of selecting, comparing, and purchasing products online (Salma et al., 2022). Online purchase decisions involve a series of behaviors, including information seeking and product selection via digital platforms (Zhao & Tarndamrong, 2023). Purchasing decisions represent the stage where consumers choose among alternatives and proceed with transactions (Harahap et al., 2024). The shift from physical to digital marketing has redefined consumer habits, with online shopping becoming the norm (Rahmadi & Malik, 2016).

According to Indonesia's Ministry of Trade, e-commerce penetration rose from 2020 to 2023 by 21.56% and is projected to reach 34.83% by 2029 (satudaata.kemendag.go.id, 2024). E-commerce, a subset of e-business, refers specifically to buying and selling goods and services online (Turban et al., 2017). Marketplaces such as Tokopedia, Shopee, and Bukalapak play a vital role in Indonesia's digital economy, offering diverse products and services (Aisha & Kurnia, 2023). In 2023, Shopee led with 2.3 billion visits, followed by Tokopedia (1.2 billion) and Lazada (762.4 million) (Ahdiat, 2024).

Social media has evolved from personal communication tools into strategic platforms for business and marketing. In January 2022, Indonesia had 191.4 million social media users, representing 68.9% of the population (Kemp, 2022). A survey revealed that 95.17% of businesses used messaging apps like WhatsApp for sales, 41.30% used social media platforms, and 19.75% used marketplaces (Kusumatrisna et al., 2023). This highlights the growing use of both e-commerce and social commerce (s-commerce).

S-commerce, defined as commerce via social media platforms, is gaining traction. A Populix survey found that 52% of Indonesians were aware of s-commerce, with TikTok Shop (46%) and WhatsApp (21%) being the most used platforms (info.populix.co, 2022). In 2022, Shopee and Tokopedia contributed 36% and 35% respectively to Indonesia's GMV, followed by Lazada and Bukalapak (10% each), TikTok Shop (5%), and Blibli (4%) (trade.gov, 2024).

To remain competitive, businesses must adopt effective marketing strategies. The marketing mix (4P: product, price, place, promotion) has evolved into 7P by adding people, process, and physical evidence (Chaffey & Smith, 2017). Studies show mixed results on how each element influences purchase decisions across platforms like Shopee and TikTok Shop (Khotimah & Jalari, 2021; Zhao & Tarndamrong, 2023; Verina et al., 2024). Millennials, the dominant online consumer group, are tech-savvy and influenced by convenience, reviews, and digital promotions (Lesmana, 2022; kredivocorp.com, 2023).

2. Literature review

5.6.E-Business

E-business integrates digital technologies into all aspects of business operations, enabling efficiency, global reach, and customer-centric strategies. It encompasses more than e-commerce by including digital marketing, CRM, fintech, and data analytics. Key benefits include operational automation, personalized services, and strategic scalability (Nasution et al., 2024). An effectively designed e-business strategy that aligns with business characteristics can significantly enhance company performance (Brzozowska & Bubel, 2015).

5.7. Marketplace and S-commerce

A marketplace, as conceptualized by Apriadia and Saputra (2017), refers to a digital platform that enables electronic transactions between multiple vendors and consumers. In Indonesia, marketplaces constitute a dominant segment of the e-commerce industry, with platforms such as Tokopedia, Bukalapak, Shopee, Blibli, and Elevenia acting as intermediaries that facilitate transactions, manage payments, and coordinate logistics (Rachmat et al., 2023). Meanwhile, social commerce (s-commerce) is a distinct subset of e-commerce conducted via social media platforms. It integrates digital marketing strategies, technological infrastructure, and user-generated content to enhance consumer engagement and drive commercial activity (Turban et al., 2016).

5.8.Marketing Mix 7P

Chaffey and Smith (2017) describe the marketing mix as a strategic framework that aids in formulating marketing plans and optimizing resource allocation. Kotler et al. (2018) further

define it as a set of tactical tools used by firms to generate desired responses from target markets. To enhance its applicability, particularly in service-based industries, Chaffey and Chadwick (2016) emphasize the evolution of the traditional 4P model product, price, place, and promotion into the 7P model by incorporating people, process, and physical evidence, thereby offering a more holistic approach to marketing strategy.

5.9. Online Purchase Decision

Zhao and Tarndamrong (2023) define online purchase decision as a sequence of consumer behaviors involving information search and evaluation of alternatives when selecting products or services via e-commerce platforms. This process includes comparing product attributes across brands before making a final choice (Muslimah et al., 2020). Harahap et al. (2024) further describe purchasing decisions as a problem-solving activity, where consumers assess available options, form brand preferences, and develop purchase intentions prior to committing to a transaction.

5.10. Framework and Hypothesis Development

Based on the theoretical framework, prior research, and formulated hypotheses concerning the marketing mix (7Ps) and online purchase decisions, this section outlines the research framework adopted in this study.

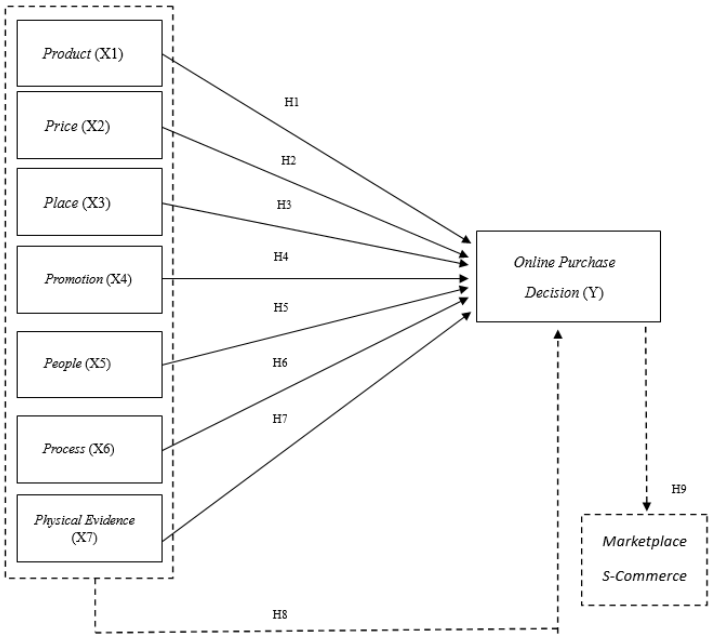

Figure 1. Research Framework

The hypothesis development in this study is based on prior empirical findings that examine the influence of the 7P components of the marketing mix on online purchase decisions within both marketplace and social commerce (s-commerce) platforms.

First, product quality is consistently found to have a positive and significant impact on purchase decisions (Khotimah & Jalari, 2021; Nabila et al., 2022; Widyowati & Slamet, 2021), leading to the formulation of H1. Price also demonstrates a significant positive effect (Dewi et al., 2023; Pelengkahu et al., 2023; Anto et al., 2022), supporting H2. The place variable, which refers to distribution and accessibility, is shown to influence consumer decisions positively (Wardani & Manalu, 2021; Indraswari & Prabantoro, 2025; Sari & Kusdiyanto, 2024), forming H3. Promotion strategies, including digital campaigns and loyalty programs, are found to significantly affect purchase behavior (Indraswari & Prabantoro, 2025; Siahaan & Christiani,

2021; Khotimah & Jalari, 2021; Harahap et al., 2024; Ramadhan & Jumhur, 2018), supporting H4.

The people element, referring to service personnel and influencers, also shows a significant impact (Muliyana & Suyanto, 2019; Verina et al., 2024; Zhao & Tarndamrong, 2023), leading to H5. Process, which includes service delivery and transaction flow, is positively associated with purchase decisions (Khotimah & Jalari, 2021; Hamidah & Suhardiyah, 2020; Yudho & Agustin, 2022), forming H6. Physical evidence, such as website design and product presentation, also contributes positively (Pelengkahu et al., 2023; Hamidah & Suhardiyah, 2020; Khotimah & Jalari, 2021), supporting H7.

The overall marketing mix (7P) is found to have a simultaneous and significant effect on purchase decisions (Nabila et al., 2022; Khotimah & Jalari, 2021; Kusumawati et al., 2021), leading to H8. Lastly, H9 is proposed based on studies showing that millennials exhibit different purchasing behaviors on marketplaces versus s-commerce platforms, influenced by factors such as service quality, price, promotion, and content marketing (Aryanto et al., 2023; Putri & Handayani, 2021; Ferdianto et al., 2023).

H1: Product has a positive effect on online purchase decisions in marketplace and s-commerce

H2: Price has a positive effect on online purchase decisions in marketplace and s-commerce

H3: Place has a positive effect on online purchase decisions in marketplace and s-commerce

H4: Promotion has a positive effect on online purchase decisions in marketplace and s-commerce

H5: People has a positive effect on online purchase decisions in marketplace and s-commerce

H6: Process has a positive effect on online purchase decisions in marketplace and s-commerce

H7: Physical evidence has a positive effect on online purchase decisions in marketplace and s-commerce

H8: The 7P marketing mix has a significant effect on online purchase decisions in marketplace and s-commerce platforms.

H9: There is a difference in online purchase decisions between marketplace and s-commerce platforms among millennial consumers.

8. Methodology

This study employs a quantitative methodology to examine the impact of the 7P marketing mix on online purchase decisions among Indonesian millennials, defined as individuals born between 1981 and 1996 (sensus.bps.go.id, 2020), targeting those with prior experience purchasing via marketplace or social commerce platforms (Sugiyono, 2019; Hartono, 2017). The independent variables include product, price, place, promotion, people, process, and physical evidence, while the dependent variable is online purchase decision. Each variable is operationalized using indicators adapted from Charastrakool (2020) and Pogolerova (in Ghiffarin et al., 2019). Data were collected via a structured online questionnaire using a five-point Likert scale (Sugiyono, 2022).

Data analysis was conducted using SPSS version 25, including descriptive statistics, validity and reliability testing (Ghozali, 2021), and classical assumption tests. Regression analysis and hypothesis testing were used to assess the relationships between variables. Classical assumption tests included normality (using the One-Sample Kolmogorov-Smirnov Test), linearity, heteroscedasticity (Park test), and multicollinearity (using tolerance and VIF values). Multiple linear regression analysis was employed to examine the influence of the independent variables on the dependent variable. The regression model is expressed as:

$$Y = \alpha + \beta_1X_1 + \beta_2X_2 + \beta_3X_3 + \beta_4X_4 + \beta_5X_5 + \beta_6X_6 + \beta_7X_7 + e$$

where Y is the online purchase decision, α is the constant, β_1–β_7 are regression coefficients, and X_1–X_7 represent the seven independent variables.

Hypothesis testing included partial t-tests and simultaneous F-tests. Additionally, an independent sample t-test was conducted to compare online purchase decisions between marketplace and s-commerce platforms. The coefficient of determination (R^2) was used to assess the explanatory power of the model.

9. Results and discussions

9.1.Descriptive statistics

Data collection was conducted via a structured online questionnaire distributed through Google Forms and gathering 243 respondents. The demographic profile of respondents reveals that the majority were female (75.7%), aged between 28 and 31 years (50.6%), employed in the private sector (36.2%), and earning a monthly income of up to Rp 5,000,000 (56.4%). Most participants resided on the island of Java (82.3%), reported a low frequency of online shopping (44%), and predominantly favored marketplace platforms for their online purchases (93.8%).

Table 1 Descriptive Statistics

No	Respondents	Characteristis	Total	Percentage
1.	Gender	Male	59	24,3%
		Female	184	75,7%
2.	Age	> 28 tahun – ≤31 tahun	123	50,6%
		> 31 tahun – ≤ 34 tahun	51	21,0%
		> 34 tahun – ≤ 37 tahun	29	11,9%
		> 37 tahun – ≤ 40 tahun	17	7,0%
		> 40 tahun – ≤ 43 tahun	14	5,8%
		> 43 tahun	9	3,7%
3.	Employment Status	Student	11	4,5%
		Employee	88	36,2%
		Entrepreneur	68	28,0%
		Teacher	13	5,3%
		Civil Servant	6	2,5%
		Unemployed	51	21,0%
		Freelancer	2	0,8%
		Driver	2	0,8%
		Ride-hailing motorbike service	2	0,8%
4.	Monthly income	≤ Rp 5.000.000	137	56,4
		> Rp. 5.000.000 - ≤ Rp. 10.000.000	91	37,4
		> Rp. 10.000.000 - ≤ Rp. 30.000.000	12	4,9
		> Rp 30.000.000 - ≤ Rp 50.000.000	1	0,4
		>Rp.50.000.000 - ≤ Rp 100.000.000	0	0
		>Rp.100.000.000	2	0,8
5.	Island of Residence	Sumatra	14	5,8
		Kalimantan	4	1,6
		Java	200	82,3
		Sulawesi	2	0,8
		Papua	1	0,4
		Bali	1	0,4
		Maluku	0	0

No	Respondents	Characteristis	Total	Percentage
		West Nusa Tenggara	6	2,5
		East Nusa Tenggara	0	0
		Others	15	6,2
6.	Online Shopping Frequency	Very Often	35	14,4
		Often	101	41,6
		Rarely	107	44,0
		Never	0	0
7.	Favourite Platform	Marketplace	228	93,8
		S-commerce	15	6,2

9.2. Classic Assumption Test

The classical assumption tests conducted in this study affirm the statistical adequacy of the regression model used to analyze the influence of the 7P marketing mix on online purchase decisions. The normality test, performed using the Kolmogorov-Smirnov method, yielded a Monte-Carlo significance value of 0.154, which exceeds the 0.05 threshold. This result in Table 2 indicates that the residuals are normally distributed, satisfying the assumption of normality (Ghozali, 2021).

Table 2 Normality Test

One-Sample Kolmogorov-Smirnov Test	
	Unstandardized Residual
N	243
Monte-carlo sig (2-tailed)	0,154

Source: Data Processing

Linearity was assessed through deviation-from-linearity analysis. All independent variables product, price, place, promotion, people, process, and physical evidence produced significance values greater than 0.05 and F-values below the critical threshold of 2.047 as shown in Table 3. These findings confirm that the relationships between the independent variables and the dependent variable (online purchase decision) are linear (Ghozali, 2021).

Table 3 Linearity Test

Variabel	Deviation from linearity	
	F	Sig
Product	0,723	0,607
Price	0,502	0,734
Place	0,377	0,893
Promotion	0,457	0,808
People	1,721	0,117
Process	0,402	0,878
Physical Evidence	0,284	0,922

Source: Data Processing

Heteroskedasticity was tested using the Park test. The significance value of 0.154 indicates homoskedasticity, meaning the variance of residuals is consistent across observations. Thus, the model does not exhibit heteroskedasticity based on Table 4.

Table 4 Heteroscedasticity Test

Coeffcients[a]					
Model		Unstandardized Coeffcients	Standardized Coeffcients		

		B	Std. Error	Beta	t	Sig
1	(Constant)	1,771	0,871		2,034	0,044
	TotalX	-0,013	0,009	-0,121	-1,433	0,154

Source: Data Processing

Multicollinearity was evaluated using tolerance and Variance Inflation Factor (VIF) values. All tolerance values exceeded 0.1 and all VIF values were below 10, indicating no multicollinearity among the independent variables. These results confirm the model's robustness and suitability for regression analysis.

Table 5 Multicolinearity Test

1	Model	Unstandardized Coeffcients		Standardized Coeffcients	Collinearity Diagnostic	
		B	Std. Error	Beta	Tollerance	VIF
	(Constant)	4,264	3,078			
	Product	1,479	0,315	0,258	0,341	2,931

9.3.Multiple Regression Analysis and Hypothesis Testing

The multiple linear regression analysis reveals that all seven components of the 7P marketing mix product, price, place, promotion, people, process, and physical evidence positively influence online purchase decisions. Product, process, and physical evidence show the strongest effects, indicating that product quality, transaction efficiency, and digital presentation significantly drive consumer behavior. Each coefficient reflects the extent to which improvements in these strategies enhance purchasing decisions. The error term accounts for other unmeasured factors influencing consumer choices.

Based on the results presented in Table 6, the following multiple linear regression equation can be derived:

$Y= \alpha + \beta_1X_1 + \beta_2X_2 + \beta_3X_3 + \beta_4X_4 + \beta_5X_5 + \beta_6X_6 + \beta_7X_7 + e$

OPD (Y)= 4,264 + 1,479 X1 + 0,295 X2+ 0,075 X3 + 0,638 X4+ 0,460 X5+ 1,050 X6+ 1,269 X7+ e

Table 6 Result of Multiple Linear Regression Test

Coefficient[a]						
Model		Unstandardized Coeffcients		Standardized Coeffcients	t	Sig
		B	Std. Error	Beta		
1	(Constant)	4,264	3,078		1,385	0,167
	Product	1,479	0,315	0,258	4,691	0,000
	Price	0,295	0,349	0,045	0,846	0,398
	Place	0,075	0,296	0,014	0,252	0,801
	Promoton	0,638	0,251	0,128	2,543	0,012
	People	0,460	0,209	0,109	2,194	0,029
	Process	1,050	0,223	0,237	4,710	0,000
	Physical Evidence	1,269	0,283	0,238	4,744	0,000
a. Dependent Variable: Online purchase decision						

Source: Data Processing

Referring to Table 6, the variables product, promotion, people, process, and physical evidence exhibit t-calculated values exceeding the critical t-table value of 1.970, indicating a statistically significant and positive influence on online purchase decisions. Conversely, the variables price and place yield t-calculated values below the threshold, suggesting their effects are not statistically significant. Accordingly, hypotheses H1, H4, H5, H6, and H7 are supported, while H2 and H3 are not substantiated.

Table 7 Simultaneous Significance Test (F Test)

Anova[a]						
Model		Sum pof Squares	df	Mean Square	F	Sig
1	Regression	11958,731	7	1708,390	105,007	0,000
	Residual	3823,269	235	16,269		
	Total	15782,000	242			
a. Dependent Variable:Online purchase decision						
b. Predictors: (Constant), physical evidence, people, price, process, promotion, price, product						

Source: Data Processing

According to the data presented in Table 7, the results of the F-test indicate that the computed F-value (105.007) exceeds the critical F-value from the table (2.047), while the associated significance level (0.000) is below the threshold of 0.05. These findings suggest that the variables product, price, place, promotion, people, process, and physical evidence collectively exert a statistically significant and positive influence on online purchase decisions. Consequently, hypothesis H8 is supported.

Table 8 Group Descriptive Statistics

	Platforms Category	N	Mean	Std. Deviation	Std. Error Mean
Online Purchase Decision	Marketplace	228	75,5877	8,13196	0,53855
	S-commerce	15	75,0667	7,40142	1,91104

Source: Data Processing

As shown in Table 8, a total of 228 millennial respondents reported making online purchase decisions via marketplace platforms, whereas only 15 did so through social commerce platforms. The results of the independent sample t-test are detailed in Table 9.

Table 9 Independent sample t-test Result

		Levene's Test for Equality of Variances		t-test for Equality of Means		
		F	Sig	t	df	Sig (2-tailed)
Online Purchase Decision	Equal variances assumed	0,144	0,705	0,242	0,241	0,809
	Equal Variances not assumed			0,262	16,306	0,796

Source: Data Processing

Table 9 presents the results of Levene's Test, which yielded an F-value of 0.144 and a p-value of 0.075, indicating that the assumption of homogeneity of variances is met. Furthermore, the Sig. (2-tailed) value of 0.809 suggests that there is no statistically significant difference in online purchase decisions between millennial users of marketplace platforms and those of social commerce platforms.

9.4.Coefficient of Determination

Table 10 Coefficient of Determination

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0,870	0,758	0,751	4,03351
a. Predictors: (Constant), Physical evidence, people, price, process, promotion, place, product				

Source: Data Processing

As indicated in Table 10, the Adjusted R Square value of 0.751 demonstrates that the variables product, price, place, promotion, people, process, and physical evidence account for 75.1% of the variance in online purchase decisions. The remaining 24.9% is attributable to other factors not included in the scope of this research model.

9.5. Discussion

This study investigates the influence of the marketing mix on online purchase decisions among Indonesian millennials. The research involved 243 respondents and employed purposive sampling through online questionnaires.

The findings indicate that product attributes significantly shape millennials' online purchasing behavior. Ease of accessing product information, discovering new or trending items, and the availability of after-sales services contribute to increased consumer confidence and purchasing intent. Lesmana (2024) highlights that millennials value platforms that allow them to explore trends and express personal identity. Nartea et al. (2019) emphasize the role of online reviews and feedback in guiding trustworthy product and store selection. Ferraz et al. (2023) and Kotler & Keller (2016) underscore the importance of after-sales service in enhancing consumer satisfaction and loyalty.

In contrast, price does not appear to be a decisive factor. Kotler & Keller (2016) suggest the existence of a "price indifference band," where price changes do not significantly affect demand. Supporting this, Putri et al. (2023) and Mulyana (2021) argue that consumers often prioritize product quality over low prices, especially when cheaper options compromise quality. Patel (2024) adds that millennials are more motivated by variety, style, and product trends than by price alone.

Similarly, place or distribution channels do not significantly influence purchase decisions. Millennials tend to trust the reliability of online logistics systems and are less concerned with the seller's location. Ramadhanis (2024), Muliyana & Suyanto (2019), and Pratama (2019) affirm that efficient delivery systems reduce the relevance of distribution-related concerns in online shopping.

Promotion plays a meaningful role in encouraging purchases. Discounts, effective promotional strategies, and frequent engagement with platforms increase millennials' likelihood to buy. Indraswari & Prabantoro (2025) note that strategic and innovative promotional approaches can substantially influence consumer decisions. Siahaan & Christiani (2021) emphasize the impact of visually appealing and well-targeted promotions. These findings align with studies by Khotimah & Jalari (2021), Wardani & Manalu (2021), and Putri et al. (2023).

The people aspect particularly seller responsiveness and communication also affects purchasing behavior. Quick responses, clear communication, and seller understanding of customer needs enhance service quality and consumer satisfaction. Chaffey & Chadwick (2016) highlight that prompt service improves customer experience. This is supported by Muliyana & Suyanto (2019), Verina et al. (2024), and Zhao & Tarndamrong (2023), who found that consumers consider seller reliability when making purchase decisions.

Process factors, such as simple transactions, easy claims, and accessible customer support, are highly valued. Fatihudin & Firmansyah (2019) argue that service delivery systems are integral to customer experience. These findings are consistent with research by Khotimah & Jalari (2021), Hamidah & Suhardiyah (2020), and Yudho & Agustin (2022).

Physical evidence, including website design, mobile app usability, and social interaction features, also influences consumer behavior. Visual and functional elements shape trust and engagement. Khotimah & Jalari (2021), Hamidah & Suhardiyah (2020), and Pelengkahu et al. (2023) affirm that physical cues contribute to consumer perceptions and decisions.

Collectively, all seven marketing mix elements product, price, place, promotion, people, process, and physical evidence demonstrate a positive influence on online purchase decisions. This supports the principles of flexibility, personalization, and virtual presence in digital marketing (Pogorelova et al., 2016; Kusumawati et al., 2021; Ramadhanis, 2024).

Finally, the study finds no significant difference in purchasing behavior between marketplace and social commerce platforms among millennials. Dharmesti et al. (2021) explain that millennials' digital lifestyles and familiarity with online shopping procedures shape consistent behavior across platforms. Salim et al. (2019) and Lesmana (2024) further note that millennials seek not only convenience but also emotionally satisfying and personalized shopping experiences.

10. Conclusion, Limitations, and Suggestions

The study concludes that product, promotion, people, process, and physical evidence significantly influence online purchase decisions among millennials on both marketplace and social commerce platforms. However, price and place do not show a significant impact. Additionally, there is no notable difference in purchasing behavior between the two platform types, indicating that millennials prioritize marketing strategy over platform choice.

This research is limited by its sample size and focus solely on the millennial generation. It also excludes other potentially influential variables such as trust, perceived risk, and prior online shopping experience, which may affect consumer behavior.

Future studies should consider expanding the sample size and including broader demographic groups to enhance generalizability. Incorporating additional variables like trust, security, and digital experience could provide deeper insights into online consumer behavior across different generations and platforms.

Abstrak

Penelitian ini bertujuan untuk menganalisis hubungan antara kualitas pelayanan elektronik terhadap kepuasan pelanggan pada pengguna aplikasi PLN *Mobile* di UP3 Bogor. Dimensi kualitas pelayanan elektronik yang diteliti meliputi efisiensi, pemenuhan, ketersediaan sistem, dan privasi. Sementara itu, dimensi kepuasan pelanggan terdiri dari kesesuaian harapan, minat menggunakan kembali, dan kesediaan merekomendasikan.Metode penelitian menggunakan pendekatan kuantitatif deskriptif, dengan teknik pengumpulan data melalui kuesioner kepada 100 responden. Teknik analisis data yang digunakan adalah *Customer Satisfaction Index* (CSI) dan *Importance Performance Analysis* (IPA). Hasil penelitian menunjukkan bahwa kualitas pelayanan elektronik berada pada kategori baik (76,90%) dan tingkat kepuasan pelanggan juga berada pada kategori puas dengan nilai CSI sebesar 77,95%. Dimensi efisiensi memiliki nilai tertinggi dalam kualitas pelayanan elektronik, sementara kesesuaian harapan menempati nilai tertinggi pada dimensi kepuasan pelanggan. Analisis IPA mengidentifikasi beberapa indikator layanan yang penting namun kinerjanya masih perlu ditingkatkan.

Kata Kunci**:** Kualitas Pelayanan Elektronik, Kepuasan Pelanggan, PLN *Mobile*

Abstract

This study aims to analyze the relationship between electronic service quality and customer satisfaction of PLN Mobile application users at UP3 Bogor. The dimensions of electronic service quality investigated include efficiency, availability, system availability, and privacy. Meanwhile, the dimensions of customer satisfaction consist of similarity of expectations, intention to reuse, and willingness to recommend. The research method uses a quantitative descriptive approach, with data collection techniques through questionnaires to 100 respondents. The data analysis techniques used are Customer Satisfaction Index (CSI) and Importance Performance Analysis (IPA). The results of the study indicate that the quality of electronic service is in the good category (76.90%) and the level of customer satisfaction is also in the satisfied category with a CSI value of 77.95%. The efficiency dimension has the highest value in electronic service quality, while consistency of expectations meets the highest value in the customer satisfaction dimension. IPA analysis identifies several important service indicators but their performance still needs to be improved.

Keywords: Electronic Service Quality, Customer Satisfaction, PLN Mobile

1. Introduction

The development of digital technology has encouraged companies to provide application-based services to improve efficiency and service quality. PT PLN (Persero) developed the PLN Mobile application as a digital tool in meeting customer needs, especially in electricity services. PLN continues to build foundations and carry out digitalization (Anshar & Ros Bangun, 2023). One of PLN's efforts in responding to this challenge is by developing the PLN Mobile application. The PLN Mobile application was officially launched by the PLN Board of Directors on October 31, 2016, coinciding with the commemoration of National Electricity Day.

E-service quality includes various dimensions that affect the user's experience in interacting with digital services. According to Wilson et al. (2020) electronic service quality is defined as the extent to which a website facilitates efficient and effective shopping, purchasing, delivery. The dimensions of electronic service quality are Efficiency, Fulfillment, System availability, Privacy. The things that customers need include convenience, and a satisfying experience in electronic media that matches expectations so that customers can feel new experiences and feel satisfied.

Based on a comparison of various views of experts, this becomes customer needs, convenience, and a satisfying experience in electronic media, such as the internet. According to Kotler & Keller (2021) customer satisfaction is a feeling of happiness or disappointment that arises when a product or service meets or does not meet expectations. Dissatisfaction occurs when performance does not match expectations, while satisfaction occurs when performance matches expectations. Purchase evaluation is carried out by consumers to assess the level of tension experienced when buying goods or services.

PLN Mobile as a digital-based electricity service application, is PLN's solution in providing services that are more efficient and easily accessible to the public. This application offers various features that allow customers to access services such as electricity bill payments, reporting disturbances, purchasing tokens, and other information services through only one application.

The research location chosen was PLN UP3 Bogor, with the consideration that this region includes a large number of active customers who use the PLN Mobile application. The region also has diverse geographic and demographic characteristics, such as residential areas, offices, and public facilities that make PLN Mobile an important and needed service tool for the community. Therefore, it is important to know the extent to which the quality of electronic services provided through the application is able to provide satisfaction to customers.

According to Wilson et al. (2020), electronic service quality includes dimensions of efficiency, fulfillment, system availability, and privacy. Meanwhile, Indrasari (2019) states that indicators of customer satisfaction include conformity to expectations, interest in reuse, and willingness to recommend.

This research discusses the quality of electronic services and the level of customer satisfaction of PLN Mobile application users in the UP3 Bogor area as a whole, in order to provide a clear picture of the strengths and weaknesses of digital services provided by PLN. This research aims to evaluate how the quality of electronic services contributes to customer satisfaction using the PLN Mobile application in the UP3 Bogor area.

2. Methodology

2.1. Research Time and Location

This research was conducted from February to May 2025. The research location was carried out in the work area of PT PLN (Persero) Managing Unit Customer Service (UP3) Bogor,

which includes various Customer Service Units (ULPs) such as Bogor City, West Bogor, Leuwiliang, and others. The selection of this location is based on the high use of the PLN Mobile application in the region and the ease of reaching customers who are research respondents.

2.2.Data Collection Methods

The data sources in this study come from primary and secondary data. Primary data was obtained directly from the results of distributing questionnaires to active users of the PLN Mobile application. Meanwhile, secondary data was obtained from PLN internal reports, journals, and other relevant literature. The methods used in this study include: a. Questionnaire Primary data collection was carried out through distributing questionnaires to 100 respondents. This questionnaire was designed to measure customer perceptions of electronic service quality and their level of satisfaction in using the PLN Mobile application. The questionnaire is divided into two parts, namely questions related to service quality dimensions (efficiency, fulfillment, system availability, and privacy) and questions related to customer satisfaction (expectations, reuse, and recommendations). b. Documentation and Literature Study c. Researchers also document relevant secondary data such as statistics on the use of the PLN Mobile application, internal company reports, and references from journals and books that support the theory in this study. Data collection was carried out through a questionnaire with a Likert scale of 1-5.

2.3.Sampling Technique

This research uses purposive sampling technique, which is a sampling technique carried out with certain considerations in accordance with the research objectives.

Respondents in this study are active customers of the PLN Mobile application in the UP3 Bogor area who have used the application at least twice. Other criteria are respondents aged at least 17 years and over and willing to fill out the questionnaire completely.

The number of respondents sampled in this study was 100 people. Determination of this number refers to the number of research indicators consisting of 4 indicators for electronic service quality variables and 3 indicators for customer satisfaction variables. Based on Sugiyono (2017), in quantitative research, determining the number of samples can be done using the Slovin formula if the population is known, taking into account the error tolerance of 10% (0.1), in accordance with the general standards used in social research to obtain results that are representative enough but still efficient in terms of sample size. Here is the Slovin formula, namely:

$$n = \frac{N}{1 + N(e)^2}$$

Description:
n : Number of Samples.
N : Total Population
e^2 : Limits error tolerance, errors that can be tolerated within a certain level of confidence.

$$n = \frac{314782}{1+(314782)(0,1)^2}$$

$$n = \frac{31478200}{314782} = 100$$

However, due to time constraints and research effectiveness the sample size was adjusted

to 100 respondents.

2.4.Data Analysis Methods

1. Validity TestThevalidity

Test is carried out to measure the extent to which each item in the questionnaireable to measure the variable in question. This test is carried out by calculating the correlation value between the score of each item and the total score. In this study, all statement items from each variable were declared valid because the calculated r value was greater than the r table (r count> 0.197 for n = 100 at the 5% significance level). Thus, all items in the questionnaire are suitable for further analysis.

2. Reliability Test

The reliability test aims to measure the consistency of the research instrument. This study uses Cronbach's Alpha coefficient to test reliability. The test results show that all instruments are declared reliable if the Cronbach's Alpha value is> 0.6. The following is the formula used to test reliability:

$$\mathrm{r11} = \left[\frac{k}{(k-1)}\right]\left[1 - \frac{\Sigma\sigma^2 b}{\sigma^2 t}\right]$$

ri: Reliability value

k : Number of items

$\sum S\ i\ 2$: Total variance of each score

sx 2: Total variance has an Alpha Cronbach value> 0.6, which means that all instruments in this study are reliable.

3. Customer Satisfaction Index (CSI)

CSI is used to determine the overall level of customer satisfaction. The CSI method is used to determine the level of customer satisfaction by paying attention to the importance of service and product attributes. CSI is a form of quantitative analysis in the form of a percentage of satisfied users in a user satisfaction analysis survey (Setiawan et al., 2022). In the CSI analysis, the Weighting Factor (WF), Weight Score (WS), Weight Total (WT), and Satisfaction Index values are calculated (Sihotang & Oktarina, 2022), as follows: Calculating the Weighting Factor (WF), which is to convert the average value of importance into a percentage figure of the total average level of importance of all tested attributes, so that a total WF of 100% is obtained.

1. Calculating Weight Score (WS), which assesses the multiplication between the average value of the satisfaction level of each attribute with the WF of each attribute.
2. Calculating Weight Total (WT), which is the sum of the WS of all attributes.
3. Calculating the Satisfaction Index (ST), namely WT divided by the maximum scale used, then multiplied by 100%. The overall level of respondent satisfaction can be seen from the satisfaction level criteria.

2.5.Importance Performance Analysis (IPA)

Penggunaan metode pengolahan IPA *(Importance and Performance Analisis*) used to determine an effective strategy in measuring satisfaction based on the level of importance of an attribute and performance.

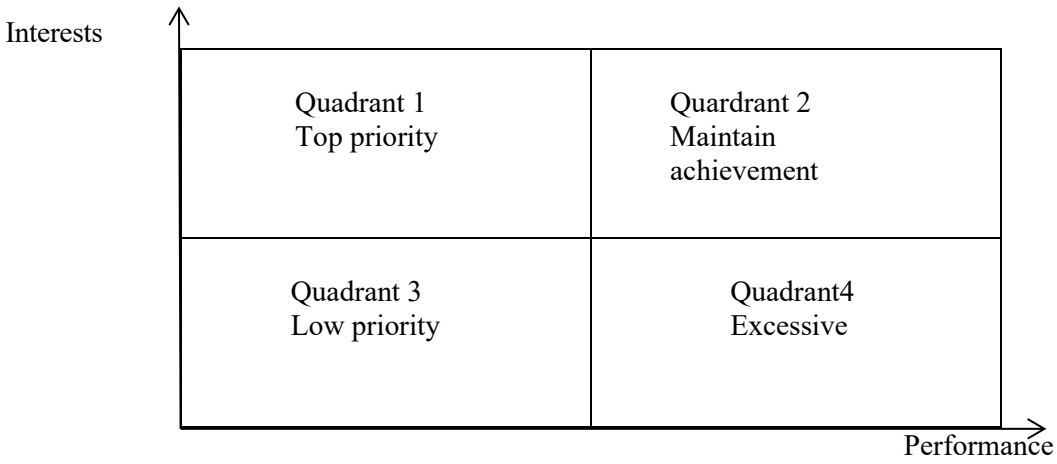
The following is the formula used: Description:

$$\overline{Y} = \frac{\sum_{i=1}^{n} Y_i}{n} \quad \overline{X} = \frac{\sum_{i=1}^{n} X_i}{n}$$

X = average score of performance level

Y = average score of importance level n = Total consumer data

This analysis uses a cartecius diagram which is divided into 4 parts and bounded by two lines. The following is a division of the diagram based on the level of importance:



picture Bagan Diagram Kartesius

1. Quadrant I (Top Priority)

This quadrant contains attributes that are considered important by consumers but in reality these attributes are not in accordance with customer expectations. The performance level of the attribute is lower than the level of customer expectations. The attributes contained in this quadrant must be further improved in order to satisfy customers.

2. Quadrant II (Maintain Achievement) statements in this quadrant have a high level of expectation and performance. This shows that these attributes are important and have high performance. Attributes in this quadrant must be maintained in the future because they are considered important and the results are very satisfying.

3. Quadrant III (Low Priority)

Attributes in this quadrant are considered less important by customers but in fact their performance is not too special / ordinary. Attributes in this quadrant have a low level of expectation and performance is also considered poor.by customers. Improvements in this quadrant need to be reconsidered by looking at their small effect on customers.

4. Quadrant IV (Excessive)

According to customers, this quadrant has a low level of expectation but has good performance, so it is considered excessive by customers. This shows that the attributes / statements that affect customer satisfaction are considered excessive in their implementation.

4. Results and Discussion

4.1.Respondent Characteristics

Table 1 Profile of respondents based on gender and age

Gender	Frequency	Persentase (%)	Age	Frequency	Persentase (%)
Male	39	39	17	5	5
Female	61	61	17 -25	29	29
Total	100	100	26- 35	45	45
			36- 45	17	17
			> 45	4	4
			Total	100	100

4.2. Validity Test Analysis

Table 3 Electronic Service Quality Validity Test Results

	Electonoic service quality			
No	Question	R hitung	R tabel	conclusion
	Efisiensi *(Efficiency)*			
1.	The features in the PLN Mobile application are clearly organized and easy to access.	0,861	0,463	Valid
2.	The transaction process (electricity token purchase/bill payment) through the app is fast and efficient.	0,888	0,463	Valid
3.	The PLN Mobile application has a fast response time when accessed.	0,871	0,463	Valid
	Pemenuhan *(Fulfillment)*			
1.	PLN mobile application has complete features	0,866	0,463	Valid
2.	PLN mobile application always provides information that	0,916	0,463	Valid

	accuracy regarding electricity bills and transactions.			
3.	Purchasing electricity tokens through the PLN Mobile application is always successful without any problems.	0,723	0,463	Valid
	Ketersediaan sistem *(System availability)*			
1.	The PLN mobile application can be accessed at any time without technical problems.	0,910	0,463	Valid
2.	PLN mobile applications rarely experience interruptions or down systems.	0,894	0,463	Valid
3.	The features in the PLN mobile app always work well.	0,865	0,463	Valid
	Privasi *(Privacy*)			
1.	PLN mobile application protects customers' personal and transaction information.	0,878	0,463	Valid
2.	PLN mobile applications have strong security systems to protect user data.	0,855	0,463	Valid
3.	Feel comfortable using PLN mobile because of security features such as OTP or password verification.	0,896	0,463	Valid

Source: Primary data processed by researchers, 2025

The results of the validity test of 12 statement items on the electronic service quality variable show that all items are declared valid, because the rcount value is more than the rcountvalue. is greater than rtable (0.463). Thus, the research can proceed ti the next stage.

Table 4 Customer Satisfaction Validity Test Results

	customer decisions			
No	Question	R hitung	R tabel	Conclusion
1.	The quality features provided are in line with expectations.	0,911	0,463	Valid
2.	The PLN mobile application provides solutions in overcoming electricity problems.	0,887	0,463	Valid
3.	Experience using PLN Mobile application in accordance with expectations	0,937	0,463	Valid
4.	Services provided meet expectations	0,866	0,463	Valid
1.	Interest in reusing because of the service satisfactory.	0,932	0,463	Valid

2.	Interest in reusing because account security is guaranteed.	0,734	0,463	Valid
3.	I prefer PLN mobile over other services.	0,889	0,463	Valid
4.	I recommed this app because i will continue to use it.	0,723	0,463	Valid
Kesediaan Merekomendasikan				
1.	Willing to recommend because the service is satisfactory.	0,924	0,463	Valid
2.	Willing to recommend because of the quality features provided.	0,887	0,463	Valid
3.	The PLN mobile app is useful and therefore worth recommending.	0,869	0,463	Valid
4.	Willing to suggest because account security is maintained	0,916	0,463	Valid

Source: Primary data processed by researchers 2025

Based on the results of the validity test calculation on nine statements on the customer satisfaction variable, all items are valid.

4.3.Reliability Test Analysis

declared valid because the rcount value exceeds the rtable of 0.463. Therefore, the research can be continued to the next stage.

Table 5 Reability Test

Variabel	***Cronbach's Alpha***	***N of Items***
Electronic Service Quality	0,938	*Reliabel*
Customer Satisfaction	0,940	*Reliabel*

4.4. Descriptive Analysis Test

Table 6 Research Results of Descriptive Analysis of Electronic Service Quality

Dimensi	**Rata-Rata Perindikator (%)**
Efficiency	82.00
Fulfillment	78.20
System Availability	73.00
Privacy	74.30
Rata-rata Total	**76.90**

Source: Primary data processed by researchers, 2025

With an overall average value of 76.90%, user perceptions of the quality of PLN Mobile electronic services are at category is quite satisfied to satisfied, according to the rating scale from Tjiptono & Chandra (2019) which states that the range of 70-85%.

However, the aspects of system stability and service speed are two areas that can be the focus of improvement for categorized as good service improve the overall quality of the app.

Table 7 Research Results Descriptive Analysis of Customer Satisfaction

Dimensi	**Rata-Rata Perindikator (%)**
Kesesuaian Harapan	81.20%
Minat Menggunakan Kembali	74,87%
Kesediaan Merekomendasikan	77,93%
Rata-rata CSI	**78,00**

Source: Primary data processed by researchers, 2025

With an average value of 78.00%, with the highest indicator in the "Expectation Match" dimension of 81.20%. These results are in line with the study by Hidayat et al. (2021), which shows that perceived expectations of the PLN mobile application affect consumers' decisions to recommend the application to others.

4.5.Customer Satisfaction Index (CSI)

Table 8 CSI Calculation Result Data

P	**MISS**	**H**	**MSS**	**Peryataan**	**WF**	**WS**
P1	4,21	H1	4,26	1	9,16	39,04
P2	3,74	H2	3,97	2	8,14	32,32

P4	3,92	H4	3,92	4	8,53	33,45
P5	3,87	H5	3,97	5	8,42	33,44
P6	3,74	H6	3,64	6	8,14	29,63
P7	3,74	H7	3,69	7	8,14	30,04
P8	3,71	H8	3,87	8	8,08	31,25
P9	3,65	H9	3,88	9	7,95	30,83
P10	3,83	H10	3,88	10	8,34	32,35
P11	3,9	H11	3,93	11	8,49	33,36
P12	3,84	H12	3,74	12	8,36	31,26
Jumlah	45,94	**Jumlah**	46,72	**WT**		389,77
				CSI	77,95	

Source: Primary data processed by researchers, 2025

shows the Customer Satisfaction Index (CSI) rating scale based on Widodo & Sutopo (2018) which is used to interpret the level of customer satisfaction based on the percentage value. Based on the table, the CSI value is 77.95% is in the range of 66% - 80.99%, so it is included in the "Satisfied" category. This means that customers of the PLN Mobile UP3 Bogor application are satisfied with electronic services". This value reflects that most of the features and services in the application have been able to satisfy customers. meet user expectations, such as ease of access, data security, and transaction efficiency.

However, despite being in the satisfied category, there are still several aspects that need to be improved so that customer satisfaction can rise to the "Very Satisfied" category, especially in indicators that are included in the priority of improvement in the IPA analysis results.

Thus, the results of the CSI table provide an overview that PLN Mobile electronic services have been running quite well, but still need to focus on improving quality in priority indicators in order to increase overall and sustainable customer satisfaction.

4.6.Importance Performance Analysis (IPA)

Table 9 Calculation of Importance Performance Analysis

Indicator	Performance Level (X)	Level of Importance (Y)
1	4,2	4,3
2	3,7	4,0
3	3,8	4,0
4	3,9	3,9
5	3,9	4,0
6	3,7	3,6
7	3,7	3,7
8	3,7	3,7
9	3,7	3,9
10	3,8	3,9
11	3,9	3,9
12	3,8	3,9
Total	45,9	46,7
Rata - rata	3,8	3,9

Source: Primary data processed by researchers, 2025

Next is the calculation using IPA, here is the formula used:

IPA = $\frac{Xi}{_}x$ 100% IPA = $\frac{Xi}{_}x$ 100% =

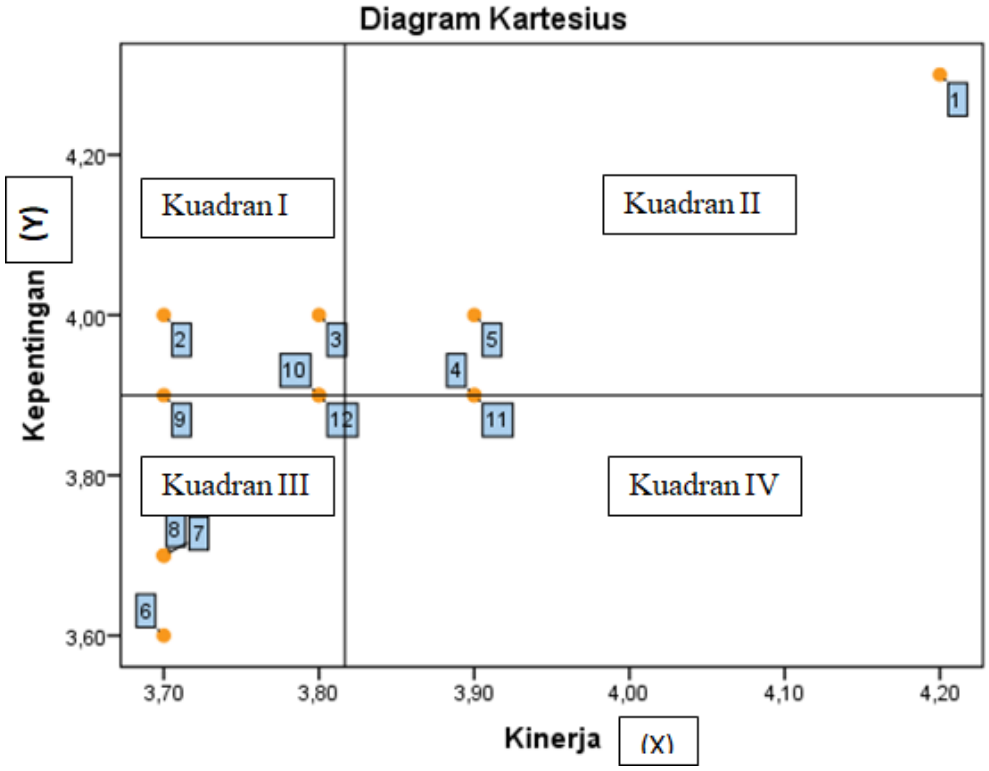
After calculating the value of the level of importance and performance of each indicator using the Importance Performance Analysis (IPA) method, the next step *Importance Performance Analysis* (IPA), is to map the results into the Importance Performance Analysis (IPA) method.

$Yi \quad x$

IPA = $\frac{45,9}{46,7}x$ 100% $\frac{45,9}{12}x$ 100% = 3,82`

IPA = 98,33% IPA = $\frac{Yi}{y}x$ 100% =

$\frac{45,9}{12}x$ 100% = 3,89



Quadrant I - Top Priority

Quadrant I is the most crucial area in IPA analysis. Indicators in this quadrant have a high level of importance, but their performance level is still below average. This means that customers feel this aspect is important, but are not satisfied with the performance shown. Therefore, the indicators in this quadrant must be the main focus of improvement in order to increase customer satisfaction. Indicators in Quadrant I are: Indicators 2, 3, 10 and 12.

Indicators in this quadrant are related to speed, efficiency and accuracy of service. Customers really expect transactions to run efficiently and the application to be responsive, but the realization is still inadequate.

This finding is reinforced by the results of research (Theresa et al., 2025) which analyzed e-banking services. The results state that attributes such as speed and ease of service in Quadrant I indicate the need for improvement. Indicators in Quadrant I must be the top priority to be improved, because if they are not improved, then the attributes in Quadrant I must be improved. will have an impact on decreasing customer satisfaction.

Quadrant II - Maintain Achievements

Indicators in this quadrant have a high level of importance and high performance, which means that customers feel this aspect is important and are satisfied with the performance provided. This position is an ideal area in IPA analysis. Therefore, indicators in this quadrant must continue to be maintained and maintain their quality so that they do not experience a decline that can affect overall customer satisfaction. Indicators in Quadrant II are 1 and 5.

Indicators in this quadrant are related to ease of access and accuracy. Research from (Theresa et al., 2025) states that indicators in Quadrant II reflect the strength of the service and must be used as service standards for other indicators. PLN Mobile has successfully compiled features with a user-friendly and informative display. This needs to be maintained through system maintenance, improving the user interface, as well as improving the user interface.

Continuous information updates so that there is no decline in quality in the future.

1. Quadrant III - Low Priority

This quadrant reflects indicators with

The level of importance and performance are both low. This means that customers do not pay much attention to this aspect, and the performance is also not optimal. Although not a top priority at the moment, indicators in this quadrant still need to be improved gradually, especially if their importance increases in the future. If it is not improved, and in the future customers begin to pay attention to this aspect, it can affect the overall level of satisfaction. Indicators in Quadrant III are 6, 7, and 8.

Indicators in this quadrant are related to ease of access, and system stability. Although aspects such as system stability and 24-hour accessibility are considered less important by respondents at this time, improvements are still needed to maintain customer trust and prevent potential complaints in the future.

According to research (Sihotang & Oktarina (2022), indicators in Quadrant III generally have little effect on current customer satisfaction, but can be crucial in the future, especially if there are changes in user behavior or expectations.

Quadrant IV – Excessive

Indicators in this quadrant show a high level of performance but are considered less important by customers. In other words, the resources used to maintain performance in this aspect are potentially excessive or inefficient, because they are not proportional to the perceived importance of customers. These indicators still need to be maintained, but do not need to be the main focus of improvement. If possible, the resources used can be diverted to improve indicators in

Quadrant I. Indicators in Quadrant IV are 4,,9 and 11.

Indicators in this quadrant are related to feature completeness, and security. Although the security features and system completeness have functioned very well, it turns out that not all customers consider this aspect to be very important. Therefore, the company can balance the allocation of resources, and consider shifting the focus to indicators that fall into

Quadrant I.according to (Sihotang & Oktarina, 2022) indicators in Quadrant IV should be monitored regularly, and if there are changes in customer perceptions of the importance of these indicators, adjustments to the strategy can be made. Thus, indicators 4, 9, and 11 should be maintained but do not need to get a large improvement allocation, unless their level of importance changes in the future.

5. Conclusion

Based on the results of the research that has been conducted, it can be concluded that there is a positive relationship between electronic service quality and customer satisfaction of PLN Mobile application users in UP3 Bogor. The CSI value of 77.95% indicates that the level of customer satisfaction is in the satisfied category. The dimensions of efficiency and conformity to expectations are the most dominant factors in shaping positive perceptions of PLN Mobile services.

IPA analysis shows that indicators in Quadrant I are the most important priorities to immediately improve service quality because they are considered very important by customers but their performance is still not optimal. On the other hand, there are seven indicators that are in line with customer expectations and need to be maintained.

Overall, good electronic service quality will contribute directly to increasing customer loyalty and satisfaction. Therefore, PT PLN (Persero) is expected to continue to improve the quality of the PLN Mobile application to make it more responsive, secure, and informative according to user expectations.

THE EFFECTIVENESS OF SKINTIFIC PRODUCT ADVERTISING THROUGH TIKTOK SOCIAL MEDIA USING THE EPIC METHOD (CASE STUDY IN BOGOR CITY)

[1]Widya Zahra Syafutri, [2]Oktori Kiswati Zaini, [3]and Abel Gandhy.

[123]Faculty of Economics and Business, Pakuan University

e-mail: widyazahra.wz02@gmail.com

Abstract

Social media has changed the way we interact, communicate, and even do business. The increasing number of social media users every year, especially TikTok in Indonesia, business competitors need to optimize their performance with various special strategies to increase advertising effectiveness. The purpose of this study is to analyze the effectiveness of skintific product advertising through TikTok social media. This study is an exploratory descriptive study, with qualitative data types and data sources derived from primary and secondary data. The sampling method in this study is non-probability sampling with a purposive sampling technique. The sample in this study was 100 respondents. The data analysis method used is descriptive analysis by conducting validity and reliability tests using SPSS 25 and calculating the results for the EPIC rate. The results showed that the level of effectiveness of skintific product advertising through TikTok social media using the EPIC method had an overall EPIC model value of 3.50. So based on the decision position, the value of 3.50 is in the range of 3.40 - 4.20 which means that the level of effectiveness of skintific product advertising falls into the effective criteria. The most dominant indicator is communication which has a score of 3.65.

Keywords: Advertising effectiveness, Tiktok social media, EPIC Model

1. Introduction

The development of information technology is increasingly rapid and affects almost all aspects of life today, the internet is no longer something foreign to society. The presence of the internet seems to eliminate the limits of distance and time to obtain information, everyone can also communicate with other people in any country. Social media has become an inseparable part of the daily lives of Indonesians. From TikTok, Instagram and other platforms, it has changed the way we interact, communicate and even do business. In recent years, Indonesia has become one of the biggest markets for platforms like Facebook, Twitter and YouTube. In fact, local platforms such as Tiktok and Gojek have become very popular among Indonesian users. Social media has changed the way we communicate and interact with each other. From small moments in daily life to expressing political opinions, social media has become the main platform for self-expression and information dissemination (Noor, 2024).

Indonesia ranks third in the largest number of internet users in Asia with more than 200 million users, which shows that the number is significant in the Asian region. TikTok has experienced rapid growth in Indonesia. In January 2024, the number of TikTok users in

Indonesia reached 126.83 million. Indonesia is the country with the second largest TikTok users after the United States. TikTok's popularity in Indonesia is also supported by the integration of TikTok Shop which is getting stronger, especially after establishing a strategic partnership with Tokopedia. With a growing number of users and a strong *e-commerce* strategy, TikTok continues to be one of the most influential platforms in Indonesia, not only as social media but also as a key tool for business.

TikTok as a *social media platform* is very beneficial and makes it easier for Skintific to disseminate information. The rapid and wide spread of information can be described as a virus that quickly spreads from one person to another. Similarly, videos or content from Skintific quickly spread from one *audience* to another. Skintific has been present in Indonesia since late 2021 and is now growing rapidly. Since last year, it has been highly sought after by *skincare* lovers and has gone viral on social media. As such, beauty brand Skintific offers products that help strengthen the skin barrier and address various skin concerns. In a competitive *skincare* market, businesses like Skintific must implement effective marketing communication strategies.

In December 2023 Skintific achieved the highest sales value of 400 million in the *double date* period, Skintific's sales experienced a significant increase compared to *normal day* with a percentage increase of 53.5%. But in January-March 2024, Skintific's sales value fluctuated compared to 2023. This makes Skintific products have to optimize their performance with various special strategies to increase the effectiveness of advertising on Skintific products.

Based on the pre-survey data regarding the effectiveness of Skintific product advertisements through TikTok social media using the EPIC method, it is found that overall the Skintific content displayed gets a very good response from respondents. In the *Empathy* indicator question, all respondents (100%) agreed that the promotion of Skintific content on TikTok attracts attention, which shows that the appearance and creativity of the content has succeeded in attracting attention. In the *Persuasion* indicator question, the majority of respondents (11 out of 15 people) felt encouraged to buy the product after seeing the advertisement, although there were still a small number of respondents (11 out of 15 people) who felt encouraged to buy the product. content, although there are still a small number (4 people) who disagree. This indicates that the content has the potential to influence purchasing decisions, but needs to be improved to reach more potential consumers. Meanwhile, in the *Impact* indicator question, all respondents agreed that Skintific content provides knowledge about product benefits, which means that the educational message has been conveyed well. Similarly, in the *Communication* indicator question, all respondents considered that the messages conveyed in the content were clear and easy to understand. Overall, Skintific promotion through TikTok is considered effective in attracting attention, providing information, and influencing purchasing decisions, but there is still room for improvement in terms of persuasion of audiences related to content has the potential to influence purchasing decisions.

Based on the results of the pre-survey related to the reasons why respondents like content on TikTok social media, it is known that the majority of respondents (9 out of 15 people) like content on TikTok because it is short and not boring. This indicates that short videos are one of the main factors that attract users' attention. In addition, 4 respondents stated that they like TikTok because there is a lot of informative and educational content. Meanwhile, 2 other respondents considered that the content on TikTok was funny and entertaining. From these results, it can be concluded that the effectiveness in delivering

information through short videos is the main factor that makes users interested in watching content on TikTok social media.

2. Literature Review

2.1.Social Media

Social media is an online *platform* that allows users to communicate, share information, and interact with each other. Social media takes many forms, including social media such as Facebook, Instagram, Twitter, and LinkedIn, as well as online forums, blogs, and location-based applications according to Jamaludin, et al., 2022 in Hasniaty et al., (2023).

2.2.Advertising

According to Firmansyah (2020) Advertising is one of the most common tools used by companies to direct persuasive communication to target buyers and the public. Advertising is basically part of modern industrial life. The life of the modern world today is highly dependent on advertising.

The purpose of advertising in the book Durianto et al (2003) explains that in general, advertising is in the form of a presentation of non-personal information about a product, brand, company, or store that is run with compensation for these costs. Thus, advertising is a communication process that aims to persuade or lead people to take actions that are profitable for the ad maker.

2.3.Advertising Effectiveness

According to Durianto et al (2003), advertisements that are delivered should be mixed in such a way that the message to be conveyed is easy to digest and understand by the public, and contains correct information. If the message of an advertisement can be deeply imprinted in the minds of consumers, and consumers look at it from the right perspective, then it means the work of market mechanisms. This phenomenon in marketing is known as "effective advertising".

2.4.EPIC Model

According to Durianto et al (2003), the effectiveness of advertising can be measured using the EPIC Model, which includes four dimensions, namely: *Empathy*, *Persuasion*, Impact and *Communication* (*EPIC).*

3. Research Method

This research is *exploratory* descriptive research, with qualitative data types and data sources derived from primary data and secondary data. The sampling method in this study was *non-probability sampling* with *purposive sampling* technique. The sample in this study were 100 respondents. The data analysis method used is descriptive analysis by conducting validity tests and reliability tests using SPSS 25 and calculating the results for the EPIC rate.

4. Results And Discussion

Table 3. Results of the EPIC Model Value of *Empathy* Indicators

No	Statement	Score Value
1	Skintific ads are easy to understand	3,69

2	Skintific ads are able to attract attention	3,53
3	Skintific ads manage to make you happy about the ad	3,40
4	Skintific ads are able to attract interest in re-viewing the ad	3,32
5	give a positive assessment of Skintific's advertisements on social media Tiktok	3,47
6	Skintific ads understand needs better than other ads	3,08
Total Average Score		**3,41**

The table above is a table of EPIC value scores for the *empathy* indicator model, it can be concluded that overall Skintific advertisements on Tiktok social media are in the Effective category with an average score of 3.41. This shows that Skintific advertisements are able to build a fairly good emotional connection with the audience.

The table shows each statement item and the score value obtained. However, of the six statements, there is one statement that gets the lowest score, namely the statement that "Skintific ads understand needs better than other ads" with a score of 3.08. with a score of 3.08. The score shows that although the ads are considered attractive and acceptable to the audience, there is still a gap in terms of conveying more empathy towards the audience's needs. Therefore, Skintific needs to improve the aspect of understanding consumer needs.

Table 4. Results of EPIC Model Score for *Persuasion* Indicator

No	Statement	Score Value
1	Skintific's advertisements succeeded in attracting my interest to know more about the product	3,37
2	Skintific's advertisement successfully conveys a trustworthy message	3,62
3	The Skintific ad succeeded in appealing to my feelings	3,20
4	Skintific's advertisement succeeded in attracting interest in buying its products	3,42
5	The suitability of Skintific advertisements with reality/reality	3,65
6	Skintific advertisements on Tiktok are able to provide an explanation that the products offered have advantages products offered have advantages	3,63
Total Average Score		**3,48**

The table above is a table of EPIC value scores for the *persuasion* indicator model, it can be concluded that overall Skintific advertisements on Tiktok social media are in the Effective category with an average score of 3.48. Of the six statements, there is a statement that gets the lowest score, namely the statement that "Skintific ads managed to captivate my feelings" with a score of 3.20, the lowest among the other six statements, which shows that the emotional aspect of attracting audience feelings is still not very strong.

There are five other statements that show higher scores, indicating that the ad is considered quite capable of strengthening product character, building trust, and delivering messages well. Thus, although the overall *persuasion* aspect is effective, Skintific still has room to further improve the appeal to make the ad more capable of appealing to the audience's feelings more deeply.

Table 5. Results of EPIC Model Value of *Impact* Indicator

No	Statement	Score Value
1	Knowing the Skintific advertising brand on Tiktok social media	3,79
2	Skintific ads help you know how to use the product	3,82
3	Skintific advertisements help to know the various benefits of its products	3,80
4	Skintific advertisement is the first choice to buy Skincare/makeup	3,03
5	Skintific ads present creative and easy-to-understand messages	3,59
6	Remember the creativity of Skintific ads more than other product ads other products	2,91
Total Average Score		**3,49**

The table above is a table of EPIC model value scores for *impact* indicators, it can be concluded that overall Skintific advertising on Tiktok social media is in the Effective category with an average score of 3.49. It is known from the six existing statements, there is a statement with the lowest score, namely the statement "More remember the creativity of Skintific advertisements than other product advertisements" with a value score of 2.91. This score shows that the creativity aspect in Skintific advertisements is still less prominent in the eyes of the audience, so the memory of the uniqueness of the advertisement is not strong.

The overall *impact* indicator remains in the effective category, this result indicates that there is a need for improvement in terms of creativity so that Skintific advertisements not only provide information, but can also be more memorable by the audience.

Table 6. Results of the EPIC Model Value of *Communication* Indicators

No	Statement	Score Value
1	Skintific ads are easy to remember	3,54
2	Skintific ads use language that is easy to understand	3,74
3	Skintific ads contain clear information	3,73
4	Skintific ads provide a clear image display	3,76
5	The visuals and narration in the ad are interesting to watch until the finished	3,44
6	Music, sound, or effects in the ad help convey the message better message better	3,70
Total Average Score		**3,65**

The table above is a table of EPIC model scores for *communication* indicators, it can be concluded that overall Skintific advertisements on Tiktok social media are in the Effective category with an average score of 3.65. Of the six statements, there is one statement that gets the lowest score, namely the statement that "Visuals and narratives in advertisements are interesting to watch until completion" with a value score of 3.44. This indicates that although the message conveyed by the Skintific advertisement is quite clear and understandable, the visual and narrative appeal aspects have not been fully able to maintain audience attention until the end of the video.

From the explanation above, it can be concluded that Skintific's advertisements on Tiktok are overall classified as effective, with indicators of *empathy*, *persuasion*, *impact*, *communication* showing an average value in the effective category. However, there are still several statements that have low value scores.

Table 7. EPIC Score

No.	**EPIC Model**	**Score**	**Description**
1	*Empathy*	3,41	Effective
2	*Persuasion*	3,48	Effective
3	*Impact*	3,49	Effective
4	*Communication*	3,65	Effective

Source: Data processed by researchers, 2025

Table 8. Rating Scale

Rate	**Description**
1,00 - 1,80	VIE (Very Ineffective)
1,81 - 2,60	NE (Not Effective)

2,61 - 3,40	ME (Moderately Effective)
3,41 - 4,20	E (Effective)
4,21 - 5,00	SE (Very Effective)

Source: (Ahmad & Megayani, 2020)

$$EPIC\ Rate = \frac{X\ Empathy + X\ Persuasion + X\ Impact + X\ Communication}{4}$$

$$EPIC\ Rate = \frac{3{,}41 + 3{,}38 + 3{,}49 + 3{,}65}{4} =$$

$$= 3{,}50$$

The final result of the EPIC rate is 3.50 which if entered into the rating scale is-included in the effective category.

The results of this study are the same as previous research conducted by Kembang et al (2024) which examined the analysis of the effectiveness of Shopee advertisements using the EPIC Model and obtained research results showing that the EPIC model value of 4.14 is in the range of 3.41-4.20 with the effective category. Further research was conducted by Wulandari (2019) which examined the effectiveness of el's coffee advertisements using the EPIC Model and obtained research results which showed that the EPIC model value of 3.75 which means that it falls into the scale range with the effective category.

5. Conclusion

Based on the results of the research conducted and the discussion that has been obtained, it can be concluded that the level of effectiveness of Skintific product advertising through Tiktok social media using the EPIC method as a whole is 3.50, which means that the level of effectiveness of Skintific product advertising through Tiktok social media using the EPIC Method (Case study in Bogor city) falls into effective criteria. Then**, the** most dominant indicator is the *communication* indicator which gets a score of 3.65, which means it falls into the effective criteria.

The level of effectiveness in this study falls into the effective criteria, but there are still indicators that score below the average, namely the *empathy* indicator with a score value of 3.41. Which needs to strengthen understanding of consumer needs and create attractiveness by presenting more personalized and relevant content. The most dominant indicator is the *communication* indicator, but the *impact* indicator w824

ith the measure "More remember Skintific's advertising creativity than other product advertisements" has the lowest value score compared to the measures in other indicators. The suggestion to Skintific is that Skintific can design more creative and different advertising concepts, by combining innovative elements and adjusting to the trends that are currently viral on TikTok.

Abstract

This research was conducted at the Regional Public Company Tirta Pakuan, Bogor City, which consists of independent variables, namely the Work Environment and dependent variables, namely Employee Job Satisfaction, this study aims to determine the state of the work environment with employee job satisfaction at the Regional Public Company Tirta Pakuan, Bogor City. The research was conducted using quantitative methods. The research sample was 32 employees of the Regional Public Company Tirta Pakuan, Bogor City. The type of research used a quantitative approach through distributing questionnaires. Using primary and secondary data, the data analysis method used descriptive analysis, and the data analysis method used correlation coefficient analysis and determination coefficient analysis, validity test analysis and reliability test using IBM SPSS Statistics 25. The results of the analysis show that the data from the descriptive analysis at the Regional Public Company Tirta Pakuan, Bogor City regarding the Work Environment obtained that the results of the Spearman rank correlation coefficient test, obtained an r value or correlation value of = 0.451. Which shows that the level of relationship between the work environment and employee job satisfaction is in the moderate category. So it can be concluded that there is a positive relationship between the work environment and employee job satisfaction at the Regional Public Company Tirta Pakuan, Bogor City.

Keywords: Work Environment, Job Satisfaction

1. Introduction

Amidst increasingly fierce global competition, companies are required to operate more efficiently and effectively. To survive, companies need to continuously improve their competitiveness. As organizations, companies recruit individuals known as employees to carry out the company's production activities. Without proper human resource management within an organization or company, established goals will be difficult to achieve consistently. Human resources are a crucial element in any organization or company. For effective management, companies need employees who understand and master their field of knowledge and possess high skills. Furthermore, companies must strive to optimally manage their operations to improve employee performance. In today's business era, organizations no longer view employees merely as a means to an end. They are also beginning to pay attention to their employees' needs, desires, and expectations. Every organization needs employees who are able to increase their own job satisfaction in carrying out their duties. Employees who are satisfied with their work will view work as something enjoyable.

Job satisfaction in an organization indicates the extent to which employees enjoy their work. An employee's attitude toward their work can be seen from their emotional responses and reactions to it. According to (Afandi, 2021), job satisfaction is an emotional response to various work factors and an employee's feelings about whether or not a job is enjoyable. Generally, regarding a person's work, it shows the difference between the amount of rewards received by workers and the amount they believe they should receive. Feelings related to a person's self-worth, such as age, health, abilities, and education, will influence job satisfaction. Employees will feel satisfied if These factors support their work, but conversely, if these factors do not support them, employees tend to feel dissatisfied.

Previous research conducted by Prayogo (2019) states that job satisfaction is an emotional attitude that is pleasant and loves one's job. Employee job satisfaction must be created as well as possible so that employee morale, dedication, and discipline can increase. According to Hanum et al. (2021), job satisfaction indicates that the expectations and benefits received after completing the job are aligned. "It is often associated with the number of likes and dislikes of workers." Work enthusiasm, discipline, and performance all reflect this approach. Furthermore, "job satisfaction is an emotional attitude towards the tasks performed.

Employee job satisfaction level in 2024. Based on the table, it can be seen that the level of employee job satisfaction for one year, obtained from the results of the questionnaire that has been carried out at PERUMDA Tirta Pakuan, Bogor City is still not good, Some employees feel not completely satisfied with the salary given by the company, coupled with some employees who feel that the relationship with coworkers is not completely good, so they feel less satisfied in their work. PERUMDA Tirta Pakuan, Bogor City employees need to have the right abilities and competencies to carry out their duties well. Improving individual performance will have a positive impact on the overall performance of human resources. HR competencies play an important role in helping individuals adapt to work effectively.

Creating a productive environment is no easy feat; it requires the active participation of every team member to naturally foster a comfortable and enjoyable work environment. A conducive work environment, where employees can collaborate, is crucial for improving their performance. The work environment is a crucial factor in determining employee performance, as it directly influences how employees complete their work, ultimately improving the agency's performance. Careful attention must be paid to the work environment to ensure optimal, healthy, safe, and comfortable work. Conversely, neglecting the work environment can reduce employee motivation and enthusiasm, impacting their performance.

According to Budiasa (2021;39), the work environment is everything surrounding employees while they are working, whether physical or non-physical, directly or indirectly, that can affect them and their work. Companies need to pay attention to the importance of a good work environment because it significantly impacts employee satisfaction. A comfortable and safe environment makes employees feel at home and focused on their work. The condition of the work environment also plays a crucial role in determining the quality of work results. A supportive work environment and smooth communication between employees will result in optimal performance.

Every employee needs a comfortable and clean work environment to support their job satisfaction. An unconducive work environment can lead to various negative impacts,

such as decreased work morale, high absenteeism, and increased work errors. Organizations must avoid such situations as they can be detrimental to the continuity of their operations. Therefore, organizations need to create a safe, comfortable, and enjoyable work environment. Employee job satisfaction is greatly influenced by the conditions of the work environment within the organization. This is reflected in employees' attitudes and feelings, whether they feel comfortable or not. The attitudes that emerge, whether positive or negative, will depend on their experiences in the workplace.

Perumda Tirta Pakuan Bogor is a drinking water company owned by the Bogor city government, which serves the daily drinking water and toilet needs of Bogor residents. Every agency requires a good and comfortable environment. They believe that a clean and comfortable environment can indirectly encourage increased performance, motivation, and loyalty, leading to job satisfaction. Therefore, it is crucial for companies to pay attention to the welfare of their employees, one way of doing this is by paying attention to the condition of their workplace environment. The work environment for employees at the Perumda Tirta Pakuan Bogor City plant is still not optimal and does not fully support employee job satisfaction. Some employees appear dissatisfied with the room layout, which tends to appear untidy and unorganized. Furthermore, some employees feel uncomfortable with the hot temperature, and some sometimes choose to leave the room. This is due to the uncomfortable work environment, particularly the excessively hot room temperature, which disrupts their comfort while working.

In general, a person will feel comfortable and have high loyalty to the organization if their work provides satisfaction according to their expectations. This job satisfaction will encourage increased employee performance. This is in accordance with the opinion of Budiasa (2021), the work environment is everything around employees while working, whether physical or non-physical, directly or indirectly, which can affect the employee's self and work while working. According to Afandi (2021:66), the work environment is everything in the workers' surroundings that can influence them in carrying out their tasks, such as temperature, humidity, ventilation, lighting, noise, cleanliness of the workplace, and the adequacy of work equipment. The work environment can be defined as all the tools encountered, the surrounding environment where a worker is, his work methods, as influences on his work both as an individual and as a group.

2. Literature review

2.1.Job Satisfaction

Job satisfaction is a crucial aspect that every individual needs to have at work. This satisfaction is a personal one, meaning it isn't always constant and can be influenced by various factors, both internal and external to the work environment. Job satisfaction can wane just as quickly as it begins, so leaders need to pay closer attention to this.

According to Edy Sutrisno (2019, P.74) Job Satisfaction is an employee's attitude towards work related to work situations, cooperation between employees, rewards received at work, and matters relating to physical and psychological factors.

According to Prayogo (2019), job satisfaction is an emotional state characterized by a sense of enjoyment and love for one's work. Employee job satisfaction must be fostered to improve morale, dedication, and discipline.

According to (M. Afuan, 2021) job satisfaction is not only a part of work but can be described as life satisfaction, where if work is able to provide satisfaction then it is also able to provide satisfaction in life.

According to Weihric, Koontz (2019)*"Job satisfaction refers to experience the pleasure or liking felt by someone when they want something achieved"* (Job satisfaction refers to the experience of pleasure or enjoyment that a person feels when what he or she desires is achieved).

Menurut Robbins and Judge (2017:48) *"Job satisfaction is a feeling positive about work, that is resulting from an evaluation of its characteristics"* (Job satisfaction is a positive feeling towards work that arises after assessing various characteristics of the job).

From the various opinions of experts that have been explained, it can be concluded that job satisfaction is an attitude, view, or feeling that a person or employee has towards their work.

2.2.Work environment

The work environment is a crucial factor that organizations pay close attention to, as it directly impacts employee performance in carrying out their responsibilities within the company. A comfortable and supportive work environment will motivate employees to perform better and help achieve company goals. Conversely, a less than ideal work environment can impact employee satisfaction. Several experts defines the work environment as follows:

According to (Prasetyo, 2021), the work environment is all the equipment, materials, and work methods that a person encounters when working, both individually and in groups, along with their work arrangements.

According to (Ekawati, 2022) the work environment is the conditions around workers when workers carry out their duties, where these conditions have an influence on workers when carrying out their work in the context of carrying out company operations, because the work environment has an important role for workers so that they can complete their tasks effectively and efficiently.

According to (Latif et al., 2022), the work environment is the environment in which employees carry out their daily work. A conducive work environment will provide a sense of security and encourage employees to perform optimally.

According to Edward (2020)*"The work environment is a place where employees carry out their duties and is a working condition of employees who live and work together and continue continuously and produce memorable actions in carrying out each task and work"* (The work environment is a place where employees carry out their duties and is a working condition where employees live and work together continuously and produce impressive actions in carrying out each task and job).

According to McSherry and Pearce (2018) *"The work environment is used to designate the nearby conditions in which an employee work. The work environment could be composed of physical conditions, including office temperature, or equipment, such as personal computers. It could also be related to factors such as work procedures"* (The work environment is used to refer to the immediate conditions in which an employee works. The work environment can consist of physical conditions, including office temperature, or equipment, such as a personal computer. It can also relate to factors such as work procedures).

Based on the responses from the experts above, it can be concluded that the work environment includes everything in the environment around the organization that can influence employees when carrying out their duties, both visible and invisible things.

3. Research Methods

3.1 Types of research

This research uses a quantitative method by distributing questionnaires to respondents.

3.2 Research Objec

This study uses two variables as research objects, namely the Work Environment which acts as a variable *Independent* (X), and Job Satisfaction which is a variable *Dependent* (AND).

3.3 Unit of Analysis

The unit of analysis in this study is the individual, meaning the data obtained comes from individual respondents. The individuals in question are employees of the Tirta Pakuan Regional Public Company in Bogor City who work in the Customer Service and Public Relations Department, a total of 32 employees.

3.4 Research Location

The Tirta Pakuan Regional Public Company of Bogor City is located at Jl. Siliwangi No. 121, Sukasari, Kec. East Bogor, Bogor City, West Java 16142.

4. Research results

Table 4.1 Results of Respondents' Responses to Work Environment Variables

No	Indicator	Response Respondent	Rate-rate Indicators
	Description		
1	Requires sufficient lighting in the environment work	78 %	74%
2	getting enough light will make the environment be comfortable in the work environment	74%	
3	lighting levels increase work accuracy	68%	
	Air temperature		
4	a room with good air circulation will provide a positive effect for employees	74%	74%
5	a room with little air circulation can causing the officer to experience suffocation	75%	
	Noise Level		

6	Noise in the work environment must be minimized in such a way as not to disturb employees when working. Work	74%	74%
7	noise in the work space can be minimized accordingly what the company wants so that no errors occur in work	74%	
	Security		
8	comfort is a driving force in a activities in the work environment	75%	75%
9	Comfort in the work environment is necessary for an employee to achieve results. the maximum	73%	
10	Having good relations with other employees and superiors is one of the comforts of working	76%	
	Layout		
11	the layout looks neat and tidy	77%	73%
12	an area with a good layout will create work efficiency in increasing productivity high officials	70%	
	Rate-Rata	74%	

Based on respondents' responses regarding the work environment, an average score of 74% was obtained. This indicates that the work environment at PERUMDA Tirta Pakuan, Bogor City is in the good category. The indicator with the highest average value based on respondents' responses is the security indicator with a percentage of 75% while the indicator with the lowest average value is the layout indicator with a percentage of 73%. For the sub-indicator with the highest average value of respondents' responses, namely Requires adequate lighting in the work environment with a percentage of 78%. Meanwhile, for the sub-indicator with the lowest average response of respondents, namely the level of lighting increases work accuracy with a percentage of 68%.

Table 4.2 Average Results of Respondents' Responses to Job Satisfaction Variables

No	Indicator	Response Respondent	Rate-rate Indicators
	The Job Itself		
1	able to complete the work assigned to me	76%	74%

2	satisfaction with one's own work results	73%	
	Salary

10	the level of communication with colleagues is good	74%	
11	friendly attitude towards fellow employees	72%	
	Rate-rate	74,25%	

Source: primary data, processed 2024

Based on respondents' responses regarding job satisfaction, an average score of 74.25% was obtained. This indicates that employee job satisfaction at PERUMDA Tirta Pakuan, Bogor City is in the good category, the indicator with the highest average respondent response is the Supervision indicator with a percentage of 75%. Meanwhile, the indicator with the lowest average value is the Work Itself with a percentage of 74%. For the sub-indicator with the highest average respondent response value, namely employees feel that supervision in the workplace is carried out effectively and harmonious relationships between one employee and another with a percentage of 78% while for the sub-indicator with the lowest average respondent response is a friendly attitude towards fellow employees with a percentage of 72%.

4.1.Spearman Rank Correlation

The research used two variables, namely Work Environment (X) and Job Satisfaction (Y), calculated using the Spearman rank method using SPSS software. This can be seen in the following table:

Table 4.3 Spearman Rank Correlation

Correlations

			Lingkungan	Kepuasan
Spearman's rho	Lingkungan	Correlation Coefficient	1.000	.451**
		Sig. (2-tailed)	.	.010
		N	32	32
	Kepuasan	Correlation Coefficient	.451**	1.000
		Sig. (2-tailed)	.010	.
		N	32	32

Table 4.4 Guidelines for Interpretation of Spearman's Rank Correlation Coefficient

Correlation Coefficient and interpretation of the coefficient interval	Level Connection
0,00-0,199	Very Low
0,20-0,399	Low
0,40-0,599	Currently
0,60-0,799	Strong
0,80-1,000 (0,959)	Very strong

Source: Sugiyono, 2017

Based on the results of table 4.31 regarding the results of the Spearman rank correlation coefficient analysis test, the r value or correlation value was obtained as = 0.451, which indicates that the level of relationship between the Work Environment and Employee Job Satisfaction is in the moderate category.

4.2.Coefficient of Determination

The determination coefficient test aims to determine how much the independent variable is able to explain the dependent variable as seen through Adjusted R. The larger the r number, the better the model used to explain the relationship between the independent variable and the dependent variable.

Table 4.5 Results of the Determination Coefficient

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.963[a]	.927	.924	1.264

a. Predictors: (Constant), Lingkungan

Source: *Results of processing questionnaire data using SPSS 25*

Based on table 4.32, the R Square value is 0.927. This means that 92.7% of the job satisfaction variable is influenced by the work environment variable (X), while the remaining 8.3% is influenced by other factors not included in this study.

4.3.Discussion

4.3.1. Employee Work Environment at Perumda Tirta Pakuan Bogor

The work environment is an important factor that is a major concern for organizations, because it directly influences employee performance in carrying out their responsibilities.

Research conducted at the Bogor City Regional Public Company (PERUMDA) Tirta Pakuan showed that some employees were still dissatisfied with the layout of their offices, which tended to appear untidy and unorganized. This was due to the uncomfortable environment.

These results indicate that most respondents' responses are in the 61%-80% interval, meaning the work environment at PERUMDA Tirta Pakuan, Bogor City, is considered good. This is evident from the many positive responses related to indicators such as lighting, air temperature, noise level, security, and layout. The highest responses were found in the lighting and layout indicator for the statement "adequate lighting in the work environment is needed" at 78% and the statement "the layout looks neat and orderly" at 77%. Meanwhile, the lowest responses were found in the lighting and layout indicator for the statement "the level of lighting increases work accuracy" at 68% and the statement "the layout looks neat and orderly" at 70%. This indicates that the indicators with the lowest scores need attention and improvement, so that work can run smoothly according to the company's expectations. A comfortable work environment creates a sense of security and allows employees to work optimally. When employees feel happy with the environment in which they work, they will feel at home, carry out their duties well, and utilize work time efficiently. Conversely, if the work environment If the environment is not supportive, it can negatively impact employee performance. A good work environment will positively influence employee performance. Therefore, improving the work environment can encourage increased performance. Therefore, weaknesses in work environment indicators need to be addressed immediately to create a comfortable work environment that meets employee expectations.

4.3.2. Job Satisfaction of Perumda Employees

Job satisfaction is an important aspect of work. Job satisfaction is individual in nature, meaning that it is not a fixed state, as it can be influenced and changed both inside and outside the work environment. Based on the descriptive analysis of respondents' responses regarding the job satisfaction variable, the score was 74.25%.

This result indicates that most respondents' responses were in the 61%-80% range, indicating that job satisfaction at PERUMDA Tirta Pakuan, Bogor City, is considered good. This is evident from the numerous positive responses related to indicators such as the work itself, salary, supervision, and coworkers.

The highest response was found for the supervision indicator, which stated, "Employees feel that supervision in the workplace is carried out effectively," at 78%. Meanwhile, the lowest response was found for the coworkers indicator, which stated, "Friendly attitude towards fellow employees," at 72%.

This indicates that the indicator with the lowest score needs attention and improvement so that work can run smoothly according to company expectations. Job satisfaction reflects an employee's attitude toward their work, which is influenced by the work environment, relationships between coworkers, rewards received, and physical and psychological factors.

who joined him.

To improve employee job satisfaction, sub-districts must evaluate their work. They must identify the causes of declining employee job satisfaction and the factors that contribute to its improvement.

4.3.3. The Relationship between Work Environment and Job Satisfaction of Employees at PERUMDA Tirta Pakuan, Bogor City

The results of research at PERUMDA Tirta Pakuan, Bogor City regarding the work environment showed that the results of the Spearman rank correlation coefficient analysis test obtained an r value or correlation value of = 0.451. This indicates that the level of relationship between the work environment and employee job satisfaction is in the moderate category.

Based on table 4.32, the R Square value is 0.927. This means that 92.7% of the job satisfaction variable is influenced by the work environment variable (X), while the remaining 8.3% is influenced by other factors not included in this study.

The results of the descriptive analysis of the two variables from the total average score on several indicators have been calculated for the average result on the work environment variable of 74% and for the job satisfaction variable the average result value of the indicator is 74.25%. In the work environment variable, the indicator that has the highest value is in the lighting and layout indicator in the statement "requires sufficient lighting in the work environment". by 78% and the statement "the layout looks neat and orderly" by 77%. While the lowest average value of respondents' responses is in the lighting and layout indicator in the statement "the level of lighting increases work accuracy" by 68% and in the statement "the layout looks neat and orderly" by 70%. In the job satisfaction variable, the indicator that has the highest value is in the supervision indicator in the statement "employees feel that supervision in the workplace is carried out effectively" by 78%. While the indicator that has the lowest value is in the co-worker indicator in the statement "friendly attitude towards fellow employees" by 72%.

It can be concluded that in this study, there is a relationship between the work environment and employee job satisfaction, which is in the moderate category. This indicates that when PERUMDA Tirta Pakuan employees have a good work environment, this includes: supervision and layout so that it can improve the employee work environment, but when employees have a low level of work environment, the level of job satisfaction will not be optimal.

The results of this study are supported by previous research conducted by Afifah Amalia Daulay (2023) & The Relationship Between Work Environment and Job Satisfaction in Employees of the National Narcotics Agency of North Sumatra Province and the results of the study show that there is a positive relationship between the work environment and job satisfaction.

5. Conclusion

Based on the discussion in chapter IV, it can be concluded that the work environment is related to employee job satisfaction, which was analyzed using SPSS (*Statistical Package for Social Science*) version 25, with the following conclusion:

1. Based on the results of descriptive analysis in the work environment research, an average value of 74% was obtained with the highest average value obtained by the security indicator at 75%, and the lowest value obtained by the layout indicator at 73%. For values that get a percentage below the average, the indicator and sub-indicator need to be improved, while for values that get a percentage above the average, the indicator or

sub-indicator needs to be maintained. Based on the results of the average respondent responses above, it can be concluded that the work environment of PERUMDA Tirta Pakuan Kota Bogor employees is good.

2. Based on the results of descriptive analysis in the Job Satisfaction study, an average value of 74.25% was obtained with the highest average value by the supervision indicator of 75%, and the lowest value obtained by the co-worker indicator of 74%. If the value of an indicator or sub-indicator is below average, then there needs to be an improvement in the indicator or sub-indicator. Meanwhile, if the value of an indicator or sub-indicator is above average, then the indicator or sub-indicator needs to be maintained. Based on the results of the average respondent responses mentioned, it can be concluded that job satisfaction at PERUMDA Tirta Pakuan, Bogor City has a good assessment.
3. The results of a descriptive analysis of the work environment at PERUMDA Tirta Pakuan show that the Spearman rank correlation coefficient test yielded an r value or correlation value of = 0.451. This indicates that the relationship between the work environment and employee job satisfaction is in the moderate category.

Abstract

Human resources are the main element in the implementation of all company operational activities. Without the role of humans in it, the company will not be able to operate properly. The successful execution of this task is highly dependent on the optimal performance of the employees in volved in its various operational processes. One of the factors that affect this performance is work motivation. This study aims to determine the influence of work motivation on employee performance in the network division and substation of PT. PLN (Persero) ULTG Bogor. This study uses a type of verifiable research with an explanatory survey research method, and uses primary and secondary data. The sampling technique used is saturation sampling. Then the data analysis methods used were quantitative descriptive analysis, normality test, simple linear regression analysis, R square determination coefficient and (t) test. The analysis tool used using the IMB SPSS 26 tool. The results of the data research show that work motivation has a positive and significant effect on employee performance in the network division and substation of PT. PLN (Persero) ULTG Bogor is 39.6% and 51.4% is influenced by other variables that are not included in this study.

Keyword: Work Motivation, Employee Performance

1. Intoduction

Every company is highly dependent on the existence of human resources (HR) as the most important element in achieving the vision, mission, and goals that have been set. Human resources have an essential role because they are the core of the implementation of all company activities. Without reliable human resources have an essential role because they are the core of the implementation of all company activities. Without reliable human resource support, the company's entire operations will not be able to run optimally. Therefore, effective and efficient human resource management is an important thing to do so that organizational performance can be improved. HR also plays a role as the main driver in the process of achieving success, strategizing, and long-term planning of the company.

Companies are required to be able to handle human resource management properly and correctly in an effort to achieve good performance so that the company's expected results can be realized in accordance with the goal to be achieved. According to Moeherino (2020), performance describes the extent to which the implementation of an activity program, policy, or activity has succeeded in achieving the goals, vision, mission, and objectives of the organization that have been designed in an organization's planning strategy. An employee is considered to have good or optimal performance if his work results are in accordance with the set targets or meet the company's standards.

PT. PLN (Persero) is a state-Owned Enterprise (BUMN) engaged in the fulfilment and provision of national logistics needs. The research will be conducted at PT. PLN (Persero) ULTG Bogor which is part of the service unit of the Bogor Transmission Implementation Unit. This unit has a great responsibility in managing and maintaining installation assets to maintain

the continuity of electricity distribution in an efficient, reliable and environmentally friendly manner for the people of Bogor and its surroundings. The successful execution of this task is highly dependent on the optimal performance of the employees involved in its various operational process. The following is data on the results of employee performance achievements at PT. PLN (Persero) ULTG Bogor:

Table 1.1 Employee Performance of PT. PLN (Persero) ULTG Bogor

Source: PT. PLN (Persero) ULTG Bogor, 2024

Based on Table 1.1 above, it is known that the performance achievement of employees at PT. PLN (Persero) ULTG Bogor experienced a decline. From the data, in the first semester of 2022, the performance reached 106.45%, and in the second semester of 2022, employee

performance was 105.63%. However, in the first semester of 2023, it decreased to 96.20%, and further dropped in the second semester of 2023 to 90.89%.

From the employee performance data, it can be seen that there were issues regarding employee performance due to this decline in 2023. Good performance is of course a key goal in every organization, as optimal performance will bring positive impact to the overall achievement of organizational goals. The following is the employee performance standard data at PT. PLN (Persero) ULTG Bogor:

Table 1.2 Employee Performance Assessment Standard of PT. PLN (Persero) ULTG Bogor

No	Score (%)	Category
1	Performance ≥ 100	Achieved
2	95 ≤ Performance ≤ 100	Almost Achieved / Caution
3	Performance < 95	Needs Improvement / Problematic

Source: PT. PLN (Persero) ULTG Bogor

It can be seen from table 1.2 that the company has established a standard performance outcome for all employees, assumed to be the same. The performance evaluation results from previous data indicate that employee performance at PT. PLN (Persero) ULTG Bogor has experienced a decline. In 2022, performance was categorized as "achieved", while in 2023 it feel into the categories of "almost achieved/caution" and "needs improvement." The author also conducted a pre-survey of 30 employees of the network division and substation to see the problems that existed in the performance of their employees. The indicators used according to Robbins (2023) are quality, quantity, timeliness, effectiveness, and independence. The following are the results of a pre-survey regarding the performance of employees of the network division and substation of PT. PLN (Persero) ULTG Bogor:

Table 1.3 Pre-survey Employee Performance

No	Question	Yes	%	No	%
1.	Carry out work in accordance with standard operating procedures	30	100%	0	0%
2.	Always able to achieve the targets set by the company	23	76,7%	7	23,3%
3.	Getting the job done on time	18	60%	12	40%
4.	Leveraging resources in the workplace effectively and efficiently	26	86,7%	4	13,3%
5.	Have the initiative in carrying out work without having to wait for orders from superiors	14	46,7%	16	53,3%

Source: Primary Data, processed 2024

Based on the results of the pre-survey in table 1.3, it is known that the performance of employee in the network and substation division of PT. PLN (Persero) ULTG Bogor is still not fully optimal. This can be seen from the answers of 18 employees who stated that they did not have the initiative to complete the work without having to wait for orders from their superiors. The success or failure of an organization depends heavily on the quality of its employees' performance. Therefore, in order for employee performance to be maintained and improved, companies need to pay attention to the various factors that affect that performance and create an environment that supports productivity. Mangkunegara (2020) stated that performance is influenced by 2 main factors, namely ability, and motivation. One of the important factors that can affect employee performance is work motivation.

High work motivation is indispensable to encourage employees to be enthusiastic and focused on the company's goals. Therefore, it is important for companies to understand the factors that affect work motivation and design the right policies to increase employee motivation. According to Mangkunegara (2020), employee work motivation includes physiological needs, security needs, social needs, the need for appreciation and the need for self-actualization. The following are the results of the pre-survey conducted by the author the work motivation of 30 employees of the network division and substation PT. PLN (Persero) ULTG Bogor:

Table 1.4 Results of the Work Motivation Pre-survey

No	Statement	Yes	%	No	%
1.	The salary received is enough to meet the needs of life	28	93,3%	2	6,7%
2.	The conditions of the workspace used are quite safe and comfortable	20	66,7%	10	33,3%
3.	Relationships between people and bosses are well established and not rigid	15	50%	15	50%
4.	Earn compliments/awards for satisfactory work	13	43,3%	17	56,7%
5.	Receive training to improve skills and career development	14	46,7%	16	53,3%

Source: Primary Data, processed 2024

Based on the table 1.4 regarding work motivation, there are some employees who are still less motivated at work. It can be seen that 17 employees answered no to the question "Getting praise/appreciation for satisfactory work results". Some employees still feel that giving praise/appreciation in the form of bonusses for satisfactory work results has not been able to provided encouragement or enthusiasm in work.

In addition to the phenomena and problems described above, there are several relevant results of previous research. Research by Suprapti and Muliate (2019) shows that work motivation has a positive and significant effect on the performance of employees of PT. PLN (Persero) Rayon Prigen. Similar research was also put forward by Ningsih, et al. (2020), which stated that work motivation has a significant influence on employee performance at PT. PLN (Persero) UPDK Mahakam. However, different results are shown by Wiryang's (2019) research which states that work motivation does not affect employee performance at PT. PLN (Persero) Manado Area. The same thing was also found by Setiawan, et al (2022) who stated that work motivation did not have a significant effect on the performance of employees of PT PLN (Persero) UPT Gresik.

Based on the above background, the purpose of this study is to find out and analyze the influence of work motivation on employee performance in the network division and substation of PT. PLN (Persero) ULTG Bogor.

2. Literature Review

2.1.Human Resource Management

Human resources are a very valuable asset and need to be managed optimally through human resource management, because human resources play a key role in carrying out various organizational activities. HR management encompasses a series of activities within an organization that aim to recruit, develop, and retain a competent workforce to support the achievement of organizational goals. In general, human resource management can be

interpreted as a form of a company's efforts to organize and manage its workforce systematically.

Mangkunegara (2020) stated that human resource management involves the stages of designing, organizing, implementing, and controlling activities such as recruitment, training, compensation, alignment, maintenance, and termination of employment, in order to support the achievement of company goals.

The functions of human resource management according to Afandi (2021) include:

1. Planning is an initial process that includes organizational goals as well as the selection of strategies, policies, projects, programs, procedures, methods, budget systems and benchmarks to achieve goals.
2. Organizing or organizing includes:
    1. Identify resource needs and design activities to support the achievement of organizational goals.
    2. Design an organizational structure or form a work team that is able to direct these processes and resources to a goal.
    3. Assign specific responsibilities according to their field of duties.
    4. Giving appropriate authority to each party so that they can complete the work optimally.
3. Staffing or personnel preparation is the process of recruitment, training and development, placement, and providing orientation that supports the creation of a healthy, productive, and mutually beneficial work environment.
4. Leading or directing function is how to make or influence employees to do what they have to do.
5. Controlling or supervision is a process to ensure that all activities have been carried out according to the plan, through the use of appropriate methods and evaluations so that they are in accordance with what has been set.

2.2.Work Motivation

Motivation is an attitude or action that encourages, arouses, and directs individual behavior towards meeting needs, satisfaction, and achieving goals, so that a person is encouraged to act optimally.

According to Afandi (2021), motivation is a desire that arises from within a person or individual because they are inspired, encouraged, and encouraged to carry out activities with sincerity, joy, and sincerity so that the results of the activities carried out get good and quality results.

Sutrisno (2019) stated that work motivation is influenced by 2 factors, namely internal factors and external factors. The explanation is as follows:

1. Internal Factors, are factors from within a person that can affect their motivation at work.
    a. The desire to be able to live is a need of every human being. To survive, one will be willing to do a variety of jobs.
    b. The desire to be able to have, is often a strong motivation for a person to work. For example, a person's desire to buy a car can be the main reason for the individual to work hard to make it happen.
    c. The desire to earn awards is also a factor that drives a person to work, because there is a desire for himself to be respected and appreciated by others.
    d. The desire to gain recognition, is also a driver for a person to do a job. In the world of work, the recognition includes appreciation for performance, the

existence of good and solid working relationships, fair and wise leadership and a positive image of the company in the eyes of the public.

e. The desire to be in power can be a reason for a person to work. In the work environment, power can be obtained through various means, including non-positive ones. However, individuals can also achieve positions or power in a healthy way through high ability and dedication, which can later attract the attention of superiors to give them trust in a position of power.

2. **External Factors,** are factors from outside a person that can affect the motivation of the person at work.
    a. The overall condition of the work environment, including the facilities and infrastructure available, can affect the way a person completes his or her tasks. Aspects such as work location, supporting facilities, cleanliness, lighting, tranquility, and relationships between fellow workers at work also determine comfort at work.
    b. Decent compensation, compensation is the main source of income for employees to meet their living needs. Providing appropriate compensation is one of the effective tools and strategies for companies to encourage employee morale and performance, because the amount of compensation is directly proportional to the level of employee motivation.
    c. Effective supervision, supervision aims to provide direction and support to employees so that they can complete their work well without making mistakes.
    d. Clear career certainty can increase a person's seriousness at work. When individuals feel that they have promising job prospects, such as promotion opportunities, promotions, or opportunities to develop self-competence, it will encourage them to work more optimally.
    e. Status and responsibility, not only expecting compensation but every employee certainly wants a certain status and position in their job.
    f. Flexible regulations, applicable regulations in the company have an important role and have the nature of regulating as well as protecting the rights and obligations of employees which include the employment relationship between employees and the company, including in terms of providing compensation, promotions, mutations, and so on.

According to Abraham Maslow, in Mangkunegara (2020), it is stated that the indicators of work motivation as in the theory of the hierarchy of human needs are as follows:

1. Physiological needs, namely the need to eat, drink, physical, breathe, and sexual.
2. The need for a sense of security, namely the need for protection from threats, dangers, conflicts, and the environment.
3. Social needs, namely the need to feel belonging, the need to be accepted by the group, to be affiliated, to interact, and the need to love and be loved.
4. The need for appreciation, i.e. the need to be respected, and appreciated by others.
5. The need to self-actualize, namely the need to use abilities, skills, and potential. The need to argue by putting forward ideas gives judgment and criticism of something.

2.3.Employee Performance

The company can achieve the goals that have been set with the efforts of its employees. Employee performance is critical to the survival of the organization. Performance is not just a

matter of quantity, but includes how individuals or groups in a company can achieve the goals that have been set, by paying attention to the efficiency, quality, and impact of the work.

According to Mangkunegara (2020), performance is the achievement of work results, both in terms of quantity and quality, which are completed by an employee based on the responsibilities given to him.

According to Mangkunegara (2020), the factors that affect employee performance are:

1. Ability factor Psychologically, an employee's ability consists of potential ability (IQ) and reality ability (knowledge skill). This means that employees who have an above-average IQ (IQ 110–120) with adequate education for their position and are skilled in doing daily work, then they will more easily achieve the expected achievements. Therefore, employees need to be placed in jobs that are in accordance with their skills.
2. Motivation factor Motivation is formed from an employee's attitude in dealing with work situations. Motivation is a condition of moving employees who are directed to achieve organizational goals (work goals).

According to Robbins in Glorinasmus (2023), performance indicators are tools to measure the extent of employee performance achievements. The employee performance indicators include:

1. Work Quality, Can be measured from employees' perception of the quality of work produced and the perfection of the task to the employee's skills and abilities. The quality of work can be described from the level of good and bad results of employees in completing the work as well as the ability and skills of employees in doing the tasks assigned to them.
2. Quantity is the amount achieved and expressed in terms of the number of units, the number of activity cycles completed. Quantity is a measure of the total work output of the unit as well as the number of activity cycles completed by employees so that employee performance can be measured through the number (units/cycles).
3. Punctuality is the level of activity completed at the beginning of the stated time, seen from the point of view of coordination with the output results and maximizing the time available for other activities. Employee performance can also be measured from the employee's punctuality in completing the work assigned to him.
4. Effectiveness is the level of use of organizational resources such as manpower, money, technology and raw materials maximized with the intention of increasing the results of each unit in the use of resources. That the use of human resources themselves as well as the technological resources, capital, information, and raw materials in the organization can be used as much as possible by employees.
5. Independence is the level of a person who will later be able to carry out his work functions without receiving help, guidance from or supervisors. This means that employees who are independent, namely employees who want to do their work, do not need to be supervised and can carry out their work functions without asking for help, guidance from other people or supervisors.

Based on the theories stated above, as well as some previous research that has been conducted. Work motivation is one of the factors that can affect employee performance. As per a study conducted by Azhari, et al. (2022) which states that work motivation affects the performance of employees of PT. PLN (Persero) Main Unit of the SULSELARBAR Region. Research conducted by Hasanah & Sa'diah (2022) states that work motivation affects the performance of employees of PT. PLN (Persero) ULP Daha. Another study conducted by Sinaga (2022) also states that work motivation affects the performance of employees of PT. PLN (Persero) UP3 Medan.

Based on the framework of thought that has been described above, a research constellation can be made, which is as follows:

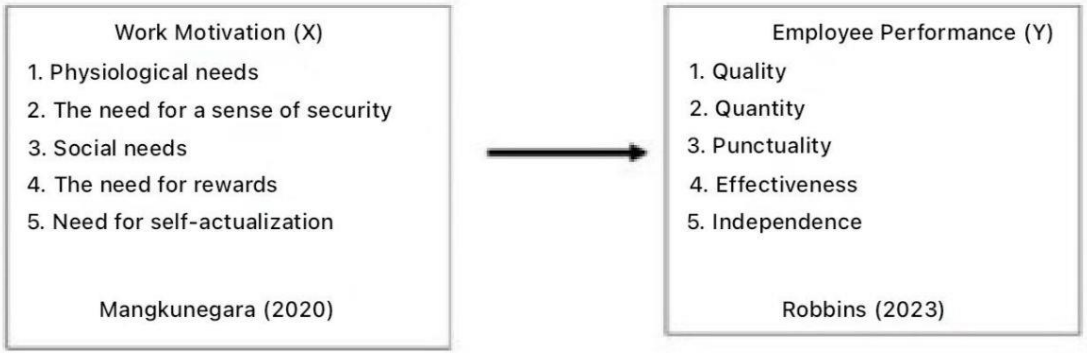

Figure 2.1 Research Constellation

Based on the formulation of the problem, the framework of thought, and the previous research that has been stated above, the author formulates the following hypothesis:

H1: It is suspected that work motivation has a positive effect on employee performance in the network and substation division of PT. PLN (Persero) ULTG Bogor.

3. Research Methods

The type of research used in this study is verifiable research. The method used in this study is an explanatory survey. The analysis techniques applied include descriptive statistics and inferential statistics. In its implementation, this study uses a regression method to determine the influence of independent and dependent variables. The main focus of this study is to analyze the extent of the influence of work motivation (X) on employee performance (Y).

The unit of analysis in this study is individual, where data is generated from each person/individual in a company. The individual in question is an employee at PT. PLN (Persero) ULTG Bogor network and substation division totaling 40 people.

The data collection method in this study is primary data obtained directly by the researcher from the respondents, namely employees of the network division and substation of PT. PLN (Persero) ULTG Bogor. This data was collected through the distribution of questionnaires containing questions related to work motivation and employee performance. Secondary data derived from books, journals, previous research and data obtained from PT. PLN (Persero) ULTG Bogor.

The data analysis method in this study is descriptive analysis. Next, the Classical Assumption Test consisting of the Normality Test, the Multicollinearity Test, and the Heteroscedasticity Test. Simple linear regression analysis, according to Sugiyono (2020), to find out how much independent variables influence the dependent variable is by looking at the form of the regression equation. Furthermore, the Determination Test according to Sugiyono (2020) measures how much variation of bound variables can be explained by independent variables in a regression model. The t-test according to Sugiyono (2020) is to analyze the average difference between two groups or samples taken randomly from the population, assuming that the data has a normal distribution as well as the same or unknown population variant.

4. Results And Discussion

Based on the table of overall results, the responses from 40 respondents regarding the work motivation variable showed an average of 87.6%. The value is in the range of 81%-100%, so it can be concluded that the level of employee work motivation in the network division and substation of PT. PLN (Persero) ULTG Bogor is very good. This is shown by the number of respondents who gave "Strongly Agree" responses to various indicators on the work motivation variable. The indicator with the highest score was in the aspect of physiological needs, with a percentage of 92%. The sub-indicator that obtained the highest score was the statement "The basic salary I received was enough to meet the needs of life," with a percentage of 94%. Meanwhile, the indicator with the lowest score is the need for awards, which gets a percentage of 81%. The lowest sub-indicator is the statement "I get praise or appreciation for satisfactory work," with a percentage of 78%.

Based on table 4.32 above, the total results of responses from 40 respondents regarding employee performance variables were obtained an overall average score of 90.6%. Where the total responses of the respondents were at intervals (81%-100%), so it can be concluded that the work motivation of employees of the network division and substation of PT. PLN (Persero) ULTG Bogor is very good. This is shown by the presence of respondents who give many responses "Always" regarding indicators on employee performance variables.

The indicator with the highest score is in the quality aspect, with a percentage of 95.7%. The sub-indicator that obtained the highest score was the statement "I carried out the work in accordance with standard operating procedures," with a percentage of 96%. Meanwhile, the lowest indicator is independence, with a percentage of 84%. The lowest sub-indicator is the statement "I have initiative at work without having to wait for orders from my superiors" with a percentage of 81.5%.

4.1.Simple Linear Analysis

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	33.119	6.996		4.734	.000
	Motivasi Kerja	.530	.106	.629	4.992	.000

a. Dependent Variable: Employee Performance

Based on the table above, it can be seen that the value of the constant is 33.119 and the regression coefficient is 0.530. based on these results, a simple linear regression equation model can be formulated in this study as follows:

Y=a+bX

Y=33.119+0.530X

In the table above, it is noted that the constant value obtained is 33.119, so it means that if the work motivation variable (X) is assumed to be 0, then the employee performance value (Y) is 33.119. The value of the regression coefficient with a positive value of 0.530 with a significance of 0.000 where the value is less than 0.05. this means that if there is an increase of 1%, then employee performance (Y) will increase by 0.530 units assuming another variable, namely constant work motivation (X).

4.2.Determinant Test

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.629[a]	.396	.380	3.63367

a. Predictors: (Constant), Work Motivation
b. Dependent Variable: Employee Performance

Based on the table above, an R Square value of 0.396 = 39.6% was obtained, this means that the independent variable of work motivation contributed to the dependent variable of employee performance by 39.6% and the remaining 60.4% was influenced by other variables that were not included in this study.

4.3.T Test

Coefficients[a]

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	33.119	6.996		4.734	.000
	Motivasi Kerja	.530	.106	.629	4.992	.000

a. Dependent Variable: Employee Performance

Based on Table 4.4- above, the t-count value is 4.992 which means t-calcul > t-table (4.992>2.024) and can also be seen from the significance value of 0.000<0.05. so that H0 is rejected and Ha is accepted, it can be concluded that the work motivation variable (X) has a significant effect on employee performance (Y).

4.4.Discussion

Based on the management of questionnaire data in the descriptive analysis of the work motivation variable (X), the average overall response regarding work motivation was 87.6% with the highest value found in the physiological needs indicator with a percentage of 92%, meaning that the company has succeeded in meeting the basic needs of employees regarding salary, reasonable working hours and adequate work facilities. Meanwhile, the response with the lowest score was found in the indicator of the need for an award with a percentage of 81%, meaning that even though the score was still in the very good category, it showed that some employees felt that they did not get recognition/praise, awards/appreciation for their contributions. If left unchecked, it can have an impact on decreasing employee motivation in the long run.

Based on the management of questionnaire data in a descriptive analysis on the employee performance variable (Y), the average overall response to employee performance was 90.6% with the highest score found in the quality indicator with a percentage of 96.7%, meaning that the performance of employees of the network division and substation at PT. PLN (Persero) ULTG Bogor meets the standards expected by the company. This is shown by the number of employees who always respond to quality indicators. While the response with the lowest score was found in the indicator of the need for an award with a percentage of 84%, even though the score was still in the very good category but showed that some employees still depended on the direction of their superiors to complete the work or were not fully confident in making decisions.

4.5.Interpretation of Research Results

Based on the results of the classical assumption test, the normality test shows a significance value of 0.200 where the value is greater than 0.05. This indicates that the data in this study is normally distributed and meets the requirements of the normality test. Meanwhile, the results of the heteroscedasticity test showed a significance value of 0.657 where the value was greater than 0.05. Thus, it can be concluded that there are no symptoms of heteroscedasticity, so the data are suitable for use in simple linear regression analysis.

Based on simple linear regression analysis, it is known that work motivation (X) has a positive and significant effect on employee performance (Y), with the regression equation model Y = 33.119 + 0.530X. This means that every one unit increase in the work motivation variable will increase employee performance by 0.530 units. Furthermore, from the results of the analysis of the determination coefficient (R^2), a value of 0.396 was obtained. This means that work motivation contributes 39.6% to employee performance, while the remaining 60.4% is influenced by other factors outside of this study.

Based on the t-value of 4.992, it is located in a positive area or the t-value of the calculation is greater than the t-table of 2.026 and the significance value is 0.000 < 0.05. So it can be concluded that work motivation (X) has a positive and significant effect on employee performance (Y).

From the results of this study, it can be compared in accordance with previous research, namely in a study conducted by Azhari, et al (2022) with the title "The Effect of Work Motivation on Employee Performance at PT. PLN (Persero) SULSELRABAR Main Unit". That work motivation (X) has a positive and significant influence on employee performance (Y) at PT. PLN (Persero) SULSELRABAR Main Unit. Similarly, Hasanah & Sa'diah (2022) in their research titled "The Influence of Work Motivation on Employee Performance at PT. PLN (Persero) ULP Daha". That Work Motivation (X) has a positive and significant influence on employee performance (Y) at PT. PLN (Persero) ULP Daha.

Thus, it can be concluded that work motivation has a positive effect on employee performance. In other words, the higher the work motivation that employees feel, the better their performance will be. On the other hand, if employee work motivation decreases, then employee performance will also decrease. Therefore, providing the right motivation is one of the important factors in encouraging employees to achieve optimal performance to achieve company goals.

5. Conclusion

Based on the results of the research conducted to determine the level of work motivation, employee performance and the influence of work motivation on employee performance in the network and substation divisions at PT. PLN (Persero) ULTG Bogor, the following conclusions were obtained:

1. The results of the descriptive analysis on the work motivation variable (X) show that the work motivation of employees in the network and substation division of PT. PLN (Persero) ULTG Bogor is in the very good category, with an average total score of 87.5%. The highest average score is on the physiological needs indicator with a percentage value of 92%, which shows that basic aspects such as salary, work facilities, and the fulfillment of daily living needs have been well met by the company. Meanwhile, the smallest average score was in the indicator of the need for appreciation with a percentage value of 81%, which indicates that although most employees feel

motivated, there is still room for improvement in terms of giving appreciation, praise/appreciation and recognition for satisfactory employee work.

2. The results of descriptive analysis on the employee performance variable (Y) also show that employee performance at PT. PLN (Persero) ULTG Bogor is included in the category of very good, with an average total score of 90.6%. The highest average score is on the quality indicator with a percentage value of 95.7%, which shows that most employees have carried out their work in accordance with standard operating procedures (SOPs). Meanwhile, the smallest average score is on the independence indicator with a percentage value of 84%, indicating that there are still some employees who do not fully have the initiative to complete work without direct direction from their superiors.

3. Based on the results of the t-test regarding the effect of work motivation on the performance of employees of the network division and substation at PT. PLN (Persero) ULTG Bogor is known that work motivation has a positive and significant effect on employee performance. These results can be known from the results of the t-test, where the significance value is 0.000<0.05 with a tcalcu>ttable (4.992>2.024) so it can be concluded that Ho was rejected and Ha was accepted, meaning that work motivation has a significant effect on employee performance. Based on the results of the determination coefficient analysis, an R Square value of 0.396 or 39.6% was obtained, which means that work motivation contributed to employee performance by 39.6% and by 60.4% was influenced by other factors or variables that were not included in this study.

6. Suggestion

Based on the results of the research and the conclusions that have been presented in this study, the author will provide suggestions in the hope of providing benefits and input, as follows:

1. The company must continue to maintain the fulfillment of physiological needs as the main foundation of work motivation. The work motivation of employees of the network division and substation at PT. PLN (Persero) ULTG Bogor has weaknesses in the indicator of the need for awards. So the author's suggestion is to strengthen appreciation programs such as awarding the best employees, promotions or recognition of individual and team achievements in an informal but meaningful form by giving sincere praise more often for the work that has been done. By giving this appreciation, employees will feel appreciated for the work they have been doing so far so that they can provide more motivation for the work to be done.

2. The company must continue to maintain and even improve employee performance. The performance of employees of the network and substation division at PT. PLN (Persero) ULTG Bogor has weaknesses in the independence indicator. So the author's suggestion is to provide greater support in the development of employee competence and confidence. This can be done through regular training, evaluating employees and encouraging employees when facing failures or problems, as well as assigning tasks that are challenging but still tailored to individual abilities and potential. If employees feel safe and supported in taking the initiative, then they will be more motivated to complete the work in innovative and responsible ways, and can prove that the human

resources that are owned by the company has met the criteria in understanding the job description well in accordance with the goals that the company wants to achieve.

3. As the results of the determination analysis, it can be seen that the value of R square = 0.396 is that the variation in the performance of the employees of the network division and substation at PT. PLN (Persero) ULTG Bogor is influenced by work motivation by 39.6% and the remaining 60.4% is influenced by other factors that are not included in this model. Therefore, it is hoped that the next researcher can pay attention to adding variables or other factors besides the variables in this study to find out and analyze it.

Abstract

This study aims to improve the quality of service at the Regional Drinking Water Company (PDAM) Tirta Pakuan in Bogor City using the Principal Component Analysis (PCA) method as a quantitative method. As a vital public service provider, PDAM is heavily responsible for ensuring customer satisfaction with its clean water supply. Therefore, assessing service aspects is crucial to ensure operational effectiveness and efficiency. This study uses the relevant ES-QUAL framework to assess electronic-based services and digital systems, particularly considering that PDAM Tirta Pakuan has developed an online customer service system.
Information was obtained from a questionnaire distributed to active customers of PDAM Tirta Pakuan. The questionnaire was structured based on four key aspects of ES-QUAL: Efficiency, Fulfillment, System Availability, Privacy, Responsiveness, Compensation, and Contact. The collected data was then analyzed using PCA to reduce dimensionality and identify the key components that most influence customers' perceptions of digital service quality.
The analysis results show several key components that significantly influence service quality, namely ease of accessing information and making online payments, system reliability in handling customer requests, and assurance of personal data security. These components explain most of the variation in customer perception data. These findings suggest that PDAM Tirta Pakuan needs to prioritize improving digital system efficiency, strengthening online service infrastructure, and enhancing user privacy security. This study concludes that PCA can be an effective analytical tool for simplifying multivariate data and providing appropriate recommendations for improving digital service quality.

Keywords: Service quality, PCA, key factors, ES-QUAL, customer satisfaction.

1. Introduction

Clean water is a basic human need that is crucial for public health, economic productivity, and overall well-being. According to WHO data,(2022)Approximately 2.2 billion people worldwide lack access to safe drinking water, and 3.6 billion have inadequate sanitation facilities. This situation contributes to the spread of diseases such as diarrhea, cholera, and dysentery. Efforts to increase access to clean water and safe sanitation are essential to reduce mortality, especially among children under five, as well as to increase productivity and reduce health costs.

Indonesia also faces similar challenges, as it commits to the Sustainable Development Goals (SDGs), particularly Targets 6.1 and 6.2, which aim to achieve universal access to safe and affordable drinking water and sanitation by 2030. At the local level, Bogor City is experiencing steady population growth, resulting in increased demand for clean water. According to the Bogor City Central Statistics Agency(2023)The total population is projected

to reach approximately 1,070,000 by 2023, up from 1,063,000 the previous year. This growth requires water service providers to increase the reach and quality of their services.

The Regional Drinking Water Company (Perumda) Tirta Pakuan in Bogor City plays a crucial role in supplying clean water to local residents. The number of customers continues to grow, reaching 179,461 in 2024. This trend reflects a healthy level of public trust, but also presents challenges in maintaining consistent service quality amidst increasing demand. Customer surveys indicate persistent complaints regarding water quality, service affordability, and speed of response. This underscores the need for in-depth evaluation and improvement of service quality to maintain customer satisfaction and trust.

Service quality is recognized as a critical element in building customer satisfaction and loyalty. The SERVQUAL model highlights five key dimensions: tangibles, reliability, responsiveness, assurance, and empathy, that influence customer perceptions.(Edward & Sahadev, 2011)However, in today's digital era, this model needs to be adapted to the characteristics of electronic-based services. The ES-QUAL model was developed to measure the quality of electronic services through dimensions such as efficiency, system availability, compliance, and privacy.(Parasuraman et al., 2005).

Perumda Tirta Pakuan has begun using a digital platform for bill payment processing, complaint management, and service monitoring, with the aim of improving the customer experience. However, an evaluation of this digital system implementation is needed to ensure it effectively meets customer expectations. Initial survey results indicate a gap between service expectations and actual customer experiences, particularly in terms of responsiveness and assurance. Previous research conducted byFithriyyah(2024)also noted issues such as delays in responding to complaints, inconsistent communication, and the use of digital channels that need to be further optimized.

In facing these challenges, a systematic and data-driven analytical approach is needed to determine priorities for service improvement. Principal Component Analysis (PCA) is a statistical method that can simplify the complexity of service quality data by identifying the main components that most influence customer perceptions. This study aims to apply PCA in the context of ES-QUAL to identify important factors that influence the service quality of PDAM Tirta Pakuan in Bogor City. It is hoped that the results of this study can serve as a basis for strategic decision-making in improving services, both conventional and digital, so that customer satisfaction can increase and support sustainable development in Bogor City.

2. Literature review

2.1 Service Quality and Customer Satisfaction

Service quality is the customer's perception of the extent to which the service received meets or exceeds their expectations.(Zeithaml et al., 2013)Good service quality contributes to customer satisfaction and loyalty, as well as enhancing a company's reputation. In the context of public services such as clean water, customer satisfaction is a key indicator of a service provider's success. Kotler(2000)states that consumer satisfaction arises from a comparison between expectations and actual service performance, where satisfied consumers tend to be loyal and recommend the service to others.

2.2 SERVQUAL and ES-QUAL Models

The SERVQUAL model measures service quality using five key aspects: physical, reliability, responsiveness, assurance, and empathy. This model is widely applied in various fields to assess the difference between customer expectations and experiences of a service.

However, with the increasing use of technology-based services, this model needs to be adapted to remain relevant to the digital context.

With this aim, Parasuraman et al.(2005)created the ES-QUAL model aimed at evaluating the quality of electronic services. ES-QUAL consists of four main dimensions, namely:

a) *Efficiency*: ease and speed in accessing online services.
b) *Fulfillment*: the ability of the service to fulfill commitments accurately and quickly.
c) *System Availability*: consistency and reliability of the system used.
d) *Privacy*: protection of personal information and security of transactions carried out.

Additionally, additional aspects such as Responsiveness, Compensation, and Contact are also important within a digital-based public service framework. These dimensions help organizations understand priority areas for improvement to meet customer expectations.

2.3 Implementation of ES-QUAL in PDAM Services

Bogor City's Tirta Pakuan Water Company (PDAM) has begun using digital services for payment processing, problem reporting, and water usage monitoring. However, a survey revealed a gap between service expectations and reality, particularly in terms of responsiveness and assurance. This aligns with previous research by Anisa et al.(2024)which noted that customer assurance scores were still relatively low. Meanwhile, a survey conducted by Fithriyyah(2024)revealed that although the level of customer satisfaction is considered very good, the responsiveness aspect still needs to be improved with a score of 69.52%.

These findings underscore the need for strategies to improve service quality, both in traditional and digital services. Amidst the digital transformation, PDAM's ability to provide fast, transparent, and secure services is crucial to increasing customer satisfaction and loyalty.

2.4 Principal Component Analysis

Principal Component Analysis (PCA) is a statistical method used to reduce the dimensionality of data by converting several interrelated variables into a smaller number of unrelated principal components.(Jolliffe, 2002). PCA attempts to retain the maximum variation of the original data, making it easier to understand and interpret patterns in complex data.

In service quality research, PCA is used to identify the key factors that most influence customer perceptions. By reducing data complexity, PCA helps service providers focus improvement efforts on aspects that have the greatest impact on customer satisfaction. Several previous studies have successfully applied PCA to analyze public services (Masanja et al., 2015), demonstrating the method's effectiveness in uncovering the factor structure underlying customer perceptions.

2.5 Previous Research

Several studies on service quality at drinking water providers in Indonesia show that dimensions such as physical appearance, reliability, responsiveness, assurance, and empathy are very important. Sintia and her colleagues(2020)This study highlights the lack of empathy in the Dampit District Water Company (PDAM). Research by Rheannisa Priyanka and colleagues(2022)found that responsiveness and empathy are the main factors influencing customer satisfaction at PDAM Tirta Taman Kota Bontang. Ihsan Rafi Muta'ali and Lena Satlita(2024)stated that although the clean water service at PERUMDAM Tangerang Regency was considered good, there were still complaints regarding the way complaints were answered and water distribution.

These results underscore the need for planned evaluations to improve service quality. For PDAM Tirta Pakuan in Bogor City, this includes the use of digital technology, increased responsiveness, and improved system reliability to meet today's customer expectations.

3. Methodology

3.1 Theoretical Framework

This study focuses on the ES-QUAL model designed by Parasuraman et al. in 2005 to assess service quality in cyberspace. The ES-QUAL model evaluates service quality using the dimensions of efficiency, fulfillment, system availability, and privacy, all of which are relevant to PDAM digital services. Furthermore, this study is also based on the concept of service quality from SERVQUAL, which outlines five key dimensions: physical appearance, reliability, responsiveness, assurance, and empathy.

In this study, the ES-QUAL model was chosen because PDAM Tirta Pakuan, Bogor City, has launched technology-based services such as applications for payments, complaints about water problems, and water usage monitoring. Therefore, service quality assessments must be able to accommodate more complex digital dimensions.

To analyze complex, multivariate data, this study used Principal Component Analysis (PCA). According to Jolliffe(2002)PCA is a statistical technique that can simplify data dimensions by finding the principal components that best explain data variation. PCA is particularly useful in public sector research because it can help group service indicators into key factors that influence customer perceptions, making it easier to prioritize service improvements.

3.2 Conceptual Framework

This study connects the theory of service quality based on the ES-QUAL model with the PCA method to determine the key elements that influence service quality at PDAM Tirta Pakuan in Bogor City. The conceptual framework of this study is explained below:

a) Input: Customer perception data regarding service quality measured by seven ES-QUAL aspects (efficiency, fulfillment, system availability, privacy, responsiveness, compensation, and contact).
b) Process: Data processing from the survey was carried out using PCA to reduce the number of dimensions and find important components.
c) Output: Key elements that need to be prioritized to improve service quality.

This framework is designed to assist PDAM Tirta Pakuan in developing evidence-based service improvement strategies for both traditional and digital services.

3.3 Instrumentation

This study used a quantitative method with a survey approach. Initial data were obtained through a questionnaire distributed to active household customers of PDAM Tirta Pakuan in Bogor City. The questionnaire was structured based on the ES-QUAL model, which consists of seven dimensions with various specific indicators within each dimension, including:

a) Efficiency: page loading speed, ease of browsing, efficient search system.
b) Fulfillment: accuracy of service information, timeliness, and reliability of delivery.
c) System Availability: system stability, access to key features.
d) Privacy: protection of personal data, security of transactions.
e) Responsiveness: speed in responding, ability to offer solutions.
f) Compensation: return, replacement and discount policies.
g) Contact: ease of access to communication channels, quality of interaction.

The research instrument was tested for validity and reliability. Validity testing was conducted using confirmatory factor analysis and construct validity using SPSS, where all indicators showed values >0.444. The reliability test yielded Cronbach's Alpha values above 0.7 for each dimension, indicating good internal consistency.

3.4 Research Design, Objects, and Locations

This research falls into the quantitative category with a descriptive approach. The focus of this study is customer perceptions regarding the service quality of PDAM Tirta Pakuan in Bogor City. The units analyzed are household customers who actively utilize PDAM services. The research location is the area served by PDAM Tirta Pakuan in Bogor City, West Java.

3.5 Population, Sample, and Sampling Techniques

The population of focus in this study is all household customers of PDAM Tirta Pakuan in Bogor City. The sample for the study was taken using the Simple Random Sampling method, where every individual in the population has an equal chance of being selected. This approach was applied to obtain a more accurate representation and minimize bias in sample selection. The respondents were active customers who were willing to complete a questionnaire regarding their views on the quality of service provided by PDAM Tirta Pakuan.

3.6 Data Collection and Processing Techniques

Data was obtained by distributing questionnaires both online and offline. After data collection was complete, the next step was data cleaning to remove incomplete or invalid entries. The verified data was then analyzed using PCA to reduce dimensionality and identify the principal components that explain the greatest variation in customer perceptions.

3.7 Data analysis

The data analysis phase was conducted using Principal Component Analysis (PCA) using SPSS and RStudio software. PCA functions to group service quality indicators into several main, mutually independent components, thus facilitating the determination of important factors for service improvement. The PCA results were interpreted to provide strategic recommendations for improving the service quality of PDAM Tirta Pakuan, Bogor City.

4. Results and Discussion

4.1 Principal Component Analysis (PCA) Results

After analyzing 37 digital service quality indicators using PCA with Varimax rotation, six principal components (RC1 to RC6) were generated, which collectively explain 74.04% of the total data variation. Table 1 below summarizes the PCA component results based on the resulting variance:

Table 1. Summary of Principal Component Analysis Components

Main Components	Standard Deviation	Proportion of Variance (%)	Cumulative Proportion (%)
RC2(Component 1)	17,215	**27.44%**	27.44%
RC4(Component 2)	5,371	**11.99%**	39.43%
RC3(Component 3)	1,391	**11.75%**	51.18%
RC6(Component 4)	1,317	**10.88%**	62.06%

RC5(Component 5)	1,074	**6.72%**	68.78%
RC1(Component 6)	1,025	**5.26%**	74.04%

Source: Primary Data 2025, processed

Indicators with a minimum loading value of 0.5 were used to determine the indicators that make up each component. Table 2 below presents a summary of the indicators included in the six components.

Table 2. Loading Indicator ≥ 0.5 per PCA Component

Component	Code	Question	Loading
RC2	P29	How quickly do you respond to technical issues?	0.869
	P5–P8	The speed and smoothness of the SIMOTIP application and the ease of digital payments	0.837–0.857
	P20–P21	Minimal interference & application system speed	0.827
	P14–P15	Accuracy and up-to-dateness of billing and schedule information	0.777–0.779
	P25–P26	Security in digital payment transactions	0.764
RC4	P11	Website appearance and design	0.792
	P10	Ease of finding service information	0.659
	P12	Payment and billing information	0.630
	P28	Trust in digital data	0.614
	P9, P18	Website speed, informative Instagram content	0.537–0.614
RC3	P31	Instagram admin's speed in responding	0.748
	P37	Experience of interaction with officers	0.743
	P36	Ease of finding service contact information	0.667
	P30	Response speed of digital service channels	0.643
RC6	P24–P23	Consistency and activity of service information on Instagram and the official website	0.528–0.765
	P22, P19	Update service information & reliability of social media information	0.528–0.765
RC5	P1–P4	Ease and consistency of access to digital services across multiple platforms	0.558–0.698
RC1	P33	How easy is it to get service disruption information?	0.535
	P27	How secure are you when accessing your customer data?	0.517
	P34	How often does Perumda Tirta Pakuan provide information on digital disruptions?	0.508

Source: Primary Data 2025, processed

4.2 Principal Component Interpretation

1. RC2 – Digital System Speed and Reliability (27.44%)

These aspects include application speed, minimal disruption, accurate billing information, and security in digital transactions. Customers want efficient, reliable, and secure digital systems for various services.

2. RC4 – Ease of Navigation and Readability of Digital Content (11.99%)
   This section underlines the importance of the appearance and readability of digital information on a website, as well as the ease of finding service information visually.
3. RC3 – Digital Officer Rapid Response (11.75%)
   Demonstrates customer expectations for human interaction through digital channels. Responding quickly via Instagram or other digital channels significantly impacts perceptions of service quality.
4. RC6 – Regularity and Activity of Official Information (10.88%)
   Customers appreciate consistency in the delivery of active and scheduled official information, especially on websites and social media platforms.
5. RC5 – Easy Access and Cross-Channel Integration (6.72%)
   Demonstrates customer desire for a connected service experience across multiple digital platforms, such as apps, social media, and websites.
6. RC1 – Information Protection and Clarity (5.26%)
   This dimension includes the need for clarity in service disruption announcements as well as customer data protection when using digital services.

4.3 Discussion

These findings indicate that the quality of digital services from Perumda Tirta Pakuan, Bogor City, is not only influenced by the technical performance of the application or website, but also by views on security, relationships between service channels, and the quality of digital interactions.

PCA successfully grouped interrelated indicators into six key aspects. This demonstrates the effectiveness of this method in simplifying data and establishing fact-based strategic priorities.

These results also support the ES-QUAL theory.(Parasuraman et al., 2005)which identifies aspects such as efficiency, system availability, compliance, and privacy as central to digital service perceptions. In the local context of PDAM, this is evident in customers' high emphasis on service speed, information consistency, and digital security.

5. Conclusions

5.1 Conclusion

This study aims to identify key elements influencing the quality of digital services at Perumda Tirta Pakuan, Bogor City, using principal component analysis (PCA) based on the ES-QUAL framework. The analysis resulted in the classification of 37 indicators into six main components, which together explain 74.04% of the variation in the data.

The six main elements include:

1. Smoothness and Reliability of Digital Systems – includes application speed, minimal disruption, information accuracy, and security in transactions.
2. Navigation and Readability of Digital Information – emphasizes ease of finding service information through informative websites and user-friendly designs.
3. Digital Officer Responsiveness – highlights the importance of officer response speed through digital channels.
4. Consistency and Activeness of Official Information – indicates the need for consistent and active information updates on official channels.

5. Ease of Access and Cross-Channel Integration – relates to the connected service experience across digital platforms.
6. Information Security and Transparency – includes customer data protection and transparency in service disruption notifications.

The results of this study show that the quality of PDAM services in the digital era does not only depend on the technology used, but also on the method of delivery, access, and protection of information.

5.2 Strategic Implications

The results of this study provide significant suggestions for Perumda Tirta Pakuan, Bogor City, in formulating data-driven service improvement strategies. Some proposed strategies are as follows:

1. Improving digital infrastructure to accelerate and strengthen applications.
2. Develop website and application designs that are more accessible and understandable to customers.
3. Strengthening data protection systems to maintain customer trust.
4. Establish responsive service standards for digital channels, including social media.
5. Establish a regular schedule for updating service information across all official channels.
6. Integrate communication and transaction channels to make the customer experience smoother and more coordinated.

By implementing the strategy based on the PCA results, it is hoped that PDAM Tirta Pakuan can increase customer satisfaction and support sustainable development goals in the clean water services sector in Bogor City.

Abstract

This study examines the influence of hedonic shopping, shopping lifestyle, and shopping motivation on impulse purchases among e-commerce consumers in Indonesia. With the rapid growth of Indonesia's e-commerce market, it is important to understand the psychological factors that drive consumer behaviour. This study uses a descriptive quantitative approach by distributing questionnaires to 112 respondents who are e-commerce users. Independent variables include hedonic shopping and shopping lifestyle; the dependent variable is impulse buying, and the moderating variable is shopping motivation. The results show that hedonic shopping and shopping motivation have a significant positive effect on impulse purchases, while shopping lifestyle does not. Furthermore, shopping motivation cannot moderate the relationship between hedonic shopping and shopping lifestyle on impulse purchases. These findings underscore the importance of emotional experience and internal motivation in driving impulse purchases in e-commerce environments.

EMPLOYEE WELL-BEING AND EMPLOYEE RETENTION: AN EMPIRICAL STUDY IN INDONESIAN COMPANIES

Hendri Ardianto[1,*], Gunawan Gusnadi[2], Indra Dharma[3]
[1,2,3]Buddhist Business and Management Department, Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

The high rate of employee turnover remains one of the most pressing challenges faced by modern organizations. This phenomenon is driven not only by salary-related concerns but also by limited career development opportunities, unsupportive workplace cultures, and misalignment between personal and corporate values. Employee resignations are frequently motivated by dissatisfaction in the workplace and the pursuit of better career prospects or a more compatible organizational environment. This study aims to examine the influence of employee well-being on employee retention. Employing a quantitative survey method, data were collected from 154 employees out of a total population of 250 in an agricultural product processing company. A five-point Likert-scale questionnaire, validated and tested for reliability, served as the primary instrument for data collection. The data were analysed using descriptive and inferential statistics, including simple linear regression at a 0.05 significance level via SPSS version 24.0. The results revealed a significant and positive relationship between employee well-being and retention. Employees who experience a higher sense of well-being are more likely to remain with the company. Furthermore, longer tenure is associated with more stable levels of well-being and retention. These findings underscore the critical importance of prioritizing employee well-being as a strategic approach to fostering loyalty and minimizing turnover. Targeted managerial interventions particularly during critical tenure periods are essential for cultivating a sustainable and healthy work environment.

Keywords: employee well-being, employee retention, workplace well-being, turnover, fidelity.

REWARD SYSTEMS AND EMPLOYEE PERFORMANCE: EXAMINING THE IMPACT IN ORGANIZATIONAL SETTINGS

Meta Amelia Putri[1,*], Hendri Ardianto[2], Andi Prayoga[3]
[1,2,3]Buddhist Business and Management Department, Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

The increasing demands for productivity in the food industry require companies to optimally manage their human resources. One key factor believed to drive employee performance is the reward system. This study aims to analyse the impact of the reward system on employee performance in companies operating within the food sector. The methodology employed is a quantitative survey involving 85 employees, selected through total sampling techniques. Data were collected using a five-point Likert scale questionnaire and analysed using descriptive and inferential statistics through simple linear regression with the assistance of SPSS version 24 at a significance level of 0.05. The results indicate that the reward system has a positive and significant effect on employee performance. The better the reward system implemented, the higher the level of performance exhibited by employees. These findings underscore the importance of a fair and structured reward system as a managerial strategy to enhance work productivity within the food industry.

Keywords: reward system, employee performance, food industry, human resource management

1. Introduction

The increasing competitiveness of the job market encourages organizations to manage human resources effectively to achieve their goals optimally. One crucial aspect of human resource management is the provision of rewards or recognition for employees (Meirinhos et al., 2023). A reward system not only serves as a form of appreciation for performance but also acts as a motivational tool that encourages employees to work more productively and with higher quality (Førland & Roxå, 2024).

Rewards can take the form of financial incentives such as bonuses and commissions, as well as non-financial rewards like recognition, promotions, or a comfortable work environment (Alkandi et al., 2023; Siregar et al., 2023). When employees feel valued for their contributions, they are more likely to exhibit higher work commitment, loyalty to the organization, and motivation to enhance their performance (Rizaie et al., 2023). Conversely, the absence of an effective reward system can diminish work enthusiasm and lead to job dissatisfaction.

Companies inherently have high expectations for each employee to demonstrate good, consistent performance and to make tangible contributions to the achievement of organizational goals. The ideal employee, from the company's perspective, is one who not only meets targets but also possesses initiative, responsibility, and a strong work ethic (Nayem & Uddin, 2024). Additionally, employees who are disciplined, results-oriented, capable of teamwork, and continuously developing their competencies are highly sought after in a dynamic and competitive work environment (Islam & Periaiah, 2023). However, in reality, not all employees can meet these standards. Various internal and external factors, such as lack of motivation, inadequate reward systems, disproportionate workloads, or unsupportive work environments, can negatively impact employee performance (Afrin et al., 2023). Therefore, it is essential for companies to understand the factors influencing employee performance, including the implementation of an effective and fair reward system.

According to a survey conducted by the National Administrative Agency (LAN) in 2023, it was found that 52% of civil servants feel that the reward system in their institutions does not effectively motivate performance improvement. Additionally, around 48% of respondents indicated that the lack of clarity in reward distribution negatively affects work enthusiasm and loyalty to the organization. This data highlights the critical role of the reward system in creating a productive and competitive work environment. However, many organizations have yet to implement this system optimally, whether in terms of the types of rewards, achievement indicators, or transparency in the distribution process.

Data from the National Civil Service Agency (BKN) indicates that approximately 35% of Civil Servants (ASN) in Indonesia are classified as "deadwood," meaning they exhibit low performance, while only 19.82% fall into the "star" category, indicating high performance. In the private sector, a survey conducted by Jobstreet.com involving 17,623 respondents in October 2022 revealed that 73% of employees are dissatisfied with their jobs. This dissatisfaction is driven by several factors, including 54% of employees working in roles that do not align with their educational backgrounds, 60% feeling they lack clear career advancement opportunities, and 85% experiencing an imbalance between work and personal life (work-life balance). Furthermore, a report from Gallup revealed that employee engagement levels in Indonesia are relatively low, with only 8% of managers actively engaged, 23% not engaged, and 36% highly disengaged in managerial activities and team development. These data points underscore the need for a comprehensive evaluation of performance management systems across various sectors, as well as the importance of implementing an effective reward system as a strategy to enhance motivation, job satisfaction, and employee productivity sustainably.

Although various organizations have implemented reward systems as part of their performance enhancement strategies, the effectiveness of these implementations remains an unresolved issue. Some organizations provide rewards routinely but do not base them on objectively measurable performance indicators, thus failing to drive significant changes in employee work behavior. Conversely, there are organizations that lack a clear reward system, resulting in low employee motivation and loyalty. This gap indicates a misalignment between the implementation of the reward system and the expected performance outcomes. Additionally, the limited quantitative research directly measuring the impact of reward systems on employee performance, particularly within specific contexts, makes this topic important for further investigation.

From the discussion above, there is a need for further research to quantitatively assess the impact of reward systems on employee performance. This research is essential to provide empirical evidence regarding the extent to which the implemented reward systems can enhance productivity, responsibility, and the quality of employee work. The results of this study are expected to serve as a reference for institutions or organizations in designing more effective and targeted reward policies.

2. Literature review

2.1. Employee Performance

Employee performance is one of the key indicators of an organization's success in achieving its objectives. Employee performance is not only related to an individual's ability to complete tasks but also to the extent of the employee's contribution to the company's strategic goals (Udin et al., 2023). According to Ardianto et al., (2020); Kundan et al., (2024), employee performance is influenced by various factors, such as motivation, ability, and the opportunities provided by the organization. These factors work simultaneously to determine how well employees execute their tasks and responsibilities.

Research conducted by (Rivaldo & Nabella, 2023), emphasizes that employee performance is significantly affected by external factors, such as organizational support, effective leadership, and a positive work culture. An organization that can create a supportive environment is likely to have high-performing employees. Furthermore, research by Mustaqim et al., (2024), reveals that employee engagement is a key factor contributing to performance improvement. Employees who feel valued and actively involved in the decision-making process are more likely to demonstrate better performance.

Studies by Abdelwahed et al., (2023); Al-Kharabsheh et al., (2023), show that job satisfaction and organizational commitment are closely related to employee performance. When employees are satisfied with their jobs and have a high commitment to the organization, they tend to work harder and deliver more optimal results.

2.2.Reward System

The reward system is one of the most commonly used strategies by organizations to enhance employee performance. According to Chi et al., (2023), an effective reward system can serve as a strong motivational driver. A fair and transparent reward system can motivate employees to improve their performance, as they feel appreciated for their contributions. A well-designed reward system also plays a role in fostering loyalty and high job satisfaction.

A study by Chen, (2023) indicates that performance-based rewards have a significant impact on increasing employee productivity. Rewards given based on clear and measurable performance achievements will enhance employees' work enthusiasm, encouraging them to reach higher targets. Research by Adaora Chinelo Uzochukwu et al., (2023) also found that a reward system that includes financial incentives, social recognition, and career development opportunities can improve overall employee performance.

However, on the other hand, research by Sulistiasih & Widodo, (2022) reveals that an unfair reward system can have negative consequences on employee motivation and performance. When employees feel that the rewards they receive do not correspond to the effort they have put in, it can lead to dissatisfaction, decreased morale, and ultimately poor performance. Therefore, it is crucial for organizations to design a reward system that is fair, transparent, and aligned with the needs and expectations of employees.

3. Methodology

The research method employed in this study is a survey method with a quantitative approach. The sample consists of 85 employees working in a company operating in the food sector. The entire population was used as the research sample, thus the sampling technique applied is total sampling. This approach was chosen to obtain a comprehensive and accurate depiction of the relationship between the reward system and employee performance within the company.

Data collection was conducted through the distribution of a questionnaire designed to measure respondents' perceptions of two main variables: the reward system as the independent variable (X) and employee performance as the dependent variable (Y). The research instrument utilized a five-point Likert scale, ranging from "strongly disagree" to "strongly agree," to ensure that the data collected is structured, objective, and amenable to statistical analysis.

Data analysis in this study was conducted using two approaches: descriptive statistics and inferential statistics. Descriptive statistics were used to describe the characteristics of the respondents and the distribution of data for each variable, while inferential statistics were employed to test the impact of the reward system on employee performance. Prior to conducting further analysis, validity and reliability tests were performed on the questionnaire instrument to ensure that the measurement tool used is appropriate and consistent. Hypothesis testing was carried out using a significance level of 0.05, and data processing was conducted

with the assistance of SPSS version 24 statistical software. This research is expected to provide empirical contributions to the understanding of human resource management, particularly regarding the role of the reward system in enhancing employee performance in the food industry sector.

4. Results and discussions

4.1. The Validity Test

The validity test was conducted to determine the extent to which the question items in the questionnaire were able to measure the intended variables. The validity criteria are determined based on the r-count> r-table value (in this case, the r-table at N = 85 and α = 0.05 is 0.213). All items on the instrument show an r-count value greater than r-table, so all items are declared valid and suitable for use in this study.

4.2.The Reliability Test

Reliability test is used to measure the internal consistency of the research instrument. This test was carried out using Cronbach's Alpha with the criteria that the value of α> 0.6 was considered reliable.

Table 1. Instrument Reliability Test Results

Variable	Cronbach's Alpha	Description
Reward System	0,811	Reliable
Employee Performance	0,832	Reliable

The Cronbach's Alpha value for both variables is above 0.8 which indicates that the instrument has a very good level of reliability.

4.3.The Normality Test

The normality test is carried out to determine whether the data is normally distributed, as a condition of inferential analysis. This test uses the Kolmogorov-Smirnov method with sig criteria. > 0.05 indicates that the data is normally distributed.

Table 2. Normality Output Test (Kolmogorov-Smirnov)

Variable	Sig. (Asymp. Sig. 2-tailed)	Description
Reward System	0,200	Normal
Employee Performance	0,135	Normal

The significance value for both variables is greater than 0.05, so the data is declared normally distributed and fulfils the assumptions of the parametric test.

4.4.Statistical Descriptions

Statistical descriptions are used to provide an overview of the data on each variable. The statistics displayed include the number of respondents (N), minimum, maximum, average (mean), and standard deviation values of each variable.

Table 3. Variable Statistical Descriptions

Variable	N	Minimum	Maximum	Mean	Std. Deviation
Reward System (X)	85	15	25	20,84	2,317
Employee Performance (Y)	85	18	30	24,73	2,814

The average respondent's perception of the reward system is at 20.84 from a maximum scale of 25, indicating that the reward system in the company is perceived well by employees. Meanwhile, the average employee performance value of 24.73 out of a maximum of 30 indicates that in general employee performance is in the high category. The relatively small standard deviation value indicates that respondents' perceptions of the two variables tend to be homogeneous.

Table 4. Respondent Distribution

Respondent Distribution by Gender		
Gender	**Frequency**	**Percentage**
Male	48	56,5%
Female	37	43,5%
Total	85	100%
Distribution of Respondents Based on Age		
< 25 years	20	23,5%
25–35 years	42	49,4%
> 35 years	23	27,1%
Total	85	100%
Distribution of Respondents based of Length of Service	**Frequency Percentage**	
2–5 years	33	38,8%
6–10 years	29	34,1%
> 10 years	23	27,1%
Total	85	100%

The majority of respondents in this study were male (56.5%), indicating that the workforce in this food company is slightly dominated by men. Based on age, the 25-35 age group was the largest (49.4%), indicating that the majority of employees are in the productive and professionally mature age phase. Meanwhile, in terms of tenure, 38.8% of respondents have worked for 2-5 years, indicating that most employees have sufficient work experience to understand the reward and performance appraisal system in place at the company. This composition supports the validity of the data, as the respondents are considered to have had adequate exposure to the work dynamics and managerial systems applied.

4.5.Hypothesis Test

Hypothesis testing was conducted to determine whether there is a significant influence between the reward system (X) on employee performance (Y). Simple linear regression analysis was used in this test.

Table 5. Simple Linear Regression Analysis Results

Model	**Unstandardized Coefficients (B)**	**t**	**Sig.**
(Constant)	12,415	4,822	0,000
Reward (X)	0,634	6,738	0,000

Tabel 6. Model Summary

R	**R Square**	**Adjusted R Square**	**Std. Error of the Estimate**
0,615	0,378	0,371	3,467

The analysis shows that the reward system has a positive and significant effect on employee performance with a significance value of 0.000 <0.05. The regression coefficient of 0.634 means that every one unit increase in the reward system will increase employee performance by 0.634 units. The R square value of 0.378 indicates that 37.8% of the variation

in employee performance can be explained by the reward system, while the rest is influenced by other factors. Based on the results of simple linear regression analysis, the regression equation is obtained as follows: Y = 12,415 + 0,634X

- Y = Employee Performance
- X = Reward System
- 12,415 is a constant (intercept), which means that if there is no reward system (value X = 0), then the base value of employee performance is predicted to be 12.415 units.
- 0,634 is the regression coefficient, which shows that every one unit increase in the reward system will increase employee performance by 0.634 units.

The reward system has a positive impact on employee performance. This means that the better the reward system implemented by the company, the higher the performance exhibited by the employees. This positive coefficient underscores that the reward system variable is a significant predictor in explaining variations in employee performance. Therefore, companies aiming to enhance employee performance need to pay special attention to the reward systems in place, both in financial and non-financial forms. The findings of this study indicate that the reward system positively and significantly affects employee performance. This aligns with the assertion by Di Ponzio et al., (2023) that individuals are motivated to work optimally when they believe that their efforts will yield good performance, which will subsequently be followed by rewards that hold value for them. In the context of the food company that is the subject of this research, employees demonstrate higher performance when they perceive the implemented reward system as fair, transparent, and relevant to their contributions.

These results are in line with the research conducted by which found that reward systems, whether in financial or non-financial forms, play a significant role in enhancing employee motivation and productivity in the food and beverage industry. Rewards are not only viewed as a form of compensation but also as a form of recognition that motivates employees to perform better.

Additionally, these findings are supported by research by Hu et al., (2024) which states that a well-structured reward system has a direct impact on individual performance improvement, particularly in labor-intensive companies. In the food industry, which demands teamwork and consistency in production quality, rewards can serve as an effective driving tool to ensure that employees not only meet standards but also focus on results and quality (Correia et al., 2023).

From a descriptive data perspective, the average score for the reward system is 20.84 out of a maximum of 25, indicating that employees' perceptions of the reward system are relatively high. Similarly, the average employee performance score reaches 24.73 out of a maximum of 30, signifying that their performance is also very good. This demonstrates a direct correlation between perceptions of the reward system and performance outcomes, as confirmed by the regression analysis results.

Thus, it can be concluded that the existence of an effective reward system is a strategic factor in efforts to enhance employee performance. Food companies that wish to maintain and improve employee productivity need to develop a reward system that is not only financially competitive but also considers intrinsic factors such as recognition, career development opportunities, and a supportive work environment.

5. Conclusion

Based on the results of the data analysis and the discussions conducted, it can be concluded that the reward system has a positive and significant impact on employee performance in companies operating within the food sector. This is evidenced by the results of the simple linear regression analysis, which indicates that each increase in the reward system is proportionally followed by an improvement in employee performance. The high average values for both the

reward system and employee performance further reinforce the finding that, in general, employees have a positive perception of the reward policies implemented by the company, and this directly affects their performance. Thus, it can be concluded that the implementation of a fair, transparent reward system that aligns with employee contributions is a crucial strategy for enhancing productivity and work effectiveness in the food industry sector. This research provides empirical contributions to the development of human resource management policies, particularly in designing reward systems that can drive optimal employee performance.

EMPLOYEE ENGAGEMENT AND TURNOVER INTENTION: A QUANTITATIVE ANALYSIS OF WORKFORCE DYNAMICS

Juniartie[1*], Fendi Darma[2], Hendri Ardianto[3]
[1,2,3]Buddhist Business and Management Department, Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

This study investigates the impact of employee engagement on turnover intentions among employees in the pharmaceutical industry. The objective of this research is to examine the influence of employee engagement on turnover intentions, focusing on how employee engagement affects the desire to leave the organization. The method employed is a quantitative cross-sectional survey design, with data collected from 100 employees. Employee engagement is measured using the Utrecht Work Engagement Scale (UWES), while turnover intentions are assessed using a standardized Turnover Intention Scale. Data analysis is conducted using simple linear regression through SPSS 26. The results indicate a significant negative relationship between employee engagement and turnover intentions ($B = -0.452$, $p < 0.001$), with employee engagement explaining 37.5% of the variance in turnover intentions ($R^2 = 0.375$). These findings suggest that higher levels of employee engagement are associated with lower turnover intentions. Theoretically, this research contributes to the existing literature by confirming the inverse relationship between engagement and the desire to leave. Practically, it highlights the importance for organizations to invest in strategies that enhance employee engagement to reduce turnover rates and retain talent.

Keywords: Employee Engagement, Turnover Intentions, Employee Retention, Pharmaceutical Companies

1. Introduction

Employee engagement is a crucial concept in human resource management studies that describes the extent to which employees are emotionally, cognitively, and physically involved in their work and the organization they work for. Engaged employees typically exhibit high enthusiasm, loyalty, and a strong internal drive to contribute maximally to the achievement of organizational goals (Park & Kim, 2024; Zhong et al., 2024). Conversely, turnover intention reflects an employee's tendency or desire to leave their job in the near future, often serving as an early indicator of employee turnover (BowenXue et al., 2024). In a global context, employee retention has become a primary concern for organizations, as losing competent employees not only impacts recruitment and retraining costs but also leads to serious consequences such as the loss of institutional knowledge, decreased productivity, lowered team morale, and disrupted operational continuity. A study by Dwidienawati et al., (2024), shows that companies with high levels of employee engagement experience 21% higher productivity and 59% lower turnover rates compared to companies with low engagement.

In the context of Indonesia, the issue of employee turnover has become increasingly complex due to various external and internal factors (Wang et al., 2024). Intense labor competition, especially in rapidly growing industries such as information technology, finance, and manufacturing, has led to active workforce mobility, where workers have more career options and incentives from other companies (Galanis, Moisoglou, Papathanasiou, et al., 2024). Additionally, there is a shortage of skilled labor in certain sectors, further exacerbating the situation (Zambrano-Chumo & Guevara, 2024). Other factors, such as generational value and expectation differences (e.g., between Generation Z and Millennials versus Generation X),

economic instability, and suboptimal human resource management systems, also contribute to the intention to leave. A JobStreet Indonesia survey (2023) revealed that approximately 45% of employees in Indonesia expressed a desire to change jobs within the next year, primarily due to feeling undervalued, lacking clear career prospects, or feeling emotionally disengaged from their work (Jobstreet, 2022). Meanwhile, according to Work Institute, (2020), each employee who leaves an organization can incur a loss of up to 33% of their annual salary, including recruitment, training costs, and indirect impacts on productivity. This underscores the importance of understanding and enhancing employee engagement as a primary strategy for reducing turnover intentions and maintaining organizational stability.

Although the relationship between employee engagement and turnover intention has been extensively studied in various countries, there are several gaps in the literature that need to be addressed, particularly in the context of pharmaceutical companies. First, most previous studies were conducted in Western countries with different organizational culture characteristics, making their relevance and applicability in the Indonesian context still needing validation. Second, the limited research focusing on specific industries or employee groups in Indonesia has resulted in a lack of in-depth understanding of the factors influencing turnover intentions in sectors with high turnover rates. Third, specific dimensions of employee engagement such as vigor, dedication, and absorption have not been extensively studied separately to determine which dimensions contribute most to turnover intentions. Additionally, approaches that consider mediating variables such as job satisfaction or moderating variables like perceptions of organizational support are still very limited, even though they could provide a more comprehensive and accurate picture of the mechanisms underlying the relationship between engagement and turnover intentions (Dwidienawati et al., 2024; Kida & Takemura, 2024). Furthermore, most previous studies utilized cross-sectional designs with limited sample sizes, which do not adequately explain causal relationships in depth. Therefore, this research aims to fill these gaps by empirically examining the relationship between employee engagement and turnover intentions in the context of the [specific industry] in Indonesia, using an approach that considers the dimensions of engagement in detail as well as the potential influence of mediating and moderating variables.

Based on this background, this study formulates the main research question as follows: To what extent does employee engagement influence turnover intentions in the context of pharmaceutical companies? Based on this problem formulation, the objectives of this study are to (1) analyze the impact of employee engagement on turnover intentions in pharmaceutical companies.

This research is expected to provide significant theoretical and practical contributions. Theoretically, this study enriches the literature on employee engagement and turnover intentions by adding empirical evidence from pharmaceutical companies, which have received limited academic attention to date. By examining specific dimensions of employee engagement, this research also offers a deeper and more complex understanding of the factors influencing turnover intentions. From a practical perspective, the findings of this study can provide valuable guidance for managers and HR practitioners in designing more targeted and effective employee engagement strategies to reduce turnover and enhance workforce retention and loyalty. Thus, this study not only addresses gaps in the literature but also offers concrete solutions for organizations facing workforce sustainability challenges in today's competitive era.

2. Literature review

2.1. Employee Engagement: Conceptualization and Dimensions

Employee engagement refers to the level of enthusiasm and emotional involvement that employees have towards their work and their organization. Alshaabani & Rudnák, (2023),

define employee engagement as a psychological condition in which individuals utilize themselves physically, cognitively, and emotionally in the execution of their job tasks. Meanwhile, Canavesi & Minelli, (2022), interpret employee engagement as a positive and satisfying state related to work, characterized by three main dimensions: vigor, dedication, and absorption. Nguyen & Nguyen, (2023), define engagement as the extent to which employees feel emotionally and cognitively connected to their work, which is assessed through the Q12 survey that evaluates aspects such as role clarity, recognition, and opportunities for growth.

The theoretical model commonly used to understand employee engagement is the Job Demands-Resources (JD-R) model, which explains that employee engagement arises when there is a balance between job demands and job resources. Additionally, the Utrecht Work Engagement Scale (UWES) was developed to measure engagement through three dimensions: vigor, which refers to the level of energy and mental resilience while working; dedication, which reflects a sense of significance, inspiration, and pride in one's work; and absorption, which refers to full involvement in work to the point of losing track of time. Furthermore, various studies have shown that employee engagement is influenced by several factors such as job characteristics (task variety, autonomy, feedback), transformational leadership styles, an inclusive organizational culture, and employees' perceptions of organizational support.

2.2.Turnover Intention: Conceptualization and Measurement

Turnover intention refers to the tendency or desire of employees to voluntarily leave their jobs in the near future. According to Sypniewska et al., (2023), turnover intention is an early stage in the resignation process that reflects the mental consideration of seeking other employment. Although turnover intention does not always result in actual resignation, many studies indicate that this intention is the strongest predictor of actual turnover behavior. Therefore, understanding turnover intention is crucial in organizational research as it can provide early signals for management to implement interventions.

Factors influencing turnover intention include job satisfaction, organizational commitment, perceptions of alternative job opportunities outside the organization, and work-life balance (Singh et al., 2024; Zambrano-Chumo & Guevara, 2024). Additionally, negative work experiences, role ambiguity, and work pressure can also increase the intention to leave. Turnover intention is typically measured using multi-item scales, such as the instrument developed by Gautam & Gautam, (2024), which includes questions like: "I often think about leaving this organization" or "I will look for another job in the near future."

2.3. The Relationship Between Employee Engagement and Turnover Intention

Various studies have explored the relationship between employee engagement and turnover intention, with most indicating a significant negative relationship between the two. Theoretically, employees with high levels of engagement tend to experience job satisfaction, exhibit greater loyalty to the organization, and possess high intrinsic motivation, which ultimately reduces their desire to change jobs. The JD-R model suggests that when job resources such as peer support, recognition, and development opportunities are available, employee engagement increases, and turnover intentions decrease.

Empirically, a study conducted by Maharani & Tamara, (2024), shows that high work engagement is negatively correlated with turnover intention. Other research by Abet et al., (2024); Winoto Tj et al., (2024) also supports the finding that vigor, dedication, and absorption can significantly reduce the intention to quit. However, some studies have found varying results depending on the context, industry type, or individual factors. Additionally, several studies indicate that the relationship between engagement and turnover intention can be mediated by variables such as job satisfaction or affective commitment, and influenced by moderating factors such as organizational support, leadership style, or employee personality. This highlights the importance of a more complex approach to understanding this relationship.

3. Methodology

This study employs a quantitative approach with a cross-sectional survey design to analyze the impact of employee engagement on turnover intention among employees in pharmaceutical companies in Indonesia. The sampling technique used is purposive sampling, with criteria including permanent employees who have a minimum tenure of six months, resulting in a total of 100 respondents. Data collection was conducted through an online questionnaire using Google Forms, which was distributed voluntarily, ensuring anonymity and confidentiality of the data, and including informed consent. The instruments used consist of the Utrecht Work Engagement Scale (UWES) to measure employee engagement and the turnover intention scale from Cammann et al. (1979), both utilizing a 5-point Likert scale. Data analysis was performed using SPSS version 26 through simple linear regression, following a data cleaning process and testing of basic assumptions such as normality and linearity. The reliability test results indicate that the instruments have a Cronbach's alpha value of 0.88 for employee engagement and 0.79 for turnover intention, demonstrating good internal consistency, while content validity is supported by the use of instruments that have been validated in previous studies.

4. Results and Discussions

4.1. Sample Size and Response Rate

A total of 100 questionnaires were distributed to permanent employees in pharmaceutical companies. Of these, 89 questionnaires were returned and could be analysed. Thus, the response rate obtained was 89%, which indicates that the participation of respondents in this study is high and reflects adequate representation of the population.

4.2. Demographic Characteristics of Respondents

Demographic characteristics include gender, age, education level, and length of service. The data is presented in Table 1 below:

Table 1. Demographic Characteristics of Respondents

Demographic Variable	Category/Value	Frequency (n)	Percentage (%)
Gender	Male	78	59.1%
	Female	54	40.9%
Age	Average	32.8 years	
	Standard Deviation	6.2	
Last Education	SHS	20	15.2%
	Bachelor Degree	89	67.4%
	Master Degree	23	17.4%
Length of Service	Average	5.7years	
	Standard Deviation	3.4	

Respondents were predominantly undergraduate graduates, and the majority were male. Age and length of service show high variability, as shown by the standard deviation of the respondents.

4.3. Validity Test

The type of validity used is construct validity through exploratory factor analysis (EFA). The KMO test result of 0.843 indicates that the data is adequate to be analysed using EFA.

Bartlett's Test of Sphericity is significant ($p < 0.001$), indicating a correlation between components.

Table 2. KMO dan Bartlett's Test

KMO Measure of Sampling Adequacy	**0.843**
Bartlett's Test of Sphericity	Sig. = .000

All items had factor loadings > 0.5, with two main factors extracted: Employee Engagement and Turnover Intention, explaining 67.8% of the total variance.

4.4. Reliability Test

Reliability was tested using Cronbach's Alpha and Composite Reliability. The results are shown in Table 3.

Table 3. Reliability Test Output

Construct	Cronbach's Alpha	Composite Reliability
Employee Engagement	0.892	0.901
Turnover Intention	0.864	0.880

The value of $\alpha > 0.7$ indicates that both constructs have high reliability and good internal consistency.

4.5. Normality Test

The normality test was conducted using the Shapiro-Wilk Test. The results show that the data is normally distributed:

Table 4. Normality Test (Shapiro-Wilk)

Variable	Statistic	Sig. (p)
Employee Engagement	0.978	0.072
Turnover Intention	0.975	0.056

Because the p value> 0.05, it can be concluded that the data is normally distributed.

4.6. Variance Homogeneity Test

Levene's test was used to test the homogeneity of variance between groups. The results are as follows:

Table 5. Levene's Test for Equality of Variances

Variable	Levene Statistic	df1	df2	Sig. (p)
Turnover Intention	1.172	1	130	0.284

Since $p > 0.05$, the variance between groups is considered homogeneous.

4.7. Hypothesis Testing

4.7.1. Correlation Analysis

The relationship between Employee Engagement and Turnover Intention was tested using Pearson correlation. The results of the analysis are shown in Table 6.

Table 6. Pearson Correlation between Employee Engagement and Turnover Intention

Variable 1	Variable 2	Pearson Correlation	Sig. (p)
Employee Engagement	Turnover Intention	-0.612**	< 0.001

There is a significant negative correlation between Employee Engagement and Turnover Intention. This means that the higher the employee engagement, the lower their intention to leave the company.

4.7.2. Simple Linear Regression Analysis

Hypothesis: *"Employee engagement is negatively related to turnover intention."*

Table 7. Results of Simple Linear Regression Analysis

Model	B	Std. Error	Beta	t	Sig. (p)
(Constant)	4.875	0.379	—	12.86	<0.001
Employee Engagement	-0.452	0.065	-0.612	-6.95	<0.001

Tabel 8. Model Summary

R	R^2	Adjusted R^2	F	Sig. F
0.612	0.375	0.370	48.30	<0.001

The negative regression coefficient indicates that every one unit increase in Employee Engagement will decrease Turnover Intention by 0.452 units. The R^2 value of 0.375 indicates that Employee Engagement explains 37.5% of the variance in Turnover Intention. The regression model is statistically significant ($p < 0.001$), thus the research hypothesis is accepted.

4.8. Discussion

The results of the simple linear regression analysis in this study indicate a significant negative relationship between employee engagement and turnover intention. This means that the higher the level of employee engagement, the lower their tendency to leave the organization. The regression coefficient (β) of -0.452 indicates that for every one-unit increase in employee engagement, the turnover intention score decreases by 0.452 units. This relationship is supported by a significance value (p-value) < 0.05.

These findings align with theory and previous studies that state employee engagement is a protective factor against the intention to leave a job. As noted by Husniati et al., (2024); Rizky, (2022), employees who are emotionally, cognitively, and physically engaged in their work tend to have higher organizational commitment and do not seek alternative employment.

This research also supports the findings of Galanis, Moisoglou, Malliarou, et al., (2024), which show that employee engagement has a direct effect on turnover intentions, where high engagement influences employees' perceptions of job meaning, loyalty, and job satisfaction. From a theoretical implication perspective, these results emphasize the importance of engagement theory in explaining employee work behavior, particularly regarding the intention to change jobs. Engagement is not only a reaction to the work environment but also an indicator that can significantly predict employee retention. Practically, these results provide important insights for human resource management, especially in designing employee retention strategies (Ardianto et al., 2020; Kundan et al., 2024). HR managers can enhance employee engagement through career development programs, involvement in decision-making, and creating a supportive work environment. By increasing engagement, companies can reduce turnover rates, which can incur high costs both financially and culturally.

The R-squared value of 0.385 indicates that 38.5% of the variation in turnover intention can be explained by the employee engagement variable. This suggests that while the relationship is significant, there are other factors that also influence turnover intention (e.g.,

work stress, salary satisfaction, or relationships with supervisors) that need to be further investigated.

5. Conclusion

This study aims to examine the effect of employee engagement on turnover intention among employees in pharmaceutical companies. Based on the statistical analysis conducted using SPSS software, it was found that employee engagement has a significant negative effect on turnover intention. This means that the higher the level of employee engagement with their work, the lower their intention to leave the organization. These findings are supported by the results of the Pearson correlation test, which shows a strong negative relationship ($r = -0.612$, $p < 0.001$), as well as the simple linear regression analysis indicating that employee engagement explains 37.5% of the variance in turnover intention ($R^2 = 0.375$). The negative and significant regression coefficient value ($B = -0.452$, $p < 0.001$) further emphasizes that employee engagement is an important factor in reducing employees' intention to leave.

Regarding the validity and reliability of the instruments, the results of the construct and reliability tests indicate that the measurement tools used have met scientific standards, with Cronbach's Alpha and composite reliability values above 0.7. Statistical assumption tests such as normality and homogeneity of variance were also satisfied, which strengthens the validity of the analysis conducted. Practically, the results of this study provide important implications for human resource management, particularly in formulating employee retention strategies. Enhancing employee engagement through emotional involvement, commitment to work, and effective communication can be a strategic step to reduce turnover intention. However, this study also has limitations, such as the limitation of generalizability since it was conducted in only one company and did not consider other factors that may influence turnover intention, such as work stress or salary satisfaction.

Therefore, future research is recommended to include additional variables and to use longitudinal methods to observe the dynamics of the relationships between variables over a certain period. The results of this study are not only statistically significant but also practically relevant in the context of human resource management. The measurement of effect size and the proportion of variance explained reinforce the importance of building employee engagement as an effort to reduce the desire to change jobs among employees.

FLEXIBLE WORK ARRANGEMENTS AND WORK EFFECTIVENESS: INSIGHTS FROM EMPLOYEE EXPERIENCES

Juni Suryanadi[1,*], Lia Sari[2], Derianto[3]
[1,2,3]Buddhist Business and Management Department, Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

Technological advancements and shifts in social dynamics have transformed the way organizations manage their workforce, prompting many to adopt Flexible Work Arrangements (FWAs) as a means of enhancing employee work effectiveness. This study aims to explore the influence of FWAs on employee work effectiveness, taking into account individual factors, organizational culture, and the readiness of supporting infrastructure. The research methodology employed is quantitative, utilizing a survey of 135 respondents who are directly involved in the implementation of FWAs. Data analysis was conducted using simple linear regression with the aid of SPSS version 27. The research findings demonstrate that FWAs have a positive and significant impact on work effectiveness, contributing 27.1% to overall effectiveness. This discovery underscores that flexibility in work arrangements, including time and location, can enhance employee performance and work-life balance. However, work effectiveness is also influenced by other factors such as motivation, leadership, and organizational culture. This study provides practical implications for management in designing adaptive and sustainable work policies to increase employee productivity and well-being.

Keywords: Flexible work arrangements, flexible policy, work effectiveness, work productivity

1. Introduction

Technological developments and changing social dynamics have shifted the way organizations manage their workforce (Rotatori, Lee, & Sleeva, 2021). The post-COVID-19 pandemic has brought significant transformations in organizational management, especially in terms of work system arrangements (Vahdat, 2022). One form of innovation that is growing rapidly is the implementation of Flexible Work Arrangements, a work system that provides flexibility to employees in determining the time and place of work (Akkaş, 2023). . Flexible Work Arrangements include various schemes such as remote working, hybrid working, flextime, job sharing (Anik & Habib, 2025). This phenomenon has received widespread attention among practitioners and academics because it is considered capable of increasing productivity, efficiency, and balance between work life and personal life of employees (Cavaliere et al., 2021). However, the implementation of Flexible Work Arrangements does not always run smoothly and often raises various issues, especially those related to the effectiveness of employees in carrying out their duties and responsibilities.

The emergence of flexible work schemes is triggered by the need for organizations to remain productive in conditions that limit direct physical interaction. However, the work effectiveness expected from the implementation of Flexible Work Arrangements is not always achieved (Soga, Bolade-Ogunfodun, Mariani, Nasr, & Laker, 2022). In practice, many organizations face challenges such as difficulties in supervision, weak communication between teams, and lack of work synergy due to physical distance (Neirotti, Raguseo, & Gastaldi, 2019). This creates a gap between management's expectation of work efficiency through flexibility, and the reality on the ground, which shows barriers to productivity and decreased employee engagement with tasks and organizations (Urrila, Siiriäinen, Mäkelä, & Kangas, 2025). This

mismatch indicates a fundamental problem in human resource management, especially in building an effective and sustainable work system.

One of the common challenges arising from the implementation of Flexible Work Arrangements (FWAs) is the blurring of boundaries between personal life and work. Many employees struggle to manage their time effectively as their workspace and personal space merge into one (Kossek, Perrigino, & Lautsch, 2023). This situation can potentially lead to stress, emotional exhaustion, and reduced work focus, ultimately negatively impacting work effectiveness. On the other hand, employees with strong self-discipline and time management skills often feel more productive and motivated due to the flexibility offered by FWAs. This suggests that the impact of Flexible Work Arrangements on work effectiveness is contextual and heavily influenced by individual characteristics, organizational culture, and the readiness of supporting infrastructure (Weideman, 2018).

This suggests that there is an urgent need to better understand how employees' subjective experiences of flexible working contribute to work effectiveness. In this case, work effectiveness is not only understood as achieving targets or work results, but also includes efficient, collaborative, and sustainable work processes (Cabarcos et al., 2022). For this reason, an approach that is able to comprehensively explore the views and experiences of employees is important. This approach can open new insights into the factors that support and hinder the success of Flexible Work Arrangements in improving work effectiveness.

Based on this description, it is important to conduct this research to fill the knowledge gap regarding the relationship between Flexible Work Arrangements and work effectiveness from the perspective of employees in more depth. By understanding the dynamics that occur behind the implementation of flexible work systems, organizations can design human resource management strategies that are more adaptive, responsive, and sustainability-oriented. Therefore, this study aims to comprehensively explore how the implementation of Flexible Work Arrangements affects work effectiveness, by considering individual factors, organizational culture, as well as the readiness of relevant support systems.

2. Literature Review

2.1. Work Effectiveness

Work effectiveness is a key indicator in assessing an individual's success in carrying out the tasks and responsibilities assigned by the organization. This concept not only refers to the achievement of targets or work outputs, but also encompasses process efficiency, the quality of results, and contributions to organizational goals (Gazi, Yusof, Islam, Amin, & Senathirajah, 2024). It covers the extent to which employees are able to achieve set objectives, utilize resources efficiently, and contribute to the organization's overall outcomes (Qalati, Zafar, Fan, Sánchez Limón, & Khaskheli, 2022). Work effectiveness is influenced by various internal and external factors, such as individual motivation, leadership, organizational culture, as well as technological and workplace support. Work effectiveness can be described as the extent to which a person performs tasks according to established standards and contributes to the achievement of organizational objectives (Nirwana, Sriyanti, & Nurdyanti, 2025). The importance of competence, effort, and consistency in work behavior is emphasized as the foundation for achieving optimal effectiveness (Modise, 2023).

Work effectiveness results from the interaction between an organization's formal systems and the dynamics of individual behavior within the work environment (Nnah Ugoani, 2020). Work effectiveness not only measures final outcomes, but also takes into account work processes, the quality of decision-making, and the ability to adapt to organizational dynamics. Within this framework, effectiveness serves as an important measure of both operational and strategic success (Korhonen, Jääskeläinen, Laine, & Saukkonen, 2023). An individual's work effectiveness depends on the expectation that their efforts will lead to good performance

(expectancy), that performance will yield certain outcomes (instrumentality), and that these outcomes are valued by the individual (valence). When all three are high, individuals are more motivated to work effectively (Fang, 2023). Work effectiveness also depends on the balance between job demands (such as workload and time pressure) and job resources (such as social support, autonomy, and feedback) (Demerouti & Bakker, 2023). When resources are sufficient, effectiveness can be maintained even under high demands.

2.2. Flexible Work Arrangements

Flexible work arrangements are an organizational response to the changing dynamics of modern work, influenced by technological advancements, globalization demands, and shifting workforce values (Stella, 2020). Flexible work arrangements encompass various forms of flexibility in the workplace, such as remote working, telecommuting, flextime, compressed workweeks, job sharing, and hybrid working, which allow employees greater freedom in determining when, where, and how they work (Austin-egole & Iheanacho, 2022). The aim of flexible work arrangements is to improve work-life balance, increase job satisfaction, and help organizations attract and retain top talent (Indradewa & Prasetio, 2023; Yildizhan et al., 2023). Flexible work arrangements can have a positive impact on productivity and work effectiveness (Wei & Li, 2024).

The implementation of flexible work arrangements is also associated with increased employee retention and loyalty, as it provides a sense of autonomy and trust in performing their work (Astriani, 2023). Therefore, the success of flexible work arrangements heavily depends on organizational readiness, including technological infrastructure, digital leadership, and a work culture that supports flexibility and collaboration (AlNuaimi, Kumar Singh, Ren, Budhwar, & Vorobyev, 2022). In this context, employees' subjective experiences become a crucial element that needs deeper understanding to assess the effectiveness of flexible work arrangements in a contextual and humane manner (Lauring & Jonasson, 2024). Furthermore, the implementation of flexible work arrangements is supported by various management and organizational behavior theories that explain how work flexibility can influence individual and organizational effectiveness.

The work-life balance theory states that when employees are able to balance job demands and personal life, stress levels decrease, job satisfaction increases, and performance becomes more optimal (Susanto et al., 2022). This theory emphasizes the importance of flexible policies as an organizational effort to create a healthy and productive work environment (Hyder, 2024). The implementation of flexible work arrangements provides space for such autonomy, allowing employees to manage their own work rhythms and methods (Alifyanti et al., 2021). Assessing employees' subjective experiences is crucial to understanding the barriers, opportunities, and effectiveness of these policies in enhancing job performance, productivity, and emotional attachment to the organization. This experience-based approach can offer deep insights to refine workforce management strategies in an increasingly dynamic and technology-driven modern work era.

3. Methodology

This study uses a quantitative approach with a survey method to measure the effect of flexible work arrangements on work effectiveness in employees. The population in this study were all 203 employees, with a sample size of 135 respondents determined using the Slovin formula with an error rate of 5%. The sampling technique used purposive sampling, with the criteria of employees who have worked for at least one year and are directly involved in the implementation of flexible work arrangements at work. Data collection was conducted through the distribution of a closed questionnaire designed using a five-point Likert scale, ranging from

"strongly disagree" to "strongly agree", to measure respondents' perceptions of flexible work arrangements and work effectiveness variables. Prior to analysis, the research instruments were tested for validity and reliability to ensure measurement accuracy and consistency. Furthermore, the data were analyzed using SPSS version 27 software, with descriptive statistical techniques to describe the characteristics of respondents and data distribution, and simple linear regression analysis to test the effect of flexible work arrangements on work effectiveness. This research aims to provide empirical evidence on how the implementation of work flexibility contributes to employee effectiveness in completing their tasks and responsibilities.

4. Results and Discussions

4.1. Classical Assumption Tests

4.1.1. Normality Test

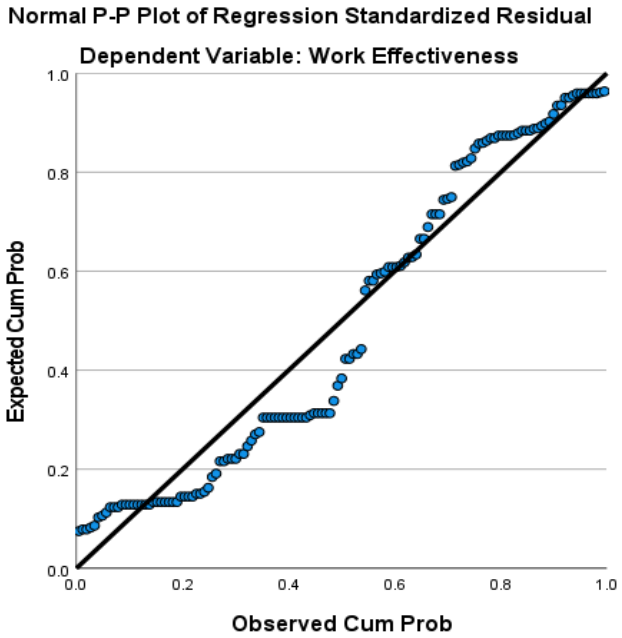

Figure 1.1 Normal P-P Plot of Regression Standardized Residua

In this graph, there is a straight diagonal line that represents a perfectly normal distribution. The blue dots represent the standardized residual values of the regression results. If the points spread and follow the diagonal line with a pattern that is relatively close to the line, it can be concluded that the residuals are normally distributed. Based on observations of the graph, most of the points appear to follow a pattern close to the diagonal line, although there are slight deviations at the beginning (bottom left) and the center. However, these deviations are not very significant and are still within reasonable limits. Therefore, it can be concluded that the residuals in this regression model generally fulfill the assumption of normality. This shows that the regression model used has good enough validity in terms of the assumption of normal distribution of residuals, so that the results of the analysis can be considered reliable to be used in making decisions or drawing conclusions.

4.1.2. Multicollinearity Test

Table 1.1 Multicollinearity Test

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	39.946	5.570		7.171	.000		
	Flexible Work Arrangements	.265	.083	.266	3.178	.002	.392	2.544
a. Dependent Variable: Work Effectiveness								

Based on Table 1.1 regarding the multicollinearity test results, it is known that the Flexible Work Arrangements independent variable has a Tolerance value of 0.392 and a VIF value of 2.544. Both values are still within acceptable limits, where the tolerance value is greater than 0.10 and the VIF value is less than 10. This indicates that there are no multicollinearity symptoms in the regression model, so the Flexible Work Arrangements variable does not show a high correlation relationship with other independent variables and can still be used in the regression analysis model appropriately..

Furthermore, the regression coefficient value of 0.265 with a significance level of 0.002 (smaller than 0.05) indicates that the Flexible Work Arrangements variable has a positive and significant influence on Work Effectiveness. In other words, in addition to proving to be free from multicollinearity problems, this variable also makes a meaningful contribution in improving work effectiveness.

4.1.3. Multicollinearity Test

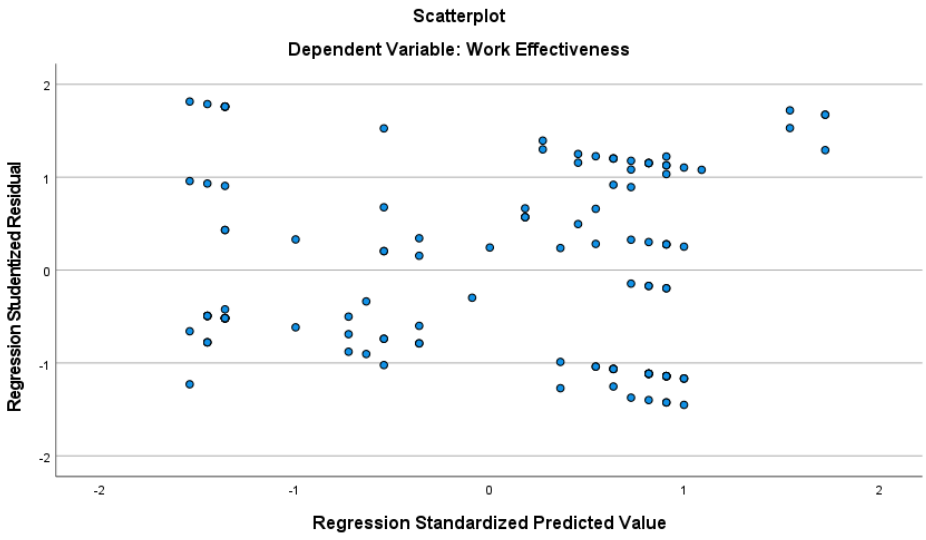

Figure 1.2. Scatterplot Dependent Variabel: Work Efffectiveness

Based on Graph 1.2 scatterplot displayed above, which shows the relationship between Regression Standardized Predicted Value and Regression Standardized Residual, it can be concluded that the distribution of residual points does not form a certain clear pattern, either curved, U-patterned, or linear. Instead, the points spread randomly around the zero horizontal line. This indicates that the assumption of homoscedasticity is fulfilled, i.e. the residual variance is constant across the entire range of predicted values.

This random distribution pattern also indicates that there is no heteroscedasticity problem in the regression model used. Thus, the regression model is considered to fulfill one of the classical assumptions of multiple linear regression, namely the assumption of normality and homogeneous distribution of residuals. This aspect is important to ensure the validity of the

results of the regression analysis conducted on the effect of Flexible Work Arrangements variables on Work Effectiveness.

4.2. Simplified Linear Regression Test

Table 1.2 Anova Model

ANOVA[a]						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1144.878	1	1144.878	10.099	.002[b]
	Residual	15077.715	133	113.366		
	Total	16222.593	134			
a. Dependent Variable: Work Effectiveness						
b. Predictors: (Constant), Flexible Work Arrangements						

Based on Table 1.2 ANOVA above, it can be seen that the significance value (Sig.) is 0.002, which is smaller than the 0.05 significance level. This shows that the regression model used is statistically significant, which means that the independent variable Flexible Work Arrangements together have a significant influence on the dependent variable Work Effectiveness. The calculated F value of 10.099 also indicates that the regression model constructed is good enough to explain the variation in the observed data. This value is obtained from dividing the regression Mean Square (1144.878) by the residual Mean Square (113.366), which reflects the strength of the relationship between the predictor variable and the predicted variable. Thus, the effect of flexible work arrangements on work effectiveness is significant, which means that the better the implementation of a flexible work system in an organization, the higher the work effectiveness achieved by employees. This result supports the hypothesis that Flexible Work Arrangements play an important role in improving work performance, which in turn can be used as a basis for managerial policy making in the workplace.

Table 1.3 Summary Model

Model Summary[b]				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.466[a]	.271	.064	10.647
a. Predictors: (Constant), Flexible Work Arrangements				
b. Dependent Variable: Work Effectiveness				

Table 1.3 shows that the R Square value is 0.271, which indicates that the Flexible Work Arrangements variable has an influence on Work Effectiveness of 27.1%. This means that 27.1% of variations or changes in employee work effectiveness can be explained by the existence of flexible work arrangements. Meanwhile, the remaining 72.9% is influenced by other factors outside this model, such as work motivation, leadership, work environment, organizational culture, or other individual factors. The R Square value, which is in the medium range, shows that work flexibility does have an important role in shaping work effectiveness, but it is not dominant enough. This indicates that flexible work arrangements do not fully determine the success of work effectiveness, but can be one of the significant supporting elements. Therefore, to get a more comprehensive picture, further studies are needed by including other variables that also have the potential to influence work effectiveness.

4.3. The Effect Flexible Work Arrangements to Work Effectiveness

The main problem in this research is the low work effectiveness faced by some organizations, especially in the context of work flexibility that has not been regulated

optimally. In the midst of changes in the modern work environment and the increasing need for a balance between work and personal life, the question arises whether flexible work arrangements have a significant influence on employee work effectiveness. To answer this, a simple linear regression analysis was conducted to test how much work flexibility contributes to work effectiveness. The results of the analysis show that flexible work arrangements have a positive and significant influence on work effectiveness. This can be seen from the regression coefficient value of 0.265 with a significance level of 0.002 which is smaller than 0.05. Thus, it can be concluded that the higher the application of work flexibility in an organization, the higher the work effectiveness achieved by employees. This shows that more flexible work time and place arrangements can have a positive impact on individual performance.

The analysis shows that the R Square value of 0.271 indicates that flexible work arrangements are able to explain about 27.1% of the variation in employee work effectiveness. Although the contribution is not yet dominant, this value indicates a significant influence, considering that work effectiveness is the result of a combination of various complex factors. This finding is in line with Shammout's view, which states that work effectiveness is influenced by work environment factors, organizational behavior, and individual characteristics. Therefore, work flexibility can be considered as one of the important components in supporting employee performance, although it is not the only determinant (Shammout, 2021). The remaining 72.9% variation is most likely caused by other factors not included in this model, such as intrinsic motivation, leadership, organizational culture, and personal factors such as personality and individual abilities. This is reinforced by the opinion of Alkaf et al who emphasize that work effectiveness is the result of the interaction of internal and external factors that influence each other (Alkaf, Yusliza, Saputra, Muhammad, & Bon, 2021). Therefore, further research development is strongly recommended by adding other variables in order to be able to explain variations in work effectiveness more comprehensively.

Meanwhile, the ANOVA test results show that the regression model is statistically significant with a significance value of 0.002 ($p < 0.05$). This indicates that overall, the model built has a good ability to explain the relationship between work flexibility and work effectiveness. Thus, it can be concluded that the independent variable, namely flexible work arrangements, simultaneously exerts a real and significant influence on the dependent variable, namely work effectiveness. This result is consistent with Geoffrey's findings that work flexibility has a positive impact on employee productivity and job satisfaction. The feasibility of the regression model indicates that the results of the analysis can be used as a basis for managerial decision-making, especially in the preparation of flexible work policies in organizations. (Geoffrey, 2025). Work arrangements that allow employees to customize their work time and location are proven to increase work comfort, reduce stress, and ultimately improve work effectiveness. (Sultan, Fachmi, & Klimko, 2024). Therefore, these results provide important practical implications for management in an effort to create an adaptive work environment that supports optimal performance.

Furthermore, the results of this study support the concept of work-life balance, where work flexibility is considered an important instrument in helping employees balance the demands of work and personal life. Work flexibility can increase employee commitment and retention, and reduce burnout. Thus, organizations that implement flexible work policies can gain long-term benefits in the form of increased human resource loyalty and effectiveness (Boccoli, Tims, Gastaldi, & Corso, 2024). However, it is important to realize that work flexibility also requires effective management, as not all types of work are suitable for flexible work systems. The implementation of work flexibility must be adjusted to the type of work, organizational culture, and individual needs so that the benefits can be optimized. Therefore, this policy needs to be

supported by a good performance monitoring system and effective communication between managers and employees (Sekhar & Patwardhan, 2023).

Theoretically, this study contributes to strengthening the literature on the relationship between work flexibility and work effectiveness in the context of modern organizations. The findings support the two-factor theory of motivation which states that favorable working conditions are one of the factors that increase employee satisfaction and performance. (Nickerson, 2025). Work flexibility, in this case, acts as a motivating factor that can increase employee enthusiasm and responsibility for their duties. Taking the results and analysis into consideration, it is concluded that flexible work arrangements make a noticeable contribution to employee effectiveness. Although there are still other factors that influence overall effectiveness, work flexibility has proven to be one of the viable approaches to be implemented in improving productivity and job satisfaction in today's organizational environment. Therefore, the implementation of flexible work systems deserves management attention as part of a strategy to improve human resource performance.

5. Conclusion

Based on the results of this study, it can be concluded that flexible work arrangements have a positive and significant influence on employee work effectiveness. Although the contribution is not fully dominant, work flexibility is proven to have a significant impact in improving individual performance in the organizational environment. This shows that the higher the application of flexibility in work time and location, the higher the level of work effectiveness achieved by employees. Work flexibility allows employees to organize their work schedules according to their personal and professional needs, which ultimately results in increased motivation, comfort, and productivity. Flexible working conditions also help reduce stress due to time and travel pressures, and support work-life balance.

The findings strengthen the argument that work flexibility is one of the strategic approaches that can be applied in improving the quality of human resources. In a managerial context, the results of this study provide a foundation for policy making that supports the implementation of flexible work systems in a sustainable manner. Therefore, the implementation of work flexibility should be accompanied by a good performance monitoring system and effective communication between leaders and employees to ensure that organizational goals are still optimally achieved.

EMPLOYEE BRANDING AND RETENTION: INVESTIGATING STRATEGIC IMPLICATIONS IN THE WORKPLACE

Nadila Asmanisa[1,*], Juni Suryanadi[2], Intan Panya Lita Teri[3]
[1,2,3]Buddhist Business and Management Department, Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

This study aims to determine the effect of Employee Branding on Employee Retention. The background of this research is based on the importance of building a positive company image not only for external interests but also in efforts to retain employees in a competitive work environment. The research method used is quantitative with a simple linear regression approach. The number of respondents in this study is 128 employees selected through purposive sampling techniques. Data analysis was conducted using two approaches: descriptive statistics and inferential statistics. Before further analysis, the instruments were tested for validity and reliability to ensure the feasibility and consistency of the measurements. Hypothesis testing was conducted at a significance level of 0.05 using statistical software such as SPSS 24.0. The analysis results show that Employee Branding has a positive and significant effect on Employee Retention. The better the Employee Branding strategy implemented by the company, the greater the tendency for employees to stay and remain loyal to the organization. These findings emphasize that Employee Branding is one of the strategic factors in human resource management that can enhance workforce stability in the long term.

Keywords: Employee Branding, Employee Retention, Loyalty, Human Resources.

1. Introduction

In the era of globalization and increasingly strict business competition, organizations are required not only to attract the best talent but also to ensure that employees who have joined remain engaged and contribute optimally (Judeh & Khader, 2023). Employee retention has become one of the important indicators of successful human resource management, as high turnover rates can lead to operational instability, increased recruitment and training costs, and the loss of knowledge and experience that have been built within the organization (AlQudah et al., 2023). The phenomenon of high employee turnover is still prevalent across various industrial sectors, particularly in organizations that have not adopted a strategic approach to building employee loyalty (Paigude et al., 2023). One strategy that has gained attention is employee branding, which is the process of shaping and strengthening the organization's image as a positive workplace by conveying values, work culture, and meaningful work experiences for employees (Elsafty & Oraby, 2022). Employee branding is believed to enhance pride, emotional attachment, and a sense of belonging to the company, which ultimately impacts employees' desire to stay longer within the organization (Alzaid & Dukhaykh, 2023). Therefore, this research is important to understand the extent to which employee branding influences employee retention, particularly in the context of organizations in Indonesia.

Employee branding was first introduced by Sutanto & Kurniawan, (2016) as an internal marketing approach aimed at attracting and retaining employees. Alhmoud & Rjoub, (2019); Hassan, (2022), later developed this concept by emphasizing employer value proposition (EVP) and internal branding, both of which play a role in creating an attractive company identity for employees. Various previous studies have shown that employee branding has a positive relationship with work engagement (Ikram et al., 2021), kepuasan kerja (Khalid & Nawab, 2018), and intention to stay within the organization (Wassem et al., 2019). Zayed et

al., (2022) also emphasize the importance of consistent internal communication in shaping employees' understanding and commitment to the company's values. However, most of these studies were conducted in developed countries and focused more on specific industrial sectors. Research on the direct impact of employee branding on employee retention is still limited, especially in the context of organizations in Indonesia. Therefore, this study is novel in empirically testing the relationship between employee branding and employee retention in a work environment characterized by different cultural traits and work values.

Although previous literature has extensively researched the impact of employer branding on organizational attractiveness from an external perspective, there remains a gap in understanding how employees' perceptions of the company brand as an employer can influence their behavior, particularly regarding their decision to stay with the organization. Existing research tends to highlight the external aspects of employer branding, while its internal contributions to employee retention have not been explored in depth. Additionally, a social exchange theory-based approach provides a strong theoretical foundation for understanding the reciprocal relationship between employees and the organization (Bibi et al., 2018). In this context, when organizations provide positive work experiences and meet employees' expectations through various employer branding initiatives, employees are likely to reciprocate by increasing their loyalty and desire to remain employed in the long term (Tian et al., 2020). Considering the importance of employer branding in shaping employee loyalty and retention, this study aims to examine the direct effect of employer branding on employee retention. This study is also expected to enrich the literature on human resource management, particularly in the context of internal branding as a strategy for workforce sustainability in the current era of global competition.

Based on the above description, the research problem formulated in this study is: Does employee branding significantly affect employee retention? This study aims to analyze the effect of employee branding on employee retention in an organization. Specifically, this research is expected to provide theoretical contributions to the development of human resource management knowledge, as well as practical recommendations for organizations in designing effective employee branding strategies to enhance loyalty and workforce sustainability amid the challenges of global competition.

2. Literature Review

2.1. Employee Branding

Employee branding is a strategic concept in human resource management that relates to an organization's efforts to build a positive company image as an ideal workplace, both in the eyes of internal employees and potential external candidates. According to Juariyah et al., (2023), employee branding is the process by which a company consistently communicates its values and organizational culture to employees so that they can authentically represent the company's identity. Employee branding not only serves to attract new talent but also plays a crucial role in enhancing the engagement and loyalty of employees who have already joined the organization. Research conducted by Fatih Fuadi & Destin Fitria Anjayani, (2023) shows that employee branding significantly affects employee engagement and commitment. When a company is able to build a strong employer brand, employees feel prouder to be part of that organization, which encourages them to contribute more and stay longer. In this context, employee branding becomes a strategic tool that bridges the relationship between the company's values and the behaviors and perceptions of employees. Furthermore, Khairy et al., (2023) emphasize that effective employee branding can strengthen positive perceptions of the company, increase job satisfaction, and reduce the intention to leave the organization.

Näppä et al., (2023), state that the success of employee branding heavily depends on the consistency between the promises made in the employer brand and the actual experiences felt

by employees. Discrepancies between expectations and reality can diminish trust and lead to decreased retention. Meanwhile, Santiago, (2023), highlights the importance of strong internal communication and an inclusive organizational culture in shaping internal brand awareness, allowing employees to internalize the company's values more effectively. Overall, employee branding is a strategic approach focused on creating meaningful work experiences, fostering a sense of belonging, and strengthening collective identity within the organization. This strategy is becoming increasingly relevant amid the competition for talent recruitment and the rising expectations of the workforce regarding values, meaning, and balance in the workplace. Thus, strengthening employee branding is believed to not only enhance the company's reputation as an employer of choice but also play a vital role in improving employee retention sustainably. However, the effectiveness of employee branding is significantly influenced by the organizational culture, leadership style, and clarity of the values instilled internally.

2.2. Employee Retention

Employee retention is one of the primaries focuses in human resource management, as high employee turnover can negatively impact the stability and performance of an organization. Employee retention is defined as the organization's efforts to retain high-potential employees who contribute to the achievement of the company's long-term goals (Heriyanti & Nasim, 2023). In this context, employee retention depends not only on salary or financial incentives but also on non-financial factors such as job satisfaction, employee engagement, and the relationships formed between employees and supervisors (Asep Dadan Suhendar, 2021). This indicates that employee retention is more than just a matter of remuneration; it is also about creating a supportive and satisfying work environment.

Research Lisdayanti et al., (2018), shows that job satisfaction is one of the main factors influencing employees' decisions to stay within the organization. Employees who are satisfied with their jobs, whether in terms of the tasks they perform, social relationships with colleagues, or recognition for their contributions, tend to have a higher attachment to the organization and are less likely to leave the company. This aligns with the study Wirayudha & Adnyani, (2020), which emphasizes that job satisfaction is a significant predictor of employee retention decisions, as it provides a sense of meaning in work and positive relationships with supervisors. Additionally, organizational commitment is also an important factor in employee retention. (Ma'rufi & Anam, 2019) identify three dimensions of organizational commitment: affective commitment, continuance commitment, and normative commitment, each of which has a significant impact on employees' decisions to stay. Affective commitment, which reflects employees' feelings toward the organization, is the strongest factor in enhancing employee retention (Knezović & Jamak, 2023).

Employees with high affective commitment will feel more attached and have a greater desire to remain with the organization, even when presented with more attractive job offers from outside. Another study by Hendriana et al., (2023), emphasizes the importance of career development opportunities in influencing employee retention. Employees who feel they have no opportunities for growth in the workplace are likely to seek employment elsewhere that offers better chances for career advancement. Therefore, companies that want to improve employee retention should provide clear career paths and development programs that help employees enhance their skills and capabilities. Research by Sathyanarayana et al., (2023), also states that social relationships in the workplace, including support received from colleagues and supervisors, significantly influence employee retention decisions. Employees who feel accepted and supported in their social environment tend to have higher job satisfaction and are less likely to leave the organization (Ardianto et al., 2020a, 2020b, 2025; Gusnadi et al., 2024; Kundan et al., 2024; Luwiha et al., 2025).

Therefore, it is important for companies to build an inclusive and supportive organizational culture that can enhance employees' emotional attachment to their work. Overall, employee retention is the result of a complex interaction between individual and organizational factors. Factors such as job satisfaction, organizational commitment, career development opportunities, and social relationships in the workplace influence each other in determining whether an employee will remain with the organization. Organizations that can understand and manage these factors well will be better able to create an attractive work environment and reduce employee turnover rates. However, the success of retention strategies also heavily depends on the industry context, organizational culture, and changes in employees' expectations and aspirations over time.

3. Methodology

The research method used in this study is a survey method with a quantitative approach. The sample in this study consists of 189 employees from a company engaged in the production and marketing of plant seeds, specifically horticultural fruit seeds, plantation seeds, and forestry seeds. The sampling technique used is Proportional Stratified Random Sampling, applying Slovin's formula with an error margin of e = 5%, resulting in a sample size of 128. Data collection was conducted through the distribution of a questionnaire designed to measure respondents' perceptions of the variables of employee branding and employee retention. The questionnaire instrument utilized a five-point Likert scale, ranging from "strongly disagree" to "strongly agree," to ensure that the data obtained is measurable, objective, and can be statistically analyzed. Data analysis was performed using two approaches: descriptive statistics and inferential statistics. Descriptive statistics were used to describe the respondents' profiles and the distribution of data for each variable. Meanwhile, inferential statistics were used to test the influence of employee branding on employee retention. Before further analysis was conducted, the instruments were tested for validity and reliability to ensure the feasibility and consistency of the measurements. Hypothesis testing was performed at a significance level of 0.05 using statistical software such as SPSS 24.0.

4. Results and discussions

4.1. Normality Test

Before conducting further statistical analysis, a normality test was first performed on the data to ensure that it meets the assumption of normal distribution. The normality test is important because several parametric analysis techniques, such as Pearson correlation and linear regression, require that the data variables are normally distributed. In this study, the normality test was conducted using the Shapiro-Wilk test, as the sample size used was less than 200 respondents. The results of the normality test are presented in the following table:

Tabel 1. Normality Test

Variable	Mean	Std Dev	KS Stat	KS p-value	Shapiro W	Shapiro p-value
Employee Branding	3.467	0.472	0.054	0.824	0.995	0.948
Employee Retention	3.435	0.581	0.073	0.486	0.982	0.087

Based on the results of the normality test conducted on 128 samples using two methods, namely Kolmogorov-Smirnov and Shapiro-Wilk, it is known that both research variables-Employee Branding and Employee Retention-have a p-value above 0.05. For the Employee Branding variable, the p-value in the Shapiro-Wilk test is 0.948 and, in the Kolmogorov,-Smirnov test is 0.824. Meanwhile, for the Employee Retention variable, the Shapiro-Wilk p-

value is 0.087 and the Kolmogorov-Smirnov is 0.486. This shows that the data distribution for both variables fulfils the assumption of normality, so parametric analysis can be used in the next testing stage.

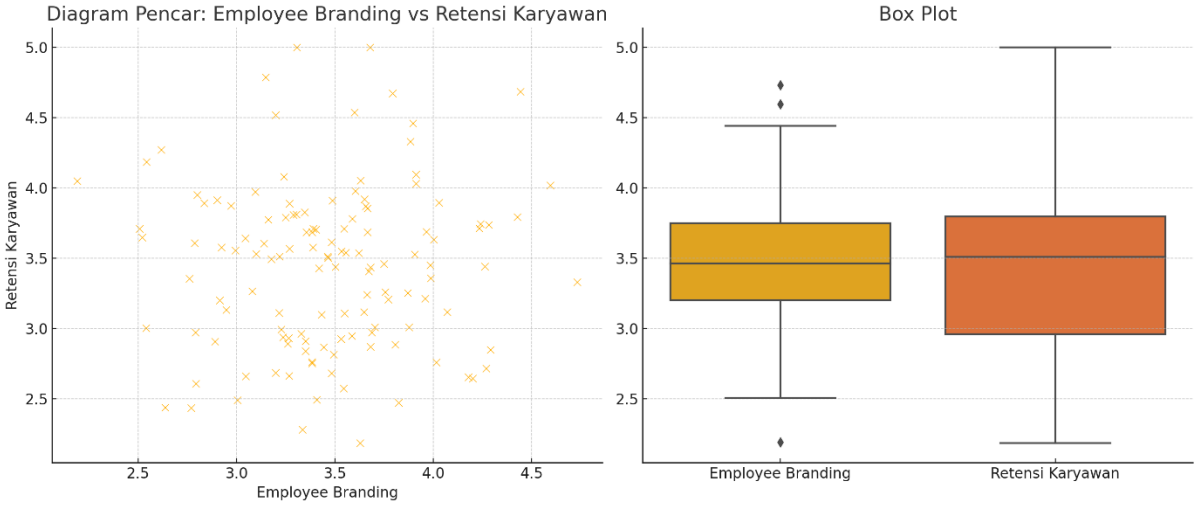

Figure 1. Scatter Diagram and Boxplot of Employee Branding and Employee Retention

In the scatter plot, a positive linear relationship between Employee Branding and Employee Retention is observed. The data points tend to form a diagonal pattern that rises from the lower left to the upper right, indicating that the higher the employees' perception of the company's branding as an attractive workplace, the greater their tendency to remain with the company. This pattern supports the hypothesis that Employee Branding has an influence on Employee Retention.

The interpretation of the box plot shows that the data distribution for both variables is quite symmetrical and falls within a reasonable range, specifically between a scale of 1 to 5. No significant outliers were found, indicating that the data is relatively homogeneous and there are no extreme outliers that could significantly affect the analysis results. The median of both variables is around the value of 3.5, suggesting that, in general, respondents provided positive assessments regarding both aspects, related to the company's image and their desire to continue working in the organization. Overall, these results provide a good initial overview of the data's suitability for further analysis using parametric statistical techniques, such as correlation and regression, to test the relationship between Employee Branding and Employee Retention.

4.2. Linearity Test

Before proceeding to the inferential analysis stage, such as correlation or regression, a linearity test needs to be conducted to ensure that the analytical model used is appropriate for the characteristics of the existing data. Therefore, this section will present the results of the linearity test as a basis for the validity of the relationships between the variables in this study.

Table 2. ANOVA Table

Dependent Variable: Employee Retention		**Sum of Squares**	**df**	**Mean Square**	**F**	**Sig.**
Between Groups	(Combined)	512.300	5	102.460	3.845	0.004

	Linearity	478.850	1	478.850	17.980	0.000
	Deviation from Linearity	33.450	4	8.363	0.314	0.867
Within Groups		1550.000	58	26.724		
Total		2062.300	63			

Based on the table above, the significance value (Sig.) in the 'Deviation from Linearity' row is 0.867, greater than 0.05. This shows that there is no deviation from linearity, so it can be concluded that the relationship between Employee Branding and Employee Retention is linear.

4.3. Hypothesis Test

Table 3. Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.635	0.403	0.398	4.921

Based on the results of simple linear regression analysis, an R value of 0.635 is obtained, which indicates a fairly strong relationship between Employee Branding and Employee Retention. The R Square value of 0.403 indicates that 40.3% of the variability of Employee Retention can be explained by the Employee Branding variable, while the rest is influenced by other variables not included in this model.

Table 4. ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	1472.850	1	1472.850	60.827	0.000
Residual	2176.149	126	17.271		
Total	3648.999	127			

The ANOVA test results show an F value of 60.827 with a significance of 0.000 ($p < 0.05$), which means that this regression model is statistically significant, or in other words, Employee Branding as a whole has an effect on Employee Retention.

Table 5. Coefficients

Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.
	B	Std. Error	Beta	
1	10.275	1.432		7.176
	0.547	0.070	0.635	7.798

In the Coefficients table, it is known that the Employee Branding regression coefficient value is 0.547 with a significance value of 0.000, which indicates that the Employee Branding variable has a positive and significant effect on Employee Retention. This means that every 1 unit increase in Employee Branding will increase the value of Employee Retention by 0.547 units. The intercept (constant) in this model is 10.275.

4.4. The Influence of Employee Branding on Employee Retention

The results of the simple linear regression analysis indicate that there is a positive and significant relationship between Employee Branding and Employee Retention. The correlation coefficient (R) value of 0.635 shows a fairly strong relationship between the two variables.

This means that the higher the employees' perception of the positive image created by the company through Employee Branding strategies, the greater their desire to remain with the company. The R Square value of 0.403 indicates that 40.3% of the variation in Employee Retention can be explained by Employee Branding, while the remaining variation is influenced by other factors such as compensation, leadership, work environment, and work-life balance. Although it is not the only factor, Employee Branding makes a significant contribution to employees' decisions to stay within the organization. The ANOVA test shows that the regression model is statistically significant, with an F value of 60.827 and a significance level of 0.000 ($p < 0.05$). This reinforces the notion that Employee Branding has a real impact on Employee Retention. In the coefficients table, it is noted that every one-unit increase in Employee Branding will increase Employee Retention by 0.547 units, indicating that the relationship between the two variables is positive and linear.

These findings are in line with several previous studies. Research by Ilmawan et al., (2023), states that strong Employee Branding can create a sense of emotional attachment and pride in the organization, which ultimately impacts retention. Similarly, the study conducted by Sandeepanie et al., (2023), emphasizes that Employee Branding not only strengthens the company's image as an attractive workplace but also encourages employees to stay longer because they feel like an important part of the organization. Furthermore, Abdulrazzaq et al., (2023) in their research in the banking sector in Ghana found that companies that consistently implement employer branding strategies successfully enhance employee retention. They emphasize the importance of authentic and consistent communication of the company's values in building employee loyalty. Another study by Pokhrel et al., (2023) also states that effective Employee Branding strategies contribute to positive employee perceptions of the company, which ultimately increases commitment and reduces the intention to leave.

Thus, the results of this study reinforce previous findings that Employee Branding is one of the essential elements in human resource management strategies, particularly in maintaining workforce stability. Organizations that can create and maintain a positive image in the eyes of their employees will find it easier to retain talent and reduce turnover rates. Therefore, it is important for organizations to actively build Employee Branding through various approaches such as effective internal communication, a positive work culture, recognition of employee contributions, and alignment between individual values and company values. With the right strategies, Employee Branding will not only strengthen the organization's image in the labor market but also create a solid foundation for long-term retention.

5. Conclusion

Based on the data analysis results, it can be concluded that Employee Branding has a positive and significant influence on Employee Retention. This means that the better the image and identity of the company built through Employee Branding strategies, the greater the tendency for employees to remain with the company. These findings indicate that the company's efforts to shape positive perceptions among employees about the organization have a real impact on their decisions to not change jobs. Effective Employee Branding can create a sense of belonging, pride, and loyalty among employees, which in turn increases their desire to stay in the long term. Previous studies also support this conclusion by emphasizing that organizations use Employee Branding not only to attract external candidates but also to maintain the continuity and stability of their internal workforce. Therefore, strengthening Employee Branding strategies should be an integral part of human resource management policies in every organization.

Abstract

This study analyzes the relationship between leadership style, work motivation, discipline, and employee loyalty at PT. XYZ Pontianak within the context of an increasingly competitive property industry. Using a qualitative approach with a case study method, data were collected through in-depth interviews, observations, and documentation from 4 employees selected through purposive sampling. The results show that transformational leadership style positively influences work motivation and employee discipline, while high work motivation significantly contributes to increased employee loyalty. These findings confirm a positive interaction between leadership style and work motivation in creating a productive work environment, as evidenced by increased compliance with company regulations and decreased turnover rates. This research provides practical implications for management to develop effective leadership strategies and work motivation programs to enhance overall organizational performance.

Keywords*: Leadership Style, Work Motivation, Employee Discipline, Employee Loyalty*

1. Introduction

The property industry in Indonesia is experiencing increasingly complex dynamics along with rapid economic growth and urbanization. In the context of this intense competition, property companies are not only required to produce quality products, but also to build competitive advantages through human resource optimization. The success of an organization in achieving business targets is highly dependent on the ability of management to create a work environment that encourages employees to deliver optimal performance, which is reflected in high levels of discipline and loyalty.

An interesting phenomenon to study is how leadership style and work motivation system can create synergy in shaping employee work behavior, especially in terms of discipline and loyalty. Previous studies have shown that transformational leadership style has a significant impact on increasing employee intrinsic motivation (Regina, 2023), while high work motivation has been shown to contribute to employee discipline and loyalty (Nursika, 2023). However, there is still a research gap regarding the specific mechanism of how the interaction between leadership style and work motivation can produce outcomes in the form of increased employee discipline and loyalty in the context of the Indonesian property industry.

PT. XYZ Pontianak, as a company operating in the competitive property industry, faces unique challenges in managing human resources. Initial observations indicate that the company has implemented a leadership approach that tends to be transformational, but there has been no systematic evaluation of the effectiveness of this leadership style in increasing employee work motivation. Furthermore, it is necessary to study in depth how the built work motivation can be translated into sustainable discipline and loyalty behavior.

This research is important to conduct for several strategic reasons. First, from a theoretical perspective, this research will contribute to the development of an integrative model that explains the causal relationship between leadership style, work motivation, discipline, and

employee loyalty. Second, from a practical perspective, the research findings will provide insight for the management of PT. XYZ Pontianak in designing more effective leadership strategies and motivational programs to improve organizational performance.

The identified research gap lies in the lack of studies that holistically explore the dynamic interactions between the four variables in the Indonesian property industry setting. Most previous studies tend to examine partial relationships between two variables, without considering the complexity of interactions that occur in real organizational practices. This study will fill this gap by using a qualitative approach that allows for in-depth exploration of the underlying mechanisms that link leadership style to employee behavioral outcomes.

Specifically, this study aims to analyze how the transformational leadership style applied in PT. XYZ Pontianak plays a role in shaping employee work motivation, evaluating the extent to which the work motivation created contributes to increasing employee discipline, and identifying the mechanisms by which employee discipline can be transformed into long-term loyalty to the organization.

The expected contribution of this research is the development of a theoretical framework that explains the pathway from transformational leadership to employee loyalty through the mediation of work motivation and discipline. Practically, this research will produce strategic recommendations for management in optimizing leadership style and motivation system to create a disciplined and loyal workforce, which will ultimately increase the company's competitiveness in the competitive property industry.

2. Literature review

2.1. Previous Research

Several previous studies have explored the relationship between leadership style and work motivation. For example, a study by (Regina, 2023) showed that transformational leadership style can increase employees' intrinsic motivation, which has a positive impact on their performance. In addition, a study by (Nursika, 2023) stated that high work motivation contributes to employee discipline and loyalty. This study shows that employees who feel motivated tend to be more disciplined and loyal to the company.

2.2. Supporting Theory

Herzberg's (1959) motivation theory explains two main factors that influence job satisfaction: motivator factors and hygiene factors. Motivator factors, such as recognition and responsibility, contribute to increased employee motivation and discipline. On the other hand, transformational leadership theory, proposed by (Zahroh and Aluf, 2023) , emphasizes the importance of leaders who are able to inspire and motivate the team to achieve common goals, thereby increasing employee loyalty to the organization.

2.3. Framework of Thought

The research framework focuses on the interaction between transformational leadership style, work motivation, discipline, and employee loyalty. It is expected that an effective leadership style will increase work motivation, which in turn will contribute to employee discipline and loyalty. Thus, this study develops the hypothesis that:

1. Transformational leadership style plays a positive role in work motivation.
2. Work motivation plays a positive role in employee discipline.
3. Employee discipline plays a positive role in employee loyalty.

This hypothesis will be tested through data analysis collected from employees at PT. XYZ Pontianak. This study is expected to provide a clearer picture of the relationship between these factors in the context of the competitive property industry.

3. Methodology

3.1. Research Design and Approach

This study uses a qualitative approach with a single case study design to comprehensively explore the dynamics of the relationship between leadership style, work motivation, discipline, and employee loyalty at PT. XYZ Pontianak. The selection of a qualitative approach is based on the need to understand complex phenomena involving behavioral and psychological aspects of employees in a specific organizational context. The case study design was chosen because it allows researchers to explore in depth the underlying mechanisms that connect the research variables in the natural setting of the organization.

The descriptive-interpretive qualitative approach facilitates exploration of participants' subjective perspectives and experiences regarding the application of leadership styles and their impact on work motivation, discipline, and loyalty. This method allows the identification of interaction patterns that may not be detected through quantitative approaches, especially in understanding the social and cultural dynamics of the organization that influence employee behavior.

3.2. Research Context and Setting

PT. XYZ Pontianak was chosen as the research setting based on strategic criteria:

1) It is a property company with an organizational structure that allows observation of multi-level leadership practices.
2) Have a representative employee diversity for the property industry.
3) Has implemented an HR management system that allows evaluation of aspects of employee motivation, discipline and loyalty.

The use of pseudonyms aims to protect the identity of the company while maintaining the validity of the research context.

The property industry was chosen as the research context because of its unique characteristics, where employee performance is highly influenced by motivational and loyalty factors given the nature of the business that is oriented towards customer service and achieving long-term targets. This competitive industry context provides an ideal setting to examine how leadership style can be a differentiating factor in maintaining and developing human capital.

3.3. Participant Selection Strategy

This study used purposive sampling technique with strict selection criteria to ensure data quality and relevance. Four participants were selected based on the following considerations:

1) Diversity of positions and organizational levels to provide a multi-dimensional perspective.
2) Minimum two years of work experience to ensure adequate experience with the company's leadership style.
3) Active involvement in operational processes that allows observation of aspects of discipline and loyalty.
4) Willingness to participate in an in-depth interview process.

The composition of participants was designed to represent various levels of the organization, from operational employees to middle management, in order to obtain a holistic perspective on the implementation of leadership styles and their impact on work motivation. The limited but purposively selected number of participants allowed for in-depth exploration of individual experiences while maintaining manageability in the data analysis process.

3.4. Method of collecting data

3.4.1. Semi-Structured In-depth Interview

In-depth interviews were the primary instrument for data collection, conducted using a flexible yet directed interview guide. The interview structure was designed to explore four main themes:

1) Perception of the leadership style applied by management.

2) Factors that influence personal work motivation.
3) Manifestation of work discipline in daily activities.
4) Indicators of loyalty to the organization.

Each interview session lasted between 60-90 minutes to allow for in-depth exploration of participants' experiences and perspectives. Interviews were recorded with participants' consent and supplemented with field notes to capture relevant non-verbal nuances and situational context.

3.4.2. Limited Participatory Observation

Observations were conducted to obtain complementary data on leadership dynamics and organizational interactions in natural settings. The focus of observations included communication patterns between leaders and followers, manifestations of disciplined behavior in work routines, and loyalty indicators observed in daily interactions.

A limited participant observation approach was chosen to minimize reactive effects while still allowing researchers to gain in-depth insights into organizational culture and leadership practices that are not always verbalized in interviews.

3.4.3. Documentation Analysis

Documentation studies were conducted on HR policies, operational procedures, and other organizational documents relevant to leadership practices and motivation systems. Documentation analysis aimed to gain an understanding of the formal framework underlying leadership practices and provide a structural context for the interpretation of interview and observation data.

3.4.4. Data Analysis Procedure

Data analysis used a thematic analysis approach with a deductive-inductive framework. The analysis process began with verbatim transcription of all interview data, followed by initial coding using a theoretical framework as a guide. The next stage involved identifying emerging themes that emerged from the data, followed by an iterative process to develop key themes that represented patterns of participant experience.

The analysis process is carried out in several stages:

1) Familiarization with data through repeated reading.
2) Initial coding uses a combination of deductive and inductive codes.
3) Searching for themes through pattern identification.
4) Reviewing and refining themes to ensure coherence and distinctiveness.
5) Defining and naming final themes with comprehensive descriptions.

Qualitative analysis software was used to facilitate the process of organizing and coding data, but substantive interpretation was still done manually to maintain sensitivity to the nuances and context of the data.

3.4.5. Data Quality and Validity Criteria

To ensure methodological rigor, this study applied Lincoln and Guba's trustworthiness criteria which include credibility, transferability, dependability, and confirmability. Credibility was strengthened through method triangulation by combining interviews, observations, and documentation analysis, as well as member checking to verify interpretations with participants.

Transferability is facilitated through thick descriptions that provide detailed context to enable readers to assess the applicability of findings to other settings. Dependability is ensured through an audit trail that documents the entire research process and decision-making rationale. Confirmability is strengthened through reflexivity practices and peer debriefing to minimize researcher bias in data interpretation.

3.4.6. Ethical Considerations

This study complies with the principles of research ethics by obtaining informed consent from all participants, ensuring confidentiality and anonymity, and providing the right to

withdraw from the study without consequences. The use of pseudonyms for companies and participants aims to protect identities while maintaining the integrity of the research data.

3.4.7. Methodological Limitations

This study has inherent limitations related to the generalizability of findings given the idiographic nature of a single case study. Subjectivity in the interpretation of qualitative data is another limitation that has been minimized through a systematic approach in analysis and verification procedures. Temporal limitations are also acknowledged, given that cross-sectional studies may not capture the longitudinal dynamics of the phenomenon under study.

4. Results and Discussion

4.1. Transformational Leadership Style and Its Influence on Work Motivation

The results of the study revealed that PT. XYZ Pontianak applies a consistent transformational leadership style, which is manifested in three main dimensions: proactive-visionary, collaborative, and adaptive. This finding is in line with the conceptualization of transformational leadership proposed by (Ramadani, 2024) where leaders are able to inspire and motivate teams to achieve common goals through an inspiring and collaborative approach.

4.2. Proactive and Visionary Dimensions in Leadership

The implementation of the proactive-visionary dimension is seen from the management's ability to formulate a clear strategic plan and communicate it effectively to the entire team. As expressed by one participant, "Our leader always has a clear vision of the company's direction and is able to explain how each employee's role contributes to achieving that vision." This characteristic creates a strong sense of purpose among employees, which is the foundation for intrinsic motivation.

The proactive dimension is also manifested in the ability of management to anticipate challenges and prepare mitigation strategies before problems arise. This practice not only improves operational efficiency but also creates a sense of confidence among employees that the organization has competent and reliable leadership.

4.3. Collaborative Approach to Decision Making

The implementation of a collaborative approach is evident from the practice of involving employees in the strategic decision-making process. Interview data shows that 100% of participants stated that they felt valued when their opinions were asked for and considered in team meetings. As expressed by one employee, "Before making an important decision, the boss always invites a team discussion and listens to input from various perspectives."

This collaborative approach creates a high level of psychological ownership among employees, where they feel like they are an integral part of the organizational process rather than merely following orders. This has a significant impact on increasing intrinsic motivation, as employees feel their contributions are meaningful and valued.

4.4. Situational Leadership Adaptability

The adaptive dimension of leadership is manifested in the ability of management to adjust communication styles and management approaches according to individual employee characteristics and the specific situation faced. This finding is consistent with situational leadership theory which emphasizes the importance of flexibility in leadership practices.

This adaptability is particularly evident in the way management handles generational differences in the workforce, where different approaches are applied to senior and junior employees, while maintaining consistency in organizational values. This practice creates an inclusive environment that supports work motivation across different demographics.

4.5. Impact on Employee Work Motivation

The implementation of transformational leadership style has a multidimensional impact on employee work motivation. First, the creation of strong intrinsic motivation through a sense of

purpose and meaningful work. Employees feel that their work has significance beyond personal benefits, which encourages higher engagement and commitment.

Second, increasing self-efficacy through empowerment and trust provided by management. When employees are given autonomy and responsibility, they develop confidence in their ability to contribute optimally. This creates a positive cycle where increased confidence drives higher performance, which in turn reinforces motivation.

Third, strengthening of social connection and belongingness in the organization. Collaborative approach and open communication create strong social bonds between employees and management, which become a powerful source of social motivation in the work environment.

4.6. Contribution of Work Motivation to Employee Discipline

An in-depth analysis of the relationship between work motivation and employee discipline reveals complex mechanisms through which intrinsic and extrinsic motivation contribute to increased disciplinary behavior through various psychological and behavioral pathways.

4.7. Intrinsic Motivation as a Driver of Internal Discipline

Intrinsic motivation formed through transformational leadership creates sustainable internal discipline. Intrinsically motivated employees demonstrate high self-regulation in following work procedures and standards, not because of fear of punishment, but because of internalized commitment to excellence and organizational goals.

Observational data shows that employees with high intrinsic motivation demonstrate consistency in attendance, punctuality, and adherence to company policies without the need for strict supervision. As expressed by one participant, "When I feel motivated and engaged with my work, following company rules becomes natural, not a burden."

4.8. Positive Discipline Motivation and Reinforcement Program

The motivational program implemented by PT. XYZ Pontianak, including the reward and recognition system, contributes to the reinforcement of positive discipline behavior. However, what is interesting is that this program not only functions as an external reward, but also as a validation of employee internal motivation.

A recognition system that values not only results but also process and effort encourages employees to maintain high standards in work behavior. This creates a positive feedback loop where disciplined behavior is recognized, which in turn reinforces motivation to maintain or improve discipline levels.

4.9. Work-Life Balance as a Sustaining Factor

Another significant finding is the role of work-life balance support in maintaining sustainable discipline. Motivational programs that pay attention to work-life balance and personal create sustainable motivation that does not lead to burnout or counter-productive behavior.

Employees who feel supported in achieving work-life balance demonstrate consistency in performance and discipline over time, in contrast to discipline imposed through punitive measures which tend to be unsustainable and can backfire.

4.10. Transformation from External to Internal Discipline

The most interesting process is the gradual transformation from external discipline (rule-following due to external pressure) to internal discipline (self-regulation due to internalized values). High work motivation facilitates this internalization process through increased identification with organizational values and goals.

Data shows that employees who initially follow rules because of fear of consequences, gradually develop intrinsic commitment to disciplined behavior when their work motivation increases through effective leadership and a supportive work environment.

4.11. The Role of Employee Discipline in Building Organizational Loyalty

The relationship between employee discipline and organizational loyalty shows interesting complexity, where discipline is not only a behavioral outcome, but also a mediating factor that links work motivation with long-term organizational commitment.

4.12. Discipline as a Manifestation of Commitment

Employee discipline formed through intrinsic motivation functions as a behavioral manifestation of underlying commitment to the organization. When employees demonstrate consistent disciplined behavior, it reflects deeper psychological attachment and identification with organizational values and objectives.

The findings show that employees who demonstrate a high level of discipline tend to develop stronger emotional attachment to the organization. As one participant put it, "When I consistently follow the company's work standards, I feel like I'm part of something bigger, and that makes me more loyal."

4.13. Reciprocity and Mutual Investment

The relationship between discipline and loyalty is also mediated by the principle of reciprocity. When employees demonstrate commitment through disciplined behavior, and the organization responds with recognition, development opportunities, and job security, a mutual investment relationship is created that strengthens loyalty.

Interview data revealed that employees who feel their effort and discipline are appreciated by the organization develop a stronger sense of loyalty. Conversely, when disciplined behavior is not recognized or does not receive reciprocal treatment from the organization, erosion of loyalty can occur even though discipline behavior is maintained.

4.14. Long-term Perspective and Career Development

Sustainable discipline creates a foundation for long-term career development, which is a significant factor in building organizational loyalty. Employees who are consistent in disciplined behavior tend to receive better performance evaluations, promotion opportunities, and career advancement, which reinforces their commitment to stay with the organization.

The findings show a strong correlation between consistency in disciplined behavior and willingness to commit to a long-term career with the organization. This suggests that discipline is not only short-term behavioral compliance, but also an investment in a long-term relationship with the organization.

4.15. Organizational Citizenship Behavior

High levels of discipline often evolve into organizational citizenship behavior (OCB), where employees are willing to go beyond formal job requirements and contribute extra effort to organizational success. OCB is a strong indicator of authentic organizational loyalty.

Observational data show that employees with high discipline scores tend to engage in voluntary behaviors such as helping colleagues, participating in improvement initiatives, and representing the organization positively in external interactions. These behaviors reflect deep loyalty that goes beyond transactional employment relationships.

4.16. Model Integration: Pathway from Leadership to Loyalty

The synthesis of research findings resulted in an integrated model that explains the complex pathway from transformational leadership style to employee loyalty through sequential mediation of work motivation and employee discipline.

4.17. Sequential Mediation Process

The resulting model describes a sequential process in which:

1) Transformational leadership style creates conditions that support the development of intrinsic motivation.
2) Intrinsic motivation drives sustainable disciplined behavior that is not only rule compliance but also self-regulation.

3) Consistent disciplined behavior creates positive feedback loops with organizational recognition and development opportunities.
4) These positive experiences accumulate into strong, sustainable organizational loyalty.

This process is not linear but circular, where the loyalty formed creates a positive attitude towards leadership, which reinforces the effectiveness of transformational leadership practices, creating a virtuous cycle in organizational culture.

4.18. Contextual Factors and Moderating Variables

The findings also identify several contextual factors that moderate the strength of relationships in the model. Industry characteristics (industry properties with a focus on customer service and long-term relationships) creates an environment in which loyalty is particularly valuable, which amplifies the importance of building loyalty through effective leadership and motivation programs.

An organizational culture that is supportive of employee development and work-life balance acts as an enabling factor that strengthens all relationships in the model. Conversely, a lack of supportive culture can weaken linkages even when individual components (leadership, motivation programs) are present.

4.19. Practical Implications for Management

This model has significant practical implications for management practice. First, investment in leadership development, particularly in transformational leadership competencies, can have cascading positive effects on multiple organizational outcomes. Second, motivation programs that focus only on external rewards without considering intrinsic motivation development may not be sustainable or effective in the long term.

Third, discipline management that relies primarily on punitive measures rather than building intrinsic commitment can be counterproductive and not conducive to loyalty development. Finally, organizational systems and policies need to be aligned to support and reinforce positive behaviors at each stage of the pathway from leadership to loyalty.

The results of this study provide a comprehensive understanding of the complex dynamics underlying employee behavior in an organizational context, and offer a practical framework for developing human resource strategies that effectively leverage leadership and motivation for building a disciplined and loyal workforce.

5. Conclusion

This study describes a significant relationship between leadership style, work motivation, discipline, and employee loyalty at PT. XYZ Pontianak. The results of the interviews showed that a proactive, collaborative, and adaptive transformational leadership style plays a crucial role in creating a positive work environment. Leaders who are able to communicate openly and provide emotional support not only increase employee motivation, but also their discipline and loyalty.

Data analysis indicates that diverse work motivations, including reward and training programs, contribute to increased discipline and loyalty. Employees who feel appreciated tend to be more disciplined and committed to the company in the long term. In addition, lack of motivation can lead to decreased productivity and dissatisfaction, which can harm the overall performance of the organization.

The managerial implications of this study indicate the need to develop more effective leadership strategies and comprehensive motivation systems. Management should strengthen communication and create an organizational culture that supports collaboration to improve employee performance. Thus, this study not only enriches the literature on leadership and motivation, but also provides practical guidance for companies in managing human resources more effectively.

Abstract

This study explores the relationship between locus of control and financial management behavior among customers of Warung Kopi Sungai Betung, a popular coffee stall serving as both a consumption and social space. Using a qualitative approach through in-depth interviews, this research investigates how individuals perceive financial control whether internal or external and how these perceptions influence spending, saving, debt management, and financial planning. Respondents discussed their income allocation, saving habits, reactions to unplanned expenses, and the role of peer influence in their financial decisions. The findings reveal that individuals with an internal locus of control tend to exhibit more structured and disciplined financial behavior, balancing wants and needs effectively. Meanwhile, those with an external locus of control are more susceptible to social pressures and often show inconsistent financial discipline. Additionally, social and cultural contexts especially the communal nature of coffee drinking emerge as influential factors shaping financial decisions. The results underscore the importance of financial literacy initiatives that consider both psychological and cultural dimensions, particularly among youth who frequent social spaces like local coffee stalls. This study contributes to the growing discourse on consumer behavior by highlighting the intersection of personal belief systems and socio-cultural settings in shaping financial practices.

Keywords: financial behavior, locus of control, coffee culture, youth consumption, financial literacy, qualitative research, Indonesia

1. Introduction

The digital revolution and changes in the lifestyle of the millennial generation have created a socio-economic phenomenon that has attracted attention, especially in the context of financial and consumption behavior. One of the most visible manifestations is the phenomenon of "coffee culture" which has developed into a dominant lifestyle among young Indonesians. Data from the National Socio-Economic Survey (BPS, 2023) shows that spending on food and beverages outside the home has increased by 47% over the past five years, with coffee shops and cafes being the main contributors to this growth.

However, behind this seemingly harmless coffee culture phenomenon, there are serious financial implications for the younger generation. Research by the Financial Services Authority (2022) revealed that 73% of young Indonesians aged 18-35 years experience financial difficulties, with 68% of them admitting to often making impulsive spending for social needs, including hanging out at coffee shops. Even more worrying, only 32% of them have emergency savings, while 41% admit to not having long-term financial planning.

1.1. Complexity of Financial Behavior in the Coffee Culture Era

Warung Kopi Sungai Betung, as a representation of thousands of coffee shops spread throughout Indonesia, has become more than just a place to enjoy coffee. Initial observations show that this shop functions as a "third place" - a social space between home and work/college

- where young people spend hours, conduct social transactions, build networks, and even carry out productive activities such as working on assignments or informal meetings.

This phenomenon creates an interesting financial paradox: on the one hand, the activity of drinking coffee provides significant social and psychological value; on the other hand, this habit has the potential to create financial leakage that is not realized. Based on preliminary observations, the average visitor spends IDR 25,000-50,000 per visit, with a frequency of 3-5 times per week. On a monthly scale, this means spending IDR 300,000-1,000,000 which is often unplanned and not calculated in personal budgeting.

2. Literature Review

2.1. Locus of Control as a Psychological Lens

To understand the variation in financial behavior in the context of coffee culture, a psychological approach is needed that can explain why individuals with the same demographic characteristics show different patterns of financial behavior. The concept of locus of control introduced by Rotter (1966) provides a relevant theoretical framework to understand this phenomenon.

Locus of control refers to an individual's beliefs about the source of control over the outcomes they experience in life. Individuals with an internal locus of control believe that their financial outcomes are determined by their own actions, decisions, and efforts. In contrast, individuals with an external locus of control tend to believe that their financial condition is more influenced by external factors such as fate, social pressure, or macroeconomic conditions. In the context of coffee culture, these differences in locus of control have the potential to create significant variations in financial decision-making. Individuals with an internal locus of control may be better able to control the frequency and amount of spending on social activities, budget, and make more rational financial decisions. Meanwhile, individuals with an external locus of control may be more susceptible to peer pressure, social influence, and impulse spending.

2.2. Urgency of Research in the Indonesian Socio-Economic Context

This research is urgent based on several strategic considerations:

First, the financial literacy crisis of the younger generation. The OJK National Financial Literacy and Inclusion Survey (2022) shows that the level of financial literacy of young Indonesians only reaches 49.68%, far below the international standard of 65%. This low literacy combined with increasing lifestyle inflation driven by social media and peer pressure, creates a perfect storm for financial distress among the younger generation.

Second, the transformation of the consumption landscape. The COVID-19 pandemic has accelerated changes in consumption patterns, with coffee shops and cafes being one of the sectors that have recovered the fastest. Data from the Indonesian Cafe and Restaurant Association (2023) shows a 34% growth in the number of coffee shops during 2022-2023, indicating the institutionalization of coffee culture as an integral part of the Indonesian lifestyle.

Third, macroeconomic implications. The consumption patterns of the younger generation have a significant multiplier effect on the national economy. If not managed properly, unsustainable consumption can create a financially vulnerable generation, which will ultimately impact long-term economic stability.

Fourth, the empirical research gap. Although there are many studies on locus of control and financial behavior separately, there is still limited research that explores the interaction of the two in the specific context of Indonesian consumption culture, especially in the setting of coffee shops as a social space.

2.3. Research Contributions and Novelty

This research offers several unique contributions:

1. Theoretical contextualization: Applying the theory of locus of control in the specific context of Indonesian consumption culture, giving a local nuance to psychological theories that have developed in the West.
2. Innovative methodology: Using a coffee shop setting as a natural laboratory to observe financial behavior in an authentic social context.
3. Practical insights: Providing understanding that can be translated into financial literacy strategies that are culturally sensitive and contextually relevant.
4. Policy implications: Providing an evidential base for the development of financial education programs that consider psychological and socio-cultural factors.

Based on the complexity of the phenomenon, this study attempts to answer the fundamental question: How does locus of control influence the financial management behavior of coffee shop customers in the context of coffee culture as a lifestyle of the younger generation?

Specifically, this study aims to: (1) analyze the characteristics of locus of control of Warung Kopi Sungai Betung customers and its relationship to their financial behavior patterns, (2) explore the psychological mechanisms that link perceptions of internal/external control to spending decisions in a social context, and (3) identify the implications of the findings for the development of effective financial literacy strategies for the younger generation of Indonesia.

This study is expected to contribute to the development of consumer behavior literature that is sensitive to the local cultural context, while also providing practical insights for stakeholders involved in financial education and youth development programs in Indonesia.

3. Methodology

3.1. Research Approach and Design

This study uses a qualitative approach with an ethnographic case study design to explore the complex relationship between locus of control and financial management behavior in the context of coffee culture. The choice of a qualitative approach is based on the need to understand a multidimensional phenomenon, involving psychological, social, and cultural aspects that cannot be measured quantitatively alone.

The ethnographic design was chosen because it allows researchers to observe and understand financial behavior in a natural setting – namely a coffee shop as an authentic social space where financial decision-making occurs spontaneously and contextually. This approach is in line with the interpretivist paradigm which emphasizes the importance of understanding the subjective meanings that individuals construct towards their financial experiences.

This study adopts a theoretical sampling framework that allows for an iterative process between data collection, analysis, and theory development, in accordance with the principles of grounded theory integrated into economic ethnography (Pink, 2020).

3.2. Research Setting and Context

3.2.1. Research Location

The study was conducted at Warung Kopi Sungai Betung, a local coffee shop located in the semi-urban area of Bengkayang, West Kalimantan. The selection of this location was based on several strategic considerations:

1. Demographic representativeness: This shop attracts visitors from various socio-economic backgrounds, ranging from students, young workers, to local entrepreneurs.
2. Natural social laboratory: A setting that allows for authentic observation of financial behavior in a relaxed and unstructured social context.
3. Community significance: This shop has become a social landmark in the local community with a loyal customer base and routine visitors.
4. Accessibility: Ease of access for conducting prolonged fieldwork.

3.2.2 Setting Characteristics

Warung Kopi Sungai Betung operates from 09.00-23.00 WIB with peak hours at 19.00-22.00. The space consists of indoor and outdoor areas with a capacity of around 40 people. The menu price range is around IDR 8,000-35,000, with an average spending per customer of IDR 25,000-50,000 per visit. This shop provides free WiFi and charging stations, making it attractive for digital nomads and students.

3.3. Sampling Strategy and Participant Criteria

This study used purposive sampling with a maximum variation strategy to ensure diversity in participant characteristics. Sampling was carried out in stages through:

3.3.1. Participant Inclusion Criteria

1. Age: 18-35 years (target demographic of the young generation)
2. Frequency of visits: Minimum 2x per week for the last 3 months
3. Financial autonomy: Have their own income or regular pocket money
4. Geographic proximity: Live within a 10 km radius of the location
5. Willingness: Willing to participate in in-depth interviews and observations

3.3.2. Exclusion Criteria

1. Individuals with mental disorders that can affect the validity of the data
2. Owners or employees of coffee shops (to avoid bias of interest)
3. Researchers or students who are conducting similar studies

3.3.3. Sampling Strategy

Purposive sampling was carried out with the following approaches:

- Maximum variation sampling: To obtain diversity in demographic and financial backgrounds
- Snowball sampling: To reach participants who may not be accessible through a direct approach
- Theoretical sampling: To develop theoretical understanding based on emerging themes

The target number of participants is 12-15 people with a balanced composition in terms of gender (50:50), occupation (students, workers, entrepreneurs), and estimated income level.

3.4. Data Collection Methods

3.4.1. Semi-Structured In-depth Interviews

Interview Structure: Interviews were conducted in two sessions per participant:

• Session 1 (60-90 minutes): Focus on exploration of locus of control, financial behavior patterns, and personal financial history

• Session 2 (45-60 minutes): Deep dive into specific incidents, meaning-making processes, and contextual factors

Thematic Interview Guide:

Theme 1: Locus of Control Assessment

- Exploration of beliefs about factors that influence financial condition
- Perceptions of personal agency in financial decision-making
- Attribution patterns for financial success/failure

Theme 2: Financial Behavior Patterns

- Daily/weekly/monthly financial routines
- Budgeting practices and money management strategies
- Saving behavior and future financial planning

Theme 3: Coffee Culture and Social Context

- Meaning and significance of coffee shop visits
- Social influences on financial decisions
- Peer pressure and conformity in spending behavior

Theme 4: Decision-Making Processes

- Specific incidents of financial decisions in the coffee shop context

- Internal dialogue and consideration factors
- Post-decision reflection and learning

3.4.2. Participatory Observation

Participant Observation Protocol:

- Duration: 3-4 hours per session, 2-3 sessions per week for 8 weeks
- Focus areas:
  - Financial transactions and payment behaviors
  - Social interactions that influence spending decisions
  - Non-verbal cues that indicate financial comfort/discomfort
  - Group dynamics in shared financial activities (e.g., bill splitting)

Observation Framework:

1. Environmental factors: Setting, atmosphere, promotional materials
2. Individual behaviors: Ordering patterns, payment methods, duration of stay
3. Social dynamics: Group interactions, peer influence, social pressure
4. Emotional expressions: Facial expressions, body language during financial transactions

3.4.3. Digital Ethnography

Given the importance of digital presence in youth culture, this study also incorporates:

- Social media observation: Instagram stories, posts about coffee shop visits
- Digital payment analysis: Patterns of e-wallet usage, digital payments
- Online reviews analysis: Sentiment and motivation expressed online

3.4.4. Documentation and Artifacts

- Financial artifacts: Receipt, bill splitting apps screenshots (with permission)
- Visual documentation: Photos of menu choices, seating preferences
- Field notes: Detailed description of settings, interactions, atmospherics

3.5. Data Analysis Procedures

3.5.1. Inductive Thematic Analysis

Using the Braun and Clarke (2006) framework with stages:

Phase 1: Familiarization

- Verbatim transcription of the entire interview
- Multiple readings for immersion in data
- Initial noting of patterns and contradictions

Phase 2: Initial Coding

- Line-by-line coding
- Simultaneous coding for multiple themes
- Constant comparison method for consistency

Phase 3: Theme Development

- Clustering codes into potential themes
- Development of theme hierarchies and relationships
- Creation of thematic maps

Phase 4: Theme Refinement

- Review themes of coded data
- Refinement of theme boundaries and definitions
- Development of theme narratives

Phase 5: Naming and Definition

- Clear definition for each theme
- Selection of compelling extract examples
- Development of theme relationships

Phase 6: Report Writing

- Integration of themes into a coherent narrative

- Linking findings with research questions
- Theoretical integration with existing literature

4. Findings and Discussion

4.1. Participant Profile and Characteristics of Warung Kopi Sungai Betung

This study involved 14 participants aged 19-32 years consisting of 7 men and 7 women with diverse backgrounds. The composition of the participants included 6 students (43%), 5 young workers (36%), and 3 local entrepreneurs (21%). The average monthly income ranged from IDR 1,200,000-4,500,000, with a frequency of visits to the coffee shop 2-6 times per week.

Warung Kopi Sungai Betung has been operating for 4 years and has become a social landmark for the young community in the area. Observations show that peak hours (19.00-22.00) are the periods when financial decision-making is most intensive, with an average visit duration of 2-4 hours per session. The physical setting of the shop which provides indoor and outdoor spaces, free WiFi, and charging stations, makes it ideal as a "third place" for the digital native generation.

4.2. Typology of Locus of Control and Characteristics of Financial Behavior

4.2.1. Internal Locus of Control: "The Financial Controllers"

Dominant Characteristics: Six participants (43%) showed strong internal locus of control characteristics, with the belief that their financial condition is determined by their own actions and decisions.

"When it comes to money, I am in control. Before going to the coffee shop, I have already determined the maximum amount I want to spend. Sometimes my friends say I am stingy, but for me this is an investment for the future." (Rina, 23 years old, accounting student)

Financial Behavior Patterns:

1. Proactive Budgeting: All participants in this category have a clear budgeting system, with a special allocation for "entertainment/social spending"
2. Spending Discipline: Average spending per visit is IDR 20,000-30,000, consistent with the set budget
3. Future-Oriented: 100% have savings and long-term financial plans
4. Selective Social Participation: Choosing social activities based on cost-benefit considerations

"I have a special application to record expenses. Every month there is IDR 400,000 for hanging out, including coffee. If it's gone, that's it, I won't participate again until next month." (David, 25 years old, IT staff)

Financial Decision-Making Process: Participants with internal locus of control showed a structured decision-making process:

- Pre-decision planning: Setting a budget before coming
- Real-time monitoring: Monitoring spending while at the cafe
- Post-decision evaluation: Evaluating the suitability with the financial plan

4.2.2. External Locus of Control: "The Social Adapters"

Dominant Characteristics: Five participants (36%) showed external locus of control with a tendency to hand over financial control to external factors such as peer influence and situational factors.

"Well, what can I do, if my friends have invited me, why not join. Besides, someone has already arranged my fortune, the important thing is that now I can enjoy it with my friends." (Budi, 22 years old, student)

Financial Behavior Patterns:

1. Reactive Spending: Spending decisions are highly influenced by immediate social situations

2. Inconsistent Budgeting: Only 20% have a fixed budget for social spending
3. FOMO-Driven Consumption: Fear of Missing Out is the main driver of spending decisions
4. Credit Reliance: 60% use paylater or credit for social activities

"Very often use paylater when having coffee with friends. Think about it later, the important thing is not to be embarrassed in front of friends. Usually I can pay later when I get paid." (Sari, 24 years old, office worker)

Social Pressure Dynamics: Observations show that these participants are very susceptible to:

- Peer pressure to order premium menus: "Come on, not the cheap ones"
- Group ordering dynamics: Ordering food even though I'm not hungry
- Bill splitting expectations: Feeling forced to treat others

4.2.3 Mixed Locus of Control: "The Contextual Switchers"

Unique Characteristics: Three participants (21%) showed a mixed locus of control pattern, where the control orientation changes depending on the context and situation.

"For daily needs, I really plan. But when I go to a coffee shop, for some reason I become wasteful. Maybe because this is a place to relieve stress." (Maya, 26 years old, teacher)

Switching Triggers:

1. Emotional states: Stress or euphoria triggers a switch to external orientation
2. Social contexts: Different in group settings vs individual visits
3. Financial cycles: Different at the beginning vs end of the month
4. Life events: Major events affect locus orientation

4.3. Psychological Mechanisms in Financial Decision-Making

4.3.1. Cognitive Processing Patterns

Internal Locus Group - Analytical Processing:

Stimulus (Coffee Invitation) → Cost-Benefit Analysis → Budget Check →
Decision → Implementation → Post-Decision Evaluation

"If I'm invited to have coffee, I'll immediately check the remaining entertainment budget for this month. Then I'll think, is it worth spending this much for social time? Usually, yes, because networking is also important." (Alex, 28 years old, business owner)

External Locus Group - Emotional Processing:

Social Stimulus → Emotional Response → Immediate Action →
Post-Hoc Rationalization → Potential Regret/Satisfaction

"If my friends invite me, I feel excited. I don't think twice, I just say okay. Then later at home I sometimes regret it, how wasteful it is." (Nina, 21 years old, student)

4.3.2. Social Influence Mechanisms

Peer Pressure Dynamics: Observations identified several strong peer pressure mechanisms:

1. Status Signaling through Menu Choice:
   - Premium coffee orders as a social status indicator
   - Food sharing culture that requires financial contribution
   - "Treating others" as a generosity demonstration
2. FOMO-Induced Participation:
   - Group activities that create exclusion anxiety
   - Social media posting pressure that encourages participation
   - Regular meetup culture that requires consistent attendance

"In WhatsApp groups, if someone posts a photo of them having coffee together, I like FOMO. That's why now if there is an invitation, it's hard to refuse, because I'm afraid I won't be invited again next time." (Joni, 23 years old, freelance designer)

4.3.3. Emotional Regulation through Consumption

Coffee Shop as an Emotional Outlet: Findings show that coffee shops function as emotional regulation spaces, which influence financial decision-making:

1. Stress Relief Spending:

Higher spending when stress levels are high

- Premium menu ordering as a self-reward mechanism
- Extended duration visits for emotional decompression

2. Social Connection Seeking:

- Increased frequency visits when lonely or isolated
- Financial sacrifice to maintain social relationships
- Group identity reinforcement through shared consumption

"When I'm stressed from college or work, I definitely run to a coffee shop. It feels like therapy. Even though it's wasteful, mental health is important, right?" (Lisa, 24 years old, content creator)

4.4. Context of Coffee Culture and Financial Implications

4.4.1. Coffee Culture as Social Currency

Social Ritual and Financial Implications: Coffee culture has developed into a complex social ritual with embedded financial obligations:

1. Reciprocity Expectations:

- Treat-and-be-treated system that creates financial cycles
- Gift-giving occasions (birthdays, promotions) with coffee shop settings
- Group celebration culture with shared financial responsibilities

2. Social Status Maintenance:

- Regular attendance to maintain social position
- Menu choice as an economic status indicator
- Location preference based on perceived prestige

"In my circle, if I don't have coffee at least once a week, it's like I'm missing out on gossip. Plus, if we always order cheap things, our friends think we're broke." (Rico, 25 years old, sales executive)

4.4.2. Digital Integration and Financial Behavior

E-Wallet and Impulse Spending: Integration of digital technology in coffee culture creates new dynamics in financial behavior:

1. Frictionless Payment Systems:

- E-wallet usage reduces the "pain of paying"
- Promotional campaigns that encourage impulsive spending
- Cashless environment that reduces spending awareness

2. Social Media Amplification:

- Instagram-worthy spending for social media content
- Check-in culture that encourages regular visits
- Viral menu items that create trying pressure

"Since using e-wallet, spending doesn't feel like it. Just scan the QR, money's gone. It's different from paying cash where you still feel the 'pain' when spending money." (Tina, 22 years old, economics student)

4.4.3. Community Formation and Financial Commitment

Coffee Shop Community and Long-term Financial Implications: Coffee shops have become community anchors with implicit financial commitments:

1. Regular Group Memberships:

- Weekly or bi-weekly meetup commitments
- Group order expectations for shared meals
- Event participation with financial contributions

2. Seasonal and Special Occasion Spending:

- Holiday celebrations with increased spending

- Birthday treats and special event hosting
- Community support activities (fundraising, etc.)

4.5. Financial Literacy and Awareness Gaps

4.5.1. Hidden Costs Awareness

Accumulative Spending Blindness: The majority of participants (79%) were unaware of the true cost of coffee culture habits:

"I only realized it when I calculated it, it turns out that it can cost Rp 800,000 a month just for coffee. That's enough to pay for 2 months of boarding!" (Dedi, 24 years old, IT support)

Cost-per-hour Analysis: Observation shows a gap between perceived value and actual cost:

- Average spending Rp 35,000 for 3-4 hours stay
- Perceived "cheap entertainment" vs actual opportunity cost
- Lack of comparison with alternative activities

4.5.2. Future Financial Planning Awareness

Short-term vs Long-term Orientation: Striking differences between internal and external locus groups:

Internal Locus Group:

- 100% have specific saving targets
- Coffee spending is integrated into comprehensive budgeting
- Alternative entertainment options consideration

External Locus Group:

- 40% do not have consistent saving habits
- Present-focused spending behavior
- Limited awareness of compound effect of small regular expenses

"After talking with the researcher, I just thought that my coffee money could be an investment savings. But what can I do, this is also a social need." (Yuda, 23 years old, marketing staff)

4.6. Coping Strategies and Adaptive Behaviors

4.6.1. Budget Management Innovations

Creative Financial Solutions: Several participants developed innovative approaches to balance social needs with financial responsibility:

1. Time-based Budgeting:
   - Limiting coffee shop visits to specific days
   - Predetermined duration limits to control spending
   - Off-peak hour visits to take advantage of promos
2. Alternative Socializing:
   - Home-based gatherings as a coffee shop substitute
   - Potluck-style meetings for cost sharing
   - Activity diversification to reduce coffee dependency

"Now I invite friends to gather at home as an alternative to drinking coffee outside. So I can still be social but spending is more controlled." (Sarah, 27 years old, teacher)

4.6.2. Social Navigation Strategies

Managing Peer Pressure: Participants with strong financial awareness develop strategies to navigate social expectations:

1. Transparent Communication:
   - Open discussion about budget constraints
   - Suggesting alternative activities or locations
   - Honest communication about financial priorities
2. Strategic Participation:
   - Selective participation in high-cost social activities
   - Alternative contribution methods (bringing homemade snacks, etc.)

- Finding compatible social groups with similar financial values

4.7. Implications for Financial Literacy Development

4.7.1. Contextual Financial Education Needs

Culture-Sensitive Approach: Findings indicate the need for financial literacy programs that consider cultural context:

1. Social Dimension Integration:
- Acknowledge the social value of coffee culture
- Balance individual financial goals with social relationships
- Strategies to maintain social connections without financial stress

2. Psychological Factors Consideration:
- Address locus of control in financial education
- Develop internal control strengthening programs
- Peer support systems for reinforcing positive financial behaviors

4.7.2. Technology-Mediated Solutions

Digital Tools for Financial Awareness: Based on participant feedback, several technology solutions emerge:

1. Spending Tracking Integration:
- E-wallet integration with budgeting apps
- Real-time spending alerts and notifications
- Social spending category tracking specifically

2. Peer Learning Platforms:
- Community-based financial goal setting
- Shared accountability systems
- Social gamification for positive financial behaviors

"If there is an app that can track coffee spending plus give reminders if it's over budget, it seems very helpful. But don't make it scary, just be supportive." (Indra, 26 years old, graphic designer)

4.8. Synthesis of Findings: Integrative Model of Locus of Control and Financial Behavior

Based on comprehensive analysis, this study produces an integrative model that explains the relationship between locus of control, social context, and financial behavior in coffee culture:

Pathway Model:

Locus of Control Orientation → Social Context Processing →
Financial Decision-Making → Behavioral Outcomes →
Social Feedback Loop → Reinforcement/Modification of Locus

Key Findings:

1. Internal locus of control functions as a protective factor against impulsive social spending.
2. External locus of control increases vulnerability to peer pressure and FOMO-driven consumption.
3. The social context of coffee shops creates unique challenges for financial self-control.
4. Indonesian cultural factors (communal values, social harmony) complicate individual financial boundary setting.
5. Digital payment systems reduce the pain of paying and increase impulsive spending across all locus types.

Implications for Practice:

1. Financial literacy programs need to integrate social and psychological dimensions.
2. Intervention strategies must be culturally sensitive and acknowledge the social value of communal activities.

3. Technology solutions can leverage positive peer influence to promote healthy financial behaviors.
4. Community-based approaches are more effective than individual-focused financial educatio.

These findings provide new insights into the complex intersection of psychological factors, social culture, and financial behavior, particularly in the context of the consumption culture of Indonesia's young generation.

5. Conclusion

This study reveals that the financial behavior of young people who are customers of Warung Kopi Sungai Betung is significantly influenced by their locus of control, both internal and external. Individuals with an internal locus of control tend to show more structured financial behavior, such as making a budget, saving regularly, and sorting social activities based on financial considerations. In contrast, individuals with an external locus of control are more susceptible to social pressure, impulsive consumption, and the use of credit such as paylater.

The phenomenon of coffee culture has been proven to be a social space that shapes the dynamics of financial decision-making, where factors such as peer pressure, the desire to maintain social status, and the need for emotional connection contribute to spending that is often unplanned. Digital technology such as e-wallets also exacerbate the tendency for impulsive spending by eliminating the "pain of paying" directly.

This study suggests the need for a contextual and culturally sensitive approach to financial literacy, taking into account psychological dimensions (such as locus of control) and social (such as communal values in coffee culture). Technology-based solutions also need to be directed at creating better financial awareness, for example through spending reminder applications and social category tracking.

Thus, this study not only contributes to the development of consumer behavior theory in the local Indonesian context, but also provides a practical basis for the development of more effective financial education programs for the younger generation.

aprilianoviani9@gmail.com[1] , eligia1609@shantibhuana.ac.id[2] , dedy@shantibhuana.ac.id[3]

Abstract

This study aims to analyze the work motivation of employees at the CU Keluarga Kudus Savings and Loans Cooperative in Bengkayang Service Place. This research employs a qualitative approach with an ethnographic design. Data was collected through interviews and field observations. The results of the study indicate that the work motivation of employees at CU Keluarga Kudus is divided into two categories: intrinsic motivation and extrinsic motivation. Intrinsic motivation consists of intention, reward, and responsibility. Meanwhile, extrinsic motivation consists of salary, interpersonal relationships, and work facilities. This employee work motivation is able to enhance their performance, which can be seen from their high work enthusiasm, timely completion of tasks, discipline at work, ability to work independently, effective use of resources, good work discipline, and quality of results.
This research concludes that employee work motivation plays an important role in improving employee performance at CU Keluarga Kudus, Bengkayang Service Center. Therefore, CU Keluarga Kudus needs to continue to maintain and enhance employee work motivation to achieve organizational goals.

Keywords: Work Motivation, Employee Performance, Savings and Loans Cooperative, CU Keluarga Kudus

1. Introduction

Credit Union is a financial institution that operates in the field of savings and loans, known as savings and loan cooperatives. A savings and loan cooperative (KSP) is a financial institution that operates in the area of savings and loans and provides loans to members at low-interest rates. Credit unions are managed by their members and aim to improve the welfare of the members. Savings and loan cooperatives differ from other savings and loan cooperatives in principle. In principle, credit unions adhere to the principles of self-reliance, solidarity, and education. (Aprilia et al., 2024). Credit Union is a financial organization established by members, for members, and from members. Credit Unions are established through education, grow through education, and continue to rely on education. Therefore, every community (prospective members) that wishes to become a member and be part of a Credit Union must undergo education. Prospective members at CU Keluarga Kudus must also learn about the vision and mission of the Credit Union. (Pagiu and Pundissing, 2020). Savings and Loan Cooperatives (KSP) continue to develop in line with the business development of their members. The savings and loan cooperative, also known as a credit cooperative, is a cooperative that allocates its members' savings to those who require capital support for their businesses. Additionally, the savings and loan cooperative also aims to educate its members to save, take pleasure in saving, and protect its members from loan sharks (Hasanah and Hanifah, 2020) One of the financial organizations that provide credit is CU Keluarga Kudus, which aims to improve the economic and social welfare of its members through financial services and sustainable member empowerment.

Saving and loan cooperatives are highly favored by local communities, because through these cooperatives they can easily save or borrow money. Saving and loan cooperatives offer

various loan mechanisms that are quite advantageous, such as low interest rates for MSME actors or decreasing interest rates on loans. The aim is to assist the community, especially its members, in economic improvement and advancement, as well as to promote a frugal lifestyle and wise money usage. (Vuspitasari et al., 2020)

The Holy Family Credit Union (CU KKD) was established for the first time on October 5, 2000. At that time, Father Paskalis Soedirdjo OFM. Cap, the parish priest of the Holy Family in Kota Baru, Pontianak, was responsible for the idea. The background for the establishment of the Holy Family Credit Union was the experience from the establishment of the Stella Maris Credit Union in Siantan, which showed that many people were borrowing from banks to buy houses and cars. Everyone was facing financial difficulties due to the high interest rates of bank loans. Many people are still facing financial problems.

Pastor Sudirjo explained the reason for the establishment of the Credit Union (CU). He stated that CU is always founded in every parish where he serves, but the hope has only materialized in Stella Maris Siantan Parish and Keluarga Kudus Kota Baru Parish. The reason for establishing CU in every parish is to address the need for death funds. By becoming a member of Keluarga Kudus CU, this urgent need can be promptly addressed. The funds will be provided as a benefit or solidarity in the event that a member or a member's family passes away.

Until 2005, services to the members of the Koperasi Simpan Pinjam CU Keluarga Kudus (KSP CU KKD) were managed by the board, mainly the treasurer and the credit committee, along with some volunteers. In February 2005, the board decided to recruit three additional staff members to assist the members of KSP CU Keluarga Kudus. Currently, there are four staff members and one service place head (TP) working at KSP CU Keluarga Kudus Service Place Bengkayang.

Human Resources play a strategic role in determining the future of an organization. Qualitative employees support the achievement of organizational goals. High employee competency indicates the quality of an organization, therefore enhancing employee competency is very necessary to support employee performance in order to achieve organizational goals. Effectiveness of performance in an organization can be driven by good work motivation. High work motivation will encourage employee morale, which will ultimately affect the performance of the employees involved. A conducive work environment will impact the personal lives of employees. Employees who feel comfortable and not stressed will have high work performance (Hutagalung, 2022).

2. Literature Review

According to Rahayu and Dahlia (2023), motivation is very important in the process of achieving a goal. High motivation will encourage someone to work hard to achieve it, thus increasing productivity.

According to Ratna Mirawati et al. (2022), work motivation is the foundation for the development of government and private institutions, as organizations seek to achieve goals and initiatives systematically and collectively. The driving force and motivation that encourage and change people's behavior towards positive directions is referred to as motivation in work. Efforts to encourage or urge employees to work are also known as work motivation. An employee's work motivation can stem from their intrinsic motivation or from extrinsic motivation that comes from external factors.

According to Siregar (2021), the main benefits of motivation are to enhance work enthusiasm and improve work productivity. However, the advantage of working with motivated people is that tasks can be completed accurately. Tasks are completed correctly and within the designated time. A person will feel happy doing something that is driven by

motivation. And individuals will feel recognized or appreciated. This is due to the fact that their work is very beneficial for those who are motivated. People will work hard to achieve the goals they have set.

Performance is a factor in achieving a goal in a company. To complete a task and work, an individual should have high enthusiasm and a certain level of ability. Readiness and skills alone are not effective for performing tasks without a clear understanding of what needs to be done and how to do it. Employee performance is very important in a company's efforts to achieve its goals (Djoko and Yandi, 2022).

Performance is the result of an employee's work demonstrated according to their role in the organization. One of the factors that influence employee performance is work motivation. Good work motivation will result in good performance as well. The organization's goals will be achieved if its human resources have high performance.

Work motivation and employee performance are two different things, although both are distinct, employee performance and work motivation are interconnected within an organization. Work motivation is one of the many factors that can influence employee performance. Motivation helps an individual take actions to achieve performance (Septiadi et al., 2020).

Lia Eriska et al. (2021), in an article titled 'Analysis of Work Motivation and Work Discipline on Employee Performance at PT Eriadi Fatkhur Rokhman Medan Accounting Service Office'. In this article, it was found that work motivation significantly affects the performance of employees at the Eriadi Fatkhur Rokhman Accounting Service Office. The factors that motivate employees to work well include not only wages but also aspects such as relationships among employees and job safety guarantees. It can be concluded that motivation is a very important factor in improving employee performance. By understanding the factors that influence motivation and applying appropriate measures, an organization can create a productive work environment and achieve its business goals.

3. Methods

This research uses a qualitative approach with an ethnographic design. Ethnography is a process and the result of a research study. As a process, ethnography involves a fairly long observation of a group, where during the observation the researcher engages in the daily life of the respondents for four months or through one-on-one interviews with members of the group. The researcher studies the meaning of every behavior, language, and interaction within the group. Qualitative research is usually used in social sciences and humanities under micro research rules. This primarily relates to the patterns and behaviors of humans, or behavior, as well as the mechanisms behind those behaviors, which are often difficult to quantify. Because thoughts and desires do not always correlate with observable symptoms. The inductive mindset is based on objective participatory observations of social symptoms (Harahap, 2020).

The phenomenon under study is Employee Work Motivation, which is the focus of this research. This research was conducted at the CU Keluarga Kudus Credit Saving Cooperative located in Bengkayang, Bengkayang District, which is situated in Bengkayang Regency, West Kalimantan, Indonesia. The aim is to analyze the work motivation of employees at the CU Keluarga Kudus Credit Saving Cooperative in Bengkayang. Interviews and field observations were used to collect data for this study. Interviews were conducted with Administrative and General Staff (Admin Staff) and two Credit Staff members. Field observations were carried out to obtain detailed information about the work motivation of CU Keluarga Kudus employees and to understand the situation and conditions at the CU Keluarga Kudus Credit Saving Cooperative in Bengkayang.

4. Results and Discussion

Work motivation is an internal drive or impulse from within oneself that makes a person feel enthusiastic and eager to work better. Meanwhile, performance improvement is the result of various factors, one of which is work motivation. When employees are motivated, they will strive to give their best in every task assigned.

This discussion refers to the analysis of employee work motivation for improving employee performance. In this section, the researcher discusses employee work motivation for improving employee performance at the Saving and Lending Cooperative CU Keluarga Kudus Bengkayang Service Place. In this discussion, the researcher presents the findings of the collected data. Furthermore, these findings are related to existing theories. The theories referred to are classified into two parts, namely: theories related to employee work motivation and improving employee performance.

Intention is the desire of employees to want to work. Especially in the job currently assigned to one of the employees, which is as a credit staff, where the employee meets new people every day as well as members who are saving at CU Keluarga Kudus to serve them.

Responsibility is an attitude to carry out tasks and obligations seriously and also to bear the risks on one's own. At CU Keluarga Kudus, the employees work with great responsibility, as observed when the researcher interned at CU Keluarga Kudus Bengkayang Service Place. The employees there do and complete their work well; for example, when working on monthly targets and reports, employees finish their tasks late at night and overtime because by working overtime, they can complete the targets and reports on time, allowing them to take on new work in the following month. And at the time of carrying out the duty to bring a sum of money to be deposited in the bank, the employees at CU Keluarga Kudus truly took the money to be saved in the bank for better security than keeping it at the office. With this, the employees have worked and fulfilled their duties and responsibilities as employees at CU Keluarga Kudus.

Salary is a monetary reward paid to employees regularly for the work they have done. Salary is one of the important factors that can influence employee performance. The salary or compensation provided to employees at CU Keluarga Kudus is already in accordance with the performance of each employee. When employees work on reports late into the night, they will receive overtime pay, so when employees work outside of regular hours, they will still receive their salary in the form of overtime pay. CU Keluarga Kudus also offers career progression for employees, which certainly can influence their salary; the higher the career level, the greater the compensation received.

Awards are a form of recognition for the achievements and performance carried out by an individual or group. Awards can be in material or non-material form. The awards given by CU Keluarga Kudus to the staff are very sufficient; one example is that staff who have been working for a long time and have a lot of experience will certainly be valued more, especially when it comes to being consulted about work, whether serving members who come to the office or serving members directly in the field.

Development is a process, or a way to develop something that already exists or something that does not exist yet, with the aim of improving its quality. CU Keluarga Kudus assists its employees in the process of personal development by providing various training to its members, both within the CU Keluarga Kudus environment and outside of it.

Interpersonal relationships are relationships that occur between two or more people. Good relationships with colleagues can enhance the performance among employees in the workplace. At CU Keluarga Kudus, there is a good personal relationship with all employees working at CU Keluarga Kudus, both at the TP Bengkayang and with employees and supervisors at the main office in Pontianak. Their relationship is very good; the staff meet almost every day and

spend a lot of time together in the office, sometimes staying late into the night. Work facilities are the resources and infrastructure used to support employee work.

Work facilities are important for certain companies or organizations because they can improve employee performance. The work facilities at CU Keluarga Kudus are currently sufficient to assist employees in their work. The facilities provided by the office make it easier for employees.

Employee work motivation at CU Keluarga Kudus is divided into two motivations: intrinsic motivation and extrinsic motivation. Intrinsic motivation consists of intention, appreciation, and responsibility. Meanwhile, extrinsic motivation includes salary, interpersonal relationships, and work facilities. Some of these motivational points encourage employees to work at CU Keluarga Kudus Service Location in Bengkayang.

Employee work motivation towards Performance Improvement at CU Keluarga Kudus involves intrinsic and extrinsic motivation that can lead to performance enhancement at CU Keluarga Kudus, Bengkayang Service Center. The performance improvement includes a high work spirit, completing tasks with full responsibility and on time, self-improvement, performance enhancement, discipline in work, being able to work independently, and utilizing resources effectively.

5. Conclusion

The conclusion of the results of this research is the analysis of employees' work motivation for improving employee performance at CU Keluarga Kudus Bengkayang Service Place. The motivation studied here includes intrinsic motivation and extrinsic motivation. The motivation present in the CU Keluarga Kudus staff is able to enhance their performance. Performance improvement can be seen from high work enthusiasm, timely completion of tasks, discipline in work, ability to work independently, effective resource utilization, good work discipline, and high-quality work results.

The following are work motivations for improving employee performance: the first is intention; intention can give rise to the desire to work. The second is responsibility; staff are responsible for completing tasks on time, which can encourage staff performance. The third is salary; having a salary that corresponds to performance can motivate employees to continue working. The fourth is recognition; this recognition can provide encouragement and work spirit for employees to continue working. The fifth is development; development is a process for employees to learn new things and improve quality in working, such as the ability to work independently. The sixth is interpersonal relationships; having good relationships can enhance performance among fellow employees. Lastly, work facilities; sufficient and complete work facilities can enhance work effectiveness for employees.

STRATEGIES TO IMPROVE THE PRODUCTIVITY OF ENTERPRISE MANAGEMENT PREVENTIVELY IN SOME COMPANIES IN INDONESIA

Budi Hartoyo[1], Sarjon Devit[2], Elfiswandi[3]
[1,2,3]Doctoral Program In Management Universitas Putra Indonesia YPTK Padang

Abstract

This study is to explain the analysis of strategies in improving the productivity of company management preventively based on internal and external factors of employees. This study utilizes the literature study method by analyzing various previous studies such as scientific articles.. Further Data processed through descriptive analysis. The results of the analysis reveal about ways to improve employee performance influenced by various factors such as motivation, work experience, discipline, leadership style, work environment, office facilities, incentives, organizational culture, policies, and training in the workplace

Keywords: Productivity, Preventive Management Internal External

1. Introduction

Human Resources (HR) is a very important part and is the greatest wealth owned by the company. If there are no people who need to be used as a source, then the programs in an organization will not be able to do. In addition, simply taking into account the existence of human beings is not enough to carry out programs or achieve the objectives of an institution or organization without adequate abilities and competencies. Individual abilities and competencies can affect performance and productivity levels directly or indirectly. The ability possessed by an employee is not a single factor that can affect the level of his performance and productivity.

However, other factors such as the office environment, regulations and leadership style also influence the working atmosphere apart from the internal factors of the employees. And indirectly, external factors also have a significant impact on the inner condition of employees, such as enthusiasm and drive to work. In this situation, morale and motivation are internal factors of an employee that can be influenced by external factors such as the condition of the work environment, support from superiors, and compensation from the office.

From this explanation, it can be said that internal factors and external factors have an equally important role in determining employee productivity. Thus, it can be concluded that both internal and external factors play a role in influencing the level of employee productivity performance. Thus, the action that needs to be taken is to recognize the methods and tactics in finding solutions to increase the productivity of employees. These actions are important to do in order to increase employee productivity so that work in the office, institution, or organization can run smoothly, effectively, efficiently, and reduce the negative impact due to lack of attention to employee conditions. Thus, it can achieve the goals of the institution or organization.

Necessary steps or methods in improving employee performance through appropriate human resource management. Edison, et al., (2016) revealed that MSDM focuses on improving the ability of employees through motivation so that their performance is optimal and achieves organizational goals. To increase employee productivity, it is important to manage human resources well in order to be able to effectively identify and solve emerging problems according to their root causes.

The implementation of strategies to increase employee work productivity in an office, institution, or organization usually involves establishing policies or regulations that must be

adhered to. Given these rules, the labor discipline of employees is formed indirectly with the help of supervision from the leadership of the office or institution of the organization. According to Kurniasari (2008) work discipline is the ability of employees to control themselves while performing tasks regularly to show their dedication while working in a team. Next, Kurniasari (2008) also suggests that there are two kinds of disciplinary approaches, namely prevention and improvement. The implementation of disciplinary action aims for employees to show good behavior, such as obeying the rules and policies of the institution, so that a relationship of mutual trust and respect is created between subordinates and superiors on an ongoing basis. That way, employees will feel more helped by a conducive work environment, which will ultimately increase their productivity.

In this context, it can be concluded that the strategies implemented use several factors that affect the increase in employee productivity. The strategy implemented is to use policies or regulations as a step to improve employee work discipline, where policies are external factors in increasing employee productivity. The main focus is on employee productivity as it includes the effectiveness and efficiency of work in HR Management, which has an impact on improving the quality of the organization. If the productivity of employees in an organization or institution is low, then directly the development of the institution or organization will be hampered or even threatened not to run.

5. Literature review

5.13. Productivity

Productivity is generally defined as relationship between output (goods or services) with input (labor, materials, money). Productivity is a measure of efficiency productive. A comparison between output and input. Input is often limited by Labor, while the output measured in physical units, forms, and values (Sutrisno, 2023).

5.14. Preventive Management

Preventive management, both internal and external, according to the latest experts 2023, focuses on preventive measures to avoid problems or losses in the future. Internally, it involves internal controls to ensure efficiency, effectiveness, and accountability of operations, as well as minimizing risks. Externally, preventive management is concerned with preventive maintenance, which aims to prevent damage or failure of equipment and assets.

6. Methodology

The method of writing this article is through literature research or literature study. Using literacy / literature studies is a method to retrieve information in solving problems from previous written sources such as books, journals, research case studies on the internet that can be accounted for. The sources are also related to the topic discussed in this article's editorial. The data obtained are then parsed and compared with the results of previous research and scientific theories, so that a more acceptable conclusion is obtained because it shows the dominance of similar data from the same object under study. Here, the author outlines the topic of strategies to increase employee productivity by looking at internal and external factors. This article discusses the factors that affect the level of labor productivity of employees, both in terms of their internal and external. Furthermore, it will also evaluate effective strategies to deal with various issues related to employee productivity. The analysis Data of this article comes from the results of a review of several scientific papers.

7. Results and discussions

The results of research conducted by Nugroho (2007) concluded that discipline supervision and work experience and wages have an influence on employee productivity together. But in other facts, data were obtained that showed that work experience does not affect the productivity of employees. This is due to the fact in the field that employees with longer work experience actually tend to freeze because they feel satisfied to be in a comfort zone so they do not want to develop again the potential that exists in themselves related to work productivity. While supervision, discipline, and wages affect employee productivity. In addition, from the results of research by Nugroho showed that there is an influence of supervision, work discipline, work experience, and salary/wages on employee productivity by 64.6% while the remaining 35.4% is influenced by other factors such as physical and mental, attitude and ethics, and nutrition and Health, which of these factors were not studied by the researchers.

The results of research by Supartha (2007) showed that there are two variables that have an influence on work discipline and employee productivity levels, including: (1) garment company leadership (implementation of management functions properly, behavior and exemplary leadership, transparency in financial management and ability to communicate with consumers) have a positive and significant effect on labor discipline (punctuality of work, adherence to implement systems and procedures, obedience in maintaining the quality of work and compliance in using raw materials). In addition, the leadership of garment companies (implementation of management functions properly, behavior and exemplary leadership, transparency in financial management and the ability to communicate with consumers) also has a positive and significant effect on labor productivity (the number of products produced, product quality produced, efficient use of materials and timeliness in product completion); and (2) manpower policy (supervision of the Manpower office on working hours in the company, the application of MSEs, supervision of Occupational Safety and the implementation of social welfare benefits for Labor) has a positive and significant effect on labor discipline (timeliness of work, adherence to implementing systems and procedures, adherence to maintaining the quality of work and compliance in using raw materials). As well as labor policies (supervision of the Department of Labor on working hours in the company, the application of MSEs, supervision of Occupational Safety and the implementation of social welfare benefits for Labor) have a positive and significant effect on labor productivity of garment companies (the number of products produced in a unit of time, the quality of products produced, the efficiency of the use of materials per unit of output and timeliness in the completion of products). Thus, it can be stated that labor discipline (timeliness of work, adherence to implement systems and procedures, as well as obedience in maintaining the quality of work and labor compliance in using raw materials) has a positive and significant effect on labor productivity (number of products produced in a unit of time, quality of products produced, efficiency of use of materials per unit of results and timeliness in product completion).

The results of research by Potu (2013) concluded that: (1) leadership, motivation, and work environment at the same time have a positive and significant influence on the performance of employees in the Regional Office of the Directorate General of state assets Suluttenggo and North Maluku in Manado; (2) leadership has a partial and significant influence on the performance of employees in the Regional Office; and (3) motivation has a partial and significant influence on the performance of employees in the Regional Office of the Directorate General of state assets Suluttenggo and North Maluku in Manado; and (4) the work environment has a partial and significant positive influence on the performance of employees in the Regional Office of the Directorate General of state assets Suluttenggo and North Maluku in Manado.

The results of research by Munadya (2012) showed that in PT BRI (Persero) Tbk. Kancana Pajajaran Bogor experienced the unattainability of the target in 2011. This is thought to be due

to the influence of internal factors, namely individual factors and organizational factors. Individual factors are the motivation and personality of the employee. While the organizational factor is the vision, mission and goals of the organization itself. Characteristics of respondents in the PT is dominated by male employees (63%), the majority of age 26 s.d. 30 years (30%), the average respondent occupies a position as AAO (37%), the final education of the most employees is S1 graduates (79%) and the average employee has worked for 1 s.d. 5 years (37%).

The results of research conducted by Sanjaya (2007) concluded that organizational culture affects work productivity is seen from the calculation of the results of a simple linear regression analysis shows that if there is an increase in employee productivity, but if there is a decrease in organizational culture automatic work productivity will decrease. This is evidenced by the data that the implementation of organizational culture carried out in the package and Logistics Division of PT Pos Class II Bandung, is still not difficult to implement employee archives, innovation and risk taking. Work productivity in the package and Logistics Division of PT Pos Class II Bandung, less attention and implement the factors that affect work productivity, namely: the amount of time, quality or quality, efficiency and effectiveness.

The results of research conducted by Etomes (2019) concluded that one of the strategies in increasing employee productivity lies in the ability of a leader to communicate effectively with subordinates or employees. In addition, a leader is also encouraged to always motivate employees and always carry out control in the form of supervision and build relationships, culture, and a good office climate.

The results of research by Hidayat and Taufiq (2012) showed that the data from the results of the first hypothesis testing is a significant influence between the work environment and work discipline and work motivation on employee performance PDAM Lumajang. Then in the second hypothesis, it was found that there is a partial influence between the work environment and work discipline and work motivation on the performance of PDAM Lumajang Regency. It is acceptable. Then from the results of the third hypothesis obtained data that work discipline has a dominant influence on employee performance PDAM Lumajang.

The results of a study by Muayyad and Gawi (2016) showed that job satisfaction did not have a significant effect on the productivity of employees of Islamic Bank X Regional Office II. The average level of job satisfaction of employees of Islamic Bank X Regional Office II only reached a level quite satisfied. While the level of work productivity of employees can be categorized as productive employees. This is because the determinants of productivity in this study focused on the ability/competence, responsibility, efficiency, reputation and record of achievement, development and evaluation and personal values, which from the results of data processing shows that the real determinants of employee satisfaction does not affect the productivity of employees of Islamic bank X regional office II. This is in line with the results that show that the effect of job satisfaction on employee productivity is only 7.5%. This value indicates a very weak influence. And on the field results of the determinants of dissatisfaction of employees of Islamic Bank X Regional Office II can be expected because the salary / wages, incentives, and motivation received are less in accordance with the job responsibilities charged from the level of risk owned by the job. Which is another variable that was not included in the research conducted by Muayyad and Gawi.

From the results of research conducted by Menon (2013), it can be concluded that many institutions or large organizations make investments through the promotion of training programs to their employees, which is because training has a positive impact on the effectiveness of their workers or indirectly can be said to have an influence on employee productivity for the better. So that their employees are able to do their jobs more effectively and efficiently after being trained. In addition, they also believe that training is used to provide

knowledge and skills that should be acquired through education. However, there are also factors that hinder the positive impact of training on productivity in the workplace including: lack of motivation of trainees, the quality of the work environment, organizational structures and processes, and lack of incentives.

And finally, from the results of research conducted by Ningrum (2017), it was concluded that office facilities partially have a significant effect on employee performance, meaning that the more complete the availability of office facilities in agencies or institutions, it makes pace Camat office employees increasingly have high performance. This supports and is consistent with the three indicators forming office facilities Faisal theory that supports Arianto's research in Ningrum (2017) which states that office facilities have a positive and significant effect on employee performance, where the more complete availability of office facilities can make employee performance increase. In addition, office facilities, work motivation, and work discipline have a significant effect on the performance of employees of the pace Sub-District Office. This shows that with the complete availability of office facilities, high work motivation and high employee discipline will have an impact on improving employee performance at the Pace District Head Office of Nganjuk Regency.

4.1. Discussion

Employee productivity is influenced by various factors that have been described, can be divided into two important factors, namely internal factors such as motivation, ability, work experience, education, discipline, physical and mental condition, and personality. External factors for employees, such as office environment, training, leadership, policies, wages/incentives, job satisfaction, organizational culture, and facilities.

In a study by Rivanto in Handoko (2015), it is stated that internal motivation, work discipline, skills, attitudes and ethics, as well as nutrition and health are internal factors that affect employee productivity. Factors from outside the employee (external) such as external motivation, work environment, institutional management, insurance/Social Security, achievement opportunities, incentives, technology, and production facilities affect employee productivity. According to Rivanto, motivation can be classified into two types, namely internal and external.

According to Nugroho (2007) states that internal factors that affect employee productivity can be in the form of thoughts or moods, which thoughts and moods have an impact on low productivity that will be produced if the atmosphere is not conducive. Then there is also the motivation that arises from within the employee to complete the job more productively. As well as the presence of a sense of saturation or boredom in employees as a result of doing work in the same field constantly. As for external factors that affect the level of employee productivity, which can be the atmosphere of the employee's work environment and the available facilities.

Supervision by the leadership are also other factors that affect employee productivity. Usually, regular supervision can encourage employees to work within the expectations of the leadership and goals of the organization. If employees work conscientiously, then they will get a promotion. Thus, the leadership style used can help improve employee discipline and optimal productivity results.

Effective communication between a leader and employees can facilitate a good leadership style. If an institution or organization wants to increase employee productivity through leadership, the first step is to select employees who are suitable for leadership based on performance and ability, and provide leadership training to them. Discipline is not only enforced with the supervision of superiors, but also through the rational application of rules to

build a good attitude of employees and encourage them to fulfill their obligations well through the consequences applied.

Salary / wage is also an additional factor that affects employee productivity. Income or honorarium, which is also referred to as reward, plays a significant role in improving the work efficiency of employees. This is because the salary / wage can be considered as a reward for the contributions made by employees to the company/organization. Thus, employees will feel happy because their efforts at work are recognized by the company/organization. Income can encourage employees to work harder and more efficiently, so they can get greater or more compensation. Thus, to increase employee productivity, a company can provide rewards, high wages, or promotions for employees who complete tasks on time and according to set targets. That way, employees and the company will get a balanced benefit. Health benefits for employees is another form of reward and wages are almost similar. Salary, incentives, promotion, and facilities also play an important role in increasing employee job satisfaction which will then affect their productivity.

Work experience, although an important internal factor in increasing employee productivity, does not always have a significant impact. It was caused by the results of research Nugroho (2007), that the length of work experience does not have a big impact on increasing employee productivity. Some institutions or organizations experience a situation where employees with long work experience tend to be less motivated to develop themselves and are quite satisfied with their existing performance. In this situation, the step that the institution or organization needs to take is to use other factors such as motivation and leadership. That is, an alternative is to motivate employees by leadership or implement policies to improve their discipline and productivity at the same time.

The work environment of the institution's office also plays a role in determining the level of productivity of the institution. This is also consistent with the statement of Sofyandi in Ulinnuha (2016) that the human resource management environment is defined as a series of factors that can affect the productivity of human resource activities consisting of internal factors that are sourced from within humans. In addition, the office work environment is classified into two, namely the physical environment and nonphysical environment. The physical environment is what things exist in the office that can be seen with the naked eye, such as office space layout. While the nonphysical environment is what things can not be seen/invisible, for example, related to the social and cultural atmosphere that exists in an institution's office. According to Supartha (2007) states that the physical environment of the office can be security, comfort, lighting, cleanliness, air circulation, and color. While the non-physical environment of the office, according to Supartha, includes the interrelation of labor relations between employees that can affect their performance.

Thus, efforts to increase employee productivity through the office environment can be done by maintaining or improving office conditions such as repainting dirty walls, replacing damaged lights and air conditioners, and installing CCTV for office security. Furthermore, measures to increase productivity from nonphysical aspects are regulated through programs and efforts to strengthen relationships between employees in the workplace through organizational culture that influences work attitudes and behavior, and supports the cultivation of socio-cultural values and discipline. An agency office leader also acts as a liaison, mentor, and creator of good relationships between employees and leaders and fellow employees. But before the action is taken, the leadership must understand the personality of each employee individually. Thus, it can avoid mistakes in the approach or actions taken by a leader to improve social relations between employees in the workplace.

Factors such as office facilities and facilities also have an impact on employee productivity levels. This is due to the fact that office facilities or equipment can help employees get work

done more easily, quickly, and effectively. According to research conducted by Ningrum (2017), there is a relationship between facilities and work discipline and employee motivation. Data shows that several office facilities have a major effect on employee performance at the Pace Sub-District Office of Nganjuk Regency, with complete facilities, motivation, and high work discipline will improve employee performance. With this explanation, an institution or organization also needs to ensure that office facilities are met so that employees can work more efficiently, quickly, and motivated. So it can also form work discipline for employees.

Employee productivity has an important role. This is because employee productivity is a determinant of the success of goals in an office or institution. Productivity is also often associated with employee performance in the running process of an organization. If productivity focuses on the results (output) of work that has been done based on a target, then performance is the ability possessed by an employee in the process of achieving something or in other words performance is the process of employees in producing a product that identifies the value or level of ability (competence) that employees have. This is in line with the opinion of Hidayat and Taufiq (2012) who said that performance is a form of action to complete the tasks assigned to employees taken over a certain period of time and the results can be measured.

Meanwhile, according to Masram and Mu'ah (2017) performance is defined as the actual work performance achieved by an employee by taking into account the number of tasks received and good or bad in the implementation of tasks adjusted to the burden or responsibility of employees. In addition, there is also the term performance appraisal. As stated by Edison, et al., (2016) which says that performance appraisal has an important function for an institution or organization, because at the same time it can provide feedback for employees to improve performance in addition to serving as an improvement for the institution or organization in analyzing existing problems. In this case, performance assessment is carried out through quantitative and qualitative measurements.

The importance of employee productivity cannot be ignored. This is due to the fact that the level of productivity of employees is a key factor in achieving the goals of a particular office or institution. Employee performance is often associated with productivity in an organization. If productivity focuses on work results according to targets, performance is the ability of employees to achieve goals by producing products that reflect their competencies. This is in accordance with the view of Hidayat and Taufiq (2012) that performance is a way to complete the tasks assigned to employees within a certain period of time and the results can be measured.

According to Masram and Mu'ah (2017), performance is the actual achievement of an employee's work, influenced by the number and quality of tasks performed in accordance with the responsibilities held. In addition, there is also the term performance evaluation. According to Edison's research, et al. (2016), performance appraisal has a significant role for an institution or organization, because in addition to providing feedback for employees to improve performance, it also helps in analyzing and correcting existing problems in the institution or organization. In this situation, performance evaluation is done by measuring quantitatively and qualitatively.

For example, it can be seen from the achievements and contributions made by employees to institutions or organizations. Thus it can be said that performance appraisal also serves as an evaluation tool in an institution or organization in order to determine the level of ability possessed by its employees so that it is also possible to supervise or train employees or even make improvements to the implementation strategy of the applicable work program. Productivity and performance of employees in an organization or institution is influenced by many factors, namely:

4.1.1. Motivation

In general, everyone has a motivation in life, which is based on the desires he has. According to Hamalik (2012) revealed that motivation is a personal or personal change of a person that occurs marked by the feelings and reactions that arise in order to achieve a goal. Self-change (personal) can also be interpreted as a psychological change which occurs due to stimuli both from within and from outside a person. In this case, motivation is included as one of the determining factors in the level of employee productivity. Because with motivation can encourage someone to act or do something in accordance with the wishes or feelings that arise from within the person. In relation to work, motivation is needed in order to encourage employees to always participate and be active in achieving the goals of the institution or organization.

4.1.2. Working Environment

As it should be, in carrying out an activity or work a person must not escape the influence of the surrounding environment. According to Potu (2013) states that the work environment is a place or space where every day employees can perform an activity or work. A good working environment should be able to encourage the smooth process / activities of employees while also paying attention to aspects of hygiene, comfort, health, and safety. So that employees in completing their work can run optimally. In addition, the meaning of the work environment is not only in the form of things that can be seen physically but also things that can be felt by using the social instincts of employees in a relationship baim as friends and colleagues who later also gave rise to a culture in the organization. Thus, the work environment cannot be separated from the influence between individuals and individuals with the surrounding nature (physical environment) in carrying out an activity or work. So that the work environment is also considered to affect employee productivity.

4.1.3. Work Discipline

According to Wursanto in Hidayat and Taufiq (2012) states that what is meant by work discipline is a form of compliance by an employee of the provisions or regulations set by an institution/organization based on self-awareness of each and no coercion from any party. Meanwhile, according to Dessler in Supartha (2007) said that work discipline is the attitude of employees who obey and can respect the rules set by the institution/organization, both in the form of written and unwritten rules. Where in this case the employee is considered willing and able to carry out the tasks given by not complaining or complaining and ready to get rewards/sanctions if the employee violates or does not carry out the responsibilities as appropriate. Of the two opinions on labor discipline in general means that labor discipline is a manifestation of employee compliance with policies or regulations set in an office or institution as well as the orders given by the leadership. So that employees work in accordance with the rules or procedures that exist in the office or institution. The level of discipline of an employee can be seen and measured from various parameters. Parameters or indicators in work discipline based on the opinion of Sinungan in Handoko (2015) include: (1) presence, which is a measuring tool that serves to monitor or review how high the level of employee compliance with existing regulations in an office or institution; (2) employee behavior or attitude (affective), is the level of adaptation of an employee in completing any work that has been given by the leadership or boss against him; and (3) responsibility, is a representation of the employee's work on what has been given to him.

4.1.4. Training

According to Sikula in Widianto (2016) suggests that training or training is a form or way in the stages of providing understanding or education with a relatively short period of time in

which the implementation also uses a structured and systematic procedure to achieve a specific goal that is relatively limited/narrow scope. For example, the provision of training to employees by providing material/knowledge as well as practices regarding technical bookkeeping operations that must be taken within a predetermined time (relatively short) with the aim of training employees ' skills in the field of bookkeeping. In this case, training is the provision of lessons to employees in a short time or a practice which aims to increase the potential possessed by employees so that employees can develop skills while improving the quality of their performance. In addition, Widianto (2016) said that effective training can help as well as support employees to always be motivated to increase their work productivity. If the employee can undergo the training program process properly and correctly, then the employee's work productivity will increase in line with the increased understanding, ability, and expertise as feedback from following the training program. Indirectly, Widianto's opinion can be concluded that training also has an influence on increasing employee productivity.

4.1.5. Leadership

According to the team of lecturers of Education Administration, University of Education Indonesia (2011) states that leadership is a form of a person's ability to influence and move a person or group of people to do something in order to achieve goals that have been set quickly and precisely. In an institution / organization where there are many people as members of the group, will not be able to run the organizational process without a leader. Therefore, in accordance with the opinion of Kempa (2015) which states that leadership is one of the vital aspects that have an influence on the results of employee performance in an institution or organization both individually and in groups. This is because every implementation of the tasks that exist in an institution or organization in various fields always involves the role of a leader. Good leadership will have an impact in the form of increasing the quality of employees. A good leader will not arbitrarily or origin in using his power, but carry out duties and responsibilities as they should be by helping subordinates or employees who have difficulty doing the job. Thus leadership has an influence on employee productivity where employee productivity can go up (for the better) or even down (for the worse) depending on the ability of an individual in performing their duties as a leader.

4.1.6. Policy

Labor policy according to Supartha (2016) itself is a Labor rule imposed by an office or institution which in this case can be measured by several indicators obtained from labor policies such as those related to the respondent's statement regarding the supervision of the Labor Office on working hours in the company, the implementation of the District/City Minimum wage (UMK) in each company, supervision of Occupational Safety, and the implementation of social welfare benefits for employees. From this explanation, it can be understood that the employment policy includes office hours, wages, safety supervision, and social welfare benefits, which of these coverage can be its own component as a factor in increasing employee productivity. If the policy is related to time, it can be continuous with employee discipline. While those related to wages and benefits are continuous with external factors in the form of incentives for employees. Because Labor policy has a broad scope and has a big impact, policy makers both from the office or institution itself and government institutions must think carefully before setting the policy. Therefore, analyzes are needed that can create benefits and fairness for both parties, namely office employees and institution owners. According to Supartha (2007) policy analysis is a form of analysis that generates and presents information in such a way that it can provide the foundation of policy makers in making decisions. With the foundation on making a policy based on an analysis can prevent errors in decision-making

and prevent the occurrence of something unexpected such as a conflict or even a strike and demonstrations of employees against the office or institution.

4.1.7. Wages / Salaries

According to Muayyad and Gawi (2016) wages and salaries have an influence on the level of employee satisfaction which also determines the level of employee productivity. However, in the opinion of Muayyad and Gawi (2016) it is also said that wages cannot fully satisfy employees. This is because no matter how much salary will be obtained by employees will not be enough for employees. In other words, in essence, the employee is also a human being who never feels satisfied. Therefore, it must be stressed that it is not too easy to give awards in the form of prizes and high wages without a big struggle, in this case the big struggle is employee productivity. Basically, a review of employee job satisfaction seen from the aspect of Wages/Salaries not only depends on the size or small nominal salaries earned by employees, but how the behavior of the owner of the institution or the organizers who have the authority and duties in the field of finance, especially the provision of salaries/wages to employees can act fairly. Providing a fair salary / wage can an institution or company achieve goals effectively and can prevent conflicts or unwanted problems. In addition, according to Edison, et al., (2016) job satisfaction is a set of feelings or emotional attitudes that employees have about things that are pleasant or not towards a job they are doing. The level of employee performance satisfaction is based on the conformity between expectations and reality regarding the work they do. Some dimensions that have a reciprocal relationship of employee job satisfaction in addition to Wages / Salaries are leadership, competence, policy, appreciation, and environmental atmosphere.

4.1.8. Organizational Culture

According to Edison, et al., (2016) states that organizational culture is the result of the process of fusion between cultural styles and individual behavior, giving rise to new norms and philosophies which have constructive values in influencing how to act and face things in order to achieve a certain goal. Meanwhile, according to Sun in Caruso (2017) states that in general organizational culture is a theoretical collection of important values, beliefs, and understandings shared by members. Culture also provides a way of thinking, feeling, and a better (or the best) way of giving a reaction that can help managers or leaders make decisions and organize the activities of institutions or organizations. In other words, organizational culture is the forerunner of policies in force in institutions which can also affect employee productivity.

4.1.9. Work Experience

According to Nugroho (2007) states that work experience is one aspect that needs to be considered because it is related to increasing employee productivity. Some people and institutions consider that work experience with a long time is needed, because an employee's work experience is in line with the level of ability and performance of employees. In this case, it means that an employee who has a longer work experience, the higher the level of productivity. In this case, it can also be said that work experience is needed none other than to support the achievement of the goals of the institution/organization effectively and efficiently, because employees with long work experience are considered ready and qualified to carry out any tasks given by the organization to them even in some institutions/organizations provide high positions or positions in certain fields for prospective employees who have had long work experience. This is also supported by the opinion of Martoyo in Nugroho (2007) which states that a company will tend to choose applicants who are experienced because those who are

experienced are seen as better able to carry out the tasks they will do. Thus, work experience can also affect employee productivity.

4.1.10. Office Facilities

According to Moenir in Ningrum (2017) states that the facility is a medium that can be utilized by employees in conjunction with work in the institution / organization in order to facilitate the completion of a job. Meanwhile, according to Kurniasari (2008) work facilities have a link with work discipline which with adequate work facilities can improve the work discipline of an employee. This is because by utilizing work facilities, an employee will feel helped because the task can be completed more quickly and easily, thus increasing the employee's work productivity. In this case, it can also be said that work facilities are related to the effectiveness and efficiency of employee work. This is in accordance with the opinion of Husnan in Kurniasari (2008) which states that the work facility is a form of corporate services to employees in order to support performance in meeting the needs of employees, so as to increase employee productivity.

5. Conclusion

Internal and external factors are interconnected and continuously affect employee productivity. Therefore, when implementing an improvement strategy, it is important to take into account all factors, both internal and External, by conducting an evaluation to find solutions in developing an office, institution or organization. Suggested actions can be plans that provide positive benefits for the continuity of activities in the office. Create a more harmonious office environment to encourage effective communication between leaders and employees and create a culture of high discipline in an institution or organization. Supported by adequate office facilities, as well as providing training for leaders and employees so that the leadership of the institution/organization runs smoothly and effectively, as well as increasing employee motivation through income that is in accordance with their performance and also providing health benefits to support the physical and mental well-being of employees for optimal performance. Some things that can affect employee productivity are Motivation, work experience, work discipline, leadership style, work environment, office facilities, Awards, corporate culture, organizational policies, and training for employees and leaders.

THE INFLUENCE OF NARCISSISM ON E-WOM, SELF-ESTEEM, AND VIRTUE SIGNALING AND ITS IMPACT ON PURCHASE INTENTION OF PREMIUM ELECTRIC CAR PRODUCTS IN INDONESIA

Frima Derris, Rhian Indradewa, Triyono Arief Wahyudi, Edi Hamdi
Esa Unggul University, Jakarta, Indonesia

Abstract

The development of electric vehicles not only reflects technological innovation, but also becomes a symbol of social status and sustainability values in modern society. In Indonesia, interest in premium electric vehicles is increasing along with the encouragement of government policies and changes in consumer behavior that are increasingly connected to social media. This study aims to examine the influence of narcissism personality on purchase intention through the mediation of electronic word of mouth (E-WOM), self-esteem, and virtue signaling. This study uses a causal approach with a LISREL-based Structural Equation Modeling (SEM) model to test the relationship between variables. A total of 200 respondents who are users or potential users of premium electric vehicles in Indonesia participated in this survey. The results of the analysis show that narcissism has a significant positive effect on E-WOM, self-esteem, and virtue signaling, and directly or indirectly increases purchase intention. The three mediating variables are also proven to contribute to the formation of purchase intention. These findings strengthen the relevance of the Theory of Planned Behavior (TPB) and Extended TPB in explaining the dynamics of consumer behavior influenced by psychological and social constructs. The practical implications of this study encourage marketers to utilize consumer personality characteristics in designing communication strategies that emphasize the exclusivity, social validation, and moral values of premium electric vehicle products.

Keywords: narcissism, E-WOM, self-esteem, virtue signaling, purchase intention, premium electric vehicles, TPB, SEM-LISREL

1. Introduction

The development of electric vehicles not only reflects the advancement of automotive technology, but also becomes a symbol of a sustainable lifestyle and a representation of modern social status. In Indonesia, the transition to electric vehicles is increasingly evident with the support of policies such as Presidential Regulation No. 55 of 2019 and various fiscal incentives (Ministry of Industry, 2022). The public is increasingly considering electric vehicles not only from a technical aspect, but also from the accompanying symbolic and psychological values, such as exclusivity, environmental concern, and social image (Cheung *et al*., 2008; Shin *et al*., 2018). In this context, Electronic Word of Mouth (E-WOM) becomes an important element in shaping consumer perceptions and decisions. Platforms such as TikTok and YouTube are now the main references for consumers in seeking authentic reviews regarding the efficiency, features, and user experience of electric vehicles. Purchasing decisions are no longer only rational, but also influenced by self-identity, social influence, and symbolic values (Van de Grint *et al.*, 2021). Personality characteristics such as narcissism also influence consumers' tendency to purchase products that support a superior self-image. Individuals with high levels of narcissism tend to use social media as a space to show off their status, share positive opinions about premium products, and display moral values, a phenomenon known as virtue signaling (Krispenz & Bertrams, 2023). On the other hand, self-esteem acts as an internal mechanism that encourages or restrains individuals from expressing themselves publicly (Baumeister *et al*., 2003). However, the relationship between narcissism, E-WOM, self-esteem, and virtue

signaling in influencing purchase intention towards premium electric vehicle products in Indonesia has not been comprehensively explored. Therefore, this study attempts to fill this gap by examining the relationships between these variables in a single framework.

2. Literature Review

2.1. Theoretical Framework

To understand the formation of purchase intention in the context of premium electric vehicles, this study uses the Theory of Planned Behavior (Ajzen, 1991) as the main theory. TPB explains that a person's intention to perform an action is influenced by attitudes towards the behavior, subjective norms, and perceived control over the behavior. In this context, positive attitudes towards electric vehicles, social influences from the environment, and beliefs about personal ability to purchase vehicles are the main drivers of the formation of purchase intention (Yau et al., 2024; Liang et al., 2024). This theory was then developed into the Extended Theory of Planned Behavior (ETPB), which includes additional factors such as moral values, cultural influences, and the use of digital technology (Abebe et al., 2024; Pradana et al., 2024). ETPB becomes relevant in the context of Indonesian consumers, who are increasingly active on social media and are starting to pay attention to sustainability aspects in their consumption.

2.2. Narcissism

Narcissism defined as a personality tendency characterized by feelings of superiority, need for validation, and the pursuit of an ideal self-image (Raskin & Terry, 1988; Morf & Rhodewalt, 2001). In the context of consumption, individuals with narcissistic traits tend to purchase products that reflect social status and self-identity, including premium electric vehicles (Cheung et al., 2008; Miller et al., 2009). They also actively share their experiences on social media as a form of image building (Buffardi & Campbell, 2008).

2.3. Electronic Word of Mouth (E-WOM)

E-WOM refers to the online dissemination of information, reviews, and product recommendations from fellow consumers (Hennig-Thurau et al., 2004). Compared to traditional advertising, E-WOM is considered more credible and influential in influencing purchasing decisions, especially for technology and premium products (Senecal & Nantel, 2004; Kotler et al., 2018). Research also shows that narcissistic individuals tend to be more active in spreading E-WOM to strengthen their self-image (Luarn et al., 2016).

2.4. Self-Esteem

Self-esteem is an individual's evaluation of his or her own worth and competence (Rosenberg, 1965; Baumeister et al., 2003). Individuals with high self-esteem are more confident and tend to share opinions openly, while those with low self-esteem tend to be more influenced by social opinion and need validation from their surroundings (Jordan et al., 2003). In the context of purchasing a premium vehicle, self-esteem influences symbolic and social motivation in decision making (Kim & Lennon, 2013).

2.5 Virtue Signaling

Virtue signaling is the behavior of publicly expressing moral values or pro-social attitudes to gain social recognition (Tosi & Warmke, 2016; Levy, 2019). In the consumer context, this is reflected in the choice of products associated with sustainability and ethics, such as electric vehicles. Narcissistic individuals tend to use virtue signaling to strengthen their moral image and social identity (Krispenz & Bertrams, 2023; Ok et al., 2021).

2.6 Purchase Intention

Purchase intention is the consumer's intention to purchase a product, which is influenced by perceived value, brand reputation, personal beliefs, and social influence (Ajzen, 1991; Hsu & Lin, 2016). In the context of premium electric vehicles, purchase intentions are driven not only by functional needs, but also by the desire to demonstrate status, personal values, and environmental concerns (Grewal et al., 1998; Kim & Gupta, 2012).

2.7. Literature Synthesis

Conceptually, the literature shows that narcissism has a direct influence on E-WOM, self-esteem, and virtue signaling. These three variables, in turn, influence purchase intention. Although several studies have examined these variables separately, there are not many studies that examine the relationship between these four factors simultaneously in the context of premium sustainability-based products, especially electric vehicles in Indonesia.

3. Research Methodology

3.1. Research Paradigm

This study uses a holistic approach to understand the relationship between variables in the context of premium electric vehicle purchase decisions in Indonesia. This approach not only emphasizes the linear relationship between constructs, but also explores the complex interactions between psychological factors (such as narcissism and self-esteem), social (virtue signaling), and digital (E-WOM). This approach is relevant to fill theoretical gaps and provide strategic insights in the context of modern consumer marketing that is increasingly multidimensional. Researchers position consumers as individuals with layered motivations: in addition to considering technological features, consumers of premium products also pursue status symbols, moral values, and social contributions. For example, narcissistic consumers tend to respond to exclusive images, while socially oriented consumers are more interested in the sustainability and ethical aspects of the product (Krispenz & Bertrams, 2023). Thus, this study integrates psychological, social, and digital aspects to explain the formation of purchase intention.

3.2. Unit of Analysis and Unit of Observation

The unit of analysis in this study is individual users or potential users of premium electric vehicles in Indonesia. Respondents consist of two categories:

- Prospective: individuals who have the intention of purchasing a premium electric vehicle.
- Existing: individuals who have used a premium electric vehicle for at least one year.

The observation unit is the behavior and attitude of individuals in the purchasing process, which is observed through questionnaire data. Data collection is scheduled for January 2025, with respondent criteria including:

- experience or interest in premium electric vehicles,
- actively using social media,
- and have an orientation towards value-based products and social image.

3.3. Research Methods

This study is causal, aiming to identify the causal influence between independent variables (narcissism, self-esteem, E-WOM, and virtue signaling) on the dependent variable (purchase intention). The causal method allows analysis that goes beyond simple correlation, emphasizing the potential for logical and significant causal relationships between variables (Malhotra, 2013; Hair et al., 2018).

3.4. Sampling Techniques

The method used is quota sampling, targeting a minimum of 105 respondents in accordance with the SEM-LISREL principle, which is 5 times the number of indicators (Hair et al., 2018). There are 21 statements in the questionnaire, so the recommended minimum number has been met. The sample selection criteria focused on involvement with premium electric vehicles and activeness in digital platforms.

3.5. Data Collection Instruments and Procedures

Data collection was conducted through a closed questionnaire compiled using a 7-point Likert scale (1 = strongly disagree, 7 = strongly agree). The implementation stages include:

a. Preparation Stage:
- The questionnaire was prepared based on validated constructs from previous studies.
- Trial on 30 respondents for initial validity and internal reliability testing.
- Editorial adjustments based on trial results.

b. Distribution Stage:
- The questionnaire was distributed online and directly to respondents according to the criteria.
- An explanation is provided regarding the purpose, confidentiality, and benefits of participation.
- A time limit for filling is set to maintain data responsiveness.

c. Evaluation Stage:
- Revalidation of the instrument after initial trials.
- Revise indicators if necessary before final deployment.

d. Final Stage:
- Final data collection from a minimum of 105 respondents.
- All data is used for model and hypothesis testing.

3.6. Data Analysis Methods

a. Validity and Reliability Test of Questionnaires
- Carried out through exploratory factor analysis using SPSS.
- Validity test using Kaiser-Meyer-Olkin (KMO) and Measure of Sampling Adequacy (MSA); a value ≥ 0.5 is considered feasible.
- Reliability test using Cronbach's Alpha; values > 0.7 indicate good consistency (Hair et al., 2018).

b. Hypothesis Testing: SEM-LISREL
- Testing was carried out using the Structural Equation Modeling approach with LISREL, in accordance with the confirmatory nature of the research.
- Statistical tests include:
  - t-value > 1.96 (95% significance level),
  - p-value < 0.05 for the significance of the relationship between constructs,
  - R^2 (coefficient of determination) as a measure of the strength of the model in explaining the dependent variable.

This approach provides strong model validity and allows for testing of paths between variables within a complex theoretical framework. SEM-LISREL is suitable for use in social research involving psychological variables, as was done in this study (Kline, 2015; Hair et al., 2018).

4. Research Results

4.1. Respondent Characteristics

A total of 200 respondents were successfully collected through the distribution of online questionnaires. Respondents are users or prospective users of premium electric vehicles spread across various regions in Indonesia.

a. Respondent Gender

Of the total respondents, the composition based on gender is as follows:

Gender	Number of people)	Percentage (%)
Man	106	53.0%
Woman	94	47.0%

This distribution shows that participation between men and women is relatively balanced, although slightly dominated by male respondents.

b. Respondent Age

The age range of respondents is categorized into five age groups. The distribution is as follows:

Age Group	Number of people)	Percentage (%)
Less than 20	12	6.0%
21–30 years	56	28.0%
31–40 years	74	37.0%
41–50 years	38	19.0%
More than 51	20	10.0%

The largest age group comes from the 31–40 year range (37%), followed by 21–30 years (28%), which reflects the characteristics of the productive and potential segment of premium electric vehicle consumers in Indonesia.

4.2. Results of Instrument Validity and Reliability Tests

a. Construct Validity

Validity test shows that all construct indicators have loading factor values above 0.50, meeting the criteria for construct validity eligibility (Hair et al., 2018). This shows that each indicator is able to represent the measured latent variables accurately.

b. Construct Reliability

All variables have construct reliability and variance extracted values.which is very good, indicating the level of consistency and stability of the measurement. The details are as follows:

Variables	Construct Reliability	Variance Extraction
Narcissism (NAR)	0.94	0.80
E-WOM	0.95	0.81
Self-Esteem (SE)	0.96	0.82
Virtue Signaling (VS)	0.96	0.86
Purchase Intention (PI)	0.97	0.92

4.3. SEM-LISREL Structural Test Results

a. Coefficient of Determination (R^2)

The structural model produces an R^2 value that reflects the proportion of variance of the dependent variable explained by the independent variables. The results are as follows:

Dependent Variable	Independent Variables	R^2	Interpretation
E-WOM	Narcissism (NAR)	0.42	42% of E-WOM variation is explained by NAR
Self-Esteem (SE)	Narcissism (NAR)	0.23	23% of SE variation is explained by NAR

Virtue Signaling (VS)	Narcissism (NAR)	0.23	23% of the variation in VS is explained by NAR
Purchase Intention (PI)	EWOM, SE, VS, NAR	0.78	78% of the variation in PI is explained by the four independent variables

b. Goodness of Fit Model

This model shows goodness of fit based on various statistical indicators. The Degree of Freedom (df) value of 158 accompanied by Chi-Square of 195.18 and Non-Centrality Parameter (NCP) of 37.18 with a confidence interval between 5.76 to 76.77 indicates that the model has a good fit. Furthermore, the RMSEA of 0.034 is included in the good fit category, with a confidence interval of 0.014 to 0.049, and a P Value of 0.96 indicating a very good model fit.

The ECVI model indicator of 1.71 also indicates good fit because its value is lower than the ECVI for the saturated model (2.32) and the independence model (70.38), with a confidence interval between 1.56 and 1.91. Likewise, the AIC value for the model of 341.18 is smaller than the AIC for the saturated model (462.00) and independence (14,006.44). The CAIC model value of 654.95 is also lower than the CAIC saturated (1,454.91) and CAIC independence (14,096.70), which strengthens the indication of good model fit.

Several other fit indicators also showed very good results, such as NFI (0.98), CFI (1.00), NNFI (0.99), IFI (1.00), RFI (0.98), and PNFI (0.74), all of which are in the good fit category. The Critical N of 187.50 also indicates that the model is suitable for use. However, the GFI value of 0.91 is included in the marginal fit category, although it is still within acceptable limits. Other indicators such as Standardized RMR (0.054), AGFI (0.88), and PGFI (0.63) provide additional support for the general suitability of the model.

Overall, this model shows a very good fit to the data, based on the combination of the various fit indicators used.

4.4. Hypothesis Testing Results

The following table presents the results of hypothesis testing using T-Value. All hypotheses are declared accepted, because they have T-Value values above the threshold of 1.96 (95% significance). The detailed description can be seen below:

Hypothesis	**Statement**	**T-Value**	**Information**
H1	Narcissism → E-WOM	9.22	Accepted
H2	Narcissism → Self-Esteem	6.98	Accepted
H3	Narcissism → Virtue Signaling	6.97	Accepted
H4	E-WOM → Purchase Intention	2.55	Accepted
H5	Self-Esteem → Purchase Intention	3.27	Accepted
H6	Virtue Signaling → Purchase Intention	3.00	Accepted
H7	Narcissism → Purchase Intention	3.96	Accepted

Source:SEM-LISREL data processing results

5. Discussion

The results of this study reveal a significant relationship between narcissism personality traits and various psychological and social variables that influence purchase intention towards Premium Electric Car products in Indonesia. The following discussion will discuss each finding based on theoretical perspectives and previous empirical findings, especially within the framework of the Theory of Planned Behavior (TPB) and Extended TPB (ETPB).

The results of this study indicate that narcissism plays an important role in shaping consumer behavior towards premium electric cars. Consumers who have narcissistic traits tend to be more active in spreading their information and experiences through electronic word of

mouth (e-WOM). This is done not only to share, but also to build self-image and gain social recognition (Kim & Jang, 2018; Luarn et al., 2016). Within the framework of the Theory of Planned Behavior (TPB), this behavior is influenced by positive attitudes towards e-WOM, pressure from the social environment, and confidence in their ability to do so. The Extended TPB (ETPB) approach adds that narcissism as a personal character helps strengthen e-WOM intentions and behavior (Marokhu & Fatoki, 2024; Chao & Yu, 2024).

In addition, narcissism has also been shown to increase self-esteem. Individuals with this trait often use symbolic consumption, such as buying luxury products to feel more confident and valued (Mao et al., 2020; Burgmer et al., 2021). The TPB explains that the formation of this self-esteem is related to attitudes towards premium products, norms from the social environment, and perceptions of control over purchasing decisions. In the ETPB, narcissism functions as part of a psychological identity that drives symbolic consumption behavior (Lombardi et al., 2024).

Interestingly, narcissistic traits also encourage virtue signaling behavior, which is demonstrating moral values through consumption, such as buying environmentally friendly products to appear to care about social issues. This behavior tends to be done in order to gain recognition as a good or ethical person (Krispenz & Bertrams, 2023; Ok et al., 2021). In the TPB, this is influenced by attitudes, social norms, and perceptions of control, while the ETPB sees it as a form of social identity expression driven by narcissism (Chao & Yu, 2024).

Furthermore, this study also found that the more frequently consumers engage in e-WOM, the more likely they are to intend to purchase the product. This sharing activity not only strengthens personal beliefs but also forms social norms in the digital environment that drive purchasing decisions (Roy et al., 2019; Lăzăroiu et al., 2020). Within the ETPB framework, e-WOM even strengthens the identity as a progressive and environmentally conscious consumer (Wongthahan et al., 2025).

Self-esteem also plays an important role in increasing purchase intention. Individuals who have high self-confidence tend to be more confident in their purchasing decisions, especially for products with symbolic value (Razmus & Laguna, 2024; Rofiq et al., 2024). In both TPB and ETPB, self-esteem strengthens the relationship between intention and consumption behavior through attitudes, norms, and perceived control.

Meanwhile, virtue signaling has also been shown to increase purchase intentions, especially when the product represents certain moral or social values. Consumers want to be known as caring and responsible individuals, and purchasing is one way to demonstrate this (Cozzio et al., 2022; Kretschmer & Kahl, 2021).

Finally, narcissism has been shown to directly increase purchase intention. Narcissistic individuals tend to want to stand out through the ownership of products that can increase their social status. Both TPB and ETPB illustrate that this trait forms positive attitudes, supportive social norms, and confidence in purchasing ability (Jiang et al., 2022; Laheri et al., 2024).

Overall, the results of this study indicate that narcissism is not just a personal trait, but also influences the way consumers interact, form self-image, and make purchasing decisions, especially for products that have symbolic, social, and environmental value.

6. Conclusion.

This study concludes that narcissism is a personality construct that directly and indirectly influences consumer purchase intention towards Premium Electric Car products in Indonesia. Through the mediation of electronic Word of Mouth (e-WOM), self-esteem, and virtue signaling, narcissism encourages the formation of strong purchase intentions, especially when consumption has high symbolic, emotional, and moral values. Within the framework of the Theory of Planned Behavior (TPB) and Extended TPB, consumption behavior is not only

influenced by attitudes, subjective norms, and perceived behavioral control, but also by psychological and emotional factors such as the need for social validation, self-image, and status achievement. Consumers do not only buy premium electric cars because of their function, but also because the car represents the values of identity, ethics, and prestige that they want to display in the social space.

THE EFFECT OF SELF CONGRUENCE ON BRAND LOYALTY IN FASHION PRODUCTS IN INDONESIA: THE ROLE OF FUNCTIONAL CONGRUENCE MEDIATION AND CONSUMER INVOLVEMENT MODERATION

Unik Dwi Lestari[1*], Tantri Yanuar Rahmat Syah[1], Triyono Arief Wahyudi[1], Mohammad Hamsal[2]
[1]Management Department, Esa Unggul University, Indonesia
[2]Management Department, Bina Nusa University, Indonesia

Abstract

This study aims to understand how consumer self-congruence influences brand loyalty in the fashion product market in Indonesia. The increasingly competitive fashion industry highlights the need for a deeper understanding of consumer perceptions toward brands. One significant psychological factor believed to affect brand loyalty is self-congruence, the extent to which consumers feel that a brand reflects their personal identity. This research employs a quantitative approach by distributing questionnaires to 100 active fashion product consumers. The analysis was conducted using Structural Equation Modeling (SEM) based on Partial Least Squares (PLS). The findings reveal that self-congruence significantly influences brand loyalty, both directly and indirectly through functional congruence. Functional congruence proves to be a strong mediator. Meanwhile, involvement does not moderate the relationship between self-congruence and functional congruence to brand loyalty in fashion brands (clothes) in Indonesia.

Keywords: self-congruence, functional congruence, brand loyalty, involvement, fashion products

1. Introduction

The Indonesian fashion sector is growing quickly, with brands facing ever fiercer competition both at local and internationally (Rosi & Muliatie, 2024). The rapid expansion is further accelerated by the increasing presence of global brands such as Calvin Klein, Gucci, Tiffany & Co., Louis Vuitton, Dior, Chanel, Bvlgari, Adidas, H&M, Levi's, and Burberry, which intensifies the competitive landscape and raises consumer expectations for both quality and brand image (Nurhayati, 2023). This trend presents major challenges for fashion companies aiming to keep customers loyal. Since loyal consumers not only buy repeatedly, but are also more likely to promote the brand and resist switching to competitors (Maulasena *et al*., 2024). As a result, building brand loyalty has become a top priority for many companies as they craft marketing strategies to stand out in a crowded marketplace (Boateng *et al*., 2020). Key drivers of this loyalty include self-congruence, where alignment between a consumer's self-identity and brand image strengthens commitment (Aguirre-Rodriguez et al., 2012; Sung & Kim, 2010). and functional congruence, which elevates loyalty when a brand's practical benefits (e.g., quality, comfort) consistently meet consumer needs (Hee Kwak & Kang, 2009). Additionally, high-involvement consumers exhibit more selective and critical brand evaluations, ultimately deepening their loyalty through deliberate involvement (Shin et al., 2017).

Previous research has examined the relationship between self-congruence and brand loyalty directly or indirectly (Das, 2014; Kang et al., 2015; Liu et al., 2012; Liu et al., 2022; Sirgy et al., 1997, 2008; Zogaj et al., 2021). In addition, actual and ideal self-congruence positively affects functional congruence (Huber et al., 2010; Hung & Petrick, 2012; Kumar & Nayak, 2014; Lee et al., 2017; Ryu & Lee, 2013; Sirgy et al., 1991). Functional congruity has

relationship with brand loyalty (Kressmann et al., 2006; Nikhashemi & Valaei, 2018; Sargeant et al., 2006; Willems et al., 2016; Zogaj et al., 2021). Self-verification (i.e., true self-congruence) increases when people deal more closely with an issue and are therefore more involved (e.g., Malär *et al*., 2011; Sirgy *et al*., 2008). In the context of involvement, the study of (Shin et al., 2019) shows that involvement not only increases attention to the brand, but also moderates the strength of the relationship between brand image and loyalty.

Although many studies have examined self-compatibility and brand loyalty, understanding of the role of mediating functional congruence and moderating consumer involvement is still limited. In this case, the integration of self-congruence, functional congruence, and consumer involvement in a single research model is still rare. In addition, most of the research still focuses on the context of developed countries and does not fully reflect the characteristics of consumer behavior in Indonesia, especially in the fashion (clothing) industry. Previous studies have tended to separate the role of each variable, without looking at how their interconnectedness and interaction shape consumer loyalty simultaneously. Therefore, there is still a gap to develop a more comprehensive understanding of the psychological and functional factors that influence brand loyalty in the context of local culture and markets.

The main purpose of this study is to analyze the influence of self-congruence on brand loyalty both directly and indirectly through functional congruence in the context of fashion products in Indonesia. In addition, this study also aims to examine the role of moderation from consumer involvement in strengthening the relationship between self-congruence and functional congruence to brand loyalty. By developing a model that integrates these three variables, this study is expected to provide new insights into the psychological and functional factors that affect consumer loyalty in the Indonesian fashion industry, as well as make a practical contribution to brand marketing strategies.

2. Literature review

5.15. The Effect of Self-Congruence on Brand Loyalty

Self-congruity influences brand attachment based on the idea of self-expansion theory (Malär *et al*., 2011). Self-congruence, which represents the extent to which a brand is part of the customer's self-concept, is positively related to self-brand connection, which stands out from attitudes towards (Park *et al*., 2010). Previous research has revealed the positive effects of actual and ideal self-congruence on customer behavior (e.g. actual and ideal self-congruence positively influences customer behavior because higher similarity of perception (i.e., self-congruence) forces customers to feel more consistency and harmony between themselves and the brand (Malär *et al*., 2011). As a result, actual and ideal self-congruence strengthens the relationship between the customer and the brand (Huber *et al*., 2018; Japutra *et al*., 2019), which results in increased brand loyalty (Hung *et al*., 2019; Kang *et al*., 2015).

In recapitulation that actual and ideal self-congruence influences individual behavior in several contexts (Choi & Reid, 2016; Kaufmann et al., 2016; Zhu et al., 2019) led to the conclusion that self-congruence has a positive effect on donor loyalty. In addition, it also confirms the relationship between image congruity (self-congruity and functional congruity) to the three components of loyalty (cognitive, affective, and native loyalty. Previous research has proven that actual self-congruence has a positive effect on brand loyalty (Das, 2014; Kang *et al*., 2015; Sirgy *et al*., 2008). Likewise, the ideal of self-congruence has a positive effect on brand loyalty (Das, 2014; Kang *et al*., 2015; Liu *et al*., 2022; Sirgy *et al*., 2008; Zogaj *et al*., 2021). So based on this, a hypothesis was developed:

H1. Self-congruence has a positive effect on brand loyalty

5.16. The Effect of Self-Congruence on Functional Congruence

Sirgy & Su (2000) argue that self-congruence and functional congruence are essential for understanding destination imagery and traveler decision-making. Self-congruence refers to the compatibility / mismatch between the perceived image of a destination and the self-image of the tourist. Previous research has revealed the positive effects of functional congruence on customer behavior (Lee *et al*., 2017b) and then Su & Reynolds (2017) and Lee *et al*. (2017) show that functional congruence plays an important role in the hospitality context by confirming the positive effects of functional congruence on customer satisfaction and brand attitude. Choi & Reid (2016) confirmed the positive effects of functional congruence on customer behavior in the context of food, while Hung & Petrick (2012) confirmed the positive effects in the context of tourism.

Kumar & Nayak (2014) found that self-congruity is an important predictor of functional congruity in the context of tourism. The findings of Ryu & Lee (2013) also confirm that self-congruence based on participants' perceptions of a convention positively affects functional conformity. Thus, it can be stated that actual and ideal self-congruence positively affects functional congruence (Huber *et al*., 2010; Hung & Petrick, 2012; Lee *et al*., 2017; Sirgy *et al*., 1991). In addition, several previous studies have proven that actual and ideal self-congruence have a positive effect on adaptive functional congruence (Choi & Reid, 2016; Hung & Petrick, 2012; Kang *et al*., 2015; Kressmann *et al*., 2006; Lee *et al*., 2017a; Zogaj *et al*., 2021). Based on this, a hypothesis was developed:

H2. Self-congruence has a positive effect on functional congruence

5.17. The Effect of Functional Congruence on Brand Loyalty

Image congruity consists of self-congruity and functional congruity (He & Mukherjee, 2007). Lee *et al*. (2017) and Su & Reynolds (2017) show that functional congruence plays an important role in the hospitality context by confirming the positive effects of functional congruence on customer satisfaction and brand attitude. Choi & Reid (2016) confirmed the positive effects of functional congruence on customer behavior in the context of food, while Hung & Petrick (2012) confirmed the positive effects in the context of tourism. With respect to non-profit organizations, Willems *et al*. (2016) stated that the importance of organizational performance has increased over the decades. The relevance of organizational performance is supported by Sargeant *et al*. (2006), who show that organizational performance has a positive effect on donor behavior (i.e., trust and commitment).

Previous research has proven that functional congruence has a positive effect on brand loyalty (Kressmann *et al*., 2006; Zogaj *et al*., 2021). Some empirical research supports the idea that functional congruence mediates the relationship between self-congruence and brand loyalty. Sung & Kim (2010) found that self-congruence not only has a direct effect on brand loyalty, but also through the role of functional congruence, which increases consumer perception of product benefits. In addition, research by Iglesias et al. (2011) revealed that the function of products that match consumer expectations increases brand loyalty, even more so when the brand reflects the consumer's personal identity or values. This study shows that functional congruence acts as a mediator that strengthens the relationship between self-congruence and brand loyalty. Based on this, a hypothesis was developed:

H3. Functional congruence has a positive effect on brand loyalty

H4. Functional congruence mediates the relationship between self-congruence and brand loyalty

5.18. Customer Involvement as Moderation

Sirgy *et al*. (2008) developed a conceptual model that shows how self-congruence with sponsorship events affects brand loyalty. This model argues that self-congruence with event sponsorship has a positive influence on brand loyalty, especially under two conditions: (1) when the customer is aware of the company sponsoring the event, and (2) when the customer involves with the event. Zogaj *et al*. (2021) show that issue involvement reinforces (reduces) the influence of actual self-congruence and ideal self-congruence on donor loyalty. Regarding the relationship between functional suitability and donor loyalty, the involvement of the issue did not have a moderate effect.

Previous studies confirmed that involvement positively moderated the actual relationship of self-congruence to brand loyalty (Sirgy *et al*., 2008; Zogaj *et al*., 2021). When self-verification (i.e., true self-congruence) becomes more important as problem involvement increases, then self-improvement (i.e., ideal self-congruence) becomes less relevant as problem involvement increases. The reason is based on the finding that individuals tend to avoid self-enhancing interactions in high-involvement situations (Malär *et al*., 2011). A person's personal values and individual self-concept (i.e., true self-congruence) enhance one's self-concept (i.e., ideal self-congruence) and explain the effect of self-congruence on individual behavior (Claiborne & Sirgy, 2014).

Empirical research supports the idea that involvement moderates the relationship between functional congruence and brand loyalty. For example, a study by Jalees *et al*. (2014) found that high levels of involvement reinforce the influence of functional congruence on brand loyalty, as highly involved customers are more likely to choose brands that functionally fit their needs. Several studies have shown that utilitarian values become more important when individuals perceive a situation or action to be very important or relevant (e.g., (Celsi & Olson, 1988; Kressmann *et al*., 2006; Sirgy *et al*., 2008). In such high-involvement situations, individuals invest more cognitive effort in thinking about an action (e.g., buying an expensive product) than they do in low-involvement situations (e.g., buying an affordable product) (e.g., Fritz *et al*., 2017; Malär *et al*., 2011). As a result, individuals are more aware of utilitarian values such as attribute performance in high-involvement situations (e.g., Kressmann *et al*. (2006). Therefore, it can be expected that subjects that deal more intensively with nonprofit organizational issues (i.e., highly involved subjects) are more concerned with and relevance to utilitarian attributes. Based on this, a hypothesis was developed:

H5a. Involvement moderates the relationship between functional congruence and brand loyalty
H5b. Involvement moderates the relationship between self-congruence and brand loyalty

3. Methodology

This study uses a quantitative approach with a survey research design. The quantitative approach was chosen because it can provide a clear picture of the relationship between the variables studied, as well as allow statistical testing of hypotheses. The survey was used to collect data from respondents who are active consumers of fashion products in Indonesia. The data collected through the questionnaire will be analyzed to test the direct and indirect relationship between variables, as well as the role of moderation of consumer involvement.

10.1. Theoretical framework

This study uses the Theory of Self-Congruence (Sirgy, 1982) and the Expectancy-Value Model as the theoretical basis to explain how self-congruence (the fit between the consumer's self-concept and brand image) affects brand loyalty. The self-congruence theory states that consumers tend to choose brands that reflect their self-image, both actual and ideal, thus creating emotional attachment and repeat purchases. Functional congruence is the conformity between the functional attributes of the brand (e.g., quality, usability) and consumer needs. In this case it is assumed to be a mediator, since this symbolic conformity translates into a real

functional value (Sirgy *et al*., 1997). Consumer involvement, which reflects the personal relevance and involvement of consumers to fashion products (Zaichkowsky, 1985), plays a moderator role, as highly involved consumers tend to pay more attention to both symbolic and functional aspects of brands in forming loyalty (Kwak & Kang, 2009).

10.2. Conceptual framework

The conceptual framework of this study proposes a mediation-moderation model in sequence. First, self-congruence (independent variables) has a direct effect on brand loyalty (dependent variable), in accordance with previous findings that consumers build an emotional attachment to brands that reflect their identity (Das, 2014; Kang *et al*., 2015; Liu *et al*., 2022; Sirgy *et al*., 2008; Zogaj *et al*., 2021). Second, functional congruence acts as a mediator: self-congruence increases the perception of the brand's functional benefits (e.g., durability, comfort), which ultimately strengthens loyalty (Zogaj et al., 2021). For example, luxury brands like Gucci can build self-congruence through aspirational imagery, but long-term loyalty still requires functional excellence in their products.

Third, consumer involvement plays a role as a moderator. Consumers with high involvement levels (e.g., fashion lovers who regularly buy Louis Vuitton) show a stronger relationship between self-congruence and loyalty, as they carefully evaluate how the brand aligns with their self-concept and practical needs. In contrast, consumers with low involvement (e.g., H&M casual shoppers) may prioritize convenience over conformity, making the relationship weaker (Tu *et al*., 2021). Thus, this framework places functional congruence as a link between symbolic identity and behavioral loyalty, with consumer involvement determining the strength of the relationship in different contexts.

10.3. Instrumentation

Data was collected through a questionnaire compiled on a 5-point Likert scale, in which respondents were asked to rate from "Strongly Disagree" (1) to "Strongly Agree" (5) on existing statements. The questionnaire consists of four main sections that include questions related to self-congruence, functional congruence, involvement, and brand loyalty. Before being distributed to respondents, this instrument was tested first to measure its validity and reliability. The population in this study is consumers who actively buy fashion products in Indonesia. The sample of this study consisted of 165 respondents who were selected using the purposive sampling technique, which is a sample selection technique by considering certain criteria, such as respondents who have bought fashion products in the last 6 months and have experience with certain brands.

The Self Congruence variable measures the actual self-congruence and the Ideal self-congruence adopted from Japutra *et al*. (2019) which are each measured with three statement items. Variable Functional Congruence with three items adopted from Talukder *et al*. (2020). The Involvement variable was measured by four items adopted from O'Cass (2000). Meanwhile, the variable Brand loyalty was measured by four items adapted from Nam *et al*. (2011) and Chaudhuri & Holbrook (2001). This questionnaire uses a total of 15 statements, hence the minimum number of respondents is 5-10 times the number of statements (Hair *et al*., 2019), which is 150 respondents. The collected data will be analyzed using the Structural Equation Modeling (SEM) technique based on Partial Least Squares (PLS). SEM with PLS was chosen because it allows to test relationships between latent variables with relatively small sample sizes and can provide more flexible estimations.

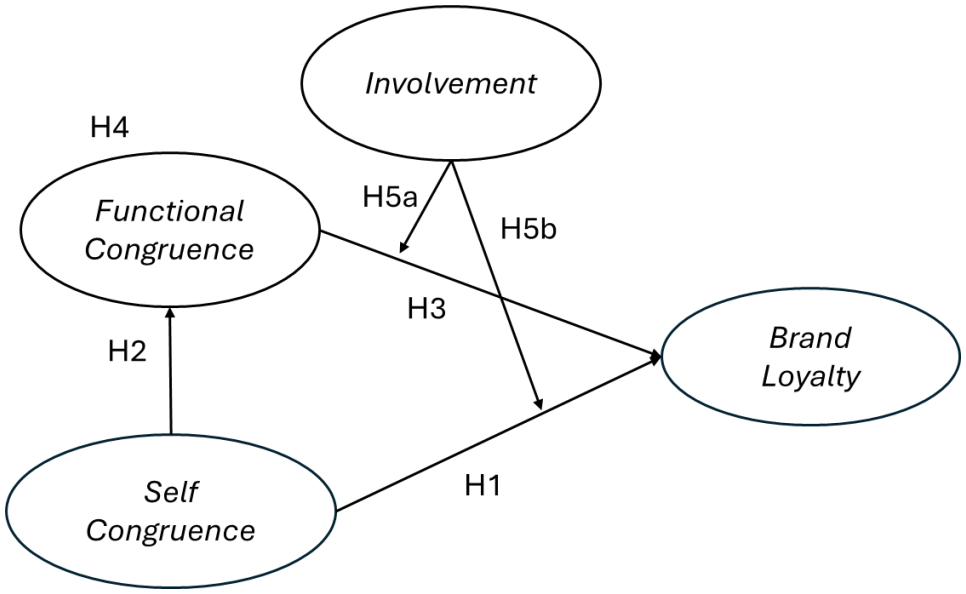

Figure 1. Conceptual Model

4. Results and Discussions

From the results of the validity and reliability test in Table 1, it can be seen that all constructs have a Composite Reliability (CR) value of > 0.90 (BL: 0.943, FC: 0.930, IN: 0.929, SC: 0.944), exceeding the minimum limit of 0.70 (Hair *et al*., 2017). The internal consistency of the items in each construct is very high which indicates the instrument measures the construct reliably and stably. All constructs had an Average Variance Extracted (AVE) value above 0.70 (BL: 0.780, FC: 0.827, IN: 0.723, SC: 0.751), higher than the minimum standard of 0.50 (Fornell & Larcker, 1981). FC has the highest AVE (0.827), followed by BL (0.780), SC (0.751), and IN (0.723). This means that each construct is able to explain 70% of the indicator's variants, proving the excellent validity of convergence. For all indicators, there is an outer loading of >0.70 (Hair *et al*., 2017), namely: FC1 (0.933) and BL3 (0.910) are the strongest indicators. In this case there is no indicator that needs to be removed (lowest load: SC1=0.810, still above the critical limit of 0.70) which means that each indicator is significantly representative of its construct.

In the Fornell-Larcker Criterion analysis (Table 2), the square root of AVE (√AVE) must be greater than the correlation with other constructs on the same row/column and if all √AVE > correlated with other constructs, then the validity discriminant is met. Table 2 shows that the assessment per construct for BL (0.894)> correlation with FC (0.759), IN (0.580), SC (0.708), then valid. FC (0.900)> correlated with BL (0.759), IN (0.549), SC (0.703), then valid. IN (0.847) > correlated with BL (0.580), FC (0.549), SC (0.562), then valid. SC (0.847) > correlated with BL (0.708), FC (0.703), IN (0.562), then valid. All constructs meet the Fornell-Larcker criterion. The square root value of AVE for each construct is greater than the correlation with the other construct, so it can be concluded that the discriminant validity of the model has been met. In this case there is no discriminating validity issue, each construct has a different identity and does not overlap excessively with other constructs. This indicates a reliable model, i.e. that the measurements used in the model are able to distinguish between one construct and another, so that the model can be used for further analysis, such as hypothesis testing or structural analysis.

Table 1. Instrument's validity and reliability test

Konstruk/Indikator	Outer Loading	Composite Reliability (CR)	AVE
Brand Loyalty (BL)		0,943	0,78
BL1	0,882		
BL2	0,892		
BL3	0,91		
BL4	0,89		
Functional Congruence (FC)		0,93	0,827
FC1	0,933		
FC2	0,907		
FC3	0,856		
Involvement (IN)		0,929	0,723
IN1	0,839		
IN2	0,814		
IN3	0,891		
IN4	0,814		
IN5	0,876		
Self Congruence (SC)		0,944	0,751
SC1	0,81		
SC2	0,848		
SC3	0,835		
SC4	0,878		
SC5	0,857		
SC6	0,851		

Table 2. Fornell-Larcker criterion

Indicator	BL	FC	IN	SC
BL	0,894			
FC	0,759	0,900		
IN	0,580	0,549	0,847	
SC	0,708	0,703	0,562	0,847

Table 3. Heterotrait-monotrait ratio (HTMT) – Matrix

Indicator	BL	FC	IN	SC
BL				
FC	0,843			
IN	0,634	0,615		
SC	0,770	0,780	0,614	

According to Henseler *et al*. (2015), HTMT is the ratio of the average correlation of indicators between constructs (heterotraits) to the average correlation of indicators in constructs (monotraits) where a low HTMT value indicates that the constructs are empirically distinguishable HTMT is calculated as the ratio between the average correlation of indicators between constructs (heterotraits) to the average correlation of indicators in constructs (monotraits). If the HTMT value between construct pairs is below 0.85 or 0.90, then the

research model is considered to have good discriminant validity. HTMT is a more sensitive tool for testing validity discriminators than Fornell-Larcker. From Table 3, it can be seen that BL-FC (0.843): Almost reached the critical HTMT value (0.85), so it is necessary to be aware of the problem of discrimination validity between BL and FC. FC-SC (0.780): Still below the critical value, but quite high. Other constructs have a correlation still below 0.85, so the validity discriminator is still acceptable.

Table 4. R Square

Indicator	R-square	R-square adjusted
BL	0,654	0,643
FC	0,495	0,491

In Table 4, BL has an R-square of 0.654 indicating that approximately 65.4% of the variation in the endogenous variable BL can be explained by the exogenous variable that affects it. Meanwhile, the R-square adjusted of 0.643 is slightly lower, indicating a correction to the bias due to the addition of independent variables, but still has strong predictive power. This value is included in the strong category according to the criteria (Chin, 1998) which states R-square ≥ 0.67 as strong, even though the BL value is slightly below (but very close to the strong threshold, and if referring to the criteria of Sarstedt *et al*. (2021) where the value of ≥ 0.50 is moderately strong.

Table 5. Fit Summary

Items	Saturated model	Estimated model
SRMR	0,052	0,064
d_ULS	0,455	0,707
d_G	0,379	0,389
Chi-square	362,207	364,946
NFI	0,856	0,855

Table 6. Hasil Pengujian Hipotesis

Hipotesis	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values	Result
H1. SC -> BL	0,623	0,622	0,061	10,283	0,000	Accepted
H2. SC -> FC	0,703	0,705	0,039	18,005	0,000	Accepted
H3. FC -> BL	0,490	0,482	0,081	6,023	0,000	Accepted
H4. SC -> FC -> BL	0,345	0,340	0,060	5,732	0,000	Accepted
H5a. IN x SC -> BL	-0,023	-0,029	0,072	0,323	0,747	Rejected
H5b. IN x FC -> BL	0,056	0,058	0,076	0,739	0,460	Rejected

SRMR < 0.08 is considered excellent, while SRMR < 0.10 is still acceptable for fit models (Henseler *et al*., 2016). From table 5, the SRMR is excellent (below 0.08), indicating that the model is able to represent the data well. For d_ULS and d_G there is no universal threshold, but the smaller the value the better the match. In this case, the d_ULS and d_G values are quite low. For the Chi-square, the smaller the better the model fits. It can be seen that the Chi-square

value is not much different between the saturated and estimated models, so there is no indication of a major problem from the Chi-square side. The NFI criterion > 0.90 is considered very good, 0.85–0.90 is acceptable, below 0.85 is not good. The result is that the NFI is quite good because it is close to 0.90, so in general this model is declared Fit.

From Table 6, it can be seen that there is a significant positive influence of self-congruence on brand loyalty (H1 accepted), thus supporting previous research (Das, 2014; Kang *et al*., 2015; Liu *et al*., 2022; Sirgy *et al*., 2008; Zogaj *et al*., 2021). When consumers feel that there is a match between their self-image and the brand, it will automatically encourage them to show loyalty to the brand. In other words, the alignment between actual or ideal self-image and brand image is the main factor that motivates consumers to stay loyal to this clothing brand.

The test results show that self-congruence has a positive and significant effect on functional congruence, so the second hypothesis (H2) in this study is proven. This research supports previous research that self-congruence has a positive effect on functional congruence (Choi & Reid, 2016; Huber *et al*., 2010; Hung & Petrick, 2012; Kang *et al*., 2015; Kressmann *et al*., 2006; Kumar & Nayak, 2014; Lee *et al*., 2017; Lee *et al*., 2017; Ryu & Lee, 2013; Sirgy *et al*., 1991; Zogaj *et al*., 2021). These findings reinforce the theory that the conformity of consumer self-image with brand image not only has an impact on psychological aspects, but also affects consumers' perception of the function and usefulness of the products offered. In other words, when consumers feel that a brand reflects their values and identity (such as conforming to or similar to their current or aspiring self-image), they are also more likely to judge that the product can optimally meet their functional needs. The functional needs of the clothes in this case such as providing a sense of comfort, fashionable, a price that matches its quality, providing satisfaction and even exceeding its expectations. This is in line with the results of research by Sirgy et al. (1991) who stated that functional congruence is significantly influenced by self-congruence, where the conformity of self-image can affect consumers' perception of the functional attributes of the product.

The results of the test in this study show that functional congruence has a positive and significant effect on brand loyalty, so that the third hypothesis (H3) is proven and supports previous research (Kressmann *et al*., 2006; Zogaj *et al*., 2021). These findings indicate that when consumers judge that the functionality and usability of products match their needs and expectations, brand loyalty will be stronger. The perception that the product is able to optimally meet the functional aspects provides satisfaction that encourages consumers to make a repeat purchase and recommend the brand to others. Consumers who feel the product fulfills the expected practical function are more likely to have a positive attitude towards the brand and show a long-term commitment. This long-term commitment can be realized by consumers in the form of if someone asks for advice, they will recommend this product brand, will choose to buy this brand or continue to use it in the future, and prefer this brand over other brands. This is in line with consumer behavior theory which states that functional satisfaction is one of the main factors influencing repeat purchase decisions and brand loyalty (Schiffman & Kanuk, 2007). Therefore, companies need to ensure that the product is not only emotionally appealing but also excels in the functional aspect to build ongoing loyalty.

Functional congruence positively mediates between self-congruence and brand loyalty, supporting hypothesis H4 and previous studies by Sung & Kim (2010) and Iglesias et al. (2011). Functional needs like comfort, fashionability, and fair pricing provide satisfaction and can strengthen the link between brand conformity and loyalty. In fashion, self-congruence both directly and indirectly boosts loyalty by enhancing perceptions of product benefits. Consumers who identify with a brand are more satisfied with its comfort and quality, increasing their loyalty. While other mediators like brand love or relationship quality reinforce this pathway,

specifically for functional congruence, satisfaction with product function amplifies loyalty when the brand image matches consumer identity.

Regarding involvement, the study found it does not moderate the relationship between functional congruence or self-congruence and brand loyalty (H5a and H5b rejected), contrary to prior research (Malär *et al*., 2011; Sirgy *et al*., 2008). Although involvement strengthens loyalty, it does not significantly moderate the path between functional congruence, self-congruence, and loyalty. Model replication Kressmann *et al*. (2006) showed product involvement affects self-congruence and functional congruence, but not their interaction with brand relationship quality or loyalty—thus, involvement does not moderate these relationships.

5. Conclusion

This study succeeded in proving that there is a close relationship between the main variables in the developed model, especially the influence of self-congruence and functional congruence on brand loyalty in clothing consumers. Self-congruence has been shown to have a positive effect on functional congruence and brand attachment, but it is not directly significant on brand loyalty. When consumers feel that their self-image aligns with the brand, they tend to believe the product is able to meet their needs and expectations, as well as build a strong emotional bond. However, loyalty does not only depend on the suitability of self-image, but also on the real experience provided by clothing brands in Indonesia. Other findings suggest that consumer involvement levels do not moderate the relationship between self-congruence and brand loyalty. The results of this study confirm the importance of marketing strategies that combine emotional and functional approaches to build consumer loyalty in the Indonesian clothing industry.

The limitation of this study is that the characteristics of respondents are relatively homogeneous, both in terms of region and market segment, which is a limiting factor in the generalization of research results. Consumers with different age, location, or cultural backgrounds may exhibit behaviors that are not uniform with the study sample. Therefore, future research should involve a more diverse and representative sample so that the picture of consumer behavior obtained becomes more comprehensive. Thus, the results of the study can better reflect the overall market dynamics.

THE INFLUENCE OF TAX REGULATIONS AND POLICIES, COMPANY SIZE, AND ECONOMIC CONDITIONS ON THE CAPITAL STRUCTURE OF FOOD AND BEVERAGE COMPANIES LISTED ON THE INDONESIA STOCK EXCHANGE (2018 – 2023)

Abraham Bernard Rudolf Gabriel[1], Irma Setyawati[2*]
[1,2] College of Economics and Business, Universitas Nasional, Jakarta, Indonesia

Abstract

This study aims to investigate the impact of tax regulations and policies, company size, and economic conditions on the capital structure of firms in the food and beverage sector listed on the Indonesia Stock Exchange (IDX) from 2018 to 2023. In this regard, transparent and accountable financial reporting is crucial for providing clear information to investors and the general public. The data utilized in this research consists of secondary data obtained from the financial statements prepared by these companies. The analysis method employed is multiple linear regression with a panel data approach. The findings of this study indicate that tax regulations and policies, company size, and economic conditions exert a positive and significant influence on the capital structures adopted by these firms. These results offer valuable insights for decision-makers in managing capital structure and serve as guidance for investors when making investment decisions.

Keywords: Tax Regulations and Policies, Company Size, Economic Conditions, Capital Structure

1. Introduction

The capital market serves as a means of investment for the general public, providing individuals and institutions with more extensive access to participate in economic growth. Through stocks, bonds, and other financial instruments, the public cannot only increase the potential for positive outcomes but also contribute to business ventures that have the potential to create new job opportunities and innovations. Additionally, the modal market serves as a platform for investment diversification, which is crucial for mitigating risk. (Sari, A. R. & Harahap, 2021).

One of the most critical aspects of business management is the capital structure, particularly in the food and beverage industry, which is characterized by a lively and easy-to-understand business model for companies that sell food and beverages. Businesses in the food and beverage industry should utilize a reasonable and appropriate modal structure to enhance operational efficiency and support the company's growth, ultimately increasing its profitability. (Ronald S.G.S. Sipayung, 2024).

In capital structure analysis, it is necessary to consider and evaluate several factors that affect a company's financial situation. Higher profitability, defined as a company's ability to generate more revenue than it spends, indicates that if a company's profitability is increasing, it will be able to provide a substantial profit that can be utilized. (Setyawati, I., Molina, M., Muhani, M., & Huda, 2021).

Modal structure is a combination of preferred stock, common stock, and debt used to support business operations. Several factors influence the capital structure, including the rate of growth, business stability, asset structure, profitability, taxes, control, operational leverage, currency flexibility, internal business conditions, market conditions, lender and government agency attitudes, and management behavior. (Setyawati et al., 2024).

Capital structure refers to the business's use of equity and debt to create the right-hand side of the company's balance sheet. Brigham, E., & Houston (2019) State that "asset structure is the amount of assets that can be used as collateral as measured by comparing fixed assets to total assets". The capital structure is presented in terms of the Debt-to-Equity Ratio (DER), Debt-to-Asset Ratio (DAR), and Interest Coverage in several studies. In this study, DER serves as a proxy for the capital structure. As can be seen, the Food and Beverages company has a high capital structure with a DER greater than 0.8, indicating that the company has a significant debt when compared to its equity. This frequently results in aggressive financing strategies in capital-intensive industries where considerable investment is required for product and marketing innovation. (Aji et al., 2024). Table 1 shows the debt-to-equity ratio for ten food and beverage companies from 2018 to 2023.

Table 1. Debt to Equity Ratio for Food and Beverages Companies 2018 to 2018 2023

No.	Company	Stock code	DER						AVERAGE
			2018	2019	2020	2021	2022	2023

Source: IDX, data processed

Table 1 lists 10 companies with a Debt-to-Equity Ratio (DER) threshold greater than 0.8%. If DER > 0.8, it indicates that the company has reduced its debt, which increases the risk to the company (Nguyen & Nguyen, 2020). The high DER is consistently seen as a reminder to be more considerate. This occurs because excessive debt might affect the stability of the company's financial operations, increase the risk of bankruptcy, and affect its long-term stability. Researchers have provided guidelines to ensure businesses utilize DER appropriately to mitigate financial risk (Kalash, 2021).

Factors that influence capital structure include asset structure, income stability, interest rate level, company profitability, firm size, asset growth or company growth, dividend policy,

business risk, rules and regulations, such as taxes, and company life cycle. In this study, tax regulations and policies, company size, and economic conditions are presented as factors that influence capital structure.

Policies and tax regulations have a significant impact on DER as they might affect a company's decision to choose between funding with debt and equity. Generally speaking, taxes that are detrimental to debt use, such as taxes that are attached to debt interest, can help businesses increase their DER. (Moro, A., & Faccio, 2020). This research suggests that companies engaging in tax avoidance tend to use high leverage. Tax avoidance occurs when companies utilize various loopholes in tax policy, such as debt, motivated by the desire to reduce the amount of tax that must be paid, as debt interest frequently fluctuates from tax. Regarding DER, businesses that engage in tax avoidance typically have a high debt-to-equity ratio, which is the DER.

According to research conducted by Sadiq, M., & Rahman (2021) Companies that are more successful in tax research have higher DERs because they use debt to maximize the benefits of tax-related interest-bearing debt. According to this study, the company's DER is caused by the loss of tax benefits on debt interest (such as interest tax shields or deductions). Businesses consistently provide debt as a response to more pronounced tax policies in their capital structure.

Company size is a metric used to describe how small or large a company is. A company that is very large has substantial total assets and a well-regarded reputation in the public eye, making it less necessary to pay for services or goods. It is generally not difficult for larger businesses to obtain information from smaller ones; the larger a company is, the easier it will be for that business to obtain external capital for a wide range of debt capacities. (Hutabarat, 2022).

Rajan, R. G., & Zingales (2020) Researched to examine various factors that affect a company's leverage, emphasizing how external factors, such as the size of the company, can affect the use of debt in the capital structure of businesses in various countries. This study utilizes company data from several countries to identify the factors influencing the debt-to-equity ratio (DER). The size of companies plays a vital role in determining their capital structure, with larger companies consistently having higher leverage. This is caused by easier access to external resources and the ability to incur larger debts without significantly increasing the risk.

The state of a country's economy can significantly impact the structure of its businesses. When the economy is doing well, this can lead to a decline in cash flow and value, an increase in volatility, a decrease in profitability, and an increase in business risk. The macroeconomic conditions of a country are closely tied to the state of the industrial sector, which experiences periods of growth and decline during times of inflation. In this study, the researchers examined the period from 2018 to 2023 for companies in the food and beverage industry listed on the Indonesian Stock Exchange, obtaining financial information from the official BEI website. (Prastio et al., 2022).

Research conducted by Ahmed, M., & Zafar (2022) found how inflation affects a company's financial structure, particularly how it affects DER. This study examines the relationship between macroeconomic factors (such as inflation) and capital structure, which involves debt. According to the results of this study, a high rate of inflation increases the cost of goods, making businesses more likely to use debt more frequently, which in turn leads to DER. This occurs because companies are more reluctant to pay off debt under high-inflation and high-interest-rate conditions.

The purpose of this study is to analyze the effects of regulations and tax policies, company size, and economic conditions on the capital structure of companies operating in the food and beverage industry that are listed on the Indonesia Stock Exchange (BEI) from 2018 to 2023.

2. Literature review

5.19. Tax regulations and policies

The importance of regulation and tax policy in shaping a business's capital structure cannot be overstated. According to Alsharif, A., & Alshammari (2022)Effective tax policies can help businesses optimize their capital structure by using various tax incentives. According to their research, companies operating in a country with a consistent tax regime tend to have more efficient capital structures.

In addition, research by Khwaja, A. I., & Mian (2021) Highlights the need for understanding changes to tax regulations that may impact the company's financial performance. They believe that a lack of rules can cause businesses to withdraw their investments, which will negatively impact their debt and equity.

Mohamad, N. A., & Zainuddin (2023) further explain that a tax structure may influence a company's preference when choosing between debt and equity. In the Indonesian context, Sari, R., & Putri (2023) examine how tax regulations affect the food and beverage industry and provide specific advice on how these regulations affect businesses in that industry. Additionally, research by Pramudianto, A., & Jannah (2023) Indicates that macroeconomic conditions, which are frequently impacted by tax behavior, also contribute to capital structure. This suggests that businesses must consider both the economic and tax conditions when developing their business plans.

5.20. Company size

Company size is one of the most important factors that influence capital structure and funding decisions. According to the study, a company's size can impact its access to financing sources and its preference for debt or equity. According to Rajan, R. G., & Zingales (2020), larger companies have better access to the mainstream market and external peer review resources, making it easier to manage financial risk. This is because larger businesses typically have better reputations and more stable earnings, which makes them more attractive to creditors.

Further study by Gaio & Gonçalves (2022), indicates that the size of Indonesian companies in the food and beverage sector has a significant impact on capital structure. They believe that larger businesses consistently use more debt in their capital structure because they can benefit from economies of scale and lower capital costs.

Additionally, research by Alsharif, A., & Alshammari (2022) Indicates that a company's size affects not only access to capital but also investment decisions. Larger companies tend to be more aggressive when investing, which can eventually affect their capital structure.

According to recent research by Mohamad, N. A., & Zainuddin (2023)A company's size, along with other factors such as market conditions and tax behavior, is crucial in determining the capital structure in the food and beverage industries. This suggests that the company's size should be taken into account when evaluating funding decisions.

5.21. Economic conditions

Company size is one of the key variables that influences the capital structure and funding policy. According to the study, a company's size can be directly related to its access to financing sources and its preference for using debt or equity. Larger businesses often have better access to the mainstream market, which enables them to obtain funding at more affordable rates. This

factor makes it more difficult for larger firms to utilize debt in their capital structure, as they can leverage a larger economic scale. (Abor, J., & Biekpe, 2021).

Furthermore, Hossain, M. A., & Khan (2022) State that the size of the company has a significant impact on the state of the economy in Bangladesh. They concluded that larger businesses are more stable and have more predictable earnings, making them better equipped to manage risks related to debt.

Due to Narteh, B., & Odoom (2023)In the manufacturing sector, a company's size plays a crucial role in determining its capital structure. They state that larger companies can invest in larger projects that require more capital, which affects the proportion of debt in the capital structure.

According to research conducted in Indonesia by Salim, M., & Mulyadi (2023)The size of a company also influences its capital structure, with larger companies more likely to consider debt as the primary source of funding innovation. This indicates a higher level of trust from creditors regarding the ability of large businesses to repay their debts.

5.22. Capital Structure

The composition of a company's operations, which comprises both debt and equity, is referred to as its capital structure. One of the most critical financial decisions that can impact a company's value and capital costs is the decision regarding its capital structure. The capital structure theory has evolved from theories that assume a pure market to theories that consider several factors, including information asymmetry and agency costs. (Zhao, 2018).

One of the fundamental theories of capital structure is the Modigliani-Miller (MM) theory, which posits that, in a market free from taxes, bankruptcy, and information asymmetry, a company's capital structure is irrelevant to its value. (Modigliani; & Miller, 1958). However, this assumption is often not realistic in the real world.

The trade-off theory recognizes the value of debt's taxes, but it also reduces the cost of bankruptcy. Businesses strive to balance the profit margin with the cost of doing business to achieve the ideal capital structure. (Kraus & Litzenberger, 1973). In other words, the pecking order theory posits that businesses possess more internal (profit) resources than external ones. If external resources are required, they have more resources than employees due to information asymmetry issues. (Myers & Majiuf, 1975).

These theories are continually being questioned and refined through empirical research. For example, research by Rahman et al. (2023) Indicates that businesses in the market are frequently more vulnerable to debt due to a decline in access to the capital market. Additionally, factors such as company size, profitability, and growth can also influence the capital structure. (Tanjung, H., & Sari, 2022).

3. Methodology

This study utilizes secondary data sources from the official website of the Indonesian Stock Exchange, specifically annual financial reports from 2018 to 2023. The software used in this study was Stata Ver 14. Because the study data has both a cross-sectional and a time-series component, the panel data model was utilized to estimate (Jeffrey M. Wooldridge, 2009).

There are 25 firms in the food and beverage industry listed on the Indonesia Stock Exchange, which makes up the study's population. After determining several parameters, the sample is selected via purposive sampling, resulting in 20 firms as the sample.

Multiple regression equations are used to analyze the relationship between internal and external factors and bank performance because they allow for the explicit control of numerous other factors that concurrently affect the dependent variable. (Gujarati & Porter, 2010; Jeffrey M. Wooldridge, 2009). One example of this is the following model:

$$Y_{it} = \beta_0 + \beta_1 X_{1it} + \beta_2 X_{2it} + \beta_3 X_{3it} + \varepsilon_{it} \quad \text{.....(1)}$$

Table 2 lists the variables that are used as a capital structure proxy and the variables that affect it. Some notes and effects are expected from each of the variables, as they are mentioned in the literature in the table above.

Table 2. Overview of the Regression Model's Variables

Variable	Proxy	Definition	Hypothesis with DER
Dependent variable			
Capital structure	Debt-to-Equity Ratio (DER)	The ratio used to measure the proportion of a company's debt compared to its equity.	NA
Independent variable			
Tax Regulation and Policy	Effective Tax Rate (ETR)	The effective tax rate is used to measure taxes paid as a proportion of economic income.	Negative
Firm Size	Natural logarithm of total assets (LNTA)	The natural logarithm of the total value of all assets owned by an individual or entity at a given point in time	Positive
Economic Conditions	Inflation (INF)	The process of a general and persistent increase in the prices of goods and services in an economy over a given period.	Negative

The following multiple regression formula is based on the variables used in the study:

$$DER_{it} = \beta_0 + \beta_1 ETR_{it} + \beta_2 LNTA_{it} + \beta_3 INF_{3it} + \varepsilon_{it} \quad \text{.....(2)}$$

The Ordinary Least Squares (OLS) method remains the standard approach for estimating multiple regression models, including the assessment of factors such as autocorrelation, heteroscedasticity, and multicollinearity, as illustrated in Equation (2). Panel data models—namely fixed effects, random effects, and common effects—were previously estimated. Based on the results of the Hausman, Chow, and Lagrange Multiplier (LM) tests, the random effects model was chosen over the fixed and common effects models. (Greene, 2002; Kenward & Roger, 1997; Setyawati et al., 2017; White, 1980).

4. Results and discussions

The study utilized data from 138 observations across 23 companies spanning 6 years. The descriptive statistics of the data are presented in Table 3.

Table 3. Descriptive Statistics

Variables	Obs	Mean	Std. Dev	Min	Max
DER	138	1.23725	2.7352	0.14	30
ETR	138	25.3262	16.8204	0.07	139.11
INF	138	0.02483	0.01021	0.01	0.041
LNTA	138	7.78662	1.66635	4.42	12.148

Source: Stata Ver 14

Table 3 shows that the mean values of ETR, INF, and LNTA are higher than their standard deviations, indicating that the data is generally more homogenous or consistent rather than widely dispersed. It is implied that there are few extreme values or outliers and that most data values are near the mean.

In selecting the panel data model estimation, the Chow test is conducted to determine between common effect and fixed effect, by looking at the probability value of F (0.015) < alpha (0.05), so that the fixed effect is selected. The selection of the panel model between common effect and random effect using the Breusch Pagan Lagrange Multiplier (LM) Test, where the Prob chi2 value (0.0000) < alpha (0.05), so that the panel model used is random effect. Meanwhile, to select the fixed effect and random effect methods using the Hausman test, where the Prob chi2 value (0.1955) < alpha (0.05), so that the random effect is used. Of the three panel data estimation model tests above, the most appropriate model to use is random effect.

The OLS test, which includes tests for multicollinearity, heteroscedasticity, and autocorrelation, is displayed in Tables 4, 5, and 6.

Table 4. Multicollinearity Test

Variable	VIF	1/VIF

Source: Stata Ver 14

The multicollinearity test, as suggested by the Variance Inflation Factor (VIF), is displayed in Table 4. There is no multicollinearity between the independent variables because the VIF value is larger than 10, and the 1/VIF value is 0.01 or below (Gujarati & Porter, 2010)The heteroscedasticity tests were performed using the Likelihood Ratio test (LR test) and the Breusch-Pagan Lagrange Multiplier (BP-LM test) (Setyawati, 2016). The model's variance structure is not heteroscedastic, as indicated by the p-value of less than 0.05 in Table 5. Table 6 for the autocorrelation test using the Wooldridge test reveals that there is no autocorrelation, as the p-value is greater than 0.05.

According to the F-statistical test (global test), the model can be accepted as an explanation for the dependent variable, as the p-value is less than 0.05, indicating statistical significance. An R^2 value of 71.68% demonstrates that variations in ETR, LNTA, and INF can account for 71.68% of the variance in DER, whereas variations in other variables not included in the model account for 28.32%.

The research model's estimated outcomes are as follows:

$$DER_{it} = 1.62 + 0.006\ ETR_{it} - 0.14\ LNTA_{it} + 22.73 INF_{3it}$$

Table 7 displays all of the estimation findings.

Table 7. Estimation Result

Equation					R2
DER =	1.62	+ 0.0066 ETR*** (1.13)	- 0.14 LNTA*** (- 1,31)	+ 22.73 INF** (0.06)	71.68

*, **, and *** denote significance at the 10%, 5%, and 1% levels, respectively.

The effective tax rate has a notably favorable impact on the debt-to-equity ratio. The positive regression coefficient shows that a company's propensity to take on more debt increases with the Effective Tax Rate. Because loan interest can be subtracted from taxable income (tax shield), businesses with a high Effective Tax Rate may attempt to lower their tax burden by utilizing debt-based financing. According to capital structure theory, particularly the trade-off theory, businesses weigh the tax advantages of debt against the risk of bankruptcy. A high Effective Tax Rate raises the debt-to-equity ratio by making the tax benefits of debt more alluring. Tax incentives or constraints in fiscal efficiency may be reflected in a high Effective Tax Rate. Businesses use debt finance to cover their investment or operating capital needs, which raises the debt-to-equity ratio. The findings of this study are consistent with those of studies by Fitriani, A., & Dewi (2022); Lee, H., & Kim (2020); Rahman, M. A., & Sari (2023); Wijaya, T., & Sihombing (2021) where the results show that Effective Tax Rate encourages management to favor debt-based funding due to the tax savings (tax shield) from debt interest. This further strengthens the connection between the debt-to-equity ratio and the Effective Tax Rate. Additionally, this result aligns with financial theories, such as the pecking order theory and the trade-off theory.

The debt-to-equity ratio is substantially impacted negatively by total assets. These findings suggest that the Debt-to-Equity Ratio decreases with increasing firm size (total assets). The proportion of debt to equity decreases significantly as the firm size grows, as it is highly negatively correlated. Businesses with substantial total assets are less reliant on external loans, as they can generate larger internal earnings. Due to their perceived stability and credibility, large corporations can secure non-debt funding sources, such as retained earnings or new shares, without increasing their leverage (debt-to-equity ratio). Furthermore, to lower the risk of bankruptcy, large businesses often employ a conservative capital structure strategy, which reduces their debt-to-equity ratio. (Setyawati, 2017). This study supports the findings of other studies by Alamsyah, A., & Nugroho (2023; Kim, S., & Park (2020); Putri, D. A., & Wibowo (2022); Wijaya, T., & Mahendra (2021), which demonstrates that larger businesses are typically more financially independent and rely on internal capital rather than debt due to the significant adverse effect of total assets on DER. Given that big businesses often steer clear of high-leverage risks, this data supports both the pecking order hypothesis and a portion of the trade-off theory.

Inflation has a notably favorable impact on the debt-to-equity ratio. This result indicates that a company's DER ratio increases in proportion to the rate of inflation. Since it is substantially positive, it suggests that rising inflation prompts businesses to increase the proportion of debt in their capital structure relative to equity (Prastio et al., 2022). The actual value of debt payments gradually declines in inflationary circumstances. Because the financial load is "lighter" in exact terms, debt becomes more alluring. Because the interest rate is set and

the actual value of the money paid declines, businesses opt to employ debt. Costs of manufacturing and distribution rise with inflation.

Businesses frequently turn to debt borrowing to sustain operating cash flow, which raises DER. While capital demands rise and companies turn to debt as an alternative source of funding, inflation frequently causes equity values to stagnate or even decline (if stock prices drop or retained earnings are reduced). The research of Nguyen, T. T., & Vo, (2020); Rahman, M. H., & Utami (2021); Sari, N. D., & Prabowo (2022); Yuliani, E., & Darmawan (2023) Additionally, other studies are consistent with this one. Companies are encouraged to expand debt financing due to rising inflation because Equity becomes inadequate, operating costs increase, and the actual value of debt declines (becoming cheaper in real terms). As a result, the Debt-to-Equity Ratio rises sharply.

5. Conclusion

This study draws the following conclusions from panel data regression analysis using a random effects model: the debt-to-equity ratio is significantly improved by the effective tax rate. This implies that a company's propensity to employ debt-based financing increases with its effective tax rate due to the tax shield benefits of loan interest. The size of the company (as measured by LN Total Assets) hurts the debt-to-equity ratio. Because large organizations often have sufficient internal funding sources and steer clear of excessive leverage concerns, the proportion of debt to equity tends to decrease with company size. The debt-to-equity ratio is much improved by inflation. Since the real value of debt payments is lower and the value of equity tends to stagnate during periods of high inflation, businesses typically take on more debt.

To prevent debt financing from posing a long-term bankruptcy risk, the company must manage its capital structure, taking into account both inflation and tax implications. The size of the company should be used to minimize reliance on debt and optimize internal funding efficiency. Tax laws must be designed to prevent excessive debt use, for instance, by restricting the advantages of overly generous tax shelters. In an inflation-prone environment, oversight of the firm's capital structure is equally crucial.

To present a more comprehensive picture, future studies are anticipated to include additional variables, such as profitability, liquidity, asset structure, interest rates, or dividend policy. Similar studies may be conducted to see whether the effect patterns are the same or different in other industrial sectors, such as heavy manufacturing, energy, or technology, in addition to the food and beverage industry. To better understand the strategic motives underlying capital structure decisions, future research is anticipated to employ dynamic models or mixed methodologies, which integrate quantitative techniques with management interviews. A broader understanding of how fiscal policy and the macroeconomic environment influence business capital structure can be gained through cross-country research using a cross-country analytical technique.

5.1. Acknowledgement

My sincere appreciation goes out to the Dean of Universitas Nasional Faculty of Economics and Business and his team for providing me with the chance to present my study at the 6th International Research Conference on Management and Business (IRCMB).

THE ROLE OF TRUST IN MODERATING THE INFLUENCE OF SERVICE QUALITY, BRAND IMAGE, AND PRICE PERCEPTIONS ON GROUP INSURANCE REPURCHASE DECISIONS AT PT ASURANSI ABC INDONESIA

Vandi C. Pradikta[1], Elwisam Elwisam[2]
[1, 2] Magister Management, University of National,
Jakarta, Indonesia
vandipradikta@gmail.com[1] ; elwisam@civitas.unas.ac.id[2]

Abstract

The revenue data of PT ABC Life Indonesia Insurance for the last four years from 2020 to 2023 has fluctuated, therefore it is necessary to have consistent revenue growth by increasing sales, one of which is by increasing repurchase decisions on corporate customers who are using or have purchased ABC group insurance products in Indonesia. This study aims to analyse the effect of trust in moderating price perceptions on repurchase decisions. The sampling technique used non-probability sampling with a sample size of 119 respondents, Data collection using questionnaires and data analysis techniques using Structural Equation Modelling (SEM) analysis processed with Warp PLS 7.0. The results showed that Service Quality has a positive and significant effect on Repurchase Decisions. Brand Image has a positive but insignificant effect on Repurchase Decisions. Price Perception has a positive and significant effect on Repurchase decisions. Trust successfully moderates the relationship between Service Quality and Repurchase decisions. Trust is unable to moderate the relationship between Brand Image and Repurchase Decision Trust successfully moderates the relationship between Price Perception and Repurchase Decision.

Keywords: trust, service quality, brand image price perceptions, repurchase decisions

1. Introduction

Kotler and Keller (2016) emphasize that retaining existing customers is more profitable than constantly acquiring new ones. Repeat purchase decisions are crucial because they reflect customer satisfaction, which can drive loyalty and recommendations (Suryani & Rosalina, 2024; Mawaddah et al., 2024). In the insurance industry, repeat purchases impact gross premium income, as shown by fluctuations in PT Asuransi ABC Indonesia's revenues between 2020 and 2023.

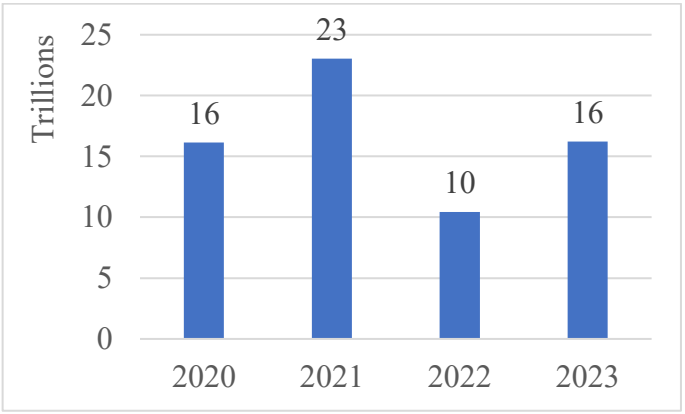

Figure 1.1 Graphic Gross Premium Income (in trillion) PT Asuransi ABC Indonesia 2020 until 2023

Repeat purchase decisions are influenced by Service Quality, Brand Image, and Price Perception. Research findings vary regarding Service Quality: some studies (Suryani &

Rosalina, 2019; Rachmansyah et al., 2023; Valentine et al., 2023) report a positive and significant effect, while others (Rifqiyyah & Surianto, 2024; Tussifah et al., 2024; Chasanah & Fauzan, 2021) find the influence insignificant.

Similar discrepancies appear for Brand Image. Studies by Damaryanti et al. (2022), Krismonanda & Iskandar (2021), and Wardhani et al. (2021) show a positive and significant effect, whereas Setiowati & Farida (2024), Rusnovia & Aryani (2024), and Marpaung et al. (2024) found no significant impact.

Price Perception also shows mixed results. Studies by Viani & Imbayani (2022), Insyira & Irianto (2024), and Prayoni & Respati (2020) found a positive and significant effect, while Ardiyani & Andriana (2024), Khuswatun & Yuliati (2022), and Risqi & Rizqiawan (2023) show no significant influence.

These differing research findings indicate a research gap. To address this inconsistency, the current study proposes a model incorporating Trust as a moderating variable, believed to strengthen or weaken the relationship between the independent variables (Service Quality, Brand Image, Price Perception) and repeat purchase decisions (Nurrachmi & Setiawan, 2020; Waruwu & Elizabeth, 2024; Baruno & Susanto, 2020). Management is defined as the art and science of planning, organizing, coordinating, and controlling resources to achieve objectives (Fayol, Terry, Hasibuan).

2. Literature review

Marketing involves creating, communicating, distributing, and exchanging value to satisfy customer needs (AMA, Kotler & Keller, Laksana, Tjiptono).

2.1. Marketing Management

The art and science of selecting target markets and attracting, retaining, and growing customers by creating and delivering superior customer value. It involves analysis, planning, implementation, and control of marketing programs (Kotler & Keller, Assauri, Howard, Basu Swasta & Irawan)

2.2. Theory of Reasoned Action (TRA)

Explains that human behavior is driven by intentions, which are influenced by attitudes toward the behavior and subjective norms. Behavior is seen as a rational result of intentions shaped by individual beliefs (Fishbein & Ajzen).

2.3. Theory of Planned Behavior (TPB)

TPB extends TRA by adding perceived behavioral control, emphasizing individuals' confidence in their ability to perform a behavior (self-efficacy) which affects both intentions and actual behavior (Ajzen).

2.4. Theory of Planned Behavior (TPB)

Consumer Decision Model (CDM) by Howard (1989) explains the consumer decision-making process through six interconnected variables: information, brand recognition, attitude, confidence, intention, and purchase.

2.5. Purchase Decision

refers to the stage where consumers actually buy a product or service, influenced by psychological, social, cultural, personal, and external factors, following stages such as problem recognition, information search, evaluation of alternatives, purchase decision, and post-purchase behavior (Kotler & Keller).

2.6. Repeat Purchase Decision

Involves consumers buying the same product or service again due to satisfaction from previous purchases. Indicators include repeat buying, recommending to others, and brand loyalty (Tjiptono).

2.7. Marketing Mix

Marketing Mix is a combination of strategic elements used to influence market demand. Originally 4Ps (Product, Price, Place, Promotion), it expanded to 7Ps in services marketing, adding People, Process, and Physical Evidence to address the unique characteristics of services (Kotler & Keller).

2.8. Service Quality (SERVQUAL)

Measured through five dimensions: tangibles, reliability, responsiveness, assurance, and empathy. It compares customer expectations with actual service experiences (Parasuraman et al.).

2.9. Brand Image

Brand Image is consumers' perception of a brand, formed through strong, favorable, and unique associations (Kotler & Keller, Tjiptono).

2.10. Price Perception

Price Perception is consumers' interpretation of the value and benefits they receive in relation to the price paid, involving affordability, quality alignment, competitiveness, and perceived value (Kotler & Armstrong, Tjiptono).

2.11. Trust

Trust is consumers' positive belief or expectation that the seller will fulfill their promises, encompassing benevolence, ability, integrity, and willingness to depend (Kotler & Keller, Mowen & Minor).

3. Methodology

3.1. Conceptual Framework

The conceptual framework is a model illustrating the relationship between theories and the variables studied, showing how independent variables (X), dependent variables (Y), and moderating variables (Z) are interconnected (Sugiyono, 2018). This framework guides hypothesis development and research analysis.

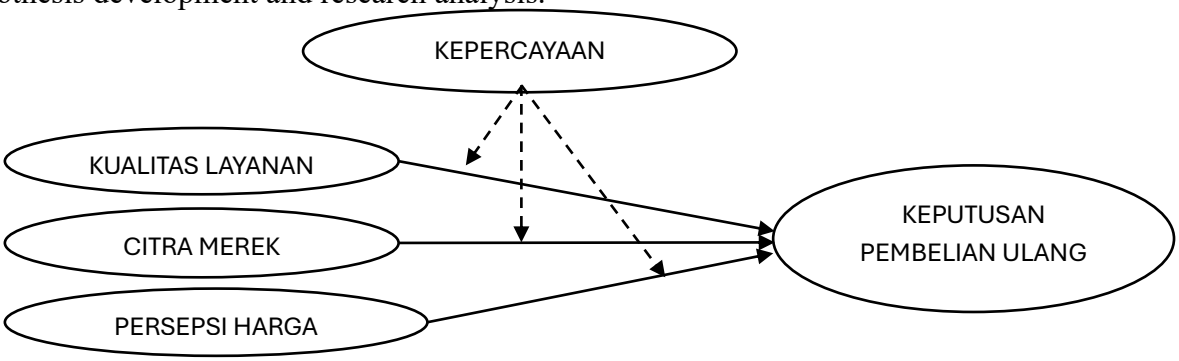

Figure 3.1 Conceptual Framework

3.2. Research Model

The research model depicts the hypothesized relationships among variables and serves as a blueprint for empirical testing.

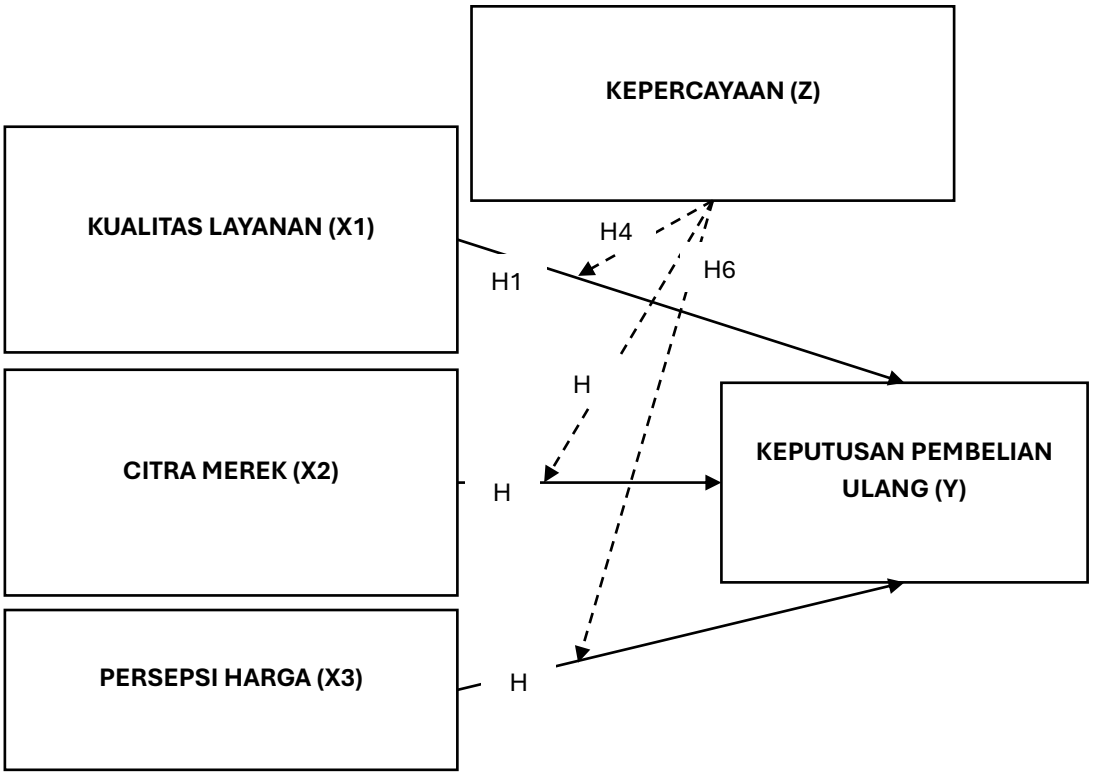

Figure 3.2 Research Model

3.3. Research Hypotheses

Six hypotheses were formulated:

- H1: Service Quality (X1) positively affects Repeat Purchase Decision (Y).
- H2: Brand Image (X2) positively affects Repeat Purchase Decision (Y).
- H3: Price Perception (X3) positively affects Repeat Purchase Decision (Y).
- H4: Trust (Z) moderates the effect of Service Quality (X1) on Repeat Purchase Decision (Y).
- H5: Trust (Z) moderates the effect of Brand Image (X2) on Repeat Purchase Decision (Y).
- H6: Trust (Z) moderates the effect of Price Perception (X3) on Repeat Purchase Decision (Y).

3.4. Operational Definition of Variables

Variables are defined and measured with indicators:

- Service Quality (X1): Tangibles, Reliability, Responsiveness, Assurance, Empathy.
- Brand Image (X2): Strength, Favorability, and Uniqueness of Brand Associations.
- Price Perception (X3): Affordability, Price-Quality Fit, Competitive Price, Price-Value Fit.
- Trust (Z): Benevolence, Ability, Integrity, Willingness to Depend.
- Repeat Purchase Decision (Y): Repeat purchase, recommending to others, and brand loyalty.

All variables are measured using a Likert scale from 1 (Strongly Disagree) to 5 (Strongly Agree).

3.5. Population and Sample

The study population consists of customers who have used ABC Group Insurance in Indonesia. Because the exact number is unknown, the sample was determined using the Lameshow formula with a 95% confidence level and 9% margin of error, resulting in a sample size of 119 respondents.

3.6. Sampling Technique

A non-probability sampling technique was used, meaning not every individual in the population had an equal chance of being selected.

3.7. Data Collection Method

Data was collected via questionnaires using a Likert scale. The survey measured respondents' perceptions of the research variables.

4. Results and discussion

This study employed quantitative analysis using descriptive statistics and hypothesis testing through Structural Equation Modeling (SEM-PLS) via WarpPLS 7.0.

4.1. Respondent Profile

Among 119 respondents:

- Industry Type**:** 67.2% operate in the service sector, while 32.8% are in manufacturing.
- Ownership Status: 42% are foreign owned, suggesting a significant presence of foreign enterprises as ABC group insurance customers.
- Firm Size: 43.7% of respondents represent companies with 10–50 employees, indicating ABC's primary market consists of small to medium enterprises (SMEs).
- Asset Size: 58% of firms hold assets between IDR 1–10 billion, suggesting mid-sized firms predominantly purchase group insurance.
- Geographical Distribution: 85.7% of companies are in Greater Jakarta (Jabodetabek), highlighting the region's central role in ABC's client base.

4.2. Measurement Model Analysis (Outer Model)

- Convergent Validity: All factor loadings exceed the threshold of 0.70, confirming that indicators validly measure their respective constructs.

Table. 4.1. Convergent Validity Result

No	Variabel	Item Pernyataan	Nilai Loading Faktor	Keterangan
1	Kualitas layanan	KL1	0,809	Valid
2		KL2	0,805	
3		KL3	0,755	
4		KL4	0,845	
5		KL5	0,795	
6	Citra Merek	CM1	0,814	Valid
7		CM2	0,877	
8		CM3	0,858	

9	Persepsi Harga	PH1	0,793	Valid
10		PH2	0,835	
11		PH3	0,831	
12		PH4	0,842	
13	Kepercayaan	KPC1	0,861	Valid
14		KPC2	0,871	
15		KPC3	0,881	
16		KPC4	0,856	
17	Keputusan Pembelian Ulang	KPU1	0,880	Valid
18		KPU2	0,909	
19		KPU3	0,867	

- Average Variance Extracted (AVE): All constructs achieved AVE values above 0.50, indicating satisfactory convergent validity.

Table. 4.2. Discriminant Validity base on AVE results

Variabel	Nilai AVE	Keterangan
Kualitas layanan	0.644	Valid
Citra Merek	0.723	Valid
Persepsi Harga	0.681	Valid
Kepercayaan	0.752	Valid
Keputusan Pembelian Ulang	0.784	Valid

- Discriminant Validity: Fornell-Larcker criteria were satisfied, demonstrating that constructs are empirically distinct.

Table. 4.3. Discriminant Validity base on Fornell-Larcker results

Variabel	Kualitas Layanan	Citra Merek	Persepsi Harga	Keper-cayaan	Keputusan pembelian ulang
Kualitas Layanan	(0.814)				
Citra Merek	0.778	(0.850)			
Persepsi Harga	0.771	0.729	(0.829)		

Kepercayaan	0.802	0.677	0.825	(0.982)	
Keputusan Pembelian Ulang	0.789	0.639	0.816	0.867	(0.886)

- Reliability: Cronbach's Alpha and Composite Reliability for all constructs exceeded recommended thresholds (0.70), confirming measurement reliability.

Table. 4.3. Reliability Results

Variabel	Cronbach's Alpha Coefficients	Composite Reliability coefficient	Keterangan
Kualitas layanan	0.861	0.900	Reliabel
Citra Merek	0.808	0.886	Reliabel
Persepsi Harga	0.844	0.895	Reliabel
Kepercayaan	0.890	0.924	Reliabel
Keputusan Pembelian Ulang	0.862	0.916	Reliabel

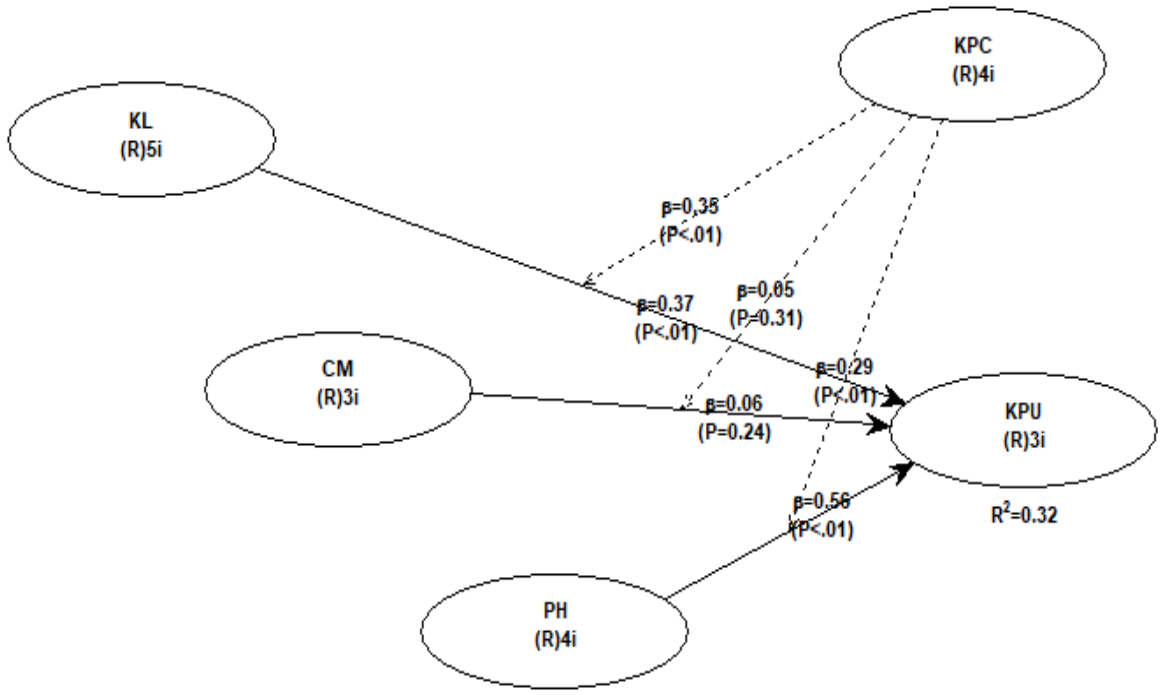
4.3. Structural Model Analysis (Inner Model)

4.3.1. Model Fit:

- The Average Path Coefficient (APC), Average R-squared (ARS), and Average Adjusted R-squared (AARS) were all significant ($p < 0.001$), indicating good model fit.
- Tenenhaus GoF value of 0.510 suggests strong overall model fit.

4.3.2. Path Coefficient.

Figure 4.1 Path Coefficient with WarpPLS 7.0



4.3.3. Coefficient of Determination (R^2):

The model explains 31.6% of the variance in repeat purchase decisions, while 68.4% remains influenced by other factors not included in this study.

4.3.4. Estimated Structural Equation:

KPU = 0.368 KL + 0.063 CM + 0.563 PH + 0.345 KPC*KL + 0.046 KPC*CM + 0.287 KPC*PH

where:
KPU = Repeat Purchase Decision
KL = Service Quality
CM = Brand Image
PH = Price Perception
KPC = Trust

4.3.5. Hypothesis Testing Results:

Relationship	Path Coefficient	p-Value	Conclusion
KL → KPU	0.368	<0.001	Significant (H1 accepted)
CM → KPU	0.063	0.243	Not significant (H2 rejected)
PH → KPU	0.563	<0.001	Significant (H3 accepted)
KPC*KL → KPU	0.345	<0.001	Significant (H4 accepted)
KPC*CM → KPU	0.046	0.305	Not significant (H5 rejected)
KPC*PH → KPU	0.287	<0.001	Significant (H6 accepted)

4.4. Discussion

Service Quality → Repeat Purchase (H1): Service quality exerts a significant positive influence on repeat purchase decisions for ABC group insurance. High-quality service—especially in assurance and reliability—enhances customer satisfaction and fosters repurchase intentions, consistent with prior findings (Suryani & Rosalina, 2019; Rachmansyah et al., 2023; Valentine et al., 2023) and supported by the Theory of Planned Behavior (TPB).

Brand Image → Repeat Purchase (H2): Brand image does not significantly influence repeat purchases. Despite ABC's positive reputation, customers prioritize tangible service experiences and perceived value over brand.

5. Conclusion

5.1. Conclusion

This study employed quantitative analysis using descriptive statistic Based on the analysis performed using WarpPLS 7.0, the following conclusions are drawn:

1. Service Quality exerts a significant positive effect on repeat purchase decisions in ABC's group insurance. Higher service quality enhances customers' intentions to renew their policies.
2. Brand Image does not significantly influence repeat purchase decisions. ABC's brand image is not a primary determinant in customers' decisions to repurchase group insurance products.
3. Price Perception significantly and positively affects repeat purchase decisions. Customers are more likely to repurchase when they perceive prices as fair and aligned with the benefits received.
4. Trust moderates the relationship between service quality and repeats purchase decisions positively and significantly, indicating that higher customer trust strengthens the impact of service quality on repurchase intentions.
5. Trust does not moderate the relationship between brand image and repeat purchase decisions, suggesting that brand image, even when coupled with trust, does not substantially influence repeat purchase behavior.
6. Trust significantly moderates the relationship between price perception and repeat purchase decisions, demonstrating that high levels of trust reinforce customers' positive perceptions of price fairness, leading to increased repurchase intentions.

5.2. Recommendations

5.2.1. Recommendations For Company

1. Enhance Service Responsiveness: Improve customer communication channels beyond phone and email, leveraging chat applications or AI-powered chatbots for timely responses, particularly for common inquiries about policies, claims, and benefits.
2. Refocus Brand Strategies: Shift emphasis toward factors more strongly influencing repeat purchases, such as service quality, price perception, and customer satisfaction, rather than relying solely on brand image.
3. Improve Price Transparency: Given the lower factor loading on price affordability, ABC should ensure transparent pricing and clearly communicate how premiums relate to the benefits offered, emphasizing the comparative advantages of ABC policies.
4. Strengthen Trust in Service Quality: Maintain open, honest communication about policy terms and claims processes. Provide seamless digital and offline channels for policy

information and customer service, and establish feedback mechanisms to better understand customer expectations.
5. Integrate Trust into Brand Communications: Reinforce trust through tangible service experiences, such as expedited claims processing and clear communication about customer rights and benefits, rather than relying solely on brand reputation.
6. Link Trust with Price Perception: Avoid hidden costs and invest in customer education initiatives that explain how premiums correspond to the tangible value and benefits received, thereby enhancing price-related trust.

5.2.2. For Future Researchers

1. Include Additional Variables: Explore other factors potentially influencing repeat purchase decisions, such as customer satisfaction, brand loyalty, customer experience, or psychological determinants.
2. Develop Mediation Models: Investigate mediating variables, like customer satisfaction, to explain how service quality or price perception influences repeat purchase intentions indirectly.
3. Employ Alternative Methodologies: Consider qualitative methods to gain deeper insights into customer decision-making processes regarding repeat purchases in the insurance sector.

THE EFFECT OF FINANCIAL LITERACY, PERCEIVED EASE OF USE, AND PERCEIVED USEFULNESS ON THE INTENTION TO USE SHARIA FINTECH LENDING (A STUDY ON SMES IN MALANG CITY)

Achmad Yoga Rifandi Andriansyah, Afifudin, Galih Ramadhan Febrianto
Faculty of Economic and Business, Universitas Islam Malang
22001083048@unisma.ac.id

Abstract

The advancement of information and communication technology has brought significant changes to many sectors, including the financial sector. Among the rapidly developing innovations is financial technology (fintech), which provides easy access to financial services, especially for MSMEs. This study aims to analyze the influence of financial literacy, perception of ease, and perception of usefulness on the interest of MSMEs in Malang City in using sharia-based fintech. Sharia fintech provides a financial alternative based on sharia principles, while encouraging national financial inclusion. This study uses a quantitative model of the survey method on MSME actors in Malang City. The data collected was analyzed using multiple linear regression to test the influence of independent variables on the interest in using sharia fintech. The study findings show that financial literacy has a significant positive effect on the interest of MSMEs in using sharia fintech. Perception of ease and perception of usefulness have also been shown to significantly influence the interest of MSMEs, where users feel that sharia fintech makes it easier to access financing and increases their operational efficiency. This study concludes that financial literacy, perception of ease, and perception of usefulness are the main factors that support the interest of MSMEs in utilizing sharia fintech services. Thus, efforts to increase financial literacy and develop a sharia fintech platform that is easily accessible and provides real benefits are very important to support the growth of MSMEs in Malang City.

Keywords: financial literacy, perceived convenience, perceived usefulness, sharia fintech, interest, MSMEs

1. Background Of Study

The development of information and communication technology has brought significant changes to many sectors of life, including the financial sector. One of the most important innovations that have emerged is Financial Technology (fintech), which leverages modern technology to provide financial services that are easier, faster, and more efficient. According to the National Digital Research Center (NDRC), fintech is an innovation that combines financial services with modern technology to meet the increasingly complex needs of users (Granita, 2020).

In Indonesia, fintech has experienced rapid growth, supported by the continued increase in internet penetration. According to a survey by the Indonesian Internet Service Providers Association (APJII), the internet penetration rate in Indonesia in 2024 reached 79.5%, with 221.6 million users out of a population of 278.6 million (OJK, 2024). This condition has become one of the driving factors for the widespread adoption of fintech services. Additionally, the presence of fintech is expected to drive national financial inclusion, considering the large

number of people still categorized as unbanked, meaning they do not have access to formal financial services.

One of the rapidly growing types of fintech in Indonesia is sharia-based fintech lending. According to data from the OJK (Financial Services Authority), there are seven licensed sharia fintech platforms, such as Ammana, Alami, Dana Syariah, and others. Sharia fintech not only provides access to financing but also offers financial services that comply with sharia principles, attracting the interest of small and medium-sized enterprises (SMEs) that want to maintain religious values in their financial activities (Alfarizi & Ngatindriatun, 2022).

Malang City, as one of the cities with rapid SME growth, serves as an example of a region that utilizes financial technology to support business development. Programs like Malang 4.0, initiated by the city government, aim to promote the digitalization of SMEs to make them more competitive in the market. Fintech provides easier and faster financing solutions for SMEs, helping them overcome the limited access to financing from traditional banking institutions (CNBC Indonesia, 2020).

However, the effectiveness of fintech adoption by SMEs is influenced by several factors. Financial literacy, for instance, is crucial in helping SMEs understand basic financial concepts, make sound decisions, and utilize fintech services optimally (Lusardi et al., 2011). Additionally, perceived ease of use and perceived usefulness of the technology also play a significant role in enhancing user interest (Nopy & Noersanti, 2022; Asri et al., 2022).

Based on this background, this study aims to examine the influence of financial literacy, ease of use perception, and usefulness perception on the intention to use sharia-based fintech lending among SMEs in Malang City. This study is expected to contribute to the development of sharia fintech and support the improvement of financial inclusion and literacy among SME actors.

Based on the background presented, the problem formulation in this study includes several key questions: Does financial literacy affect the intention to use sharia fintech lending among SMEs in Malang City? Does the perception of ease influence the intention to use sharia fintech lending among SMEs in Malang City? And does the perception of usefulness affect the intention to use sharia fintech lending among SMEs in Malang City?

The objectives of this study are to identify and analyze the effect of financial literacy on the intention to use sharia fintech lending among SMEs in Malang City, to identify and analyze the effect of the perception of ease on the intention to use sharia fintech lending among SMEs in Malang City, and to identify and analyze the effect of the perception of usefulness on the intention to use sharia fintech lending among SMEs in Malang City..

2. Literature Review

2.1. Fintech Syariah

According to Rusydiana (2019), sharia fintech refers to financial services or products that use technology based on sharia principles. Sharia P2P Lending is a financial service based on sharia principles that connects lenders and borrowers to carry out financing contracts in Indonesian Rupiah. Sharia fintech is an innovation in financial services based on sharia principles through the use of technological advancements. The schemes and offerings it utilizes differ from conventional services, and it also imposes specific restrictions on the use of funds to be invested (Nursyahida, 2022).

2.2. Intention to Use

Intention to use refers to the level of desire or how strongly an individual wants to engage in a specific behavior, or a person's planned conscious decision to either perform or not perform an action in the future, as predetermined (Permana, 2018).

2.3. Financial Literacy

Lusardi et al. (2011) state that financial literacy includes a set of skills and understanding about finance that an individual possesses in order to manage money and improve their standard of living. According to Mandel in the study by Rumbinianingrum & Wijayangka (2018), financial literacy is the ability to evaluate new and broad financial instruments and to assess financial instruments. Based on this definition, it can be concluded that financial literacy is the ability to understand and apply financial competencies, such as saving, budgeting, investing, and managing expenses.

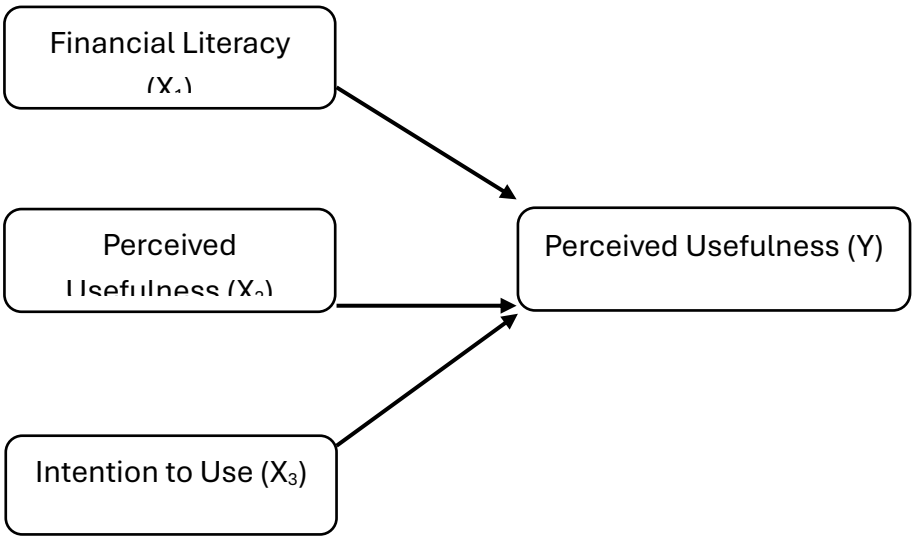
2.4. Perceived Ease of Use

According to Jogiyanto (2019:934), perceived ease of use is the extent to which an individual believes that using technology is clear and does not require much effort, but is easy to use and operate.

2.5. Perceived Usefulness

Muthi'ah & Indrarini (2023) define perceived usefulness as the degree to which users believe that using a system will result in benefits, such as improved performance. A person is likely to use an information technology system when they are convinced that the activity or task will be easier and that using the technology will improve their efficiency.

Figure 1. Conceptual Framework



Based on the explanation regarding the aspects that influence financial literacy and the differences in the findings related to financial literacy, the researcher formulates several research hypotheses. The first hypothesis (H1) states that financial literacy has a positive impact on the intention to use sharia fintech lending among SMEs in Malang City. The second hypothesis (H2) suggests that the perception of ease influences the intention to use sharia

fintech lending among SMEs in Malang City. Meanwhile, the third hypothesis (H3) states that the perception of usefulness affects the intention to use sharia fintech lending among SMEs in Malang City**.**

3. Methodology

This study uses a quantitative research approach, which relies on data in numerical form or data that can be converted into numbers. This approach aims to analyze the relationships between variables using appropriate statistical methods.

The research will be conducted in five sub-districts in Malang City: Blimbing, Kedungkandang, Klojen, Lowokwaru, and Sukun. The study will begin in September 2024 and will continue until completion, as outlined in the research plan.

In this study, the dependent variable being tested is the intention to use, with indicators including transnational interest, referential interest, preference interest, and exploratory interest based on Winanda's research (2024). This interest reflects the level of individual engagement in choosing, recommending, or seeking information about a particular product.

The independent variables in this study include Financial Literacy (X1), Perceived Ease of Use (X2), and Perceived Usefulness (X3). Each of these variables has indicators such as knowledge, trust, ability, and behavior for financial literacy, and flexibility, ease of interaction, ease of use, and ease of learning for perceived ease of use. Meanwhile, perceived usefulness includes efficiency, effectiveness, and its impact on performance enhancement.

4. Result And Discussion

4.1. Result

The population in this study consists of five sub-districts in Malang City: Blimbing, Kedungkandang, Klojen, Lowokwaru, and Sukun. The study focused on individuals who use sharia fintech and have a monthly turnover of at least 3,000,000 IDR. According to Table 4.1, a total of 22,976 questionnaires were distributed, but only 2,346 met the criteria. However, only 73 questionnaires could be processed as they were complete and met the required standards. The remaining questionnaires were excluded due to incomplete answers, resulting in a small percentage of usable data.

The characteristics of the sample are presented in terms of gender, business sector, and education level. Based on Table 4.2, the majority of respondents were male (52%), while 48% were female. In terms of the business sector, as shown in Table 4.3, the highest number of respondents were from the grocery store sector (28%), followed by the culinary sector (31%) and the fashion sector (12%). Table 4.4 illustrates that the majority of respondents had completed their high school education (78%), while 22% held a bachelor's degree (S1).

These characteristics provide a comprehensive overview of the respondents and their backgrounds, highlighting key demographic information related to their gender, business sectors, and educational levels. This information is crucial for understanding the context of the study and the sample used in the research.

Table Statistic Descriptive

Variabel	N	Min	Max	Mean	Std. Dev

Literasi keuangan (X1)	73	1	5	4,49	0,731
Persepsi Kemudahan (X2)	73	1	5	4,35	0,591
Persepsi kegunaan (X3)	73	1	5	4,05	0,291
Minat penggunaan (Y)	73	1	5	4,60	0,841

Sumber: Data primer diolah, 2025

The table above presents the descriptive statistics for the variables under study. The Financial Literacy (X1) variable has a mean of 4.49, with a minimum value of 1 and a maximum value of 5, and a standard deviation of 0.731, indicating that the data is generally concentrated around a high average. The Perceived Ease of Use (X2) variable has a mean of 4.35, with a minimum of 1 and a maximum of 5, and a standard deviation of 0.591, suggesting that respondents generally perceive a high level of ease in using sharia fintech. The Perceived Usefulness (X3) variable shows a mean of 4.05, with a smaller standard deviation of 0.291, indicating that respondents' views on the usefulness of sharia fintech are relatively consistent, although with less variation compared to other variables. Finally, the Intention to Use (Y) variable shows the highest mean of 4.60, with a standard deviation of 0.841, indicating a very high level of interest among respondents in using sharia fintech, though with slight variation among respondents. Overall, these descriptive statistics indicate that respondents tend to have positive and strong views regarding financial literacy, ease of use, and usefulness of sharia fintech, as well as a high level of intention to use it.

The instrument testing in this study consisted of validity, reliability, normality tests, and classical assumption tests. The validity test results indicated that all items for each variable, including independent variables such as financial literacy, perceived ease of use, and perceived usefulness, as well as the dependent variable, intention to use, were valid. The calculated r values for all indices were above the r table value of 0.227, with a total of 16 statements, divided into four statements for each variable: financial literacy, perceived ease of use, perceived usefulness, and intention to use.

The reliability test showed that the independent variables, including financial literacy, perceived ease of use, and perceived usefulness, were reliable, as their Cronbach Alpha scores were greater than 0.60. This indicates that the transparency, financial literacy, and religiosity in relation to the intention to become a customer at a sharia bank are all reliable.

In terms of normality, the test results in Table 4.8 showed an Asym. Sig. (2-tailed) value of 0.225. Since this value is greater than 0.05, it can be concluded that the data follows a normal distribution, which is a required assumption for the regression model.

The classical assumption tests revealed no issues of multicollinearity or heteroskedasticity. The multicollinearity test results showed tolerance values for each variable greater than 0.10 and VIF values less than 10, which indicates the absence of multicollinearity. The heteroskedasticity test results, with significance values of 0.380 for X1, 0.263 for X2, and 0.321 for X3, confirm that there is no heteroskedasticity in the regression model.

Table Multiple Liniear Regression

Variabel	Unstandardized Coefficients	Standardized Coefficients	**T**	**Sig.**

		B	SE	Beta		
1	(Constant)	0,945	1,267		0,746	0,458
	X1	0,021	0,034	0,027	0,673	0,002
	X2	0,020	0,046	0,016	0,385	0,001
	X3	0,315	0,017	0,575	18,661	0,000
a. Dependent Variable: Y						

Sumber : Data primer diolah, 2025

Equation

$$Y = 0{,}945 + 0{,}021X_1 + 0{,}020X_2 + 0{,}315X_3 + e$$

1. Intercept (0.945): The intercept (0.945) represents the expected value of Y (Intention to Use) when all the independent variables (X1, X2, X3) are equal to zero. In this case, if there were no influence from financial literacy, ease of use, or usefulness, the baseline level of intention to use would be 0.945.
2. Coefficient of X1 (0.021) – Financial Literacy: The coefficient for X1 (Financial Literacy) is 0.021. This means that for every 1 unit increase in financial literacy, the intention to use (Y) is expected to increase by 0.021, holding Perceived Ease of Use (X2) and Perceived Usefulness (X3) constant. The small coefficient indicates that while financial literacy does have a positive impact on intention to use, the effect is relatively modest compared to the other variables.
3. Coefficient of X2 (0.020) – Perceived Ease of Use: The coefficient for X2 (Perceived Ease of Use) is 0.020. This indicates that for every 1 unit increase in perceived ease of use, the intention to use (Y) increases by 0.020, holding the other variables constant. Like financial literacy, this effect is positive but small, showing that ease of use contributes slightly to the intention to use, though it's not the most influential factor.
4. Coefficient of X3 (0.315) – Perceived Usefulness: The coefficient for X3 (Perceived Usefulness) is 0.315. This is the largest coefficient among the three independent variables, meaning that Perceived Usefulness has the most significant impact on Intention to Use. For every 1 unit increase in perceived usefulness, Y (intention to use) is expected to increase by 0.315, holding Financial Literacy (X1) and Perceived Ease of Use (X2) constant. This suggests that users who perceive sharia fintech as more useful are much more likely to have a higher intention to use it.

The hypothesis testing in this study includes several tests: Simultaneous Test (F), Determination Test (R2), and t-Test (Partial Test). For the Simultaneous Test (F), based on the ANOVA test results in Table 4.12, the calculated F value is 243.971, with a significance level of 0.000. Since the significance value is less than 0.05, it can be concluded that the independent variables X1 (Financial Literacy), X2 (Perceived Ease of Use), and X3 (Perceived Usefulness) together have a significant effect on the intention to use. In the Determination Test (R2), as shown in Table 4.13, the Adjusted R Square value is 0.908, indicating that the independent variables—financial literacy, perceived ease of use, and perceived usefulness—can explain 90% of the variation in the dependent variable, intention to use. The remaining 10% of the variation is explained by other factors not included in the study. For the t-Test (Partial Test), the results show that all three variables (Financial Literacy, Perceived Ease of Use, and Perceived Usefulness) have a significant effect on the intention to become a customer at a

sharia bank. This suggests that each of these factors individually contributes to the likelihood of someone deciding to use sharia fintech.

4.2. Discussion

The Effect of Financial Literacy on Intention to Use

The findings of this study indicate that the "financial literacy" variable has a positive and significant impact on "intention to use". This result is supported by hypothesis testing and model feasibility conducted in this study. The higher the level of financial literacy an individual has, the greater their interest in using sharia fintech services. This is in line with Lusardi et al. (2011), who state that financial literacy involves the skills and understanding necessary to manage money and improve one's standard of living. In other words, individuals with a better understanding of financial management are more likely to utilize technology-based financial services, such as sharia fintech, which can enhance efficiency and access to better financial services (Mandel in Rumbinianingrum & Wijayangka, 2018). An increase in financial literacy encourages individuals to take advantage of sharia fintech, which directly influences their intention to use it.

The Effect of Perceived Ease of Use on Intention to Use

This study also shows that "perceived ease of use" has a positive and significant effect on "intention to use". These findings support the hypothesis test, showing that ease of use in sharia fintech significantly contributes to user interest. According to Jogiyanto (2019), perceived ease of use refers to how much an individual believes that using technology is easy and requires little effort. This means the easier an individual feels using sharia fintech, the more likely they are to use it. This aligns with the idea that comfort and ease of use in technology, as offered by sharia fintech, are major factors driving technology adoption. Therefore, the ease of access and use of sharia-based financial technology plays a crucial role in encouraging potential users to adopt it.

The Effect of Perceived Usefulness on Intention to Use

The findings of this study also indicate that "perceived usefulness" has a positive and significant effect on "intention to use". This hypothesis testing shows that the greater the perception of usefulness of sharia fintech, the more likely an individual is to use it. According to Muthi'ah & Indrarini (2023), perceived usefulness refers to the degree to which users believe that using a system will result in benefits, such as improved performance. In this context, users are more likely to choose to use sharia fintech if they believe that the system will make their financial activities easier, such as in terms of efficiency and fund management. In other words, if individuals see that sharia fintech can provide significant benefits in managing their finances, they will be more interested in using it, in line with the definition of perceived usefulness proposed by Muthi'ah & Indrarini (2023).

5. Conclusion

Based on the results of this study, it can be concluded that variables such as financial literacy, perceived ease of use, and perceived usefulness significantly influence the intention to use sharia fintech among SMEs in Malang City. Specifically, perceived usefulness has the greatest impact on the intention to use, followed by financial literacy and perceived ease of use. This indicates that the higher the level of financial literacy and the more positive the perception of the ease and benefits of using sharia fintech, the greater the interest in using it. Therefore, these factors are crucial in enhancing the adoption and usage of sharia fintech among SMEs.

As a suggestion, for the government and sharia fintech providers, it is essential to improve financial literacy, especially related to sharia-based financial technology. More intensive educational programs on financial management and understanding of sharia fintech can help the community, especially SMEs, to better comprehend the benefits and functionality of sharia fintech. On the other hand, sharia fintech service providers should continue to enhance the ease of use of their platforms by ensuring simpler user interfaces and better functionality. This will improve the user experience and, in turn, encourage the adoption of sharia fintech. For future research, it is recommended to explore other factors that may influence the intention to use sharia fintech, such as social, cultural, or other technical factors that contribute to increasing financial inclusion among SMEs. With these efforts, it is hoped that sharia fintech can grow more rapidly and provide greater economic benefits to Indonesian society.

BUILDING ORGANIZATIONAL LOYALTY: A STUDY OF LEADERSHIP STYLE, MOTIVATION, AND COMMUNICATION IN HIMAPRODI MANAGEMENT"

Alfian Dimas Firmansyah [1] Nurhidayah[2] Dita Roosemella Paramadina[3]
alfiandimasfirmansyah@gmail.com
Universitas Islam Malang

Abstract

This research aims to analyze and describe the influence of leadership style, motivation and organizational communication on the commitment of management study program members. This study involved a population consisting of members of the management study program. The sample was determined using the Slovin formula, resulting in 86 respondents. Data analysis was carried out using the Structural Equation Modeling (SEM) technique with the assistance of SPSS version 30 software. The variables in this study include Member Commitment as the dependent variable, and Leadership Style, Motivation, and Communication as the independent variables. The results of the study indicate that: 1) Leadership Style does not have a significant effect on Member Commitment, 2) Motivation does not significantly influence Member Commitment, and 3) Communication has a significant influence on Member Commitment.

Keywords: Member Commitment, Leadership Style, Motivation, Organizational Communication

1. Background of study

A student is someone who has the ability to understand the dynamics of global transformation and evolution, especially in education and society. As human resources with high character and intelligence, students have a strategic position and function as highly intellectual individuals to bring about changes in society. In the world of higher education, there is a close relationship between students and organizations on and off campus. Organizations are social entities that are organized in a planned manner, with generally identifiable boundaries, which strive consistently to achieve a collective vision.

This phenomenon was caused by several problems in management at the beginning of the period, resulting in a decline in the performance of the management when carrying out activities. These problems arose because it was still early in the period and the new leadership style had not yet been accepted by the Management Study Program Student Association management. There were also communication problems between the chairperson and the management, as well as between the management and other members. Communication was still unstable. Additionally, the shift in management and the introduction of new members into the Management Student Association require strong motivation to ensure that new members take their roles seriously within the organization. According to Triyanthi & Subudi (2018), commitment refers to the extent to which a member demonstrates loyalty toward an organization and its objectives, and has the resolve to remain an active member of the organization. Commitment to an organization can be influenced by various factors, one of which is the actions or attitudes of the members.

According to Siregar & Wardi, (2023) Leadership style is an approach or method used to lead an organization or institution. This style can be learned through leadership theory, but in practice, it is often influenced by the personality or habits of the leader.

According to Sosialisman et al., (2023) Motivation in an organization is the willingness to give maximum effort to achieve common goals, which is influenced by the extent to which these efforts are able to meet the personal needs of each individual. This motivation can also be interpreted as a force that fosters enthusiasm and drive from within a person.

According to Hawa (2020), organizational communication is a method established by management to optimize the exchange of information within an organization. The main objective of this communication is to support the achievement of the organization's vision and mission, as effective communication contributes directly to the success of these objectives.

The decline that occurred in the Management Study Program at the beginning of the period took the form of a decrease in the work programs carried out by the Management Study Program itself. Therefore, several supporting aspects that can be used to improve the commitment of the administrators include strengthening leadership style, improving communication, and increasing motivation in the organization. These factors are the basis for conducting research on this organization.

2. Literature review

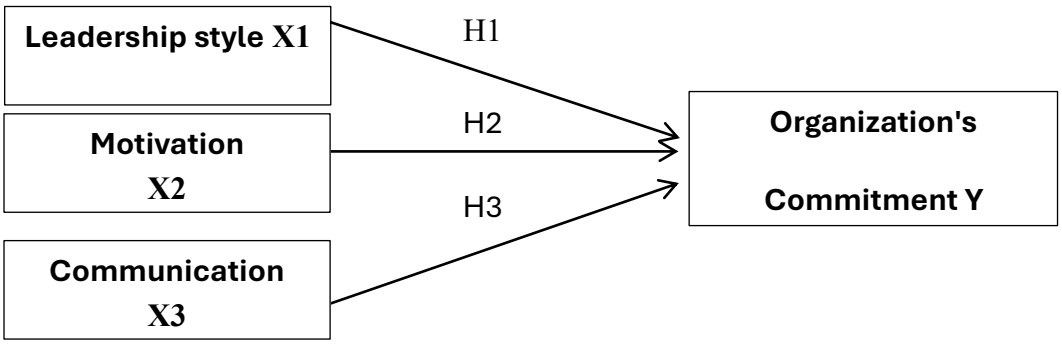
According to Andika & Pane (2018), commitment is a form of attitude or action of a person towards an organization, which is reflected in their desire to remain part of the organization and play an active role in achieving its established goals. According to Ariyani & Sugiyanto (2020), a high level of commitment to an organization is reflected in a deep belief in and acceptance of the values and goals embraced by that organization. According to Allen & Meyer (1990), the indicators of commitment are: Affective commitment, Continuance commitment, Normative commitment.

Siregar & Wardi, (2023) Leadership style is a specific approach or method used in leading an organization or institution. Although this style can be studied as part of leadership science, in practice it is often influenced by the personality and habits of the individual concerned. Meanwhile, according to Mulyadi et al. (2020), leadership can generally be defined as the capacity or potential that a person has to influence or guide individuals or groups in their efforts to achieve a specific goal. According to Babiak (2015), the indicators of leadership style are: Structuring, Authoritarian, Participative, Manipulative, Rewarding, and Unfriendly.

According to Thoha (2017), motivation is a factor that drives work enthusiasm within an organization, as well as enhances morale and decision-making within it. With motivation, organizational members work with a sense of responsibility, loyalty, discipline, as well as pride and self-confidence, which ultimately helps achieve organizational goals efficiently. Meanwhile, according to Ella Anastasya Sinambela (2021), work motivation is an important element in determining employee productivity and efficiency. According to Amabile et al. (1994), the indicators of motivation are: Challenge motivation, Pleasure motivation, Compensation motivation, and External motivation.

According to Siregar et al. (2021), communication within an organization is a highly critical aspect. The success of an organization is greatly influenced by how well communication is carried out by its leaders and members. Communication within an organization can be interpreted as signs that represent the existence of the organization itself, whether in the form of words, ideas, or structures that support, ensure, coordinate, and realize organized activities within a specific context. Meanwhile, according to Bonaraja et al. (2020), organizational communication is defined as the process of building a shared understanding

through the exchange of ideas among individuals in a hierarchical and structured system, with the aim of achieving common goals.



3. Hipotesis

H1 : Leadership style influences member commitment
H2 : Motivation influences member commitment
H3 : Organizational communication influences member commitment

4. Methodology

This study applies an explanatory research method with a quantitative approach. The research focuses on members of the Management Study Program Student Association (HIMAPRODI) located at the Secretariat: Jl. MT Haryono No. 193, Student Activity Unit (UKM), Faculty of Economics and Business, Islamic University of Malang. The research activities were conducted between November 2024 and May 2025.

The population used as the basis for this study includes all members of the HIMAPRODI Management executive board, comprising 5 members from the Executive Board (BPH), 20 members from the Human Resources (HR) division, 21 members from the Research and Development (RnD) division, 17 members from the Public Relations (PR) division, 18 members from the Creative (CR) division, and 21 members from the Entrepreneur (ETP) division. This study used the Slovin formula, which is formulated as follows:

$$n = \frac{N}{1 + \mathrm{N}(e)^2}$$

$$n = \frac{102}{1 + 102\ (0{,}05)^2}$$

$$n = \frac{102}{1{,}25}$$

$$n = 85{,}6 \text{ runded up to } 86$$

5. Results and discussion

The validity test results aim to test the validity of statements in a questionnaire that will be distributed to respondents.

Source: Processed data, 2025

The table above shows that all items in the questionnaire have a correlation value exceeding r table, which is 0.1786 with a degree of freedom (df) = N - 2. Therefore, it can be concluded that each item meets the validity criteria.

The reliability test describes the level of consistency of respondents' answers to the statements compiled in the questionnaire.

Variabel	Cronbach's Alpha	Cronbach's Alpha > 0,60	Description
Organizational commitment (Y)	0,797	> 0,60	Reliabel
Leadership Style (X1)	0,900	> 0,60	Reliabel
Organizational Motivation (X2)	0,795	> 0,60	Reliabel
Organizational Communication (X3)	0,793	> 0,60	Reliabel

Source: Processed data, 2025

Based on the data in the table above, the test results of the variables of leadership style, organizational motivation, organizational communication, and organizational commitment are reliable and can be used in research. The test results show that the data used meets the reliability

criteria. A Cronbach's Alpha value > 0.06 proves that the data is reliable and suitable for use in research.

This study used the Kolmogorov-Smirnov normality test..

One-Sampel Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		86
Normal Parameters	Mean	,0000000
	Std. Deviation	6,71016836
Most Extreme Differences	Absolute	,043
	Positive	,037
	Negative	-,043
Test Statistic		,043
Asymp. Sig (2-tailed)[c]		,200
a. The test distribution is normal.		

Source: Processed data, 2025

Referring to the Kolmogorov-Smirnov test results shown in the table, the Asymp. Sig (2-tailed) value for the four variables is 0.200, which is greater than 0.05. This indicates that the data in this study has met the assumption of normality.

Coefficients		
Model	Collinearity Statistics	
	Tolerance	VIF
1. (Constant)		
Organizational commitment	,397	2,522
Motivation	,464	2,156
Organizational Communication	,411	2,434
a. Dependent Variable: Member Commitment		

Source: Processed data, 2025

Based on the table above, the results show that the Leadership Style variable (X1) has a VIF of 2.522, the Organizational Motivation variable (X2) has a VIF of 2.156, and the Communication variable (X3) has a VIF of 2.434. Since all three independent variables have VIF values less than 10, it can be concluded that this regression model is free from multicollinearity among its independent variables.

Coefficients					
Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1. (Constant)	15,716	7,721		2,036	,045
Organizational commitment	,014	,051	.049	,282	,779

Organizational Communication	-,169	,160	-,178	-1,054	,295
a. Dependent Variable: abss					

Source: Processed data, 2025

Based on the table, it can be seen that the significance value of the Leadership Style variable (X1) is 0.779, the Organizational Motivation variable (X2) is 0.703, and the Organizational Communication variable (X3) is 0.295. All of these significance values are greater than 0.05, indicating that there is no heteroskedasticity in each variable. Therefore, it

can be concluded that the regression model does not exhibit heteroskedasticity issues, as all

Coefficients					
Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta

independent variables have significance values above 0.05.

Source: Processed data, 2025

The regression equation produces:

$Y = a + b_1 . X_1 + b_2 . X_2 + b_3 . X_3 + b_4 . X_4 + e$

$Y = 36.223 + 0{,}051X_1 + 0{,}089X_2 + 0{,}799X_3 + e$

Based on the results of multiple linear regression, it can be explained as follows :

a) The constant value (a) of 36.223 indicates that the variables of leadership style (X1), organizational motivation (X2), and communication (X3) have no effect or are zero, resulting in an organizational commitment value of 36.223. The constant value is the baseline value of organizational commitment that occurs when all independent variables have no effect whatsoever.
b) The regression coefficient value (b1) = 0.051 (positive). A positive sign means that if the leadership style variable (X1) increases, it will increase organizational commitment (Y), and conversely, if the leadership style variable (X1) decreases, it will decrease organizational commitment (Y).
c) The regression coefficient value (b2) = 0.089 (positive). The positive sign means that if the organizational motivation variable (X2) increases, it will increase organizational commitment (Y), and conversely, if the organizational motivation variable (X2) decreases, it will decrease organizational commitment (Y).
d) The regression coefficient value (b3) = 0.799 (positive). A positive sign means that if the organizational communication variable (X2) increases, it will increase organizational commitment (Y), whereas if the organizational communication variable (X2) decreases, it will decrease organizational commitment (Y).

Anova					
Model	Sum of Squares	df	Mean Square	f	Sig.
1. Regression	1680,272	3	560,091	11,992	<,001
Residual	3829,821	82	46,705		
Total	5510,093	85			
a. Dependent Variable: Member Commitment b. Predictors: (Constant), Leadership Style, Motivation, Organizational Communication					

Source: Processed data, 2025

Based on these results, the significance value is 0.001 < 0.05. Thus, it shows that hypothesis 1 (H1) in the study, Leadership Style (X1), Motivation (X2), Organizational Communication (X3) together influence Organizational Commitment (Y).

The t-test aims to identify the influence of each independent variable on the dependent variable through a t-test. The results of the test in this study are presented as follows.

Coefficients					
Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
2. (Constant)	36,223	12,673		2,858	,005
Organizational commitment	,051	,083	.089	,608	,545
Motivation	,089	,184	,065	,483	,631
Organizational Communication	,799	,263	,436	3,039	,003
a. Dependent Variable: Member Commitment					

Source: Processed data, 2025

1) Leadership Style (X1)
   With a t-value of 0.608 and a significance value of 0.545 > 0.05, it shows that it does not have a significant effect on organizational commitment, indicating that H1 is rejected.
2) Organizational Motivation (X2)
   With a t-value of 0.483 and a significance level of 0.631 > 0.05, this indicates that it does not significantly influence organizational commitment, thus rejecting H2.
3) Organizational Communication (X3)
   With a t-value of 3.039 and a significance level of 0.003 < 0.05, this indicates a significant effect on organizational commitment, indicating that H3 is accepted.

Based on these results, it can be concluded that the variables of leadership style (X1) and organizational motivation (X2) do not have a significant effect on organizational commitment (Y), while organizational communication (X3) has a significant effect on organizational commitment (Y).

The coefficient of determination (Adjusted R-square) is the model's ability to explain the variation in the dependent variable. The coefficient of determination ranges from 0 to 1, and the R-square value ranges from 0 to 1 (0 < R-square < 1).

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1.	,553	,305	,280	6,832
a. Predictors: (Constant), Leadership Style, Motivation, Organizational Communication				

Source: Processed data, 2025

Based on the results obtained from the table, it can be concluded that the Adjusted R Square is 0.280, which means the influence of independent variables on dependent variables. This means that 28% is influenced by independent variables, while 72% is influenced by other variables outside the study. The dependent variable, organizational commitment (Y), can be explained by the variables communication style (X1), organizational motivation (X2), and organizational communication (X3).

Based on the results of this study, it is known that leadership style does not have a significant effect on the commitment of HIMAPRODI Management members. This means that the level of leadership style does not directly affect the level of commitment of members to the organization. This may be due to findings in the descriptive analysis showing that leaders who impose their will on members can actually reduce their commitment to the organization. This finding aligns with the results of a study conducted by Rusni et al. (2022), which showed that

leadership style has a positive but insignificant effect on organizational commitment among members of the Kangean Islands Student Association (IMAKA) in Malang.

Based on the results of the analysis in this study, it was found that organizational motivation does not significantly influence the commitment of management program members. Motivation does not influence commitment when members of the organization do not have a strong drive to commit to the organization's goals, even though they are interested in certain aspects of the existing activities. These results are consistent with the research by Sari (2018), whose findings indicate that motivation does not significantly influence organizational commitment, and according to Shanty et al. (2017), whose findings indicate that motivation does not significantly influence organizational commitment.

Based on the analysis in this study, it was found that organizational communication significantly influences the commitment of management program members. Communication has a very large influence on members' commitment within an organization. These results align with the research by Eko Putro et al. (2023), whose findings indicate that the motivation variable has a positive and significant influence on the organizational commitment variable of the Student Executive Board (BEM) at Surabaya Institute of Technology.

6. Conclusion

Leadership style does not significantly affect organizational commitment in the management study program. Organizational motivation does not significantly affect organizational commitment in the management study program. Organizational communication significantly affects organizational commitment in the management study program.

This study has a number of limitations, so the findings obtained do not fully meet expectations. Some limitations in this study and recommendations for future research are: This study only analyzes leadership style, motivation, and organizational communication as determinants of member commitment, so there are still other variables that can be used as material for further research. This study has too many statement items, so respondents are reluctant to fill them out.

Based on the results of the research conducted, the researcher presents several recommendations: The Management Student Association should be made a home for all its executives so that loyalty and commitment continue to exist and grow stronger to achieve the organization's goals. The next leader or chairperson should proactively set aside their ego for the sake of the organization and its members, so that all members feel supported and guided for the benefit of both the members and the Himaprodi Management organization. Members of the Management Student Association are encouraged to pay more attention to the following aspects: improving precision in completing tasks to ensure responsibilities are carried out meticulously, future leaders should be able to delegate tasks to members based on their respective competencies, strengthening the dissemination of information to all members, and increasing motivation for members to contribute to achieving the organization's goals.

It is recommended to use other variables in future research, as commitment is not solely influenced by the variables studied in this research. Thus, future research results can better represent the factors that shape the commitment of Himaprodi Management members comprehensively.

SOCIAL MEDIA OPTIMISATION AND PRODUCT INNOVATION IN PROMOTING THE DEVELOPMENT OF MSMES (A STUDY OF BUSINESS ACTORS IN BULULAWANG SUBDISTRICT, MALANG REGENCY)

Alya Tamara Balqish [1] Ronny Malavia Mardani [2] Fahrurrozi Rahman [3]
alyatamara20@gmail
Universitas Islam Malang

Abstract

This study aims to examine the extent of the influence of Social Media and Product Innovation on the development of businesses carried out by MSMEs in Bululawang District, Malang Regency. The approach used in this study is quantitative with an explanatory research type. The sampling technique was carried out by purposive sampling, with a total of 113 respondents from MSMEs, which was determined using the Lemeshow formula because the population size was not known with certainty. The data collection process was carried out by distributing questionnaires, while the data analysis method used was multiple linear regression. Based on the results of the analysis, it is known that Social Media and Product Innovation have a positive and significant influence on business development among MSMEs

Keywords: Social Media, Product Innovation, Business Development

1. Background of Study

MSMEs also play a strategic role in promoting the economic welfare of society. Its role includes improving living standards, creating jobs, encouraging economic growth, and contributing to income distribution in various layers of society Lorensa (2022) . MSMEs have a strategic role in driving Indonesia's economic growth, with a large contribution to GDP and job creation. However, in the midst of the rapidly growing digital era, MSME players face challenges to adapt to technology, especially in utilising social media as a marketing tool, as well as creating product innovations that suit market needs.

This phenomenon is caused to examine the extent of the influence of social media and product innovation on the development of MSME businesses in Bululawang District. It is expected to provide a comprehensive understanding of the role of the two variables in encouraging increased business capacity, as well as providing data-based recommendations that are useful for MSME actors and local governments in developing this sector in a more competitive direction. Driving the growth of MSMEs today is the use of social media. Data from the Ministry of KUKM shows that in 2010, only 2% of entrepreneurs used social media to market their products. However, by 2023, this figure increased to 75%, and is projected to reach 85% by 2025, with the number of social media users in Indonesia reaching 200 million people. This shows that social media has become the main marketing medium, especially for MSMEs that need a wide reach at a more efficient cost.

According to Lorensa (2022) Social Media is a strategy in introducing products both directly and indirectly which aims to build consumer awareness, strengthen memory, and form attitudes and recognition of a product.

According to Masnun et al., (2024) Product Innovation encourages business people to create entirely new products or give a touch of renewal to existing products.

According to Kurniawan (2022) Business development is a series of efforts aimed at increasing the ability, effectiveness and competitiveness of a business. These efforts include implementing various strategies and tactical steps to expand market coverage, drive revenue growth, and bring innovation in the products and services offered.

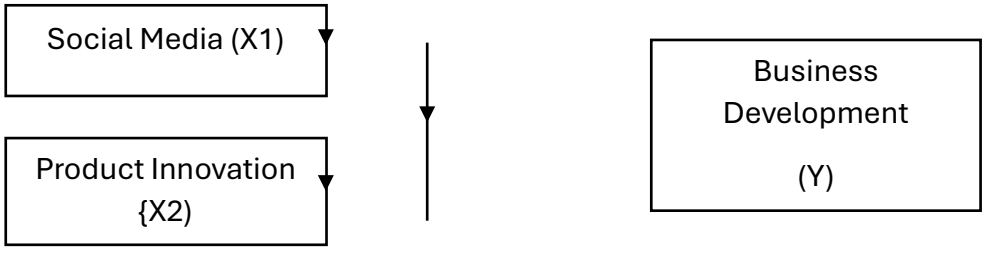
The development of MSME businesses in Bululawang Sub-district shows a tendency to stagnate, which is marked by the low utilisation of social media as a marketing tool and the lack of product innovation by business actors. Therefore, several factors that can be used to encourage the growth of MSME businesses include optimising the use of social media in promotional strategies, as well as encouraging the creation of product innovations that are in accordance with market needs. These factors are the basis for conducting research on MSMEs in Bululawang District.

2. Literature Review

According to Anoraga Pandji, (2017) in the journal Paloa et al (2024) business development can be defined as the way an entrepreneur manages his business based on his motivation and creative ideas. According to Nitisusantro (2010) in the journal Azzahra (2021) business development is steps taken by local governments, communities, and other stakeholders to empower a business unit through the provision of facilities and assistance on an ongoing basis. According to Kurniawan (2022) Indicators of business development, namely: Turnover Growth, Operational Efficiency, Product Diversification, Utilisation of Digital Technology.

According to Rika Widianita (2023) social media is a web-based service designed to build networks between users and provide space for them to connect with each other in certain communities. Meanwhile, according to Nasrullah (2015) in the journal (Kenny, 2021) social media is a medium on the internet that allows users to present themselves, interact, cooperate, share information, communicate with others and form social ties. According to Praditya (2019) Social media indicators, namely: Participation, Openness, Conversation, Community, Connecting.

According to Kotler and Keller in Rika Widianita (2023) states that innovation can be in the form of new products, services, ideas, or perceptions that arise from individuals. In the view of consumers, innovation refers to anything new that is considered different from the previous product or service. Meanwhile, according to Kotler (2012) in the journal Masnun et al (2024) asserts that innovation is not only limited to the creation of new products or services, but also includes new ways of thinking about business and the application of processes that are different from usual. According to (Setiadi, 2010) in Aliatul Margareth, et al (2015) states that innovation indicators are: relative advantage, compatibility, complexity, trialability, involvement.



Gambar 1. Research Model

3. Hypothesis

H1 : The use of social media has a positive and significant effect on the development of MSME businesses in Bululawang District.
H2 : Product innovation has a positive and significant effect on the development of MSME businesses in Bululawang District.

4. Methodology

This study applies an *explanatory research* method with a quantitative approach. The focus of the research was on MSMEs in Bululawang District, Malang Regency. The research activities were conducted between November 2024 and June 2025.

The population used as the basis for this study includes all MSMEs operating in Bululawang Sub-district, totalling 114 MSMEs. These MSMEs cover various business sectors such as agriculture, livestock, trade, and services.

5. Result And Discussion

The validity test results aim to test how valid a statement is in a questionnaire that will be distributed to respondents.

Table 1 Validity Test Result

Variable	Item	r Count	r Table	Terms Conditions	Description
Development Business (Y)	Y1	0,739	0,1830	r count>r table	Valid
	Y2	0,719	0,1830	r count>r table	Valid
	Y3	0,675	0,1830	r count>r table	Valid
	Y4	0,576	0,1830	r count>r table	Valid
Social Media (X1)	X1.1	0,663	0,1830	r count>r table	Valid
	X1.2	0,656	0,1830	r count>r table	Valid
	X1.3	0,681	0,1830	r count>r table	Valid
	X1.4	0,481	0,1830	r count>r table	Valid
	X1.5	0,756	0,1830	r count>r table	Valid
Product Innovation (X2)	X2.1	0,683	0,1830	r count>r table	Valid
	X2.2	0,672	0,1830	r count>r table	Valid
	X2.3	0,617	0,1830	r count>r table	Valid
	X2.4	0,583	0,1830	r count>r table	Valid
	X2.5	0,712	0,1830	r count>r table	Valid

Source: Data processed, 2025

The table above shows that all statement items in the questionnaire have a correlation value that exceeds r table, which is 0.1856 with degrees of freedom (df) = N - 2. Therefore, it can be concluded that each statement item meets the validity criteria..

Table 2 Reliability Test Result

Variabel	Cronbach Alpha	Ketentuan	Keterangan
Perkembangan Usaha (Y)	0,611	>0,60	Reliabel
Media Sosial (X1)	0,647	>0,60	Reliabel
Inovasi Produk (X2)	0,662	>0,60	Reliabel

Source: Data Processed, 2025.

Based on the data table above, the test results of the leadership style variables, organisational motivation, organisational communication, and organisational commitment are shown to be reliable and can be used in research. The test results show that the data used meets the reliability criteria. *The Cronbach's Alpha* value> 0.06 is evidence that the data is reliable and suitable for use in research.

Table 3 Normality Test Result

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		113
Normal Parameters[a,b]	Mean	.0000000
	Std. Deviation	1.33650199
Most Extreme Differences	Absolute	.076
	Positive	.045
	Negative	-.076
Test Statistic		.809
Asymp. Sig. (2-tailed)		.530
a. Test distribution is Normal.		

Source: Data Processed, 2025

Referring to the Kolmogorov-Smirnov test results displayed in the table, the Asymp. Sig (2-tailed) for the four variables is 0.530, which is greater than 0.05. This indicates that the data in this study have fulfilled the assumption of normality.

Table 4 Multicollinearity Test Rusult

Coefficients		
Model	Collinearity Statistics	
	Tolerance	VIF
1. (Constant)		
Social Media	,588	1,702
Product Innovation	588	1,702

a. Dependent Variable: Business Development		

Source: Data Processed, 2025

Based on the table above, the results show that the Social Media variable (X1) VIF) is 1.702, the Product Innovation variable (X2) is 1.702. Product Innovation (X2) variable is 1.702. Because both independent variables have a VIF value of less than 10, it can be said that this regression model is free from multicollinearity symptoms between the independent variables

Table 5 Heteroscedasticity Test Result

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1.761	.976		1.804	.074
	X1	-.068	.054	-.155	-1.252	.213
	X2	.031	.055	.070	.566	.573

a. Dependent Variable: ABS_RES

Based on this table, it is obtained that the significance value of the Social Media variable (X1) is 0.213, the Product Innovation variable (X2) is 0.573. All of these significance values are greater than 0.05, which means that there is no heteroscedasticity in each variable. Thus, it can be concluded that the regression model does not experience heteroscedasticity problems, because all independent variables have a significance value above 0.05.

Table 6 Multiple Linear Regression Analysis

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	6.481	1.446		4.483	.000
	X1	.367	.081	.460	4.534	.000
	X2	.127	.080	.162	1.593	.114

a. Dependent Variable: Y

The regression equation results in:

$Y = a + b_1 . X_1 + b_2 . X_2 + b_3 . X_3 + e$

$Y = 6.481 + 0.367X_1 + 0.127X_2 + e$

Based on the multiple linear regression results, it can be explained as follows:

a) The constant value (a) 6.481 indicates that the social media variable (X1), product innovation (X2) has no effect or is zero, then the value of organisational commitment is 6.481. The constant value is the basic value of business development that occurs when all independent variables have no effect at all.
b) Regression coefficient value (b1) = 0.367 (positive). The positive sign means that if the social media variable (X1) increases, it will increase business development (Y), otherwise if the social media variable *(*X1) decreases, it will decrease business development (Y).
c) Regression coefficient value (b2) = 0.127 (positive). The positive sign means that if the product innovation variable (X2) increases, it will increase organisational commitment (Y), otherwise if the organisational motivation variable (X2) decreases, it will decrease organisational commitment (Y).

Table 7 F Test Result

ANOVA[b]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	100.225	2	50.112	27.554	.000[a]
	Residual	200.059	110	1.819		
	Total	300.283	112			

a. Predictors: (Constant), X2, X1

b. Dependent Variable: Y

Based on these results, the significance value is 0.000 <0.05. Thus, it shows that hypothesis 1 (H1) in the study, Social Media (X1), Product Innovation (X2) together have an effect on Business Development (Y).

Table 8 Result of the t-test

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	6.481	1.446		4.483	.000
	Social Media	.367	.081	.460	4.534	.000
	Product Innovation	.127	.080	.162	1.593	.114

a. Dependent Variable: Y

1) Social Media (X1)
   With a t value of 1.981 and a significance value of 0.000< 0.05, it shows that it has a significant effect on business development, indicating H $_1$is accepted.
2) Product Innovation (X2)
   With a t value of 1.981 and a significance value of 0.114> 0.05, indicating that it has no significant effect on business development, indicating H $_2$is rejected.

Based on these results, it can be concluded that the social media variable (X1) has a significant effect on organisational commitment (Y), while product innovation (X3) has no significant effect on organisational commitment (Y).

Table 9 Coefficient of Determination Test Result (Adjusted R *Square*)

The coefficient of determination (*Adjusted* R *square*) is the ability of the model to explain variations in the dependent variable. The coefficient of determination is between zero and 1 and the R *square* value is between 0 and 1 (0 < R Square < 1.

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.578[a]	.334	.322	1.34860

a. Predictors: (Constant), X2, X1

b. Dependent Variable: Y

Based on the results obtained from the table, it can be concluded that the *Adjusted* R *Square* is 0.322, which means the effect of the independent variable on the dependent variable. This means that 32.2% is influenced by the independent variable, while 67.8% is influenced by other variables outside the study. The dependent variable, namely business development (Y), can be explained by social media variables (X1), product innovation (X2).

Based on the results of this study, it is known that there is a significant positive influence between social media and product innovation on business development with a coefficient of determination of 32.2%. This shows that the combination of marketing strategies such as social media and product innovation can encourage MSMEs to carry out business development. These findings are in line with the results of research conducted by Azzahra (2021) with the results of the study showing that media and product innovation simultaneously affect business development research on Dimsum businesses in Medan Johor.

Based on the results of the analysis in this study, it shows that there is a significant positive influence between social media and business development. This shows that marketing strategies using social media can affect business development. The results of this study are in line with Soleha et al (2024) which states that there is a significant positive effect on the use of Social Media and Product Innovation on Business Development in MSMEs in Kanigaran District, Probolinggo City.

Based on the results of the analysis in this study, it shows that product innovation has no significant effect on business development. Product innovation has no effect on business development is less effective in supporting business development, so that it has a negative impact. It is possible that the innovations made have not been able to meet market needs or have not been matched by adequate marketing strategies and resources, so it is necessary to evaluate and adjust so that innovation can make a positive contribution to business development. This result is in accordance with research from Suhaera (2024) whose research results show that product innovation has no significant effect on business development.

6. Conclusion

Social media and product innovation have a significant effect on business development Social media has a significant effect on business development. Product innovation has no significant effect on business development.

In this study, there are several limitations that need to be considered, as for the limitations of this study, among others: This study only uses two independent variables, namely social media and product innovation and one dependent variable, namely business development. This research was only conducted at MSMEs in Bululawang, Malang Regency. The data collection method only uses a questionnaire

Based on the results of the research that has been conducted, the researcher makes the following recommendations: For Further Researchers can be improved by adding other more relevant variables such as the halal label in order to be able to explain variations in the dependent variable more thoroughly. For UMKM Actors the next leader or chairman must be pro-active in putting aside his ego for the benefit of the organisation and its members, so that all members feel nurtured and directed for the good of the members and the Himaprodi Management organisation.

FROM SPIRITUALITY TO DIGITALIZATION, STRATEGIES FOR INCREASING CUSTOMER LOYALTY AT INDONESIAN ISLAMIC BANK (BSI)

Nur Hasanah [1], Muhammad Rizal [2] , Restu millaningtyas [3]
hasanahnur14608@gmail.com
Universitas Islam Malang

Abstract

This study aims to analyze the influence of spiritual marketing, sharia compliance, customer experience, and banking digitalization on customer loyalty at Indonesian Islamic Bank (BSI). A quantitative approach was used with purposive and random sampling techniques. The sample size of 100 respondents was determined using the Slovin formula. Data collection was conducted through questionnaires and analyzed using SPSS. The analysis included validity tests, reliability tests, normality tests, classical assumption tests, multiple linear regression, F-tests, t-tests, and determination coefficients (R^2). The results of the study indicate that all four variables significantly influence customer loyalty toward BSI. These findings highlight the importance of a value-based approach rooted in spiritual values, sharia compliance, positive experiences, and digitalization of services in building loyalty. This study provides strategic recommendations for BSI management and suggests further research incorporating additional variables such as service quality and product innovation.

Keywords: spiritual marketing, sharia compliance, customer experience, banking digitalization, customer loyalty, Bank Syariah Indonesia (BSI).

1. Background Of Study

Islamic banks are financial institutions that run their operations based on Islamic sharia principles, which not only carry out basic banking functions such as raising funds, but also try to avoid practices that challenge Islamic values, such as usury, gharar, and maysir (Safitri et al., 2023). In practice, Islamic banks earn profits through profit-sharing systems, profit margins, and service income in contrast to conventional banks that rely on interest (Sari et al., 2024). In addition, Islamic banks have a strategic role in creating a more inclusive and social justice-based economic system (Djamil, 2023; Haikal & Efendi, 2024).

Customer loyalty is a key factor in the sustainability of Islamic banking, mainly due to the aspect of trust in the bank's compliance with sharia principles (Khusnul Istiqomah et al., 2023). Islamic bank customers tend to choose services that not only offer financial benefits but also align with their Islamic values (Nugraha Triyan Putra & Thamrin, 2021). One approach that can increase *customer loyalty* is *spiritual marketing,* which is a marketing strategy that emphasizes the values of honesty, transparency, and social responsibility, thus creating an emotional bond between banks and their customers (Permatasari & Ratna Yunita, 2023; Pitri, 2024).

Apart from *spiritual* aspects*, digitalization* is also an important factor in maintaining *customer loyalty*. Islamic banks that are able to provide digital services such as mobile banking, internet banking, and sharia-based QR payments can increase convenience in transactions (Budiman & Karnadi, 2023; Nasir Tajul Aripin et al., 2022). This digitalization also allows banks to provide more personalized services, such as zakat reminder features and sharia investment calculators.

Indonesian Islamic Bank (BSI) as the largest Islamic bank in Indonesia has a strategic role in supporting the halal industry ecosystem and Islamic financial inclusion. With an asset value of IDR 357.90 trillion in the first quarter of 2024, BSI dominates the Islamic banking industry in Indonesia, far surpassing its competitors such as Bank Muamalat and CIMB Niaga Syariah. However, despite its rapid growth, BSI faced major challenges, including a cyberattack in May 2023 that disrupted banking services and tested the loyalty of its customers (BBC News Indonesia, 2023). The incident raised concerns among customers, especially in Aceh, which relies heavily on Islamic banking services following the closure of conventional banks in the region.

Therefore, this study aims to analyze the effect of *spiritual marketing, sharia compliance, customer experience, and digitalization of banking* on customer loyalty of Indonesian Islamic Bank. By exploring the relationship between these factors, this research is expected to provide insight into strategies to increase customer loyalty as well as policy recommendations that can be implemented by Islamic banking to improve service quality and competitiveness in the Islamic financial industry in Indonesia.

2. Literature Review

According to Caroline Chiko (2022) *Spiritualism* is a view that focuses more on moral values and spiritual aspects, and ignores the material elements in human life. Meanwhile, marketing is the process of designing and carrying out the concept, pricing, promotion, and distribution of product and service ideas to facilitate exchanges that meet the needs of both individuals and organizations. Nurjannah et al. (2023) also added that, *Spiritual Marketing* aims to create openness and equality for all parties. This marketing is based on honesty and moral values to prevent prejudice and ensure that no party is harmed.

Shariah Compliance is one of the main foundations in the development of Islamic banks, which is the difference between Islamic banks and conventional banks. Also is the obedience of Islamic banks in carrying out sharia principles, where all bank operations comply with Islamic rules, especially in the aspect of how to do business, (Oktapiani & Anggraini, 2022) . Based on PBI 13/2/PBI/2019, bank compliance includes values, behaviors, and actions that are in accordance with regulations, including sharia principles for Islamic banks. The better the implementation of *Shariah Compliance*, the higher the customer's confidence in the suitability of transactions with Islamic law, which in turn increases their loyalty.

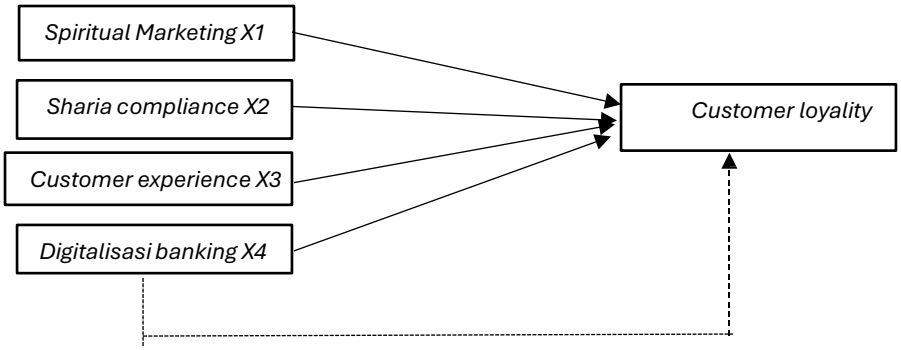
According to Sulivyo, (2021) .*Experience* is a personal event that arises as a stimulus reaction Experience includes all events in life, in simple terms, marketers must build an environment that is aligned with customer needs and understand what they really want. Tegor & Husain (2017)) states that *Customer Experience* is defined as a series of consumer engagements with products, companies, or parts of the organization that trigger certain responses. This experience is highly personalized and reflects customer involvement at various levels, both *rationally*, emotionally, *sensory*, physically, and *spiritually*. *Customer Experience* is the internal and subjective response of customers that arises from their interaction with the company, either directly or indirectly. Direct interactions usually occur at the initiative of the customer, such as in the purchase and service process. Meanwhile, indirect interactions occur without planning, for example through exposure to products, brands, advertisements, or promotions.

Mobile banking makes it easier for customers to perform banking transactions, such as balance inquiry and fund transfer, allowing users to transact anytime and anywhere. *Mobile*

banking services make it easier for customers to perform various banking transactions, such as checking the amount of funds, transferring funds between bank accounts, etc. Through this feature, mobile phone users can transact easily anytime and anywhere. As a result, many banks are competing to provide *M-banking* services to increase convenience and the number of customers. (Fadlan & Dewantara, 2018)

According to Mukti et al. (2022), loyalty is the customer's desire to continue using the product, which plays an important role in the success of Islamic banking. Al-Ghifari & Khusnudin, (2022) also argue that customer loyalty is reflected in their loyalty in buying or using banking products and services repeatedly. This loyalty shows customer commitment to a product, which has a crucial role in the world of marketing. For companies, the existence of loyal customers is needed so that the business can develop and be sustainable. loyal customers are those who have a commitment to continue using certain products, have the desire to make repeat purchases, and are willing to recommend them to other customers. (Astuti et al., 2020)

Figure 1. Research Model



Based on the conceptual framework, the following hypotheses can be formulated:
H1: *Spiritual marketing, sharia compliance, customer experience, and banking digitalization* simultaneously influence BSI customer loyalty
H2: *Spiritual marketing* influences BSI customer loyalty
H3: *Sharia compliance* influences BSI customer loyalty
H4: *Customer experience* influences BSI customer loyalty
H5: *Banking digitalization* influences BSI customer loyalty

3. Methodology

This research uses a quantitative approach, Ardiansyah et al. (2023) define quantitative methods as an approach that collects and analyzes numerical data to describe the relationship between variables statistically. The location of this research covers all regions of Indonesia, with a focus on data collection in 38 provinces, from November 2024 to February 2025.

Sugiyono (2018: 117) defines population as a collection of objects or subjects with certain characteristics that are studied to be analyzed and concluded. This study has a population of 20.5 million known through the official BSI website. And using *purposive sampling* and *accidental sampling* techniques, for the sampling technique using the slovin formula, so that the number of samples taken was 100 respondents.

This study utilizes primary and secondary data. Primary data was collected directly from respondents through an online questionnaire addressed to Bank Syariah Indonesia customers. Meanwhile, secondary data was obtained from documents related to Bank Syariah Indonesia. Data collection was carried out using a 5-point *Likert scale* to assess respondents' perceptions.

4. Results and Discussion

Table 1. Descriptive Statistic Test Results

Descriptive Statistic					
	N	Minimum	maximum	mean	std. deviation
spiritual marketing (x1)	100	12	20	17.24	2.046
sharia compliance (x2)	100	9	15	13.41	1.491
customer experience (x3)	100	16	25	22.02	2.395
banking digitalization (x4)	100	17	30	26.33	2.912
customer loyalty (Y)	100	12	20	17.51	1.982
Valid N *(listwise)*	100				

Descriptive analysis shows the average *spiritual marketing* score of 17.24, *sharia compliance* 13.41, *customer experience* 22.02, *banking digitalization* 26.33 and customer loyalty 17.51. These results indicate that respondents tend to give a positive assessment of banking *digitalization*, while *sharia compliance* gets a lower score.

Table 2 Validity Test Results

Variable	Item	r Count	r Table	Description
Customer Loyalty (Y)	Y1.1	0.727	0.1966	Valid
	Y1.2	0.728	0.1966	Valid
	Y1.3	0.702	0.1966	Valid
	Y1.4	0.65	0.1966	Valid
Spiritual Marketing (X1)	X1.1	0.698	0.1966	Valid
	X1.2	0.721	0.1966	Valid
	X1.3	0.734	0.1966	Valid
	X1.4	0.694	0.1966	Valid
Sharia Compliance (X2)	X2.1	0.752	0.1966	Valid
	X2.2	0.752	0.1966	Valid
	X2.3	0.797	0.1966	Valid
Customer Experience (X3)	X3.1	0.623	0.1966	Valid
	X3.2	0.63	0.1966	Valid
	X3.3	0.729	0.1966	Valid
	X3.4	0.642	0.1966	Valid
	X3.5	0.7	0.1966	Valid

Banking Digitalization (X4)	X4.1	0.72	0.1966	Valid
	X4.2	0.678	0.1966	Valid
	X4.3	0.707	0.1966	Valid
	X4.4	0.605	0.1966	Valid
	X4.5	0.686	0.1966	Valid
	X4.6	0.663	0.1966	Valid

The rtable value is 0.1966 (df = 98) at the 5% error rate. The instrument is declared valid if rcount> 0.1966 and invalid if rcount < 0.1966. Based on the results of the validity test with SPSS, all items on the Spiritual Marketing (X1), Sharia Compliance (X2), Customer Experience (X3), Digitalization Banking (X4), and Customer Loyalty (Y) variables are said to be Valid.

Table 3. Reliability Test Results

Variable	Reliability Coefficient	*Cronbach's Alpha*	Description
Spiritual Marketing (X1)	0.675	0,6	Reliable
Sharia Compliance (X2)	0.647	0,6	Realizable
Customer Experience (X3)	0.681	0,6	Realizable
Banking Digitalization (X4)	0.762	0,6	Realizable
Customer Loyalty (Y)	0.657	0,6	Realizable

Based on the reliability test in Table 3, each variable has a reliability coefficient value that exceeds 0.6 on *Cronbach's Alpha.* This shows that all statement items in this study are considered reliable.

Table 4 Normality Test Results

Parameter	**Value**
Asymp.Sig (2-tailed)	200c.d

The normality test shows that the data is normally distributed with a Sig. value of 0.200> 0.05, so it can be stated that the residual data is normally distributed. This shows that the assumption of normality in statistical analysis has been met.

Table 5. Multicollinearity Test Results

Variable	***Tolerance***	**VIF**	**Description**
X1	0.775	1.292	No multicollinearity
X2	0.537	1.863	No multicollinearity occurs
X3	0.45	2.222	No multicollinearity
X4	0.501	1.995	No multicollinearity occurs

Based on Table 5, the *tolerance* value for *spiritual marketing, sharia compliance, customer experience and digitalization banking* variables is more than 0.10, while the VIF value is less than 10. Thus, it can be concluded that there is no multicollinearity problem in this study.

Table 6. Heteroscedasticity Test

Variable	**Sig**	**Description**
Spiritual Marketing (X1)	0.78	No Heteroscedasticity Occurs
Sharia Compliance (X2)	0.396	No Heteroskedasticity Occurs

Customer Experience (X3)	0.854	No Heteroscedacity Occurs
Banking Digitalization (X4)	0.185	No Heteroscedasticity Occurs

Table 6 shows that the heteroscedasticity *test* is performed using the *Glejser test* method, where the significance value (sig.) is considered. In the variables of *spiritual marketing, sharia compliance, customer experience, and* banking *digitalization*, the sig. value is more than 0.05 or 5%. Thus, it can be concluded that the data in this study are free from heteroscedasticity.

Table 7. Multiple Linear Regression Test Results

Coefficients [a]					
Model	***Unstandardized Coefficients***		***Standardized Coefficients***	**t**	***Sig***
	B	*Std.Error*	*Beta*		
1.	-067	1.387		-048	962
X1	181	068	187	2.667	009
X2	269	112	202	2.400	018
X3	258	078	311	3.380	001
X4	196	059	288	3.305	001

Regression analysis shows that all independent variables, namely *spiritual marketing, sharia compliance, customer experience and digitalization of banking, have* a significant effect on the dependent variable (customer loyalty).

Table 10. Test Results of the Coefficient of Determination

Model Summary					
model	R	r square	adjusted r square	std. error of the estimate	
1	798[a]	637	622	1.219	

Based on the *R Square* value of 0.637 (63.7%), it can be interpreted that the *Spiritual Marketing (*X1*), Sharia Compliance (*X2*), Customer Experience (*X3*), and Digitalization Banking (*X4*)* variables are able to explain variations in customer loyalty (Y) As much as 63.7% is influenced by the variables studied, while 36.3% comes from other factors outside this study.

Based on the research results, the F test shows that the variables of *Spiritual Marketing, Sharia Compliance, Customer Experience, and Banking Digitalization* simultaneously have a significant effect on Customer Loyalty. These results indicate that an increase in these four variables can increase overall customer loyalty. This research is in line with studies conducted by Lestari & Kusumadewi (2017) and Fadilla et al. (2024) which states that spiritual marketing, sharia compliance, customer experience, and digitalization banking factors together affect customer loyalty.

From the research results, it is known that *Spiritual Marketing* has a significant effect on Customer Loyalty. The higher the application of spiritual marketing, the stronger customer loyalty to BSI. These results support the research of Lestari & Kusumadewi (2017) which states that *spiritual marketing* has a positive influence on customer loyalty.

Based on the research results, the *Sharia Compliance* variable has a significant effect on Customer Loyalty. The higher the level of bank compliance with sharia principles, the greater

the customer loyalty to the bank. This research is in line with a study conducted by Siregar (2022) which states that *sharia compliance* has a positive effect on customer loyalty.

From the research results, it is known that the *Customer Experience* variable has a significant effect on Customer Loyalty. The better the banking experience felt by customers, the higher their level of loyalty to BSI. These results support the research of Fadilla et al. (2024) which states that customer experience has a positive influence on the loyalty of Islamic bank customers.

Based on the research results, the *Banking Digitalization* variable has a significant effect on Customer Loyalty. Reliable and easily accessible digital banking services can increase customer loyalty to BSI. This research is in line with the Vahlevi & Indra Vitaharsa study (2022) which states that *mobile banking* services have a positive influence on customer loyalty.

5. Conclusion

This study shows that Spiritual Marketing, Sharia Compliance, Customer Experience, and Banking Digitalization simultaneously have a positive and significant effect on customer loyalty at Bank Syariah Indonesia (BSI). Individually, each of these four variables has also been proven to have a significant influence. This underscores that spiritual values, adherence to Sharia principles, a positive banking experience, and optimal digital services are crucial factors in building customer loyalty at BSI.

BSI is advised to continue strengthening its spiritual value-based marketing strategy and improving the quality of its banking service digitalization in order to create a more convenient and efficient experience for customers. Further research is recommended to include other variables such as customer trust and digital service quality in order to gain a more comprehensive understanding of the factors that influence loyalty. In addition, the use of different research models and expansion of the sample size could yield more accurate and representative findings.

THE ROLE OF TAX VOLUNTEER MODERATION IN THE INFLUENCE OF E-FILING ON INDIVIDUAL TAXPAYER COMPLIANCE (STUDY ON LECTURERS AND EMPLOYEES OF THE UNIVERSITY OF ISLAM MALANG)

Risma Ayu Febrianti[1*], Arista Fauzi Kartika Sari[2], Umi Nandiroh[3]
[1,2,3] Accounting Study Program Faculty of Economics and Business, University of Islam Malang, Indonesia

Abstract

This study aims to analyze the impact of e-Filing on the compliance of individual taxpayers with tax volunteers as a moderation variable in taxpayers, lecturers, and employees of the University of Islam Malang.This study uses a quantitative research method with the type of causal relationship research (causal relationship). This study uses primary data obtained through questionnaires. The population in this study is individual taxpayers at the University of Islam Malang with a sample of 222 respondents. The method used in this study is Moderated Regression Analysis (MRA) using SPSS Version 27. The results of the study indicate that the use of e-Filing has a positive and significant effect on the compliance of taxpayers and tax volunteers cannot moderate the influence of e-Filing on the compliance of taxpayers, lecturers and employees at the University of Islam Malang.The implications of this research are expected to contribute to the development of tax science and provide information and input for the DJP for decision-making in designing tax policies. The limitation of this study is that the research subject is only individual taxpayers, lecturers, and employees of the University of Islam Malang, and this study only uses one independent variable, namely e-Filing. It is recommended for future researchers to expand the research subjects to taxpayers, lecturers, and employees at other universities to obtain more representative results. Future researchers are also expected to add independent variables such as tax socialization, tax understanding, and digital literacy to achieve a more comprehensive understanding of the factors that influence tax compliance.

Keywords: E-Filing, Taxpayers Compliance, Tax Volunteers

1. Introduction

Tax is mandatory participation that is required for individuals or entities that do not receive direct rewards and is used for the benefit of the community. Optimal tax revenue allows the government to ensure sustainable economic growth and improved people's welfare. Therefore, the country's growth will increase if the community as taxpayers fulfills their obligations in paying taxes (Permadi & Mauludi AC, 2023).

Taxpayer compliance is 1054part of the taxpayer to fulfill obligations and exercise tax rights. Taxpayer compliance is the key to the government's success in obtaining tax revenue (Inayah. et al., 2023). In fact, there are still many taxpayers who have not reported their taxes due to the low level of compliance. Some of the factors that make the level of compliance low include tax knowledge, taxpayer awareness and taxpayer's ability to fulfill tax obligations (Nandiroh et al., 2021). The following is data on the compliance of Indonesian taxpayers in the 2020-2023 period.

No	Year	Number of Taxpayers	Reported tax returns	Compliance Ratio
1.	2020	14.1 Million	12.1 Million	85,41 %
2.	2021	13.2 Million	13.1 Million	98,73 %
3.	2022	13.8 Million	12.9 Million	93,71 %
4.	2023	13.9 Million	13.0 Million	94.07 %

In table 1, there is a ratio of individual taxpayer compliance in submitting tax returns in 2020-2023 and there are fluctuations. Compliance with tax return submission in 2021 increased by 13.32%, in 2022 it decreased by 5.02%, while in 2023 it increased by 0.36%. This decline is a concern to develop a more effective strategy in maintaining a more optimal level of compliance.

The government has made various efforts to maximize tax revenue by harmonizing tax regulations and optimizing the tax system. However, there are still many taxpayers who consider taxes as a burden, so taxpayers avoid reporting and paying taxes (Ardika, 2023). Negative perception of taxes arises due to a lack of education about the benefits obtained from tax payments so that taxpayers feel that the contribution is not proportional to the services received. In addition, there is a stigma that taxes only benefit certain parties and do not have a real impact on society. This perception will have an impact on tax avoidance, evasion and low compliance (Judijanto, 2024).

The government in improving taxpayer compliance makes efforts by implementing a *Self Assessment System* tax collection, where taxpayers are given full power to calculate, report, and pay their own taxes in accordance with applicable regulations. The success of this system distribution is greatly influenced by the compliance of taxpayers with the convenience and transparency provided by information technology.

The Directorate General of Taxes innovates to the taxation system with the launch of *e-Filing* (Fuzzi Rachmawwati et al., 2022). *E-Filing* is a technological innovation in tax system, which is used to improve services to taxpayers (Supriatiningsih & Jamil, 2021). Research Siswanti (2021) states that with the application of *e-Filing* reporting timeliness is improved, this is due to the ease of use sharing and reporting are not time-limited. However, the reality is that there are still many taxpayers who have not been able to use *e-Filing*. According to Fidyaningrum (2024) in research Andini et al, (2024) states that new and old taxpayers are still not used to using *e-Filing*.

To face these challenges, the Directorate General of Taxes held a tax volunteer program. This tax volunteer aims to provide socialization to taxpayers in fulfilling their tax obligations, especially assisting in tax reporting through *e-Filing* with the aim of increasing taxpayers' compliance and awareness in carrying out their rights and obligations (Ambarwati & Nadiya, 2022). According to research Nandiroh et al., (2024) stating that socialization and assistance are successful in increasing tax compliance is proven by reporting the Notification Letter (SPT) on time and correctly. Research Listiani et al., (2023) shows that tax volunteers have a positive influence in providing education and socialization so that they can increase taxpayer compliance.

This study was conducted to examine how the role of tax volunteer moderation in the influence of *e-Filing* on individual taxpayer compliance. The purpose of this study is to analyze the influence of *e-Filing* on taxpayer compliance moderated by tax volunteers. The results of

this research are expected to contribute to the development of tax science, as a reference material for future researchers, as well as provide information and input for the DJP for decision-making in designing tax policies.

2. Literature review

2.1. Tax Compliance Theory

The theory of tax compliance was initiated by Milgram (1963). This theory describes a condition in which a person obeys a set rule. There are two perspectives on compliance with the law, namely normative and instrumental. The normative perspective is related to morality and ignores self-interest. The instrumental perspective assumes that the individual as a whole is driven by self-interest and perception of behavior-related changes.

2.2. The Relationship Between e-Filing and Individual Taxpayer Compliance

e-Filing is a tax reporting system that is carried out electronically with taxpayers filling out and submitting tax returns via the internet. Hardika et al., (2022) declares that ease of use *E-filing* can help taxpayers in reporting their taxes anytime and anywhere. Taxpayers have the perception that *e-Filing* effectively helps speed up tax return reporting with more accurate results and can report its taxes anytime and anywhere. This perception helps increase taxpayer compliance.

2.3. The Relationship Between Tax Volunteers Moderates the Influence of e-Filing on Taxpayer Compliance

The role of tax volunteers in carrying out their duties optimally will have an impact on taxpayers to have adequate skills in reporting tax returns so that the implementation of the use of *e-Filing* will have an impact on taxpayer compliance. According to Andini, tax volunteers have proven to be able to moderate the relationship between the implementation of *e-filing* and WPOP compliance, thereby strengthening the positive impact *of e-Filing* on taxpayer compliance.

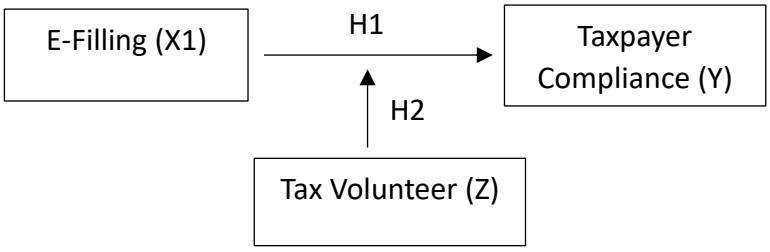

Figure 1 Conceptual Framework

2.4. Hypothesis

H1: The use of *e-Filing* has a positive effect on taxpayer compliance.
H2: Tax volunteers moderate the influence of *e-Filing* use on taxpayer compliance.

3. Methodology

3.1. Type, Location, and Research Time

This study uses a quantitative research method with a type of causal relationship research. This study was conducted on individual taxpayers of the University of Islam Malang Jl. MT

Haryono No. 193, Dinoyo, Lowokwaru District, Malang City, East Java 65144. The research time is November 2024 to April 2025.

3.2. Population and Sample

The population in this study is individual taxpayers at the Islamic University of Malang. The population in this study is 497 taxpayers. The sample in this study is individual taxpayers, namely lecturers and employees at the Islamic University of Malang. The sampling technique uses *the Random Sampling* technique. To determine the size of the sample amount, the *Slovin formula* was used with a sample error rate of 5% so that a sample of 222 respondents was obtained.

3.3. Variable Operational Definition

a. *E-Filing* (X)
   e-Filing is a computerized system assistance in filling out or submitting annual tax returns. The use of *e-Filing* aims to make reporting easier because it can be done anytime and anywhere. With *e-Filing*, taxpayers can provide services easily so that they can increase compliance.
b. Taxpayer Compliance (Y)
   Taxpayer Compliance is an activity carried out in order to implement tax regulations that must be implemented by all Taxpayers.
c. Tax Volunteer (Z)
   The effectiveness of the tax volunteer program can be measured from the extent to which this program is able to achieve the main goals, namely increasing tax socialization, helping the community understand tax obligations, and increasing taxpayer compliance.

3.4. Sources and Methods of Data Collection

In this study, primary and secondary data sources were used. The primary data source is through a questionnaire that is given directly to the respondents who have been determined. Secondary data were obtained through previous research and databases. This study uses a data collection method in the form of a questionnaire with a Likert scale of 5.

3.5. Data Analysis Methods

This research uses an interaction test technique or often referred to as *Moderated Regression Analysis* (MRA). A moderation variable is a variable that can strengthen or weaken the relationship between independent variables and dependent variables (Sugiyono, 2020). The following is the regression equation of the research variables used:

$$Y = a + \beta 1X + \beta 2X.Z + e$$

Information:

Y = Taxpayer Compliance
A = Konstanta
β1 – β2= Regression Coefficient
X = Usage *e-Filing*
Z = Tax Volunteer
X.Z = The interaction variable between the use of *e-Filing* and the tax volunteers who Describing the influence of the moderation variable, the tax volunteer who moderates the effect of the use of *e-Filing* on taxpayer compliance.
e = Error

4. Results and discussions

The data obtained in the research from the distribution of questionnaires conducted at the University of Islam Malang with a population of 497 people. The sample determination using *the Slovin formula* was obtained by a sample of 222 respondents. Data was processed using SPSS Version 27.

Descriptive Statistical Test

Table 2 Descriptive Statistical Test Results

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Hours of deviation
E-Filing	222	1	5	3.93	.608
Taxpayer Compliance	222	1	5	4.05	.576
Tax Volunteer	222	1	5	3.95	.580
Valid N (listwise)	222				

Source: Primary Data processed, 2025

Based on table 2, it can be concluded that *the e-Filing variable* obtained a minimum value of 1 and a maximum value of 5 with an average of 3.93, meaning that the respondents gave answers tending to agree with the statement of *the e-Filing* variable (X) and the standard deviation of 0.608. Meanwhile, the Taxpayer Compliance variable (Y) obtained a minimum value of 1 and a maximum value of 5 with an average of 4.05, meaning that the respondent gave an answer in agreement with the statement of the Taxpayer Compliance variable (Y) and the standard deviation of 0.576. For the Tax Volunteer variable (Z), a minimum value of 1 and a maximum value of 5 were obtained with an average of 3.95, meaning that respondents who gave answers tended to agree with the statements of the Tax Volunteer variable (Z) and the standard deviation of 0.580.

Test Instruments

1. Validity Test

Table 3 Validity Test Results

Variabel	Item	R Count	R Table	Information
E-Filing	X.1	0,752	0,137	Valid
	X.2	0,861	0,137	Valid
	X.3	0,774	0,137	Valid
	X.4	0.717	0,137	Valid
	X.5	0,719	0,137	Valid
	X.6	0,733	0,137	Valid
Taxpayer Compliance	Y.1	0,732	0,137	Valid
	Y.2	0,791	0,137	Valid
	Y.3	0,738	0,137	Valid
	Y.4	0,762	0,137	Valid
	Y.5	0,746	0,137	Valid
Tax Volunteer	Z.1	0,742	0,137	Valid
	Z.2	0,725	0,137	Valid
	Z.3	0,692	0,137	Valid
	Z.4	0,688	0,137	Valid

	Z.5	0,713	0,137	Valid
	Z.6	0,761	0,137	Valid
	Z.7	0,693	0,137	Valid

Source: Primary Data processed, 2025

Based on the results of table 3, it shows that the r value of the table > r calculation is 0.137, it can be concluded that all statement items from *the e-Filing*, Taxpayer Compliance, and Tax Volunteer variables are valid.

2. Reliability Test

Table 4 Reliability Test Results

Variabel	*Cronbach Alpha*	Conditions	Information
E-Filing (X)	0,847	>0,60	Reliabel
Taxpayer Compliance (Y)	0,810	>0,60	Reliabel
Tax Volunteer (Z)	0,897	>0,60	Reliabel

Source: Primary Data processed, 2025

Based on table 4, the test results from *the variables of e-Filing*, Tax Compliance, and Tax Volunteers were declared reliable because the *Cronbach Alpha* value > 0.60.

Normality Test

Table 5 Normality Test Results

One-Sample Kolmogorov-Smirnov Test			
			Unstandardized Residual
N			222
Normal Parametersa,b	Mean		.0000000
	Hours of deviation		2.11192896
Most Extreme Differences	Absolute		.047
	Positive		.047
	Negative		-.032
Test Statistic			.047
Asymp. Sig. (2-tailed)[c]			.200d
Monte Carlo Sig. (2-tailed)[e]	Sig		.289
	99% Confidence Interval	Lower Bound	.278
		Upper Bound	.301

Source: Primary Data processed, 2025

Based on table 5, the results of the normality test can be seen from the value of Asymp Sig. (2-tailed) of 0.200 which is greater than 0.05, then it can be concluded that the results of the normality test using the Kolmogorov smirnov test show normal distributed data.

Classic Assumption Test

1. Multicollinearity Test

Table 6 Multicollinearity Test Results

Coefficientsa

Model		Unstandardized Coefficients		Standardized Coefficients			Collinearity Statistics	
		B	Std. Error	Beta	t	Sig	Tolerance	VIF
1	(Constant)	5.742	1.070		5.368	.000		
	E-Filling	.325	.049	.411	6.627	.000	.638	1.567
	Tax Volunteer	.248	.044	.349	5.630	.000	.638	1.567

Source: Primary Data processed, 2025

Based on table 6 of the results of the Multicollinearity test, it can be seen that the value of *tolerance* variabel *e-Filing* and Tax Volunteers 0.638 > 0.10 and VIF value 1.567 < 10 can be concluded that there is no multicollinearity in independent variables in the regression equation because the value of *tolerance* > 0.10 and VIF value < 10.

2. Heteroscedasticity Test

Table 7 Heteroscedasity Test Results

Coefficientsa						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig
		B	Std. Error	Beta		
1	(Constant)	2.873	.642		4.475	.000
	E-Filing	.009	.029	.026	.311	.756
	Tax Volunteer	-.051	.026	-.162	-1.939	.054
a. Dependent Variable: Abs_Res						

Source: Primary Data processed, 2025

Based on table 7, it can be seen that the significance value of the *e-Filing variable* is 0.756 > 0.05 and the significance value of the Tax Volunteer variable is 0.054 > 0.05, so it can be concluded that the independent variable does not experience heteroscedasticity because the significance value is >0.05.

MRA Test

Table 8 MRA Test Results

Coefficientsa						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig
		B	Std. Error	Beta		
1	(Constant)	1.370	5.835		.235	.815
	E-Filling	.507	.244	.642	2.076	.039
	Tax Volunteer	.409	.216	.576	1.893	.060
	E-Filling* Tax Volunteer	-.007	.009	-.411	-.762	.447

a. Dependent Variable: Taxpayer Compliance

Source: Primary Data processed, 2025

Based on table 8, the results of the MRA (*Moderated Regression Analysis)* test constantly show that it has a beta value of 1.37, *e-Filing* produces a beta value of 0.507, Tax Volunteers produce a beta value of 0.409. Based on these data, the regression equation can be seen as follows:

Tax Compliance = 1.370 + 0.507E-Filing -0.07 E-Filing.TV + e

Based on these equations, it can be seen that:

1. The constant value (α) of 1.370 indicates that *the e-Filing* variable and the interaction of *the e-Filing* and Tax Volunteer variables if the value is 0, then Taxpayer Compliance has a level of 1.370.
2. The value of the regression coefficient β1 is 0.507, if *e-Filing* (X) increases by 1% then Taxpayer Compliance (Y) increases by 50.7% assuming that all other variables are constant
3. The value of the regression coefficient β2 is -0.007, if the interaction *of e-Filing* and Tax Volunteers increases by 1%, then Taxpayer Compliance (Y) decreases by 0.7% assuming that all other variables are constant.

Uji Hypothesis

1. Coefficient of Determination Test (R2)

Table 9 Determination Coefficient Test Results

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.681a	.464	.457	2.124
a. Predictors: (Constant), X.Z, Relawan Pajak, E-Filling				

Source: Primary Data processed, 2025

Based on table 9, it can be seen that the results of the determination coefficient test can be seen from the *Adjusted R Square* of 0.457 which means that the independent variable can explain the relationship of the dependent variable by 45.7% and as much as 54.3% is influenced by the variable outside the moderation variable.

2. T test

Table 10 Test Results t

Coefficientsa						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig
		B	Std. Error	Beta		
1	(Constant)	1.370	5.835		.235	.815
	E-Filling	.507	.244	.642	2.076	.039
	Tax Volunteer	.409	.216	.576	1.893	.060
	E-Filling* Tax Volunteer	-.007	.009	-.411	-.762	.447
a. Dependent Variable: Taxpayer Compliance						

Source: Primary Data processed, 2025

Based on table 10, it can be concluded that:

1. It is known that the significance value is 0.39 < 0.05, so it can be concluded that H1 is accepted which means that there is a positive and significant effect between *the e-Filing* variable on Taxpayer Compliance
2. It is known that the significance value is 0.447 > 0.05, so it can be concluded that H2 was rejected which means that there is no influence between the variables of Tax Volunteers and *e-Filing* on Taxpayer Compliance.

4. Research Results

1. The Effect of E-Filing on Individual Taxpayer Compliance.

The results of the study show that the application of *e-Filing* have a positive and significant effect on the Compliance of Individual Taxpayers. This proves that the application of *e-Filing* can encourage Taxpayer Compliance in fulfilling tax obligations. According to the theory *tax compliance* (Tax Compliance) by Milgram (1963) states that taxpayer compliance is driven by personal interests and perceptions of changes related to behavior. Changes made by the Directorate General of Taxes (DJP) in updating the online tax return reporting system through *e-Filing* very precise in improving compliance. *e-Filing* can overcome the perception of low risk, where taxpayers feel safer and more confident in fulfilling tax obligations. In addition, the ease of access and transparency provided by the system *e-Filing* can increase the awareness and motivation of taxpayers to meet tax obligations. This is in line with tax compliance theory which states that individuals tend to be compliant if they are directly involved and have control over the tax reporting process. The results of this study support previous research from Hardika et al., (2022) which states that the ease of use *e-Filing* can help taxpayers in reporting their taxes anytime and anywhere. In addition, the tax reporting process has become simpler. The theoretical implications of this research are useful for the development of tax science and as a reference material for future researchers. Practically, this research is useful for the Directorate General of Taxes in designing better tax administration policies to improve the quality of technological infrastructure, strengthen data security systems, and simplify administrative procedures to make them more accessible. So that the system *e-Filing* more optimal in supporting transparency, accountability, and effectiveness of tax administration in Indonesia.

2. The Effect of Tax Volunteer Interaction with E-Filing on Individual Taxpayer Compliance.

The results of the study show that the role of Tax Volunteers with *e-Filing* has no effect on Taxpayer Compliance. This shows that Tax Volunteers are not able to moderate the influence *e-Filing* on Individual Taxpayer Compliance, Lecturers and Employees at the University of Islam Malang. According to the theory *Tax Compliance* (Tax Compliance) developed by Milgram (1963), a person's compliance with tax rules is influenced by authority factors and social pressure. Individuals tend to obey the rules when there is an authority figure giving instructions or when the taxpayer feels they are in an environment that supports compliance. In this case, the existence of tax volunteers as parties who provide education and assistance can function as a form of informative authority that influences taxpayers to fulfill their obligations. However, for lecturers and employees who are generally already tied to the automatic tax withholding system by employers, the influence of tax volunteers on taxpayer compliance tends to be smaller than individual taxpayers who do not have a direct tax withholding system. In addition, the use of *e-Filing* As a modern tax administration system, it is also related to increasing tax compliance because it provides easy access and transparency in tax reporting. This system allows taxpayers to report their taxes independently, quickly, and

accurately. The results of this study support previous research from Palupi (2024) which states that the role of tax volunteers has not been maximized to help taxpayers fill out their tax returns through *e-Filing* Due to the limited number of volunteers, it is not spread to certain areas so that not all receive assistance from tax volunteers to fill in the *e-Filing* in order to comply with taxpayer compliance. Socialization and education from tax volunteers has not been optimal in reaching taxpayers who already have an understanding of taxation and are used to using automated systems, such as lecturers and employees. The theoretical implications of this research for the development of science and subsequent researchers contribute to the development of tax compliance theory. General of Taxes in optimizing cooperation with educational institutions to expand the reach of tax education programs involving tax volunteers. In addition, the DGT can provide more structured training for tax volunteers to be able to deliver materials effectively and in accordance with applicable regulations so that they can support the increase of tax awareness more broadly and form a culture of tax compliance.

5. Conclusion

Based on the results of the research that has been conducted, it can be concluded that the use of e-Filing has a positive and significant effect on taxpayer compliance. e-Filing provides convenience and efficiency in filling out tax return reporting so as to encourage the compliance of taxpayers of Lecturers & Employees of the Islamic University of Malang in fulfilling tax obligations. Tax Volunteers cannot moderate the influence of e-Filing on the compliance of Lecturers and Employees at the Islamic University of Malang. This is because lecturers and employees are already bound by the automatic tax withholding system by employers, the influence of tax volunteers on taxpayer compliance tends to be smaller than individual taxpayers who do not have a direct tax withholding system. In addition, socialization and education from tax volunteers has not been optimal in reaching taxpayers who already have an understanding of taxation and are used to using automated systems, such as lecturers and employees.

THE INFLUENCE OF TAX INFORMATION DISSEMINATION, TAX SANCTIONS, AND TAXPAYER AWARENESS ON LAND AND BUILDING TAXPAYER COMPLIANCE AMONG RESIDENTS IN TULUSREJO SUBDISTRICT.

Siti Arsyiati[1,*], Irma Hidayati[2], Tri Sugiarti Ramadhan[3]
Faculty of Economics and Business, Islamic University of Malang.
221010821012@unisma.ac.id

Abstract

This study aims to analyze the influence of tax information dissemination, tax sanctions, and taxpayer awareness on the compliance of land and building taxpayers among residents in Tulusrejo Subdistrict. The research method used is quantitative with a multiple linear regression approach. Data were collected through questionnaire distribution to registered taxpayers within the study area. The hypothesis test results indicate that, simultaneously, tax information dissemination, tax sanctions, and taxpayer awareness have a significant effect on taxpayer compliance, with a significance value of 0.000 ($p < 0.05$). Partially, each of the three independent variables also significantly influences taxpayer compliance. The broader and more effective the dissemination of tax information, the stricter the enforcement of tax sanctions, and the higher the taxpayers' awareness, the greater their compliance in fulfilling tax obligations.

Keywords: Tax Information Dissemination, Tax Sanctions, Taxpayer Awareness, Taxpayer Compliance, Land and Building Tax, Multiple Linear Regression, Quantitative Research, Tulusrejo Subdistrict.

1. Introduction

Taxes are one of the main sources of state revenue used to fund national development in order to achieve the welfare of all Indonesian people. Tax is a compulsory contribution by taxpayers to the state, owed by individuals or entities, which is coercive based on law, without receiving direct compensation, and used for state purposes for the prosperity of the people. According to Law No. 28 of 2007 Article 4 Paragraph 1, tax is a mandatory obligation imposed on society as mandated by the state and regulated by applicable laws. The money collected from tax payments will be used by the government to improve public welfare.

As the primary source of revenue in the State Budget (APBN), taxes contribute more than 70% (Suhendri, 2018). Taxes are one of the largest sources of state income, alongside other sources such as oil and gas revenues and non-tax revenues (Sitanggang & Hikmawati, 2024). This encourages the government to promote economic growth. Economic growth can increase people's income, and higher income boosts their potential to pay taxes. A high level of tax payment to the government supports development and reduces dependency on foreign debt.

Land and Building Tax (PBB) is the right and authority of local governments to manage. With the enactment of Law No. 28 of 2009 on Regional Taxes and Regional Retribution, the urban and rural sectors of the Land and Building Tax were transferred to become local taxes (Sapriadi, 2013). Land and Building Tax has fully become a regional tax managed by local governments, and its revenue goes into the Regional Treasury. Locally Generated Revenue (PAD) is one of the funding sources for implementing governance and development. Based on this regulation, every region in Indonesia has the right to manage its own Land and Building Tax. The revenue generated from this tax becomes regional income. Therefore, each region has the right to enhance and optimize the collection of Land and Building Tax. The optimization

of this tax must be supported by taxpayer compliance in paying the Land and Building Tax (PBB).

Indonesia is the fourth most populous country in the world. The population is spread across 38 provinces. The country of Indonesia cannot be separated from the concept of taxation. According to Law No. 28 of 2007, Article 1 Paragraph 1, tax is defined as "a mandatory contribution to the state owed by an individual or entity that is coercive in nature based on the law, without receiving direct compensation and used for state purposes for the greatest welfare of the people."

2. Literature review

Definition of Tax

Tax is a mandatory contribution that must be paid by individuals or business entities to the state, based on Law Number 28 of 2007. Tax is coercive in nature without direct compensation to the taxpayer, but it is fully used for the interests of the state and the welfare of the people. The Directorate General of Taxes (DGT) states that paying taxes is not only an obligation but also a form of public participation in financing national development. According to Dr. Soeparman Soemahamidjaja, tax is a compulsory levy collected by the government to finance the production of public goods and services in order to improve the welfare of society.

Dissemination of Tax Information

The dissemination of tax information is the process of distributing and communicating tax-related information to taxpayers with the aim of increasing their understanding of tax obligations, the benefits of taxation, and the procedures to be followed in fulfilling those obligations. According to Amalia (2020), effective information dissemination can help taxpayers understand their rights and obligations, thereby improving compliance in paying taxes. Tax information can be distributed through various sources such as printed media (brochures, pamphlets), electronic media (television, radio), and digital media (websites, applications, and social media). Additionally, the government may conduct outreach through seminars, community forums, or direct meetings to make the information more easily understood and accepted by the public.

For the dissemination of tax information to be effective, the content delivered must be clear and easy to understand, especially for those without a background in taxation. Explanations about tax rates, payment procedures, and applicable penalties should be presented in simple and structured language. The purpose of this information dissemination is to increase taxpayer awareness of the importance of paying taxes on time and understanding their rights and obligations in the tax system. Furthermore, consistency in the dissemination of information also plays an important role, as information delivered regularly can help taxpayers better remember and understand their obligations. Therefore, authorities must regularly update tax information and provide relevant education regarding policy or regulatory changes.

Tax Sanctions

Tax sanctions are consequences imposed on taxpayers who fail to fulfill their tax obligations according to the applicable laws and regulations. According to Ii & Pustaka (2002), the purpose of tax sanctions is to enforce taxpayer compliance by penalizing those who violate established rules. Tax sanctions can take the form of interest penalties, increased penalties, fines, and criminal sanctions, each with different levels of violation and consequences. These sanctions are expected to have a deterrent effect on taxpayers so that they become more disciplined in fulfilling their tax obligations.

Based on Article 7 of the General Provisions and Tax Procedures Law (UU KUP) No. 28 of 2007, tax sanctions are imposed if the taxpayer fails to submit the Tax Return (SPT) within the specified deadline. This is also regulated in Article 3, paragraphs 3 and 4 of the 2007 UU KUP, which stipulates the following deadlines for submitting SPTs: (a) Periodic Tax Returns

must be submitted no later than 20 days after the end of the tax period; (b) Annual Income Tax Returns for individual taxpayers must be submitted no later than 3 months after the end of the tax year; and (c) Annual Income Tax Returns for corporate taxpayers must be submitted no later than 4 months after the end of the tax year. If taxpayers fail to meet these deadlines, administrative sanctions will be imposed according to the applicable regulations.

Taxpayer Awareness

Taxpayer awareness is a crucial factor in determining the level of public compliance in fulfilling tax obligations. One of the main challenges in implementing regional taxes is the low public awareness of their tax obligations, lack of guidance for related agency staff, delays in receiving the Tax Due Notification Letter (SPPT), and weak enforcement of tax violations (Budiati, 2017). According to Fitriana (2014), awareness is defined as the state of knowing or understanding something, and in the context of taxation, it relates to the tax system and policies. Thus, tax awareness refers to a condition in which a person understands and realizes the importance of taxation. Syakura (2011) adds that tax awareness includes understanding, knowledge, and the proper and voluntary implementation of tax regulations.

Muliari & Setiawan (2011) identify several indicators of tax awareness, which include knowledge of tax rules and regulations, understanding of the function of taxes as a source of state revenue, and the willingness of taxpayers to calculate, pay, and report taxes correctly and voluntarily. High tax awareness enables taxpayers to actively participate in the tax system without coercion or threats of sanctions. Conversely, low tax awareness can lead to unutilized tax potential, thereby hindering development (Mutia, 2014). Low public participation in tax payments can also delay the implementation of government programs that rely on tax revenue. Therefore, the government must undertake various efforts to increase tax awareness, one of which is through transparency in managing regional taxes. With transparency, the public will have greater trust in the government and feel more encouraged to pay taxes voluntarily.

Taxpayer Compliance

Compliance, in general, is the attitude of obeying and adhering to rules or regulations. In the context of taxation, compliance means the willingness of taxpayers to fulfill tax obligations according to prevailing laws. According to Muhamad Karyadi (2021), tax compliance includes the attitude of obeying, submitting, and carrying out tax regulations properly. Alam (2014) also explains that compliance is the motivation of individuals, groups, or organizations to act or refrain from acting according to established regulations. In a tax system that adheres to the self-assessment principle, voluntary tax compliance is a core pillar. Taxpayers are responsible for calculating, paying, and reporting their taxes independently, accurately, and on time (Dan et al., 2011).

According to Fitriana (2014), taxpayer compliance can be divided into two types: formal compliance and material compliance. Formal compliance is the condition where taxpayers meet administrative tax obligations in accordance with the law, such as submitting the Tax Return (SPT) on time. Material compliance means that the taxpayer not only meets administrative requirements but also complies with the substance and purpose of taxation. This includes compliance with the material truth in tax reporting.

3. Methodology

This study uses a quantitative approach with a correlational research type. Quantitative research, as explained by Kasiram in a study (Yuni Fitriani, 2017), is a method aimed at acquiring knowledge by utilizing numerical data as a tool to analyze information related to the subject under investigation. Meanwhile, correlational quantitative research refers to a type of study that aims to identify relationships between specific variables and to make predictions

based on the relationships identified among those variables, as explained by Anita Wijayanti (2017).

4. Results and discussions

4.1. Descriptive Statistical Analysis

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Tax Information Dissemination (X1)	125	1	5	4,19	0,393
Tax Sanctions (X2)	125	1	5	4,18	0,460
Tax Awareness (X3)	125	1	5	4,12	0,438
Taxpayer Compliance (Y)	125	1	5	4,21	0,343
Valid N (listwise)	125				

Source: SPSS Statistic 24.0 Output

Based on the analysis results, all variables — Tax Information Dissemination (X1), Tax Sanctions (X2), Tax Awareness (X3), and the dependent variable Taxpayer Compliance (Y) — have value ranges from 1 (strongly disagree) to 5 (strongly agree), with the mean values of each variable exceeding 4. This indicates that respondents generally answered "agree" to the statements presented for each variable. The variable Y (Taxpayer Compliance) has the highest mean value at 4.21, followed by X1 (4.19), X2 (4.18), and X3 (4.12), suggesting that tax information dissemination is generally well received by respondents.

4.2. Instrument Testing

4.2.1. Validity Test Results

Based on the results of the validity test, the research instrument is considered valid if the calculated r-value exceeds the critical r-table value at a 5% significance level. The test showed that the r-values for all 25 questionnaire items were greater than the r-table value of 0.176. The highest r-value was 0.752 (item 11), and the lowest was 0.294 (item 22). Therefore, it can be concluded that all items in the questionnaire are valid.

4.2.2. Reliability Test Results

The reliability test showed varying levels of instrument reliability across different variables. For Tax Information Dissemination (X1), Cronbach's Alpha was 0.492, indicating moderate reliability. For Tax Sanctions (X2), the Cronbach's Alpha value was 0.626, indicating high reliability. For Tax Awareness (X3), the value was 0.532, also showing moderate reliability. For Taxpayer Compliance (Y), the value was 0.659, indicating high reliability. Thus, all instruments can be considered reliably appropriate for research.

4.3. Normality Test

The results of the normality test show that all variables — Tax Information Dissemination (X1), Tax Sanctions (X2), Tax Awareness (X3), and Taxpayer Compliance (Y) — are normally distributed. This is shown by the significance values (Asymp. Sig), all of which are greater

than 0.05: X1 (0.078), X2 (0.091), X3 (0.189), and Y (0.200). Therefore, the data meet the normality assumption and are suitable for further analysis.

4.4. Classical Assumption Test

Multicollinearity Test Results

Coefficients[a]								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	15,778	2,616		6,031	0,000		
	X1	0,597	0,161	0,342	3,711	0,012	0,523	1,913
	X2	0,378	0,146	0,253	2,594	0,011	0,465	2,151
	X3	0,289	0,143	0,184	2,017	0,046	0,532	1,881
a. Dependent Variable: Y								

Source: SPSS Statistic 24.0 Output

Based on the table above, no independent variable has a tolerance value less than 0.10 or a VIF greater than 10. Therefore, the regression model is free from multicollinearity.

Heteroscedasticity Test Results

Coefficients[a]								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	9,218	1,434		6,43	0,000		
	X1	0,027	0,088	0,032	0,301	0,764	0,523	1,913
	X2	0,065	0,08	0,092	0,812	0,418	0,465	2,151
	X3	-0,448	0,078	-0,603	-5,71	0,347	0,532	1,881
a. Dependent Variable: ABS_RESIDUAL								

Source: SPSS Statistic 24.0 Output

Based on the Glejser test results, all variables have significance levels greater than 0.05. Thus, the regression model is free from heteroscedasticity.

4.5. Multiple Linear Regression Test

Coefficients[a]				
Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.

		B	Std. Error	Beta		
1	(Constant)	15,778	2,616		6,031	0,000
	Tax Information (X1)	0,597	0,161	0,342	3,711	0,000
	Tax Sanctions (X2)	0,378	0,146	0,253	2,594	0,000
	Tax Awareness (X3)	0,289	0,143	0,184	2,017	0,000

Source: SPSS Statistic 24.0 Output

The constant value is 15.778. The coefficients for Tax Information Dissemination (X1), Tax Sanctions (X2), and Tax Awareness (X3) are 0.597, 0.378, and 0.289, respectively.

4.6. F-Test Results (Simultaneous Regression Test)

ANOVA[a]						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	676,603	3	225,534	34,837	,000[b]
	Residual	783,349	121	6,474		
	Total	1459,95	124			
a. Dependent Variable: Y						
b. Predictors: (Constant), X3, X1, X2						

Source: SPSS Statistic 24.0 Output

The significance value is 0.000 ($p < 0.05$), indicating that all three independent variables jointly influence taxpayer compliance.

4.7. Coefficient Of Determination

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,681[a]	0,463	0,45	2,5444
a. Predictors: (Constant), X3, X1, X2				

Source: SPSS Statistic 24.0 Output

The Adjusted R Square value is 0.450, indicating that 45% of the variation in taxpayer compliance (Y) can be explained by the independent variables (X1, X2, X3).

4.8. T-Test Results (Partial Regression Test)

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	15,778	2,616		6,031	0,000
	X1	0,597	0,161	0,342	3,711	0,000
	X2	0,378	0,146	0,253	2,594	0,011
	X3	0,289	0,143	0,184	2,017	0,046
a. Dependent Variable: Y						

Source: SPSS Statistic 24.0 Output

The significance values are all below 0.05, indicating that each independent variable significantly affects the dependent variable (Y).

4.9. Discussion

The result of the first hypothesis test using the F-Test (Simultaneous Regression) shows that the variable Tax Information Dissemination has a significant influence on Taxpayer Compliance. This is evidenced by a significance value of 0.000, which is less than the 0.05 threshold. Therefore, it can be concluded that tax information dissemination (X1) plays an important role in increasing taxpayer compliance in paying Land and Building Tax (PBB). The effective dissemination efforts in Tulusrejo Subdistrict—via digital platforms and traditional methods—have helped residents access accurate and understandable information about their tax obligations.

Furthermore, the second hypothesis test using the Coefficient of Determination indicates an Adjusted R Square of 0.450, meaning that the independent variables collectively influence the dependent variable by 45%. The T-Test results also reinforce this finding, with significance values below 0.05, confirming that the tested factors significantly contribute to taxpayer compliance. These findings serve as a foundation for developing policies and strategies to enhance taxpayer compliance, such as strengthening tax information dissemination to raise public awareness and fulfill tax obligations effectively.

5. Conclusion And Recommendations

5.1. Conclusion

Based on the results of hypothesis testing in this study on the influence of tax information dissemination, tax sanctions, and taxpayer awareness on Land and Building Tax compliance in Tulusrejo Subdistrict, it can be concluded that tax information dissemination has a significant effect on taxpayer compliance, with a significance value of 0.000, which is less than 0.05. This indicates that the broader and more effective the tax information received by the public, the higher their level of compliance in paying taxes. Tax sanctions also have a significant effect on taxpayer compliance, with a significance value of 0.000, showing that the strict enforcement of sanctions can increase public awareness in fulfilling their obligations. In addition, taxpayer awareness significantly influences their compliance in paying taxes—meaning that the higher their awareness of the importance of taxation, the greater the level of compliance exhibited.

5.2. Recommendations

Based on the findings of this study, several recommendations can be made for various stakeholders. For the development of taxation science, this research can serve as a foundation for advancing tax-related theories, particularly those concerning the factors that affect taxpayer

compliance and the importance of technology in tax systems—such as the use of digital platforms for education and online tax payment. Future researchers are encouraged to include additional variables that may influence tax compliance and to employ more diverse research methods, such as qualitative or mixed-method approaches, to gain deeper insights. Additionally, taxpayers are encouraged to be more proactive in seeking tax information and to enhance their awareness of the role of taxation in regional development. For the Directorate General of Taxes, it is recommended to strengthen tax information dissemination through digital media, enhance sustainable tax education programs, and enforce tax sanctions consistently to improve taxpayer discipline.

THE INFLUENCE OF HALAL KNOWLEDGE, ISLAMIC RELIGIOSITY, AND ATTITUDE ON PURCHASING DECISIONS FOR HALAL COSMETICS AMONG GENERATION Z AT MALANG ISLAMIC UNIVERSITY.

Syema Yusfiah, Dwiyani Sudaryanti, Ratna Tri Hardaningtyas
Universitas Islam Malang
22101083047@unisma.ac.id

Abstract

This study aims to analyze the influence of Halal Knowledge, Islamic Religiosity, and Attitude on the purchase decision of Wardah brand halal cosmetics among Generation Z at the Islamic University of Malang. The research is based on the Theory of Planned Behavior (TPB) proposed by Ajzen (1991. A quantitative research method with a survey approach was used. Data were collected from 100 Generation Z respondents who are users of halal cosmetics at the Islamic University of Malang. Data analysis was performed using SPSS software, including instrument testing (validity and reliability), multiple linear regression analysis, classical assumption testing, and hypothesis testing. The results showed that the Islamic Religiosity variable had a significant influence on the purchase decision of Wardah brand halal cosmetics. This indicates that the higher a person's level of Islamic religiosity, the more likely they are to purchase halal cosmetic products. However, the Halal Knowledge and Attitude variables did not show a significant influence on purchase decisions. This shows that knowledge about halal products and a positive attitude towards halal products do not directly affect purchase decisions among Generation Z at the Islamic University of Malang. This research provides practical implications for halal cosmetic producers in designing more effective marketing strategies by emphasizing religious values in marketing communication.

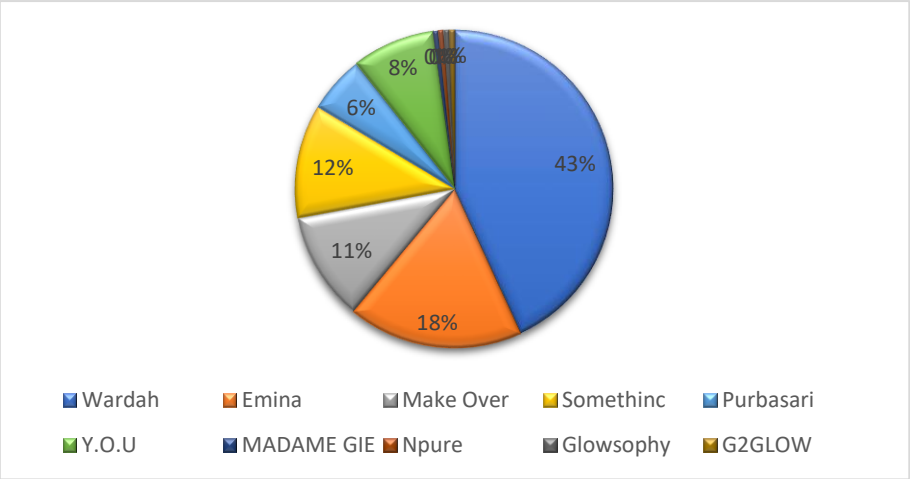
Keywords: Halal Knowledge, Islamic Religiosity, Attitude, and Purchase Decision

1. Introduction

Currently the Muslim population in the world 1.6 billion people or 25% of the world population has reached 7 billion. The Muslim population is spread across various countries, including 56 countries with a majority Muslim population which has a total GDP of 6.7 trillion dollars (Wahyudi, Setiawan, and ... 2023). According to data from the Ministry of Religious Affairs uploaded in 2020, the Muslim population of Indonesia reached 229.62 million people or around 87.2% of the total population of Indonesia which amounted to 269.6 million people. If projected to the world Muslim population which is estimated to reach 2.2 billion by 2030, the Indonesian Muslim population accounts for around 13.1% of all Muslims in the world as a whole. The potential of Muslim consumers is reflected in the aspect of global spending of Muslim consumers in the food and lifestyle sector which is expected to reach $3.7 trillion by 2019 (Adinugraha and Sartika 2019). This figure indicates the core market potential for the halal food and lifestyle industry, or halal lifestyle. This industry is part of the popular halal industry

In Indonesia, one of them is in the halal cosmetics sector. The rapid progress in the halal cosmetics sector is currently attracting attention, especially among women. Nowadays many women want to look beautiful and attractive. For women, appearance is the number one thing that must be considered (Ummah 2019). White skin and clean face are now the standard of beauty. Many women use cosmetic products to improve their facial appearance. Cosmetics become one of the important items to fulfill the needs and desires of women to look more attractive and beautiful.

According to the Indonesian Association of Cosmetics Companies and Associations (PPA Kosmetika Indonesia), the growth in the number of Indonesian cosmetics industries reached 21.9 percent, with 913 companies in 2022 and 1,010 companies in mid-2023. In addition, cosmetic companies now compete in meeting the demand for cosmetic products by presenting



various innovations to meet consumer needs. However, with the majority of the population being Muslim, the need for halal cosmetics in Indonesia is increasingly significant.

Figure 1 Survey Results of Halal Cosmetics Users

Based on the results of a survey conducted at the Islamic University of Malang (UNISMA) involving 100 respondents, In this study, the majority of respondents chose the Wardah brand, so the analysis mostly discussed the factors that influence Wardah's purchasing decisions. with the result that 43% of them use Wardah products. one of the pioneers of halal cosmetics in Indonesia which shows the dominance of this brand in the halal cosmetics market. especially Generation Z, which is currently the largest consumer group in Indonesia in the age range of 19-26 years, which is the largest group, has a great influence on market trends, including the halal cosmetics industry.

Generation Z is a generation that is very up to date with issues spread on social media or the internet. They usually find information through the internet, product reviews on social media, or advice from influencers. Currently, Generation Z consumers are more interested and trusting to buy products if they have seen product reviews from trusted sources on social media (Mutiara and Syahputra 2018). Generation Z has important characteristics and is accustomed to evaluating products, such as ensuring that the halal aspect of cosmetics is in accordance with religious principles and influences their purchasing decisions.

Machfoedz (2010: 44) suggests that decision making is a process of assessing and selecting from various alternatives in accordance with the interests of certain interests by determining an option that is considered the most profitable. To better understand this process, Ajzen's Theory of Planned Behavior (TPB) (1991) explains that consumer purchasing decisions are influenced by three main components, namely attitude toward behavior, subjective norm, and perceived behavioral control.

Wardah as a halal cosmetics brand, has significant relevance in this study because this brand is known among the younger generation and has a strong reputation as a product that emphasizes halalness. This shows that Halal Knowledge understood by customers about the halal status of products and Islamic Religiosity contribute to the formation of a positive attitude towards the brand. Wardah's Islamic beliefs and principles are in line with the religious background of Generation Z at the Islamic University of Malang, so knowledge about halal

and their religious beliefs can be an important factor in their decision to use halal cosmetics. This research focuses on the Islamic-educated Generation Z, which consists of students of the Islamic University of Malang (UNISMA). In this case, a brand like Wardah, which consistently upholds Islamic values and halalness, is a good candidate for research on how Halal Knowledge, Islamic Religiosity, and Attitude towards halal cosmetic products influence consumer decisions. At the Islamic University of Malang (UNISMA), which has a strong religious background, it is expected that these variables play a big role in influencing Generation Z students' choice of halal cosmetics.

Problem Formulation

Based on the background that has been described, the following problem formulations are obtained:

1. Is there an influence of Halal Knowledge on Generation Z's decision to purchase halal cosmetics, especially the Wardah brand?
2. Is there an influence of Islamic Religiosity in encouraging Generation Z's decision to purchase halal cosmetics, especially the Wardah brand?
3. Is there an influence of Attitude on Generation Z's decision to purchase halal cosmetics, especially the Wardah brand?

Research Objectives

Based on the formulation of the problem, this study aims to determine:

1. Analyzing the relationship between Halal Knowledge on Generation Z's decision to purchase halal cosmetics, especially the Wardah brand.
2. Assess the effect of Islamic Religiosity on purchasing preferences for halal cosmetics, especially the Wardah Gen Z brand.
3. Assessing the role of Attitude in influencing purchasing decisions for halal cosmetics, especially the Wardah brand among Generation Z.

2. Theory Basis And Hypothesis Development

Theory of Planned Behavior (TPB)

Theory Planned Behavior (TPB) was proposed by Ajzen (1991) as a development of the previous theory, namely Theory of Reasoned Action (TRA). TPB explains that human behavior is not only influenced by intentions or intentions but also by perceptions of the individual's ability to control this behavior. According to Ajzen, there are three main determinants that influence a person's intention to perform a behavior, namely attitudes towards behavior, subjective norms, and perceptions of behavioral control.

Purchasing Decision

Sunyoto (2013: 87) states that purchasing decisions are consumer actions in determining preferences among the various brands available. Kotler and Keller (2016: 198) add that purchasing decisions are the selection of certain brands based on consumer interest in several available alternatives.

Halal Knowledge

Bonne et al. (2007) explained that halal knowledge affects the awareness and attitudes of Muslim consumers in choosing halal products. Consumers who have a high understanding of halal tend to be more selective and choose products that comply with their religious rules. In addition, Ambali & Bakar, (2014) emphasized that halal awareness is not only limited to food, but also extends to other products such as cosmetics and medicines. Mukhtar & Butt, (2012) revealed that halal knowledge has a significant influence in increasing the purchase intention of halal products, especially among religious Muslim consumers.

Islamic Religiosity

Stark and Glock (1968) describe religiosity in five concepts, namely: There are 5

dimensions: belief, ritual practice, experience, knowledge and consequential. Considering this concept of religiosity in consumption, we can assert that it is the level that determines the choice in choosing products according to the teachings of Islam. Mokhlis, (2009) found that religiosity has a significant influence on the consumption patterns of Muslim consumers, including their preference for halal products. Research by Shah et al., (2011) also revealed that religiosity is a major factor in purchasing decisions for halal products, especially among the younger generation of Muslims. Said et al. (2014) emphasized that consumers with a high level of religiosity pay more attention to the halalness of products, including cosmetics.

Attitude

According to Kotler and Keller, consumer behavior is influenced by various stimuli, both from marketing aspects such as products, services, prices, distribution, and communication, as well as from external factors such as economic conditions, technological advances, political situations, and culture. These factors then influence consumers' psychological aspects, including motivation, perception, learning, and memory, as well as their personal characteristics, such as cultural, social, and personality. Furthermore, consumers will undergo stages in the purchasing decision process, from need recognition, information search, evaluation of alternatives, to the decision to buy and behavior.

Conceptual Framework

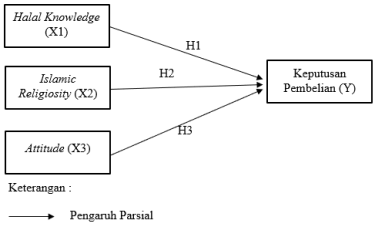


Figure 2 Conceptual Framework

Research Hypothesis

Based on the theoretical review of the results of empirical studies, the hypotheses that can be formulated are as follows:

H1: Halal Knowledge has a positive and significant effect on purchasing decisions for halal cosmetics by Generation Z.

H2: Islamic Religosity has a positive and significant effect on purchasing decisions for halal cosmetics by Generation Z.

H3 : Attitude has a positive and significant effect on the decision to purchase halal cosmetics by Generation Z.

3. Research Methods

Type, Location, and Time of Research

The type of research used in this research is explanatory research (explanatory research) using a quantitative approach. According to Sugiyono (2013: 21) “explanatory research” is research that intends to explain the position of the variables studied and the relationship between one variable and another.

This study uses Ajzen's Theory of Planned Behavior (TPB) (1991) as the main theoretical framework. This study aims to explain how each component of TPB (attitude, subjective norms, and perceived behavioral control) influences the decision to purchase Wardah halal cosmetics among Generation Z. The object of this research was conducted at Islamic University students. The object of this research was conducted on students of the Islamic University of Malang who fulfill the category of Generation Z users of Wardah halal cosmetics. This research was conducted from December 2024 to February 2025.

Population and Sample

The population in this study was 63211 students of the Islamic University of Malang. The sample research was calculated using the Slovin formula and the resulting number of samples needed was 100 respondents. The sampling technique used is purposive sampling with several predetermined criteria, namely based on age, based on religion and experience in using Wardah halal cosmetics.

Data Source

The data source used in this study is primary data distributed directly to students of the Islamic University of Malang through intermediary media (questionnaire).

Data Collection Methods

This study uses data collection methods through questionnaires. Researchers use a Likert measurement scale by providing 5 levels of answers to respondents to understand a person's opinion, perception or attitude.

4. Results

Validity Test

Table 1.1 Validity Test

Variabel	Item	R hitung	R tabel r tabel (df = 97, α = 0.05)	Sig.	Keputusan
Halal Knowledge (X1)	X1.1	387	197	< 0.001	Valid
	X1.2	360	197	< 0.001	Valid
	X1.3	472	197	< 0.001	Valid
	X1.4	429	197	< 0.001	Valid
	X1.5	587	197	< 0.001	Valid
Islamic Religiosity (X2)	X2.1	426	197	< 0.001	Valid
	X2.2	385	197	< 0.001	Valid
	X2.3	482	197	< 0.001	Valid
	X2.4	409	197	< 0.001	Valid
	X2.5	518	197	< 0.001	Valid
Attitude (X3)	X3.1	425	197	< 0.001	Valid
	X3.2	334	197	< 0.001	Valid
	X3.3	428	197	< 0.001	Valid
	X3.4	412	197	< 0.001	Valid
Keputusan Pembelian (Y)	Y1	573	197	< 0.001	Valid
	Y2	576	197	< 0.001	Valid
	Y3	653	197	< 0.001	Valid
	Y4	512	197	< 0.001	Valid

Data

Variabel	Cronbach's Alpha	Keputusan
Halal Knowledge (X1)	0,447	Reliable
Islamic Religiosity (X2)	0,470	Reliable
Attitude (X3)	0,167	Reliable
Keputusan Pembelian (Y)	0,345	Reliable

source: Output SPSS 27, 2025

The results of the validity test in the table above explain that the value of r count more on the variables Halal Knowledge, Islamic Religiosity, Attitude, towards purchasing decisions is greater than the value of r table where these results explain that all question items are declared valid.

Reliability Test

Table 1.2 Reliability Test

Data source: SPSS 27 output, 2025

Based on the table of reliability test results, the four variables tested, namely Halal Knowledge (X1), Islamic Religiosity (X2), Attitude (X3), and Purchase Decision (Y), show the Cronbach's Alpha coefficient above 0.60. This indicates that all of these variables are reliable.

Normality Test Results

The normality test using the One-Sample Kolmogorov-Smirnov method is carried out by referring to the value listed on the Asymp. Sig. (2-tailed). normality using the One-Sample Kolmogorov-Smirnov method is done by referring to the value listed on the Asymp. Sig. (2-tailed).

Table 1.3 Normality Test Results

One-Sample Kolmogorov-Smirnov Test			
			Unstandardized Residual
N			100
Normal Parameters[a,b]	Mean		,0000000
	Std. Deviation		1,15088574
Most Extreme Differences	Absolute		,076
	Positive		,069
	Negative		-,076
Test Statistic			,076
Asymp. Sig. (2-tailed)[c]			,170
Monte Carlo Sig. (2-tailed)[d]	Sig.		,168
	99% Confidence Interval	Lower Bound	,158
		Upper Bound	,177
a. Test distribution is Normal.			
b. Calculated from data.			
c. Lilliefors Significance Correction.			
d. Lilliefors' method based on 10000 Monte Carlo samples with starting seed 1314643744.			

Data source: SPSS output 27, 2025

Based on table 3, it can be concluded that the data shows normal distribution. Evidenced by the variable significance value of more than 0.05.

Classical Assumption Test Results

Multicollinearity Test

The multicollinearity test is carried out to analyze the tolerance value and variance inflation factor (VIF).

Table 1.4 Multicollinearity Test Results

Variable	**Tolerance**	**VIF**	**Decision**

Halal Knowladge(X1)	0,578	1,730	Multicollinearity Free
Islamic Religiosity(X2)	0,518	1,931	Multicollinearity Free
Attitude(X3)	0,497	2,011	Multicollinearity Free

Data source : Result of *Output* SPSS 27, 2025

From table 4, it can be concluded that there is no multicollinearity between each independent variable, because the tolerance value is above 0.01 and the VIF value is less than 10.

Heteroscedasticity Test

The heteroscedasticity test aims to identify the existence of inequality of residual variants between one observation and another. In this study, the test used is the Glejser Test.

Table 1.5 Heteroscedasticity Test Results

Variable	t	Sig	Decision
Halal Knowladge(X1)	0,169	0,866	Heteroscedasticity Free
Islamic Religiosity(X2)	-1,677	0,097	Heteroscedasticity Free
Attitude(X3)	1,345	0,182	Heteroscedasticity Free

Data source: SPSS 27 Output Results, 2025

Based on table 6, the results of the heteroscedasticity test show that the significance value for each variable is greater than α> 0.05. The significance value for Halal Knowledge is recorded at 0.886 for Islamic Religiosity 0.97, Attitude is 0.182, Thus, it can be concluded that the regression equation model does not experience heteroscedasticity problems.

Multiple Linear Regression Analysis Results

The purpose of this test is to identify the effect of the independent variables (Halal Knowledge, Islamic Religiosity, and Attitude) on the dependent variable (Purchase Decision), both individually and as a whole.

Table 1.6 Multiple Linear Regression Analysis Results

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	5,915	1,750		3,379	,001
	Halal Knowladge(X1)	,021	,079	,029	,266	,790
	Islamic Religiosity(X2)	,374	,092	,464	4,089	,000
	Attitude(X3)	,179	,129	,161	1,390	,168
a. Dependent Variable: Keputusan Pembelian (Y)						

Data source: SPSS 27 Output Results, 2025

The research results in table 7 show that Halal Knowledge (X1) does not have a significant effect on purchasing decisions (Sig = 0.790> 0.05), indicating a knowledge-behavior gap. Although consumers have a good understanding of halal, this does not directly influence their purchasing decisions. Decisions are more influenced by other factors such as environment and habits.

In contrast, Islamic Religiosity (X2) has a significant influence on purchasing decisions with a coefficient of 0.374 and Sig < 0.001. This result shows that the higher a person's level

of religiosity, the more likely they are to buy halal cosmetics. This finding supports the Planned Behavior theory (TPB) that subjective norms and individual beliefs play an important role in purchasing decisions.

Attitude (X3) has a positive but insignificant effect (Sig = 0.168 > 0.05). This shows that although a positive attitude towards halal cosmetics exists, purchasing decisions are still influenced by external factors such as price, quality, and brand preference.

Overall, this study indicates that religiosity is more dominant than halal knowledge and attitude in influencing purchasing decisions for halal cosmetics among Generation Z. The marketing strategy for halal cosmetics should emphasize the religiosity aspect to increase the attractiveness for consumers with high religious awareness.

Hypothesis Test Results

F Test Results (Simultaneous Test)

The F-test is an estimation procedure used to assess whether the independent variables in a regression model simultaneously have a significant effect on the dependent variable.

Table 1.7 F Test Results (Simultaneous Test)

ANOVA[a]						
Model		Sum of Squares	df	Mean Square	F	Sig.
	Regression	73,871	3	24,624	18,027	,000[b]
	Residual	131,129	96	1,366		
	Total	205,000	99			
a. Dependent Variable: Keputusan Pembelian (Y)						
b. Predictors: (Constant), Attitude(X3), Halal Knowladge(X1), Islamic Religiosity(X2)						

Data source: SPSS Output 27, 2025

Based on table 1.7, it can be concluded that the results of this test can be seen in Table 8. Where the calculated F value = 18,027 with Sig. <0.001 indicates that the regression model as a whole is significant in predicting halal cosmetic purchasing decisions.

Where this shows that the variables Halal Knowledge, Islamic Religiosity, and Attitude together have a significant effect on purchasing decisions for halal cosmetics.

The results of the t test (Partial Test)

Table 1.8 The results of the t test (Partial Test)

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	5,915	1,750		3,379	,001
	Halal Knowladge(X1)	,021	,079	,029	,266	,790
	Islamic Religiosity(X2)	,374	,092	,464	4,089	,000
	Attitude(X3)	,179	,129	,161	1,390	,168
a. Dependent Variable: Keputusan Pembelian (Y)						

Data source: SPSS 27 Output Results, 2025

The t test results above show that:

a) Halal Knowledge (X_1) The t test results show that Halal Knowledge has no significant effect on purchasing decisions (t = 0.266; Sig = 0.790> 0.05), so H_1 is rejected.
b) Islamic Religiosity (X_2) Islamic Religiosity has a positive and significant effect on

purchasing decisions (t = 4.089; Sig <0.001), so H_2 is accepted.
Attitude (X_3) Attitude has no significant effect on purchasing decisions (t = 1.390; Sig = 0.168> 0.05), so H_3 is rejected.
Results of the Coefficient of Determination (R^2)
The coefficient of determination (R Square) is an estimation method used to measure how much variation in the dependent variable can be explained by the independent variables.

Table 1.9 Test Results of the Coefficient of Determination (R^2)

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,600[a]	,360	,340	1,169
a. Predictors: (Constant), Attitude(X3), Halal Knowladge(X1), Islamic Religiosity(X2)				

Data source: SPSS 27 Output Results, 2025

Based on table 1.9, the R Square value is recorded at 0.360. which means that 36% of the variation in halal cosmetic purchasing decisions can be explained by the Halal Knowledge, Islamic Religiosity, and Attitude variables. The remaining 64% is influenced by other factors not included in this research model.
The Influence of Halal Knowledge on Halal Cosmetics Purchasing Decisions Halal Cosmetics Purchasing Decisions Among Generation Z at the Islamic University of Malang

The results showed that the Halal Knowledge variable in this study has a coefficient value of 0.021 with a significance value of 0.790 (>0.05), which indicates that this variable has no significant effect on purchasing decisions for halal cosmetics.

These results are in line with research (Arsad, 2023) which states that most Muslim consumers better understand the concept of halal in the context of food compared to cosmetics.

The Influence of Islamic Religiosity on Halal Cosmetics Purchasing Decisions Halal Cosmetics Purchasing Decisions Among Generation Z at the Islamic University of Malang

The results showed that Islamic Religiosity has a significant influence on purchasing decisions for halal cosmetics, as the results of multiple regression analysis show that the Islamic Religiosity variable (X1) has a positive and significant effect on Purchasing Decisions (Y). This shows that the higher a person's level of religiosity, the greater their tendency to choose halal cosmetic products. Consumers with a high level of religiosity are more careful in choosing the products they use and tend to ensure that the cosmetics they buy are in accordance with sharia principles.

This purchasing decision can be influenced by the awareness that the use of halal products is not only limited to food and beverages, but also includes body care products such as cosmetics. This finding is consistent with the study by (Sukma and Cahyono 2021) which states that religiosity has a positive influence on purchasing decisions for halal products.

The Influence of Attitude on Halal Cosmetics Purchasing Decisions Halal Cosmetics Purchasing Decisions Among Generation Z at the Islamic University of Malang

The results showed that Attitude did not have a significant influence on purchasing decisions, as the results of multiple regression analysis showed Attitude, this shows that even though someone has a positive attitude towards halal cosmetics, this does not always materialize in the form of concrete actions in the form of purchasing decisions. A good attitude towards a product does not necessarily encourage consumers to choose that product, because purchasing decisions are often influenced by various other factors such as price, promo, quality,

product availability, and the habit of using certain brands. This result is different from research by (Nisa & Ridlwan, 2022) which found that attitude has a significant effect on purchase intention of halal cosmetics. This difference may be due to other factors such as price, quality, product availability, and the habit of using certain brands that are more dominant in influencing purchasing decisions.

5. Conclusions And Suggestions

5.1. Conclusions

Based on the results of the research that has been conducted, it can be concluded as follows:

1. Halal Knowledge does not have a significant influence on purchasing decisions for Wardah Brand halal cosmetics among Generation Z at the Islamic University of Malang.
2. Islamic Religiosity has a significant influence on purchasing decisions for Wardah Brand halal cosmetics among Generation Z at the Islamic University of Malang.
3. Attitude does not have a significant influence on the decision to purchase Wardah Brand halal cosmetics among Generation Z at the Islamic University of Malang.Operational Burden.

5.2. Limitation

1. This research was only conducted on student respondents at the Islamic University of Malang, so the results cannot necessarily be generalized to all Generation Z in Indonesia or other community groups with different characteristics.
2. This study only examines the influence of Halal Knowledge, Islamic Religiosity, and Attitude, whereas there are other factors that may have more influence on purchasing decisions for halal cosmetics, such as price, product quality, market trends, or recommendations from influencers.
3. There are limitations when using questionnaires, namely that sometimes the answers given by respondents do not match the actual situation.
4. Only 34% of the variation in purchasing decisions for halal cosmetics can be explained by the variables Halal Knowledge, Islamic Religiosity, and Attitude. The remaining 66% is influenced by other factors that are not included in this research model.

5.3. Suggestion

1. Future research should involve respondents from various universities or wider community groups so that the research results can be more generalized and reflect more diverse consumer preferences.
2. To get more comprehensive results, future research can add other variables that may have more influence on purchasing decisions for halal cosmetics, such as price, product quality, and market trends.

THE INFLUENCE OF INTELLECTUAL CAPITAL ON FINANCIAL PERFORMANCE: EVIDENCE FROM FINANCE COMPANIES IN THE HOLDING AND INVESTMENT SUB-SECTORS LISTED ON THE INDONESIA STOCK EXCHANGE 2019-2023 PERIOD

Armela Amalia[1,*] Sofia Windiarti [2,*] Siti Kustinah [3,*]
[1]Universitas Jenderal Achmad Yani, Cimahi, Indonesia

Abstract

The good or bad condition of a company's financial performance, aside from being evaluated from the ability to manage its tangible assets, is also determined by intangible assets or intellectual capital. This study aims to analyze the influence of Intellectual Capital on financial performance of finance companies in the holding and investment sub-sector listed on the IDX during the 2019-2023 period as the main subject. Research method used is descriptive quantitative, with the population involved in this study is 19 companies. Furthermore, to obtain the required data, the sampling technique was conducted by using purposive sampling technique and obtained as many as 16 companies or 80 data that will be analyzed in this study. Results found, partially Value added capital employed, Structure Capital Value Added, and Value Added Human Capital have a significant positive influence on company performance, while the Value Added Intellectual Capital has a significant negative impact. Simultaneously Value added capital employed, Structure Capital Value Added, Value Added Human Capital, and Value Added Intellectual Capital have a significant positive influence on financial performance.

Keywords: Value Added Capital Employed, Structure Capital Value Added, Value Added Human Capital, Value Added Intellectual Capital, Financial Performance

1. Introduction

The development of technology has made many businesses strive to get shareholders' attention, which makes financial reports become more crucial due to its importance in decision-making, which is assessed based on the business's capability to earn profit. Study discovered that good or bad company performance is not only determined by its tangible assets but also by the intangible assets, especially intellectual capital (Andika & Dewi Astini, 2022; T. K. Dewi & Wirakusuma, 2018). Intellectual capital is a valuable company asset in current business practices. Intellectual Capital is a concept of resources based on intangible assets and is optimally utilized to perform the company's strategy effectively and efficiently, in order to be used as a corporate competency tool to enhance their competitiveness (T. K. Dewi & Wirakusuma, 2018). In Resource-Based Theory (RBT) perspective, if a company could optimize their resources, the company would have a strong competitive advantage and competitiveness against their competitors (Krivorotov et al., 2020).

Intellectual capital may create a company's wealth (financial performance improvement). In Indonesia, intellectual capital began to develop after the issuance of the Financial Accounting Standard Guidelines (PSAK) No. 19 regarding intangible assets. Based on PSAK No. 19 revised 2009, a business engaged in goods and services still requires high intellectual capital for administration and management purposes (PSAK No. 19 Year 2009). Intellectual capital is classified as a unique asset which is able to stimulate and create a competitive advantage for the company, which in turn provides added value to the company (E. Sukmana & Azizah, 2024). Intellectual capital is classified as intangible assets, in which intangible assets have its own advantages compared to tangible assets, among them are intangible assets have a

longer economic life and it can be renewed (Prasetio in Sukmana & Fitria, 2019). Therefore, intellectual capital has to be a particular concern, despite the fact that this is not stated explicitly (Wahyuni et al., 2023). However, direct measurement of intellectual capital is not feasible, Pulic (2000, 2004) has suggested to assess the efficiency of Value Added Intellectual Capital (VAIC), which is measured based on the company's intellectual capabilities.

The relationship between VAIC™ and financial performance has been proven empirically in various studies (Chen et al., 2020; Firer & Mitchell Williams, 2023; Kurniawan & Muslichah, 2019). Kurniawan & Muslichah (2019) discovered that intellectual capital has an impact on the company's financial performance, creating company value supported with good and efficient intellectual capital will assist the company in carrying out its business activities. However, contradicting with these findings, Dewi & Wirakusuma (2018) found that intellectual capital has no effect on the company's financial performance. Similar results were found by Pratiwi & Sudarso (2016) which found that intellectual capital has no effect on the company's financial performance, Intellectual Capital disclosures are still low and there are no standards related to the measurement and disclosure of Intellectual Capital in Indonesia which causes the public or investors to be unable in making the right judgment regarding the company's Intellectual Capital growth rate.

The occurrence of empirical research gaps has encouraged this study's urgency . This study tries to exploring whether intellectual capital can affect financial performance by taking finance companies in the holding and investment subsector listed on the Indonesia Stock Exchange for the 2019-2023 period as a case study.

2. Literature review

5.23. Resource Based Theory

Resource based theory is a theory that explained how the company's work ideally functions when it has a good competitive advantage and allows it to obtain value-added (Putri et al., 2023). Ulum (2022) describes that the company achieves a competitive advantage and achieves better performance due to the success of properly managing assets in the form of physical assets or intangible assets that have been created, owned, and utilized by the corporation to maintain a competitive strategy and gain profits.

Intangible assets can be viewed as strategic assets that provide a long-term competitive advantage to the business. These factors include having intrinsic value to the business, difficult to imitate by other businesses to increase profits, rarity (only a few companies have it), and difficulty to substitute so it cannot be replaced by products from other companies, which one of them is intellectual capital (Zamah & Rahayu, 2019).

Resource-based theory basically assesses resources owned by the organization as well as managing and utilizing these resources. Companies can achieve greater value and improve their financial performance with better usage of intellectual capital.

5.24. Intellectual Capital

Pulic (2004) argues that intellectual capital is a resource which is not in the form of cash and covers different assets, covering processes or technology that can be used to generate additional revenue for the business, stronger customer relationships, knowledge, experience, and skills related to employee competencies. Putri et al., (2023) believes that intellectual capital is an asset that has no form and is a combination of human, process, consume that can provide a competitive advantage to the organization.

Arifin (2020) states that intellectual capital is the empowerment of knowledge sources that are very instrumental in providing value added to the organization both physically and financially visible, but it cannot be reflected in the financial statements. Therefore, there is a need for a solution to measure and report the company's intellectual capital, and how

intellectual capital gives the idea of Value Added Intellectual Capital Coefficient (VAIC™) can be developed.

Value Added Intellectual Capital (VAIC™) coefficient model can be calculated using the following formula to determine the contribution of each resource participant in achieving value added (Pulic, 2000):

a) Value Added Capital Employed (VACA)
Value added capital employed (VACA) is an indicator to measure capital efficiency.

$$VACA = \frac{VA}{CA} \quad (2.1)$$

Description :
VACA : *Value Added Capital Employed*
VA : *Value Added*
CA : *Capital Employed* (equity, net profit)

b) Value Added Human Capital (VAHU)
Value Added Human Capital (VAHU) is an indicator to measure labor efficiency:

$$VAHU = \frac{VA}{HC} \quad (2.2)$$

Description :
VAHU : *Value Added Human Capital*
VA : *Value Added*
HC : *Human Capital* (Employee Expenses)

c) Stucture Capital Value Added (STVA)
Structure Capital Value Added (STVA) is an indicator used to measure the efficiency of structural capital (organization, process and technology).

$$STVA = \frac{SC}{VA} \quad (2.3)$$

Description :
STVA : *Structure Capital Value Added*
SC : *Structure Capital* (VA-HC)
VA : *Value Added*

d) Value Added Intellectual Capital (VAIC^{TM})
Value Added Intellectual Capital can indicate the intellectual capital capability of a company which or can indicate BPI (*Business Performance Index*).

$$VAIC^{TM} = VACA + VAHU + STVA \quad (2.4)$$

Description :
VAIC^{TM} : *Value Added Intellectual Capital*
VACA : *Value added capital employed*
VAHU : *Value Added Human Capital*
STVA : *Structure Capital Value Added*

5.25. Financial Performance

Company financial performance is a way to assess how an entity has grown by following the principles of financial implementation accurately and appropriately. According to Dewi & Rahayu (2020) company financial performance is aimed at ensuring that the company can conduct evaluations and improve operational activities in order to compete with other companies. Furthermore, it also aims to show investors or anyone concerned that the company is credible. The assessment of company performance is a crucial, as it can determine the extent of the company's success in a certain period.

Kesaulya & Christina (2019) state that financial performance has the result of being evaluated by the company in the future. Profitability analysis enhances the evaluation of a

company in utilizing profits and the effectiveness of company management, considering the company's main goal is to make a profit. Return on Asset is a ratio that shows returns earned on all assets utilized. Return on Asset reflects the profitability of the business along with the efficiency of the company when using resources to create profit. Destiani & Hendriyani (2021) also gave the same explanation that ROA reflects the company's ability to generate profits by utilizing and managing its total assets. ROA can be calculated in the following way

$$ROA = \frac{Laba\ Bersih}{Total\ Aset} x100\% \quad (2.5)$$

.

3. Methodology

This study utilizes a quantitative descriptive approach to assess research variables with numbers which aim to prove the hypothesis. The objects in this study are Finance companies in the Holding and Investment sub-sector listed on the Indonesia Stock Exchange during the 2019-2023 observation period, which amounted to 19 companies. In order to obtain data that suits the research requirements, this study uses purposive-sampling techniques and obtains as many as 16 companies with the total data that will be used is 80 data. In addition, to answer the hypothesis proposed, this study conducted multiple linear regression analysis.

4. Results and discussions

4.1. Results

After conducting data collection, it will be analyzed through statistical testing using IBM SPSS Version 26 and Microsoft Excel.

Descriptive Statistic

Descriptive statistics is used to identify the minimum, maximum, mean, and standard deviation values of the data obtained. Descriptive statistics results in this study are presented in Table 1:

Tabel 10. Descriptive Statistics

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
VACA	80	-1.17	1.09	.0818	.24805
VAHU	80	-88.52	355.67	9.9495	55.15801
STVA	80	-14.06	4.47	.2157	2.44803
VAIC	80	-87.85	357.36	10.2470	55.42536
ROA	80	-8.90	8.29	-.0333	1.39018
Valid N (listwise)	80				

Source: Data Processed, 2025

Among the 80 data collected, there is a large variation in each of the variables. VACA variable has an mean value of 0.0818 with a standard deviation of 24.805, which indicates a very widespread distribution of data (min: -1.17; max: 1.09). VAHU and VAIC recorded extreme dispersion: VAHU had a min value ranging from-88.52 to max 355.67 (mean: 9.95; SD: 55.16), while VAIC's min value was in the range of -87.85 to max 357.36 (mean: 10.25; SD: 55.43). STVA shows the highest average (2.157) with a relatively low standard deviation (2.45), although it has a negative minimum value (-14.06). ROA recorded a negative mean (-0.0333) and standard deviation of 1.39, reflecting the instability of the sample's financial performance (min: -8.90; max: 8.29).

Classical Assumption Test

The classic assumption test is a condition for regression analysis and hypothesis testing, which includes normality test, multicollinearity test, heteroscedasticity test and autocorrelation test.

Normality Test

In this study, normality test is evaluated using the One-Sample Kolmogorov-Smirnov method, where if the obtained sig. value is > 0.5, the data can be assumed to be normally distributed. Normality test result is presented in Table 2.

Tabel 11. Normality Test Result

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		52
Normal Parameters[a,b]	Mean	.0000000
	Std. Deviation	.19717806
Most Extreme Differences	Absolute	.098
	Positive	.070
	Negative	-.098
Test Statistic		.098
Asymp. Sig. (2-tailed)		.200[c,d]
a. Test distribution is Normal.		
b. Calculated from data.		
c. Lilliefors Significance Correction.		
d. This is a lower bound of the true significance.		

Source: Data Processed, 2025

Normality test results obtained a significance value (0.200) > 0.05, therefore it can be decided that the normality assumption is fulfilled.

Multicollinearity Test

Multicollinearity test aimed to check if there is a correlation between independent variables in the regression model. If a correlation between independent variables occurs, it is called a multicollinearity, or problem. Multicollinearity is considered a problem if VIF> 10 and tolerance value <0.10. The multicollinearity test results are presented in Table 3.

Table 12. Multicollinearity Test Result

Coefficients[a]								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-.053	.088		-.601	.551		
	Value added capital employed	.407	.115	.406	3.554	.001	.753	1.329
	Value Added Human Capital	.794	.210	.794	3.786	.000	.224	4.469
	Structure Capital Value Added	.568	.197	.569	2.890	.006	.254	3.930
	Value Added Intellectual Capital	-.663	.293	-.663	-2.266	.028	.115	8.706
a. Dependent Variable: Return on Asset								

Source: Data Processed, 2025

Multicollinearity test results, indicate that technically the results still fulfill the non-multicollinearity assumption with VIF values on each variable < 10 and tolerance > 0.10. So it can be decided if there is no multicollinearity.

Heteroscedasticity test

Heteroscedasticity test is aimed to examine if there is an inequality of variance in the regression model from the residuals of one observation to another. In this study heteroscedasticity test is assessed by utilizing scatterplot diagram, the results of heteroscedasticity test are presented in Figure 1.

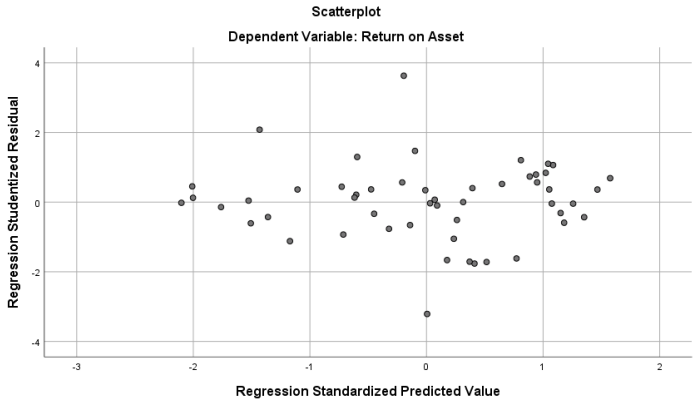

Figure 1. Scatterplot

Source: Data Processed, 2025

Scatterplot diagrams between standardized predicted values and standardized residuals display a random pattern of data points distribution and does not create a certain pattern (such as expanding, narrowing, or wavy) around the horizontal axis. The residual distribution tends to stabilize around the zero line with no systematic increase or spread of variance as the predicted value increases. This random pattern indicates that the assumption of homoscedasticity is fulfilled, which means that the residual error variance is constant between observations.

Autocorrelation Test

Autocorrelation test aimed to examine if there is a correlation between the error of confounders in period t and errors in period t-1 (previous) in a regression model. In detecting the presence or absence of autocorrelation, Durbin-Watson (DW) testing method is used by comparing Durbin-Watson (DW) calculations with Durbin-Watson (DW) table (dU). A good DurbinWatson (DW) result is a score of dU < d < 4-dU. The results of autocorrelation test are presented in Table 4.

Table 13. Autocorrelation Test

Model Summary[b]					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.733[a]	.537	.498	.2053973	1.416
a. Predictors: (Constant), *Value Added Intellectual Capital*, *Value added capital employed*, *Structure Capital Value Added*, *Value Added Human Capital*					
b. Dependent Variable: Return on Asset					

Source: Data Processed, 2025

According to autocorrelation tests results, the Durbin-Watson value is 1.416. Then the lower bound value (dU) is 1.4000 and upper bound value (dL) is 1.7228. Therefore, it can be concluded that if there is no autocorrelation problem (1.4000 < 1.416 < 2.6000) or (dU < d < 4-dU), then the data is ready for the next test.

Multiple Regression Analysis

Regression analysis has been used to examine the causality between independent and dependent variables, the results of multiple linear regression analysis are presented in Table 5.

Tabel 14. Multiple Regression Analysis

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.053	.088		-.601	.551
	Value added capital employed	.407	.115	.406	3.554	.001
	Value Added Human Capital	.794	.210	.794	3.786	.000
	Structure Capital Value Added	.568	.197	.569	2.890	.006
	Value Added Intellectual Capital	-.663	.293	-.663	-2.266	.028
a. Dependent Variable: Return on Asset						

Source: Data Processed, 2025

From these results, the following equation is obtained:

$$Y = -0{,}053 + 0.407 + 0.794 + 0.568 - 0.663 \quad (4.1)$$

1. Constant value -0.053 indicates that if Value Added Capital Employed, Value Added Human Capital, Structure Capital Value Added and Value Added Intellectual Capital is 0, then financial performance will be -0.053.
2. Coefficient Value added capital employed is 0.407 which has a positive value, which means that if there is an increase in Value added capital employed, it will increase financial performance by 0.407.
3. Coefficient of Value Added Human Capital is 0.794 with positive value, which means that if there is an increase in Value Added Human Capital, it will increase financial performance by 0.794.
4. Coefficient of Structure Capital Value Added is 0.568 which has a positive value, which means that if there is an increase in Structure Capital Value Added, it will increase financial performance by 0.568.
5. Coefficient of Value Added Intellectual Capital is -0.663 which has a negative value, which means that if there is an increase in Value Added Intellectual Capital, it will reduce financial performance by -0.663.

Coefficient Determination Analysis

Coefficient determination analysis is used to determine the effect of the independent variable on the dependent variable, the coefficient determination test is presented in Table 6.

Tabel 15. Coefficient Determination

Model Summary[b]				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.733[a]	.537	.498	.2053973

a. Predictors: (Constant), *Value Added Intellectual Capital*, *Value added capital employed*, *Structure Capital Value Added*, *Value Added Human Capital*
b. Dependent Variable: Return on Asset

Source: Data Processed, 2025

From the results of coefficient determination analysis, Value added capital employed, Structure Capital Value Added, Value Added Human Capital, and Value Added Intellectual Capital are capable of explaining 53.7% of Return on Asset (ROA) variation, as represented by the R Square value 0.537. Adjusted by the number of predictors and sample size, an Adjusted R Square value 0.498 indicates that statistically, this model explains about 49.8% of the variability in ROA after considering degrees of freedom. The R value (multiple correlation coefficient) of 0.733 indicates a strong relationship between all independent variables together on the dependent variable.

Hypothesis Testing

In order to discover the influence of the independent variables analyzed in this study on the dependent variable, hypothesis testing is carried out which is evaluated by t-test and f-test.

T test

The t test is carried out to assess whether there is a significant effect of the independent variable on the dependent variable. The results of the t test are presented below

Tabel 16. t-test

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.053	.088		-.601	.551
	Value added capital employed	.407	.115	.406	3.554	.001
	Value Added Human Capital	.794	.210	.794	3.786	.000
	Structure Capital Value Added	.568	.197	.569	2.890	.006
	Value Added Intellectual Capital	-.663	.293	-.663	-2.266	.028
a. Dependent Variable: Return on Asset						

Source: Data Processed, 2025

Table 7 presents the results of partial hypothesis testing, with the results listed as follows:

1. Value Added Capital Employed has a significant positive effect on Financial Performance, which is proven with a sig. value 0.001 (0.001 <0.05) and a t-statistic 0.554 with a positive value.
2. Value Added Human Capital has a significant positive effect on Financial Performance, which is proven with a sig. value of 0.000 (0.000 <0.05) and a t-statistic 3.786 with a positive value.
3. Structure Capital Value Added has a significant positive effect on Financial Performance, which is proven by a sig. value 0.006 (0.006 <0.05) and a t-statistic of 2.890 which has a positive value.
4. Value Added Intellectual Capital has a significant negative effect on Financial Performance, which is proven by the sig. value of 0.028 (0.028 <0.05) and a t-statistic value -2.266 which has a negative value.

F test

The f test is conducted to assess the effect of all independent variables on dependent variables simultaneously. The results of the f test are presented in Table 8.

Tabel 17. F-test

ANOVA[a]						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	2.302	4	.576	13.642	.000[b]
	Residual	1.983	47	.042		
	Total	4.285	51			
a. Dependent Variable: Return on Asset						
b. Predictors: (Constant), *Value Added Intellectual Capital* , *Value added capital employed* , *Structure Capital Value Added* , *Value Added Human Capital*						

Source: Data Processed, 2025

Table 8 presents the results of f -test which indicate that there is a positive and significant effect of Value Added Intellectual Capital, Value Added Capital Employed, Structure Capital Value Added, and Value Added Human Capital on financial performance simultaneously, as proven by the acquisition of sig. 0.000 and f-statistic value 13.642 with a positive value.

4.2. Discussion

Value Added Capital Employed Influence on Financial Performance

Value Added Capital Employed has a significant positive influence on financial performance, value added capital employed represented the amount of added value produced by the use of company's physical capital. These findings are aligned with resource-based theory which states that efficiently managed capital is a source of sustainable competitive advantage (Nimtrakoon, 2015). Knowledge and information possessed by employees can create value-added efficiency to create corporate wealth in form of physical capital. Physical capital utilization is essential to achieve profitability, without physical capital a company will not be able to carry out its operational activities (Arifin, 2020). Sukmana & Fitria (2019) believes that a company that is capable of maximizing relationships between companies and their partners could be used to enhance financial performance.

Value Added Human Capital Influence on Financial Performance

Value added human capital has a significant positive effect on financial performance, because knowledge, competence and expertise in the human capital component are able to encourage companies to create innovation. Well-developed human capital would provide a solution to every problem faced by the company. This finding is consistent with Arifin (2020), where human capital is a very important element for the company. Knowledge, competence and expertise attached to the human capital can encourage companies to create innovation. Zamah & Rahayu (2019) further explained that the ability of human resources to create innovation in physical capital owned by the company to generate wealth for the company will influence cost management so that the production and operational activities are carried out efficiently and eventually enhance financial performance. But in contrast to Jayanti & Binastuti (2017) findings, which argue that VAHU has not been able to influence financial performance because companies spend funds on employees but are not equivalent to the value added obtained.

Structure Capital Value Added Influence on Financial Performance

Structure Capital Value Added affects financial performance, which means that structural capital efficiency is able to improve the company's profit-making skills. This indicates that strengthening the management and utilization of structural capital can increase the added value

and financial performance of the company. The results are in line with research conducted by (Arifin, 2020; R. J. Sukmana & Fitria, 2019; Zamah & Rahayu, 2019) which found that structural capital value added affects financial performance. If resources is effectively managed would be able to create its own value so that the company has a competitive advantage to achieve profitability (Arifin, 2020). But this research is in contrast to the research of Azahra & Gustyana (2020), which states that STVA is not capable of improving financial performance in companies.

Value Added Intellectual Capital Influence on Financial Performance

Study findings showed that intellectual capital has a significant negative effect on financial performance. The higher intellectual capital value, the more efficient capital utilization of the company, which creates value added for the company. However, Pratiwi & Sudarso (2016) believe that this finding occurs due to the low level of intellectual capital disclosure and the absence of standards for intellectual capital disclosure or measurement in Indonesia. As a result, the public or investors are not yet capable of accurately assessing intellectual capital. Therefore, the measurement of relationship between intellectual capital and financial performance in the future remains uncertain.

Value Added Capital, Value Added Human Capital, Employed Influence, Structure Capital Value Added Influence, and Value Added Intellectual Capital on Financial Performance

Findings revealed that simultaneously Value added capital employed, Structure Capital Value Added, Value Added Human Capital, and Value Added Intellectual Capital have a significant positive effect on financial performance. This study also discovered if Value added capital employed, Structure Capital Value Added, Value Added Human Capital, and Value Added Intellectual Capital are able to explain 53.7% of the financial performance of the finance sector of the holding and investment sub-sector in Indonesia. This condition may occur due to the fact that in the financial industry, capability which includes risk analysis and portfolio management has its roots in intangible assets. A company with knowledgeable employees has an advantage in terms of innovation, and excellent reputation, which is essential, that will encourage more people to spend more and invest more (Ni et al., 2021).

5. Conclusion

Research conducted on holding and investment companies listed on IDX 2019-2023 period, Partially, Value Added Capital Employed (VACA), Structural Capital Value Added (STVA), and Value Added Human Capital (VAHU) proved to have a significant positive effect, in line with the principle of Resource-Based Theory which emphasizes valuable, rare, and inimitable resources as pillars of competitive advantage. However, a surprising finding occurs in Value Added Intellectual Capital (VAIC) which has a significant negative effect partially, which indicates that the high cost of IC development does not automatically lead to direct conversion into short-term profitability, especially if there is an imbalance in allocation between its components or miscoordination between human capital and supporting infrastructure. Therefore, companies need to balance resource allocation, strengthen knowledge management systems, and utilize VAIC as a diagnostic tool, rather than just a performance metric, in order to achieve sustainable competitive advantage.

THE EFFECT OF PERCEIVED USEFULLNESS AND PERCEIVED SAFETY OF SYSTEM ACCOUNTING ON INTENTION TO ADOPT DIGITAL PAYMENT IN CIMAHI CITY SMES

Sofia Windiarti, Nunung Aini Rahmah

Jenderal Achmad Yani University, Indonesia

Email : sofiawindiarti25@gmail.com , nunung.aini@lecture.unjani.ac.id

Abstract

Indonesia's digital financial transactions recorded rapid growth during the January-March 2022 period. According to a Bank Indonesia (BI) report, the value of electronic money transactions grew 42.06% in the first quarter of 2022. BI also estimates that the transaction value will grow 18.03% to IDR360 trillion throughout 2022 (Rahman, 2022). One of the factors driving the growth of Indonesia's digital economy is the digital payment system (Birny, 2022). Financial Technology (Fintech) is one of the innovations in financial services that can provide convenience to the public to facilitate transactions. The problem that is currently feared by fintech business actors is cybercrime. Losses from cybercrime are difficult to estimate and verify because in addition to financial losses, other losses due to damage, loss or leakage of private data cause a decline in the reputation of a company (B. Shekar & Prabha, 2020). The Kompas poll in January 2022 recorded that 67.8% of respondents had made transactions on online sites. Meanwhile, the results of a survey by the Indonesian Internet Service Providers Association (APJII) in June 2020 reported that 56.8% of respondents shopped online. Based on the results of the two studies, there is an increasing trend in transaction activities in the digital ecosystem. However, the payment method still leans towards conventional methods. The findings show that more than half of the respondents most often use cash payment methods. The majority use cash on delivery (COD). Fintech technology provides many benefits for business people, namely no need to look for change, transactions are recorded automatically, have data on income and expenses and can get many promos. But unfortunately, there are still some people who are reluctant to use fintech technology. The factors that cause this include convenience, security and lack of information on non-cash payments. The purpose of this study was to determine the effect of perceived usefullness and perceived safety of the accounting system on the intention to adopt digital payment in Cimahi City MSMEs partially and simultaneously. The research method used in this research uses descriptive analysis with quantitative methods. The object of research is MSMEs in Cimahi city, with the number of samples taken representing a population of 376 samples. The results of this study indicate that perceived usefullness and perceived safety of the accounting system affect the intention to adopt digital payment in Cimahi City MSMEs partially and simultaneously.

Keywords: Accounting information system, Fintech, purchase intention

1. Introduction

Indonesia's digital financial transactions recorded rapid growth during the January-March 2022 period. According to a Bank Indonesia (BI) report, the value of electronic money transactions grew 42.06% in the first quarter of 2022. BI also estimates that the transaction value will grow 18.03% to IDR360 trillion throughout 2022 (Rahman, 2022). One of the benefits obtained by making digital payments includes easier, faster payment transactions and

can reduce costs. A payment system is said to be efficient if it can minimise costs to benefit from a transaction.

One of the factors driving Indonesia's digital economic growth is the digital payment system (Birny, 2022). Quoting from the results of IDC research reveals that in 2025 there will be 125 million new e-wallet users, this number will make Indonesia the largest e-wallet user country in Southeast Asia (Birny, 2022). Professor of Finance Management, IPMI Business School, Roy Sembel said that digital inequality is an issue of global concern. One of the global issues that has become the world's concern besides environmental issues, is the issue of digital inequality. Digital inequality includes the inequality of people who own digital devices that can be assessed by equipment, autonomy of use, skills, social support and the purpose for which the technology is utilised, thus raising the possibility that new technology can create more inequality. It is hoped that the digital payment system will be able to reduce digital inequality.

Financial Technology (Fintech) is one of the innovations in financial services that can provide convenience to the public to facilitate transactions. Fintech is a technology-based industry that provides various financial services. There are several Financial Technology services such as digital payments, lending, financing, financial planning, investment.
Currently, with the Russian-Ukrainian war, the impact on the GDP and inflation of countries in the world is very pronounced. For this reason, efficiency is increasingly needed, one of which is digitalisation, including digitalisation of the payment system. Xendit's Head of Business Development, Nor Meydia emphasised the importance of digital payments for businesses. 'For B2C companies, this will bring businesses into a market that contains customers whose digital literacy is already very good and these are the 25-34 age group that accounts for more than 50% of online shopping,' she explained (Birny, 2022). (Martha Rahayu, 2022) revealed that the ease of checkout on websites and applications can encourage merchant sales conversion. The checkout feature innovation allows transaction information to be accessed completely and easily on one page, so consumers can save time to make payments on the merchant's website or application. This can potentially drive more sales conversions on the merchant side. In the last five years, Dea said Midtrans has shortened the time needed to complete online payments by 70% (Martha Rahayu, 2022).

The term 'digital payment' refers to a payment technique in which payment data and instructions are transmitted via a digital device, such as a mobile phone (Sahi et al., 2022). In Indonesia itself, there are several types of digital payments, one of which is e-wallet or digital wallet. Currently, many banks have launched their own version of digital wallets. Apart from banks, private companies have also launched their digital wallets, such as Gopay, OVO, DANA, Shoppee pay and so on (Dimas, 2022).

The Central Bureau of Statistics released e-commerce statistics for 2020 with quite interesting facts. People are increasingly fond of buying goods online, but most payments are made by cash on delivery (COD) or direct cash payments. One of the contributing factors, according to a researcher at the Centre for Indonesian Policy Studies, Thomas Dewaranu, is trust. People are not fully confident in digital money storage or transactions (VoA Indonesia, 2021). In rural areas, people are not comfortable with using digital payments such as e-wallets or even fintech because they do not have trust. Some people have concerns regarding information through television media regarding pinjol scams or through the radio (VoA Indonesia, 2021). In addition, the problem that fintech business players are currently concerned about is cybercrime. Losses from cybercrime are difficult to estimate and verify because in addition to financial losses, other losses due to damage, loss or leakage of private data cause a decline in the reputation of a company (B. Shekar & Prabha, 2020). As a result of cybercrime attacks, all countries in the world are affected, especially for countries that are still developing

in the field of information and communication technology, which is characterised by a dramatically increasing level of cybercrime (Kshetri, 2019).
A Kompas poll in January 2022 recorded that 67.8% of respondents had made transactions on online sites. Meanwhile, the results of a survey by the Indonesian Internet Service Providers Association (APJII) in June 2020 reported that 56.8% of respondents shopped online. Based on the results of the two studies, there is an increasing trend in transaction activities in the digital ecosystem. However, the payment method still leans towards conventional methods. The findings show that more than half of the respondents most often use cash payment methods. The majority use cash on delivery (COD) and a small proportion pay cash via Indomaret and Alfamart outlets. The factors of convenience, security and lack of information on non-cash payments are obstacles, therefore, payment digitalisation needs to be balanced with consumer literacy (Nugraheni, 2022).
Digital payment systems make economic processes better so that the government encourages micro, small and medium enterprises (MSMEs) to implement digital payment systems in their businesses. Moreover, the Deputy Governor of Bank Indonesia revealed that Financial Inclusion is a theme carried by developing countries in the G20, namely how to raise the level of marginalised groups affected by the pandemic to recover immediately and MSMEs are included in this group (Rosana, 2022).

2. Literature review

2.1 Digital Payment

Digital payment or referred to as digital payment is a type of payment that uses electronic media such as sms banking, internet banking, mobile banking and electronic wallets. All of these activities can be done using only electronic devices, namely smart phones (Saputra 2019). Currently, the use of digital payments has dominated generations X, Y, and Z. Transactions using digital are indeed fairly easy and practical, besides that another benefit of using transactions through digital payments is the promotions obtained such as cashback, and discounts (Houston 2020). Digital Payment is a representative of all non-cash payments, which are also defined as electronic payment transactions between buyers and sellers using savings accounts via the internet or electronic networks.

2.2 Perceived Usefulness

Perceived usefulness is defined as the extent to which a person believes that using a technology will improve their job performance. From this definition, it is known that perceived usefulness is a belief about the decision-making process. Thus, if someone believes in a useful information system, he will use it. Conversely, if someone believes that the information system is less useful then he will not use it. Previous studies have shown that the construct of perceived usefulness has a positive and significant effect on interest in using information systems (e.g. Davis, 1989; Chau, 1996; Igbaria et al., 1997; Sun, 2003). Previous studies also show that perceived usefulness is the most significant and important construct that influences attitude, behavioural intention and behaviour in using technology compared to other constructs.

H1 : Perceived usefulness affects intention to adopt digital payments
H1 : Perceived usefulness affects intention to adopt digital payments

2.3 Perceived safety of accounting system

An accounting information system is certainly not free from the risk of damage to the system. Various threats that come can damage the effectiveness of the system and can even

damage all existing data. Users certainly need a system that is comfortable and efficient to use. System security will encourage user interest in using the Accounting Information System because information security is believed to be able to provide benefits to system users. According to Titisari (2015), good and reliable technology is technology that is considered safe for its users. System security is part of system quality which will affect the satisfaction of accounting information system users. Perceived security can be measured through indicators, namely: not worrying about providing information, believing that information is protected, and believing that the security of money on electronic devices is guaranteed during transactions (Waspada, 2012). (Mudjiyanti, Kusbandiyah and Wardani, 2023) reveal perceived security measures the extent to which accounting information system users feel safe when using certain digital services.) In this study, perceived safety of the accounting system is defined as the perception of umkm entrepreneurs as users of accounting information systems to feel safe when using fintech services.

H2 : Perceived safety of the accounting system affects the intention to adopt digital payments

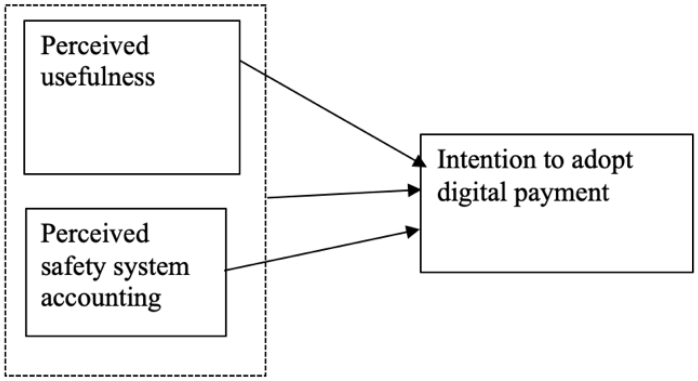
2.4 Intention to adopt digital payment

Intention is the desire to perform behaviour (Rehman et al., 2019). Ajzen (1991) reveals that intention is an important indicator of the extent to which individuals perform certain behaviours and how much effort from the individual to perform actual behaviour (Rehman et al., 2019). One study of consumers in Thailand concluded that intention to buy via the internet is influenced by attitude towards behaviour, subjective norms and perceived behavioural control (Laohapensang, 2009) and consumer purchases intention has a significant effect on consumer behaviour to buy online (Rehman et al., 2019). Several previous researchers have revealed that intention plays an important role in influencing consumers' actual behaviour to transact ((He et al., 2008); (Laohapensang, 2009); (Pavlou & Fygenson, 2006)). Based on the description above, it can be concluded that intention is the main factor that determines the behaviour of an individual. So it can be concluded that intention to adopt digital payment is the desire to use digital payments.

H3 : Perceived Usefulness and Perceived safety of the accounting system affect the intention to adopt digital payments.

3. Methodologyc

This type of research is descriptive analysis research and quantitative methods. Descriptive analysis is a statistic used to analyse data by describing or describing the data that has been collected as it is without intending to make general conclusions or generalisations. While quantitative methods are research methods for examining certain populations or samples, purposive sampling techniques, data collection using research instruments, statistical data analysis with the aim of testing predetermined hypotheses (Sugiyono, 2012). This research was conducted in Cimahi City. The research analysis unit was UMKM Cimahi City. The number of samples used in this study were 376 MSMEs in Cimahi city.



4. Results and Discussion

Descriptive Test Results

Based on the results of descriptive analysis of perceived usefullness variables, perceived safety system accounting, intention to adopt digital payment can be seen from the average score in the following table:

4.1 Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Perceived Usefullness	376	16	60	50,14	6,117
Perceived Safety System Accounting	376	9	45	37,09	5,082
Intention to Adopt Digital Payment	376	22	55	43,54	6,081
Valid N (listwise)	376				

The results of the analysis related to the variables of perceived usefulness, perceived safety system accounting, intention to adopt digital payment are as follows. The perceived usefulness variable has a fairly high average value, which is 50.14 from a maximum scale of 60, indicating that most respondents feel the system used is quite useful. The perceived safety system accounting variable has an average of 37.09 from a maximum scale of 45, indicating that respondents generally feel this system is quite safe. The intention to adopt digital payment variable has an average value of 43.54 from a maximum scale of 55, which indicates that most respondents have a high tendency to use digital payments. Based on the overall results, it can be concluded that among the three variables analysed, the perceived usefulness variable has a fairly high average value of 50.14, which shows that respondents believe that using a technology will improve their job performance. The variable that has the lowest average value among the variables perceived usefullness, perceived safety system accounting, intention to adopt digital payment is perceived safety system accounting. (Mudjiyanti, Kusbandiyah and Wardani, 2023) reveal perceived security measures the extent to which accounting information system users feel safe when using certain digital services. perceived safety system accounting has a low average value, this is because umkm business people feel that they still do not feel safe regarding personal data, especially financial data involved in business transactions using fintech which can be misused by irresponsible parties such as personal data theft. In addition, business people also still feel concerned about transactions that fail to be recorded due to internet network problems.

4.2 Hasil pengujian hipotesis

Tabel 1. Hasil uji T

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	4,804	1,919		2,503	,013
	Perceived Usefullness	,319	,041	,321	7,764	<,001
	Perceived Safety System Accounting	,613	,050	,512	12,376	<,001

a. Dependent Variable: Intention to Adopt Digital Payment

Tabel 2. Hasil uji F

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	7467,738	2	3733,869	217,623	<,001[b]
	Residual	6399,741	373	17,157		
	Total	13867,479	375			

a. Dependent Variable: Intention to Adopt Digital Payment
b. Predictors: (Constant), Perceived Safety System Accounting, Perceived Usefullness

Tabel 3. Hasil uji koefisien determinasi

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,734[a]	,539	,536	4,142

a. Predictors: (Constant), Perceived Safety System Accounting, Perceived Usefullness

Based on table 1, it can be concluded that the perceived usefulness and perceived safety system accounting variables affect the intention to adopt digital payment and Perceived Safety System Accounting has a greater influence (B = 0.613) than Perceived Usefulness (B = 0.319), which means that safety factors play a greater role in determining a person's intention to use digital payments. Based on table 2, it can be concluded that the significance value is <0.001, which shows that there is an influence between perceived usefulness and perceived safety of the accounting system on the intention to adopt digital payment. Based on table 3, it can be concluded that 53.9% of the variation in intention to adopt digital payment can be explained by the Perceived Usefulness and Perceived Safety System Accounting variables and the other 46.1% is explained by other factors not examined in this study such as discounts, promotions, perceived ease of use and others.

4.3 Discussion

Based on the results of hypothesis testing (H1) that has been carried out, the results of Perceived Usefulness have a significant effect on intention to adopt digital payment. This can be seen from the sig value <0.001. The magnitude of the effect of perceived usefulness on intention to adopt digital payment is 31.9%. The results of this study are in line with the results of previous research, namely research by Davis, 1989; Chau, 1996; Igbaria et al., 1997; Sun, 2003. Previous studies have shown that perceived usefulness is the most significant and important construct that influences attitude, interest (behavioural intention) and behaviour in using technology compared to other constructs. the more a person believes that using a technology will improve their job performance, it will also have an impact on increasing interest in using fintech.

Based on the results of hypothesis testing (H2) that has been carried out, the results of perceived safety system accounting have a significant effect on intention to adopt digital payment. This can be seen from the sig value <0.001. The magnitude of the effect of perceived sefety system accounting on intention to adopt digital payment is 61.3%. Based on the results of hypothesis testing, the perceived safety of the accounting system variable has a greater influence than the Perceived Usefulness variable. Respondents considered that the security of the accounting system was the main thing that determined the interest in using fintech. The results of this study are in line with previous research, namely (Wijaya et al., 2024), (Habibur Rahman, Al-Amin and Sharmin Lipy, 2020), (Sarwar et al., 2024). Security is a very important and crucial issue when making electronic payments (Travilla, 2015). Security system accounting services include security measures to protect users' personal and financial information from unauthorised access or cyber attacks. Strong security is felt necessary by users, in this case umkm businessmen, when using fintech platforms. Fintech companies can offer stronger security so that customers will be more willing to agree and use these services because they are confident that their information will be safe (Aribake et al., 2020).

Based on table 2. the results of hypothesis testing (H3) that have been carried out provide results that Perceived Usefulness, perceived safety of the accounting system has an effect on intention to adopt digital payments, this can be seen from the significance value of <0.001. Based on table 4, it is known that Perceived Usefulness and perceived sefety system accounting affect the intention to adopt digital payment by 53.9% and 46.1% is influenced by other factors not examined in this study such as discounts, promotions, perceived ease of use and others. This shows that a person's interest in using fintech is influenced by Perceived Usefulness, perceived safety system accounting. This shows that umkm owners will consider using fintech technology if fintech technology has benefits for umkm owners in improving their performance and accounting system security factors related to personal data and financial transactions.

5. Conclusion

Based on the results of research that has been processed and various research discussions carried out, there are several conclusions, namely:

1. Perceived Usefulness affects the intention to adopt digital payment
2. Perceived safety system accounting affects the intention to adopt digital payment
3. Perceived Usefulness and perceived safety system accounting have an effect on intention to adopt digital payment 3.

THE INFLUENCE OF LECTURER COMPETENCE, QUALITY OF WORK LIFE, AND PERCEIVED ORGANIZATIONAL SUPPORT ON AFFECTIVE COMMITMENT AND ITS IMPLICATIONS ON THE LECTURER PERFORMANCE AT PRIVATE UNIVERSITY IN THE BANDUNG METROPOLITAN AREA

Trisnia Manggiasih[1]
[1]Faculty of Economics and Business, Jenderal Achmad Yani University, Cimahi, Indonesia

Abstract

This study aims to analyze the factors influencing lecturer performance in private universities in the Bandung Metropolitan area. The main focus of this research is on lecturer competence and quality of work life in supporting their productivity and professionalism. Using a quantitative approach, this study collected empirical data through questionnaires, which were statistically analyzed to identify the relationships between variables. The findings indicate that lecturer competence is in the moderately high to high category, with the pedagogical dimension being the most dominant, while the personality dimension still needs improvement. Meanwhile, the quality of work life is categorized as fairly good to good, with the opportunity to develop work skills as the most significant factor, whereas lecturers' rights in the workplace remain a challenge. These findings suggest the need for policies to enhance competence and improve quality of work life to support optimal lecturer performance in carrying out the Tri Dharma of Higher Education.

Keywords: Lecturer competence, quality of work life, lecturer performance, private universities, Bandung Metropolitan.1. Introduction

1. Introduction

Education is the primary foundation for the development of quality human resources. Quality education produces competitive individuals who can contribute to national progress (Griffin, 2022). In the context of higher education, lecturers play a strategic role in producing graduates who are competent and globally competitive. Law No. 20 of 2003 on the National Education System emphasizes that the goal of education is to develop students' potential so they become faithful, devout, and knowledgeable individuals (Law No. 20 of 2003).

Furthermore, the role of lecturers is regulated by Law No. 14 of 2005 on Teachers and Lecturers, which states that lecturers are professionals whose main responsibilities include carrying out the Tri Dharma of Higher Education: education and teaching, research, and community service (Law No. 14 of 2005). Therefore, to carry out these responsibilities effectively, lecturers must possess adequate competencies and work in an environment that supports their productivity and professionalism (Karlina, 2021).

However, various studies have shown that lecturer performance in Indonesia still faces several challenges. A study conducted by Manik (2018) revealed a gap between expectations and the reality of teaching and research quality among lecturers at private universities. One of the main factors affecting lecturer performance is competence, including pedagogical, professional, social, and personal aspects (Kreber, 2018). In addition, the quality of work life—covering compensation, work environment, and opportunities for self-development—is also a key determinant of performance effectiveness (Munawaroh, 2020).

On the other hand, perceived organizational support (POS) also plays a role in enhancing lecturer motivation and loyalty. Lecturers who feel valued and supported by their institutions tend to have higher affective commitment, which in turn positively impacts their productivity

and job satisfaction (Anggriawan, 2023). According to research by Darmawan (2021), lecturers with high levels of perceived organizational support are more actively engaged in research and community service compared to those who feel less supported by their institutions.

Considering these phenomena, this study aims to analyze the influence of competence, quality of work life, and perceived organizational support on affective commitment and its implications for lecturer performance at private universities in the Bandung Metropolitan Area.

2. Literature review

2.1. The Relationship Between Lecturer Competence and Quality of Work Life

There is a relationship between lecturer competence and quality of work life. This can be seen more clearly in the following theoretical explanations and previous research.

According to Karlina Ali (2022), competence has a close relationship with education. The higher the level of education, the greater the expected increase in a lecturer's competence, as advanced education is often accompanied by experience and strong dedication, which can enhance performance.

In a study by Takalao (2019), quality of work life significantly influences employee performance. Quality of work life is a major issue that deserves the organization's attention. This refers to the idea that quality of work life can enhance employee participation in the organization. The better the quality of an employee's work life, the more it positively impacts their performance within the organization.

Research conducted by Ervian Ikhe Widowati et al. (2022) also showed a significant relationship between competence and quality of work life.

Based on the theories explained and the research conducted, it can be concluded that lecturer competence has an influence on the quality of work life.

2.2. The Relationship Between Lecturer Competence and Perceived Organizational Support

There is a relationship between lecturer competence and perceived organizational support. This can be seen more clearly in the following theoretical explanations and research findings.

Jatmiko (2020) explained that there is a positive and significant relationship between competence and perceived organizational support. Competence refers to the knowledge, skills, and attitudes possessed by an employee that are relevant to the job standards, enabling them to perform the tasks designed for them effectively, both now and in the future.

Furthermore, based on the research conducted by Prima (2022), competence is a combination of mastery, knowledge, skills, values, and attitudes that are reflected in the habits of thinking and acting when carrying out tasks or work. Lecturers play a crucial role in the learning process by contributing to the development of scientific knowledge, helping students become skilled and intelligent individuals.

Didit Darmawan et al. (2021) stated that Perceived Organizational Support (POS) refers to the extent to which employees feel that the organization cares about their well-being and values their contributions. In the context of lecturers, POS includes their perception of support from the educational institution, such as financial support, professional development, and the facilities provided to support teaching and research activities.

Lecturers with high competence may also feel more appreciated by their institutions. When institutions recognize and reward outstanding lecturers, it can enhance their perception of organizational support. Based on the theories and research described, it can be concluded that there is an influence between lecturer competence and perceived organizational support.

2.3. The Relationship Between Quality of Work Life and Perceived Organizational Support

According to Darmawan (2021), quality of work life is not only about employees' opinions, attitudes, and expectations regarding their work, but also about their interpretation of

all conditions and the fulfillment of their needs, as well as their perception of satisfaction and conditions experienced within the organization where they work.

Furthermore, a previous study by Mardikaningsih (2021) showed that there is a positive and significant relationship between quality of work life and perceived organizational support, where employees' perception reflects how secure they feel and the extent to which they perceive support from their organization.

Additionally, based on the research by Ignatius (2022), quality of work life includes working conditions and environments, as well as beneficial life aspects such as work-life balance, self-actualization, compensation, and supervisory behavior. Quality of work life is a measure of how well an employee can fulfill their personal needs through their work experience within the organization.

2.4. The Influence of Lecturer Competence on Affective Commitment

According to Tadrib (2018), the effort to produce high-quality and competitive graduates requires the presence of qualified lecturers. A qualified lecturer is one who possesses a high level of competence, which includes pedagogical competence, professional competence, personal competence, and social competence.

Furthermore, based on previous studies, as explained by Widya (2022), affective commitment refers to the emotional attachment of employees to the values and goals of their organization, which can contribute to the advancement of the organization (Tang, Kang, Lee, & Park, 2021). Employees who have a strong sense of commitment to their organization are more likely to adhere to organizational rules and participate actively in its development. They are also more likely to remain with the organization compared to employees who lack such commitment. This commitment is reflected through their belief in and emotional connection to the organization.

Lecturer competence refers to the abilities possessed by a lecturer, which include mastery, knowledge, skills, values, and attitudes, all of which are reflected in habitual thinking and actions during effective and efficient teaching and learning processes aimed at shaping students to become intelligent individuals and valuable human resources (Hariroh et al., 2022; Neta et al., 2021).

2.5. The Influence of Quality of Work Life on Affective Commitment

According to Didit Darmawan (2021), the concept of quality of work life includes work ethics and several aspects of working conditions, measures of work conditions, employee satisfaction, and production efficiency. Employee welfare is a key topic within the concept of quality of work life. Quality of work life is not only about employees' opinions, attitudes, and expectations regarding their jobs but also their interpretation of all conditions and the fulfillment of their needs, as well as their perception of satisfaction and the conditions they experience in the organization where they work.

Furthermore, according to Agung (2023), there is a direct influence of quality of work life on affective commitment, a direct influence of intrinsic motivation on job satisfaction, and a direct influence of quality of work life on job satisfaction.

According to Suhardi (2023), there is a significant influence of quality of work life (QWL) on affective commitment, which involves workers being given the opportunity to make decisions about their job design and workplace, and what they need to produce products or deliver services most effectively. Quality of work life is a somewhat broad concept referring to various aspects of the work experience.

Good quality of work life plays an important role in strengthening employees' affective commitment. Organizations that provide a supportive work environment and value employee welfare tend to have employees who are more emotionally attached, loyal, and committed to the organization's long-term success.

2.6. The Influence of Perceived Organizational Support on Affective Commitment

The study conducted by Ni Made Anggun Cahayu et al. (2019) shows that Perceived Organizational Support has a significant relationship with Affective Commitment. To enhance employees' organizational commitment, organizations should be able to provide support to their employees, as the higher the support given, the greater the job satisfaction experienced by the employees.

Research on the relationship between perceived organizational support and affective commitment was also conducted by Intan (2022). Perceived Organizational Support plays an important role in increasing affective commitment. When employees feel that the organization supports them—whether in terms of well-being, recognition, or interpersonal relationships—they tend to develop a stronger emotional attachment, which ultimately increases their loyalty and desire to contribute optimally to the organization.

When employees feel that the organization supports them, either through recognition of their contributions or concern for their well-being, it can enhance their emotional attachment to the organization. The perceived support makes employees feel valued, which strengthens their affective commitment.

2.7. The Influence of Affective Commitment on Lecturer Performance

According to Muhammad Ras (2018), affective commitment shows a significant relationship with performance. To enhance employees' organizational commitment, organizations should be able to provide support to their employees, as the higher the support given, the greater the job satisfaction experienced by employees.

Furthermore, a previous study by Rayu (2020) found that affective commitment has a significant influence on optimal performance—performance that meets organizational standards and supports the achievement of organizational goals. An organization that strives to improve the capabilities of its human resources is a good organization, and this is an important factor in enhancing employee performance. Improved employee performance will naturally lead to progress for the organization. Performance management refers to all activities undertaken to improve organizational or company performance, including the performance of individual employees and workgroups within the organization.

M. Adhan (2020) states that the success of an educational institution can be seen from the performance of its lecturers. Lecturer performance refers to the ability of a lecturer to carry out assigned tasks and to complete them effectively.

Affective commitment plays an important role in enhancing lecturer performance. Lecturers who feel emotionally attached to their institutions are more motivated to make maximum contributions—whether in teaching, research, or other activities that support the institution's mission and objectives.

3. Methodology

This study is both descriptive and verificative in nature. Descriptive research is a type of conclusive research that aims to obtain a description of the independent and dependent variables (Malhotra, 2020). There were 375 randomly selected respondents in Permanent lecturers at private universities in the Bandung metropolitan area.

This study employed a cross-sectional method, in which data were collected at a specific point in time to evaluate the relationships between variables. The data analysis technique used is Structural Equation Modeling (SEM) with the assistance of Lisrel 8.8 software. SEM was chosen because it allows for the analysis of complex relationships between latent and manifest variables.

3.1. Theoretical framework

The theoretical framework of this study is grounded in management science as the grand theory, with human resource management and organizational behavior serving as the middle-range theories. Organizations, in their efforts to achieve their goals, must navigate rapidly changing environments, making the role of human resources critically important. This is equally true in educational institutions, where human resources play a vital role in the institution's development. All stakeholders—such as principals, teachers, staff, students, and parents—interact to form the organizational culture of the institution.

Therefore, in educational institutions, human resources, particularly teachers or lecturers, are the most valuable assets that must be continuously developed and supported.

In this study, Competence, Quality of Work Life, and Perceived Organizational Support are the independent variables, Affective Commitment is the intervening variable, and Performance is the dependent variable. All these elements are classified under Applied Theory.

3.2. Conceptual framework

This conceptual framework is a contribution to advance the cognizance of the work from home environment influences productivity. Figure 1 showed that there are two main variables, job demands and job resources, that classify an employees' working condition. Job demands are the physical, psychological, social or organizational aspects of a job that require physical and/or psychological effort from an individual. They are associated with a physical and/or psychological cost and can include time pressures, heavy workloads, stressful working environments, role ambiguity and poor work relationships. On the other hand, job resources are the physical, psychological, social or organization factors that enable an individual to achieve goals and reduce stress.

The model asserts that employee well-being can be negatively impacted when job demands are high, and job resources are low, resulting in high strain and low motivation. Alternatively, when job demands are high and job resources are high, engagement and performance is improved, as illustrated in Figure 1.

3.3. Instrumentation

The research instrument used was a questionnaire with a 5-point Likert scale (1 = strongly disagree, 5 = strongly agree). The variables measured in this study include:

- Lecturer competence (subject mastery, innovation in teaching, use of technology in learning)
- Quality of work life (work environment, work-life balance, social support)
- Perceived organizational support (institutional support, recognition of achievements, career development opportunities)
- Affective commitment (loyalty, sense of belonging to the institution, work motivation)
- Lecturer performance (teaching effectiveness, research contributions, involvement in community service)

Data were processed using SPSS 27 and Lisrel 8.72, with tests for validity, reliability, and path analysis.

Validity and Reliability Testing

- Validity: All indicators had a correlation value > 0.300, indicating that all items were valid.
- Reliability: The Cronbach's Alpha coefficients ranged from 0.804 to 0.917, indicating a high level of reliability.

As a result of using Structural Equation Modeling with LISREL 8.7, the model shown in Figure 4.1

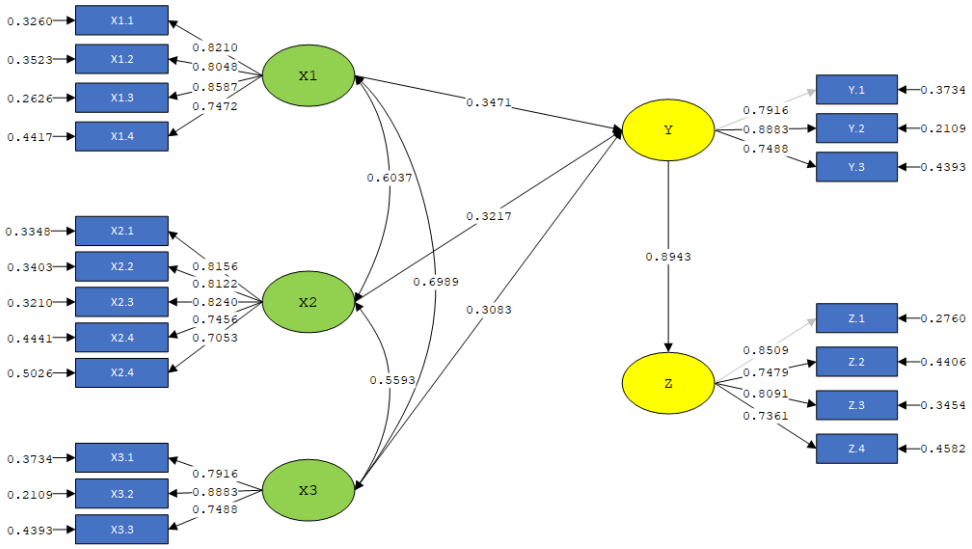

Figure 1. Research paradigm: Structural Equation Modeling (SEM)

4. Results and discussions

a. Validity Test of Lecturer Competence

Variable	Item Pertanyaan	r-hitung	r-kritis	Keterangan
Kompetensi Dosen	Item 1	0,709	0,300	Valid
	Item 2	0,368	0,300	Valid
	Item 3	0,759	0,300	Valid
	Item 4	0,668	0,300	Valid
	Item 5	0,764	0,300	Valid
	Item 6	0,696	0,300	Valid
	Item 7	0,694	0,300	Valid
	Item 8	0,661	0,300	Valid
	Item 9	0,379	0,300	Valid
	Item 10	0,692	0,300	Valid
	Item 11	0,604	0,300	Valid
	Item 12	0,627	0,300	Valid
	Item 13	0,650	0,300	Valid
	Item 14	0,588	0,300	Valid
	Item 15	0,593	0,300	Valid
	Item 16	0,309	0,300	Valid
	Item 17	0,534	0,300	Valid
	Item 18	0,426	0,300	Valid
	Item 19	0,325	0,300	Valid
	Item 20	0,409	0,300	Valid

Based on table the questionnaire on Lecturer Competence, which consists of 20 indicators across 4 dimensions, is considered valid because the calculated r-value (r-count) is greater than the critical r-value of 0.300.

b. Validity Test of the Quality of Work Life Variable

Variable	Item Pertanyaan	r-hitung	r-kritis	Keterangan
Kualitas Kehidupan Kerja	Item 1	0,567	0,300	Valid
	Item 2	0,712	0,300	Valid
	Item 3	0,687	0,300	Valid
	Item 4	0,649	0,300	Valid
	Item 5	0,607	0,300	Valid
	Item 6	0,576	0,300	Valid
	Item 7	0,602	0,300	Valid
	Item 8	0,618	0,300	Valid
	Item 9	0,562	0,300	Valid
	Item 10	0,537	0,300	Valid
	Item 11	0,532	0,300	Valid
	Item 12	0,342	0,300	Valid
	Item 13	0,540	0,300	Valid
	Item 14	0,568	0,300	Valid
	Item 15	0,594	0,300	Valid
	Item 16	0,356	0,300	Valid
	Item 17	0,308	0,300	Valid
	Item 18	0,395	0,300	Valid
	Item 19	0,356	0,300	Valid
	Item 20	0,471	0,300	Valid
	Item 21	0,487	0,300	Valid
	Item 22	0,526	0,300	Valid
	Item 23	0,531	0,300	Valid
	Item 24	0,488	0,300	Valid
	Item 25	0,304	0,300	Valid

Based on Table, the questionnaire on Quality of Work Life, which consists of 25 indicators across 4 dimensions, is considered valid because the calculated r-value (r-count) is greater than the critical r-value of 0.300.

c. Validity Test of the Perceived Organizational Support

Variable	Item Pertanyaan	r-hitung	r-kritis	Keterangan
Persepsi Dukungan Organisasi	Item 1	0,695	0,300	Valid
	Item 2	0,792	0,300	Valid
	Item 3	0,730	0,300	Valid
	Item 4	0,706	0,300	Valid
	Item 5	0,698	0,300	Valid
	Item 6	0,775	0,300	Valid
	Item 7	0,801	0,300	Valid
	Item 8	0,743	0,300	Valid
	Item 9	0,732	0,300	Valid
	Item 10	0,739	0,300	Valid
	Item 11	0,747	0,300	Valid
	Item 12	0,760	0,300	Valid
	Item 13	0,746	0,300	Valid
	Item 14	0,767	0,300	Valid

Variable	Item Pertanyaan	r-hitung	r-kritis	Keterangan
	Item 15	0,642	0,300	Valid

Based on Table, the questionnaire on Perceived Organizational Support, which consists of 15 indicators across 4 dimensions, is considered valid because the calculated r-value (r-count) is greater than the critical r-value of 0.300.

d. Validity Test of the Affective Commitment

Variable	Item Pertanyaan	r-hitung	r-kritis	Keterangan
Komitmen Afektif	Item 1	0,471	0,300	Valid
	Item 2	0,612	0,300	Valid
	Item 3	0,625	0,300	Valid
	Item 4	0,642	0,300	Valid
	Item 5	0,758	0,300	Valid
	Item 6	0,699	0,300	Valid
	Item 7	0,752	0,300	Valid
	Item 8	0,701	0,300	Valid
	Item 9	0,707	0,300	Valid
	Item 10	0,693	0,300	Valid
	Item 11	0,664	0,300	Valid
	Item 12	0,656	0,300	Valid
	Item 13	0,629	0,300	Valid
	Item 14	0,639	0,300	Valid
	Item 15	0,600	0,300	Valid

Based on Table, the questionnaire on Affective Commitment, which consists of 15 indicators across 3 dimensions, is considered valid because the calculated r-value (r-count) is greater than the critical r-value of 0.300.

e. Validity Test of the Lecturer Performance

Variable	Item Pertanyaan	r-hitung	r-kritis	Keterangan
Kinerja Dosen	Item 1	0,687	0,300	Valid
	Item 2	0,680	0,300	Valid
	Item 3	0,623	0,300	Valid
	Item 4	0,655	0,300	Valid
	Item 5	0,621	0,300	Valid
	Item 6	0,599	0,300	Valid
	Item 7	0,598	0,300	Valid
	Item 8	0,624	0,300	Valid
	Item 9	0,587	0,300	Valid
	Item 10	0,594	0,300	Valid
	Item 11	0,634	0,300	Valid
	Item 12	0,514	0,300	Valid
	Item 13	0,650	0,300	Valid
	Item 14	0,628	0,300	Valid
	Item 15	0,545	0,300	Valid
	Item 16	0,322	0,300	Valid
	Item 17	0,483	0,300	Valid
	Item 18	0,452	0,300	Valid

Variable	Item Pertanyaan	r-hitung	r-kritis	Keterangan
	Item 19	0,422	0,300	Valid
	Item 20	0,310	0,300	Valid

Based on Table, the questionnaire on Lecturer Performance, which consists of 20 indicators across 4 dimensions, is considered valid because the calculated r-value (r-count) is greater than the critical r-value of 0.300.

f. Reliability Test

Pengujian Reliabilitas Variabel

Variable	r-hitung	r-tabel	Keterangan
Kompetensi Dosen	0,886	0,700	Reliabel
Kualitas Kehidupan Kerja	0,880	0,700	Reliabel
Persepsi Dukungan Organisasi	0,940	0,700	Reliabel
Komitmen Afektif	0,906	0,700	Reliabel

Based on the results of the reliability test above, the reliability coefficients of the research instrument are greater than 0.700, which means all the research variables are considered reliable or meet the requirements. Since both the validity and reliability tests indicate that all variables are valid and reliable, it means that the instrument (questionnaire) used is valid and reliable.

Results of Data Normality Test

One-Sample Kolmogorov-Smirnov Test

		Kompetensi Dosen	Kualitas Kehidupan Kerja	Persepsi Dukungan Organisasi	Komitmen Afektif	Kinerja Dosen
N		375	375	375	375	375
Normal Parameters[a,b]	Mean	64.0667	79.9653	50.2000	50.1280	65.8293
	Std. Deviation	9.52836	11.13031	9.47019	9.07483	9.41143
Most Extreme Differences	Absolute	.088	.161	.081	.075	.094
	Positive	.088	.161	.062	.048	.079
	Negative	-.071	-.092	-.081	-.075	-.094
Test Statistic		.088	.161	.081	.075	.094
Asymp. Sig. (2-tailed)[c]		.097	.061	.104	.125	.093

a. Test distribution is Normal.

b. Calculated from data.

c. Lilliefors Significance Correction.

Based on the results of the normality test presented in Table above, the model shows multivariate normality assumptions are met, where the Asymp. Sig (2-tailed) probability values obtained are greater than the established significance level (0.05) for all variables. Therefore, it can be concluded that the data to be processed have a normal distribution.

5. Conclusion

Based on the results of data analysis and discussion, this study produces several main conclusions:

1. Lecturer Competence at Private Universities in the Bandung Metropolitan Area is categorized as fairly high to high. The largest dimension is Pedagogical competence, while the smallest dimension is Personality. Lecturer competence is still uneven among lecturers.
2. The Quality of Work Life of lecturers at Private Universities in the Bandung Metropolitan Area is categorized as fairly good to good. The largest dimension is the Opportunity to

Use and Develop Work Environment Skills, while the smallest dimension is the Rights of Lecturers/Staff within the Office.

3. Perceived Organizational Support is categorized as fairly high to high. The largest dimension is Supervisory Support, while the smallest dimension is Perceived Fairness.
4. Affective Commitment of lecturers at Private Universities in the Bandung Metropolitan Area is categorized as fairly high to high. The largest dimension is Personal Characteristics, while the smallest dimension is Organizational Characteristics.

BRAND AWARENESS AND BRAND IMAGE ON REPURCHASE INTENTION WITH CUSTOMER SATISFACTION AS A MEDIATING VARIABLE AT AMBOINA RESTAURANT BANGKALAN

Arya Satya Pratama[1], Nurita Andriani[1], Deykha Aguilika[1]
[1]Universitas Trunojoyo Madura, Bangkalan, Indonesia

Abstract

This study aims to analyze the influence of brand awareness and brand image on repurchase intention with customer satisfaction as a mediating variable at Restoran Amboina, Bangkalan. The research employs a quantitative approach, utilizing a sample of 50 respondents who have made multiple purchases at the restaurant. The findings indicate that both brand awareness and brand image significantly affect customer satisfaction. Furthermore, customer satisfaction serves as a mediator that strengthens the relationship between brand awareness and repurchase intention, as well as between brand image and repurchase intention. The results highlight the importance of not only enhancing brand awareness but also managing a positive brand image to foster customer loyalty and encourage repeat purchases. The study concludes that in the competitive culinary business, understanding and meeting customer expectations is crucial for maintaining loyalty and driving repurchase decisions.

Keywords: Brand Awareness, Brand Image, Customer Satisfaction, Repurchase Intention.

1. Introduction

Amboina restaurant Bangkalan is one of the famous food stalls in Bangkalan, Madura. This food stall has been established since 1965 and has become one of the culinary tourism destinations in Bangkalan. However, with the increasing number of food stalls popping up in Bangkalan, the Amboina Bangkalan gang restaurant must try to maintain customer satisfaction and increase repurchase decisions.

According to Kotler (2017), customer satisfaction is the result of a comparison between customer expectations and product or service performance. If customer satisfaction is not met, the customer will look for other alternatives that are more satisfying (Kotler, 2017). Therefore, the Amboina food stall in Bangkalan Alley must ensure that customer satisfaction is a top priority in its marketing strategy.

In addition, brand awareness and brand image are also very important in increasing customer satisfaction and repurchase decisions. According to Aaker (1991), brand awareness is the ability of customers to remember and recognize brands. Brand image is the image or picture formed by customers about the brand (Aaker, 1991). If brand awareness and brand image are positive, then customers will be more likely to buy products or services from that brand.

Customer satisfaction can influence repurchase decisions. If customers are satisfied with the product or service they buy, then they will be more likely to buy the same product or service again in the future (Oliver, 1997).

According to Blackwell (2001), consumer behaviour is influenced by various factors, including customer satisfaction and repurchase decisions. If customers are satisfied with the product or service they purchase, then they will be more likely to purchase the same product or service again in the future (Blackwell, 2001).

Problem Formulation

The problem formulations in this study are:

1. What is the effect of Brand Awareness (X1) on Repurchase Decisions (Y) at Amboina Restaurant, Bangkalan?
2. What is the effect of Brand Image (X2) on Repurchase Decisions (Y) at Amboina Restaurant, Bangkalan?
3. What is the effect of Brand Awareness (X1) on Repurchase Decisions (Y) through Customer Satisfaction (Z) as a mediating variable?
4. What is the effect of Brand Image (X2) on Repurchase Decisions (Y) through Customer Satisfaction (Z) as a mediating variable?
5. What is the effect of the Repurchase Decision (Y) on Customer Satisfaction (Z) at Amboina Restaurant, Bangkalan?
6. What is the effect of Brand Awareness (X1) on Customer Satisfaction (Z) at Amboina Restaurant, Bangkalan?
7. What is the effect of Brand Image (X2) on Customer Satisfaction (Z) at Amboina Restaurant, Bangkalan?

Research Objectives

The objectives of this study are:

1. Analyzing the Effect of Brand Awareness (X1) on Repurchase Decisions (Y).
2. Analyzing the Effect of Brand Image (X2) on Repurchase Decisions (Y).
3. Analyzing the Effect of Brand Awareness (X1) on Repurchase Decisions (Y) through Customer Satisfaction (Z) as a Mediating Variable.
4. Analyzing the Effect of Brand Image (X2) on Repurchase Decisions (Y) through Customer Satisfaction (Z) as a Mediating Variable.
5. Analyzing the Effect of Repurchase Decision (Y) on Customer Satisfaction (Z).
6. Analyzing the Effect of Brand Awareness (X1) on Customer Satisfaction (Z).
7. Analyzing the Effect of Brand Image (X2) on Customer Satisfaction (Z)

2. Literature review

2.1. Brand Awarness

Brand Awareness refers to the extent to which consumers are familiar with a particular brand and can recognize or recall it. It is an important component of brand equity and plays an important role in the consumer decision-making process. Brand awareness can be grouped into two main types: brand recognition (the ability to recognize a brand when prompted) and brand recall (the ability to retrieve a brand from memory when given a product category). According to Aaker (1991), brand awareness is one of the key dimensions of brand equity that influences consumer perception and behaviour. Strong brand awareness can generate a positive brand image and increase customer loyalty.

The importance of brand awareness has many aspects. Keller (1993) emphasizes that brand awareness is very important for consumers to consider a brand during the buying process. Consumers are more likely to choose brands they recognize over brands they are not familiar with, which can significantly affect market share. Research by Chaudhuri and Holbrook (2001) shows that higher levels of brand awareness can lead to greater levels of brand loyalty. When consumers are aware of a brand, they are more likely to develop a preference for the brand, which results in repeat purchases. In addition, a study by Huang and Sarigöllü (2014) found that brands with higher awareness tend to be competitive in the market, especially in crowded markets where consumers have many alternatives.

2.2. Brand Image

Brand image is an important element in marketing strategy that can influence purchasing decisions and customer loyalty. According to Aaker (1991), brand image refers to a set of associations and perceptions that consumers have about a brand. This includes the attributes, benefits, and values associated with the brand. Aaker emphasizes that a strong brand image can

help companies differentiate their products from competitors and create customer loyalty. Keller's (1993) brand image in the Customer-Based Brand Equity (CBBE) model that a positive brand image can increase customer loyalty, influence purchasing decisions, and create a higher perception of value in the eyes of consumers. This shows that brand image is not just a superficial concept, but also a strategic asset that can affect business performance.

Kotler and Keller (2016) further emphasize the significance of the brand image. They argue that brand image is the result of consumers' experiences with the brand, including interactions with products, services, and marketing communications. They emphasize that companies must actively manage their brand image to ensure that the image formed is in line with the brand's values and goals. Bennett and Rundle-Thiele (2005) also support the importance of brand image in creating customer loyalty. They found that a positive brand image can increase customer satisfaction and encourage repeat purchases, indicating a direct relationship between brand image and purchasing decisions.

2.3. Customer Satisfaction

Customer satisfaction is the result of a comparison between customer expectations and the performance of the product or service received. According to Kotler and Keller (2016), customer satisfaction occurs when product or service performance meets or exceeds customer expectations. If the product or service performance is below expectations, the customer will feel dissatisfied. Therefore, understanding customer expectations is very important for companies to be able to meet or even exceed their expectations. Research by Kumar and Reinartz (2016) also shows that customer satisfaction contributes to customer loyalty, which in turn can increase company profitability.

According to Choudhury and Kar (2018), customer satisfaction not only affects repurchase decisions but also affects word-of-mouth recommendations. They found that satisfied customers tend to recommend products or services to others, which can increase the company's market share. In addition, research by Ali et al. (2016) showed that customer satisfaction is positively related to brand image, which can increase customer loyalty and overall business performance.

Ladhari (2016) emphasizes that good service quality contributes to customer satisfaction. Ladhari found that service quality dimensions such as reliability, responsiveness, and empathy strongly influence customer satisfaction. Homburg et al. (2017) showed that customer satisfaction can influence repurchase intentions and loyalty, so companies should focus on improving customer experience to create stronger relationships and improve overall business performance.

2.4. Repurchase Decision

A customer's decision to purchase the same product or service in the future, defined by Oliver (1997) as customer loyalty, is one of the important aspects of marketing. Customer loyalty not only reflects satisfaction with the product or service that has been purchased but also includes a commitment to continue to choose a particular brand or company in the future. According to Kotler and Keller (2016), customer loyalty can result from consistent positive experiences, where customers feel that the products or services they choose meet or exceed their expectations.

According to Kumar and Reinartz (2016), there is a positive relationship between customer satisfaction and loyalty, where satisfied customers tend to make repeat purchases. Choudhury and Kar (2018) also assert that word-of-mouth recommendations, which often stem from positive customer experiences, can influence repurchase decisions. This suggests that companies should focus on improving customer experience to build strong loyalty.

Homburg et al. (2017) showed that factors such as product quality, customer service, and brand image contribute to repurchase decisions. They found that customers who feel valued

and get good service are more likely to return and make a purchase. Ladhari (2016) also emphasized the importance of service quality in building customer loyalty, where dimensions such as reliability and responsiveness strongly influence repurchase decisions. Thus, companies need to manage all aspects of the customer experience to ensure that they not only gain new customers but also retain existing ones.

2.5. Relationship between Variables

Brand Awareness (X1) → Repurchase Decision (Y): High brand awareness can increase the likelihood of customers making repurchases. When customers recognize and remember a brand, they are more likely to choose products from that brand when making future purchases.

Brand Image (X2) → Customer Satisfaction (Z): A good brand image can increase customer satisfaction. Customers who have a positive image of the brand tend to feel more satisfied with their experience because they associate the brand with good quality and value.

Brand Awareness (X1) → Customer Satisfaction (Z): Brand awareness can affect customer satisfaction. When customers recognize the brand and have clear expectations about the product or service, they are more likely to feel satisfied if the product meets or exceeds their expectations.

Brand Image (X2) → Customer Satisfaction (Z): A good brand image can increase customer satisfaction. Customers who have a positive image of the brand tend to feel more satisfied with their experience because they associate the brand with good quality and value.

Customer Satisfaction (Z) → Repurchase Decision (Y): Customer satisfaction serves as a mediator between brand awareness and brand image with repurchase decisions. Customers who are satisfied with their experience are more likely to make repeat purchases, regardless of how well they recognize the brand or how positive the brand image is.

Brand Awareness (X1) → Customer Satisfaction (Z) → Repurchase Decision (Y): In this relationship, brand awareness not only affects repurchase decisions directly but also through customer satisfaction. If customers have high awareness of the brand and are satisfied, they will be more likely to make a repurchase.

Brand Image (X2) → Customer Satisfaction (Z) → Repurchase Decision (Y): Similarly, a positive brand image can increase customer satisfaction, which in turn affects repurchase decisions. Customers who have a positive image of the brand and feel satisfied with the product or service will be more likely to repurchase.

3. Methodology

This study uses a quantitative approach which aims to analyze the relationship between the independent variables (Brand Awareness and Brand Image), the mediating variable (Customer Satisfaction), and the dependent variable (Repurchase Decision). According to Sugiyono (2016), quantitative research is used to test hypotheses based on numerical data and uses statistical analysis tools.

The population in this study were people of productive age in Bangkalan Regency, which amounted to 658,352 people according to data from the Central Statistics Agency (BPS). With the criteria that the sample had bought more than once at RM Amboina. Given the very large population, sampling was done using the Slovin formula.

Slovin Formula:

$n = N / (1 + (N * e2))$

Where:

n = Number of samples

N = Total population (658,352)

e = Margin of error (0.15)

n = 658,352 / (1 + (658,352 * 0.15^2)) n = 44.44 ≈ 50

So, with a margin of error of 15%, the sample required is around 50 respondents.

This research uses a purposive sampling technique, where respondents are selected based on certain criteria, namely customers who have made transactions at Amboina Restaurant. This technique is considered appropriate for obtaining data from customers who are relevant to the research topic.

Data was collected through a questionnaire distributed to 100 respondents. The questionnaire uses a 5-point Likert scale to measure the respondent's level of agreement with statements related to Brand Awareness, Brand Image, Customer Satisfaction, and Purchasing Decisions. Measurement using a Likert scale can help in measuring attitude and perception variables, as described by Sugiyono (2016).

Before data analysis is carried out, validity and reliability tests need to be carried out to ensure that the research instrument is suitable for use. The validity test is used to measure whether the items in the questionnaire actually measure what should be measured (Ghozali, 2018). Meanwhile, the reliability test is carried out to ensure the consistency of the measurement results of the same instrument in different situations.

Data were analyzed using SmartPLS (Partial Least Square) to test the relationship between the research variables. SmartPLS was chosen because it is able to analyze complex structural models with mediating variables, as stated by Hair et al. (2014). This analysis allows researchers to see the direct and indirect effects between independent and dependent variables, as well as the role of mediating variables. The analysis steps taken are:

1. Measurement Model Test (Outer Model): To test the validity and reliability of measurement items.
2. Structural Model Test (Inner Model): To test the relationship between variables in the research model, both directly and indirectly.
3. Hypothesis Test: Hypothesis testing is done by looking at the t-statistic and p-value to determine the significance of the relationship between variables.

4. Results and discussions

Results of Validity Testing

Validity testing is conducted to determine whether a questionnaire is valid or not. A questionnaire is considered valid if its questions can reflect the aspects that the questionnaire aims to measure. In this study, validity testing was performed by analyzing convergent validity and discriminant validity. Below are the results of the validity tests conducted in this research involving 50 respondents.

The Average Variance Extracted (AVE) method was used to assess the discriminant validity of each construct and latent variable. The AVE value should be greater than 0.50 (Ghozali & Latan, 2015: 74). In this research model, the AVE values for each variable are above 0.50, as shown in Table 1 below:

Table 1: Results of Average Variance Extracted (AVE)
Construct Reliability and Validity

Variabel	Cronbach's Alpha	rho_A	Reliabilitas Komposit	Rata-rata Varians Diekstrak (AVE)
X1	0.939	0.941	0.961	0.891
X2	0.962	0.963	0.969	0.841
Y	0.973	0.973	0.978	0.880
Z	0.957	0.959	0.972	0.921

Sumber: Output SmartPLS 3 processed 2024

From Table 1 above, since there are no issues with convergent validity, discriminant validity testing will be conducted. Discriminant validity relates to the principle that measurements (manifest variables) from different constructs should not have a high correlation. To obtain the discriminant validity value, the method used is to consider the square root of the AVE. The desired square root value must be higher than the correlation values, which can be seen in Table 2 below:

Tabel 2 Results Square Root Of Variance Extacted (AVE)
Discriminant Validity

Variabel	X1	X2	Y	Z
X1	0.944			
X2	0.926	0.917		
Y	0.836	0.883	0.938	
Z	0.710	0.780	0.841	0.960

Sumber: Output SmartPLS 3 processed 2024

From Table 2 above, it can be stated that the square root of the AVE for all constructs is higher than the relationships between those variables and other variables. The square root of the AVE and the values below it refer to the correlation values between constructs. Thus, it is evident that the square root of the AVE is greater than the correlation values. Therefore, it can be concluded that all variables in this study are valid as they have met the criteria for discriminant validity. This discriminant validity is obtained by considering the cross-loading values in the measurement of the constructs. The cross-loading values indicate the level of relationship between each construct and its indicators, as well as the indicators of other constructs.

Results of Reliability Testing

Reliability testing is used in this study to examine and demonstrate whether the instrument can be trusted, is appropriate, accurate, and consistent in collecting data. To assess the reliability of the variables, there are two methods that can be used: Cronbach's Alpha (α) and composite reliability, often referred to as Dillon Goldstein's Rule of Thumb. Reliability can be considered acceptable if the Cronbach's Alpha value is greater than 0.6; if the Cronbach's Alpha value is less than 0.60, then the data from the questionnaire is considered unreliable or inconsistent (Ghozali & Latan, 2015).

Tabel 3 Value Crombach's Alpha dan Composite Reliability
Construct Reliability and Validity

Variabel	Cronbach's Alpha	rho_A	Reliabilitas Komposit	Rata-rata Varians Diekstrak (AVE)
X1	0.939	0.941	0.961	0.891
X2	0.962	0.963	0.969	0.841
Y	0.973	0.973	0.978	0.880
Z	0.957	0.959	0.972	0.921

Sumber: Output SmartPLS 3 processed 2024

As seen from Table 3 above, the results of the reliability testing indicate that both Cronbach's Alpha and Composite Reliability for all variables have values above 0.60.

Therefore, it can be concluded that all variables are reliable and meet the reliability testing criteria.

Test R-Square

The first step in testing the inner model or structural model is to examine the R-square values, which are presented in Table 4 below:

Tabel 4 Value R-Square

Variabel	R Square	Adjusted R Square
Y	0.782	0.772
Z	0.718	0.699

Sumber: Output SmartPLS 3 processed 2024

Based on the regression analysis results shown in the table, the R Square value for variable Y is 0.782, and for variable Z, it is 0.718. Referring to the categories proposed by Hair et al. (2011) and Ghozali & Latan (2015), an R Square value above 0.75 indicates that variable Y falls into the strong category. The remaining 21.8% of the variation is influenced by other factors not included in this study.

Meanwhile, the R Square value for variable Z is 0.718, which also indicates a strong category. Thus, 28.2% of the remaining variation is influenced by other variables not included in this research.

Overall, these results indicate that both variables Y and Z have a significant relationship with the independent variables studied, and the regression model used is quite effective in explaining the variation in the data. However, it is important to note that although both variables show strong R Square values, there is still a significant proportion of variation that cannot be explained by the model, highlighting the need for further research to identify other factors that may contribute.

Test Bootstapping Direct Effect

The hypothesis testing for direct effects in this research is conducted by examining the obtained T-Statistic and P-Values. The T-Statistic and P-Values in SmartPLS 3 are obtained through a bootstrapping process applied to the model that has been validated and deemed reliable. The hypothesis is accepted if the T-Statistic value is greater than the T-table value of 3.210 or if the P-Values are less than 0.001. The results of the hypothesis testing are displayed in Table 5 below:

Tabel 5 Test Value Bootstapping Direct Effect

Path Coefficients Direct Effects

Variabel	**Sampel Asli (O)**	**Rata-rata Sampel (M)**	**Standar Deviasi (STDEV)**	**T Statistik (|O/STDEV|)**
X1 -> Y	0.128	0.068	0.254	0.504
X1 -> Z	-0.178	-0.257	0.368	0.484
X2 -> Y	0.764	0.824	0.232	3.289
X2 -> Z	0.323	0.412	0.431	0.750
Y -> Z	0.704	0.693	0.254	2.773

Sumber: Output SmartPLS 3 processed 2024

From Table 5 above, the results of the Bootstrapping test using SmartPLS 3 can be explained as follows:

The Influence of Brand Awareness (X1) on Repurchase Decision (Y)

Data shows that the T-Statistic value for the influence of Brand Awareness (X1) on Repurchase Decision (Y) is 0.504, which is lower than 1.96. This indicates that the influence of Brand Awareness on repurchase decisions is not significant. According to Aaker (1991), brand awareness is a key component of brand equity. Although it is important, research shows that brand awareness does not always guarantee repurchase decisions. Consumers may recognize a brand but may not have a positive experience or feel connected to that brand (Keller, 1993). Therefore, Brand Awareness contributes less significantly to Repurchase Decisions.

The Influence of Brand Image (X2) on Repurchase Decision (Y)

On the other hand, the T-Statistic value for the influence of Brand Image (X2) on Repurchase Decision (Y) is 3.289, which is greater than 1.96, indicating that this influence is significant. Brand Image is the consumer's perception of a brand formed through experiences and interactions. According to Kotler and Keller (2016), a positive brand image can enhance customer loyalty and encourage repurchase decisions. Research shows that a strong brand image can create trust among consumers, thereby increasing the likelihood of them making a repurchase (Chaudhuri & Holbrook, 2001). Thus, Brand Image has a strong positive influence on Repurchase Decisions.

The Influence of Repurchase Decision (Y) on Customer Satisfaction (Z)

The T-Statistic value for the influence of Repurchase Decision (Y) on Customer Satisfaction (Z) is 2.773, which is greater than 1.96, indicating that this influence is significant. Customer satisfaction is the consumer's evaluation of their experience with a product or service. According to Oliver (1999), customer satisfaction is the result of a comparison between expectations and actual performance. Repurchase decisions are often influenced by the level of customer satisfaction. If customers feel satisfied, they are more likely to make a repurchase (Anderson & Fornell, 1994). Therefore, Repurchase Decisions have a significant influence on Customer Satisfaction.

The Influence of Brand Awareness (X1) on Customer Satisfaction (Z)

Data shows that the T-Statistic value for the influence of Brand Awareness (X1) on Customer Satisfaction (Z) is 0.484, which is lower than 1.96, indicating that this influence is not significant. Although brand awareness is important, its impact on customer satisfaction is not always direct. According to Kotler and Keller (2016), customer satisfaction is more influenced by product quality and customer experience than by brand awareness alone. Research indicates that brand awareness can contribute to customer satisfaction, but its contribution may be limited if not accompanied by positive experiences and good product quality (Aaker, 1991). Therefore, Brand Awareness has a limited contribution to Customer Satisfaction.

The Influence of Brand Image (X2) on Customer Satisfaction (Z)

Lastly, the T-Statistic value for the influence of Brand Image (X2) on Customer Satisfaction (Z) is 0.750, which is lower than 1.96, indicating that this influence is not significant. Brand Image can affect customer satisfaction through the perceived quality and value offered by the brand. According to Zeithaml (1988), the value perceived by customers contributes to their satisfaction. Although a positive brand image can enhance customer satisfaction, the insignificant influence of Brand Image on Customer Satisfaction suggests that other factors, such as product and service quality, may be more influential in determining customer satisfaction (Fornell, 1992).

The Influence of Brand Awareness (X1) on Repurchase Decision (Y) through Customer Satisfaction (Z) as a Mediating Variable

The analysis results show that the total influence of Brand Awareness (X1) on Repurchase Decision (Y) through Customer Satisfaction (Z) is -0.303. This negative influence indicates that an increase in Brand Awareness tends to decrease repurchase decisions when mediated by Customer Satisfaction. While Brand Awareness is important in building consumer awareness, the overall impact on repurchase decisions becomes negative, which may be due to other unmeasured factors in this model. According to Aaker (1991), Brand Awareness is the consumer's ability to recognize or recall a specific brand, which should positively contribute to purchase decisions. However, if the customer's experience with the product does not meet their expectations, it can lead to dissatisfaction, resulting in lower purchase decisions. Therefore, while Brand Awareness can enhance brand recognition, it is crucial to ensure that customer experiences are also positive to encourage better repurchase decisions.

The Influence of Brand Image (X2) on Repurchase Decision (Y) through Customer Satisfaction (Z)

The analysis results show that the total influence of Brand Image (X2) on Repurchase Decision (Y) through Customer Satisfaction (Z) is 0.992. This significant positive influence indicates that an increase in Brand Image contributes positively to repurchase decisions through Customer Satisfaction. This suggests that a good Brand Image can enhance customer satisfaction, which in turn increases repurchase decisions. According to Keller (1993), Brand Image is the consumer's perception of a brand formed through experiences, communication, and interactions with that brand. A positive Brand Image not only creates trust and loyalty among consumers but also enhances customer satisfaction because consumers feel that the brand meets or even exceeds their expectations. Thus, this research emphasizes the importance of building and maintaining a strong brand image to drive higher customer satisfaction and repurchase decisions.

Results of Bootstrapping Test (Indirect Effects)

To demonstrate whether Customer Satisfaction (Z) can serve as an intervening variable that mediates the effects of Brand Awareness (X1) and Brand Image (X2) on Repurchase Decision (Y), the following presents the results of the indirect effects test in the table below:

Tabel 6 Results Bootstapping Indirect Effect Test

Specific Indirect Effects

Variabel	Sampel Asli (O)	Rata-rata Sampel (M)	Standar Deviasi (STDEV)	T Statistik (|O/STDEV|)	P Values
X1 -> Y -> Z	0.090	0.052	0.182	0.494	**0.621**
X2 -> Y -> Z	0.538	0.567	0.253	2.127	**0.033**

Sumber: Output SmartPLS 3 Processed 2024

According to the table above, it can be observed that there are two relationships indicating the presence or absence of indirect effects among the variables, which can be explained as follows:

Brand Awareness (X1) on Repurchase Decision (Y) through Customer Satisfaction (Z)

The results of the bootstrapping test indicate that the influence of Customer Satisfaction (Z) as an intervening variable in the relationship between Brand Awareness (X1) and Repurchase Decision (Y) is not significant. The original sample value (O) is 0.090, with a T-Statistic of 0.494 and a P-Value of 0.621. A P-Value greater than 0.05 suggests that this

influence is not significant, meaning that Customer Satisfaction does not function as a mediator in the relationship between Brand Awareness and Repurchase Decision.

Therefore, it can be concluded that although Brand Awareness is important in building brand recognition, its influence on repurchase decisions through customer satisfaction is not proven to be significant in this study.

Brand Image (X2) on Repurchase Decision (Y) through Customer Satisfaction (Z)

The results of the bootstrapping test for the relationship between Brand Image (X2) and Repurchase Decision (Y) through Customer Satisfaction (Z) show significant results. The original sample value (O) is 0.538, with a T-Statistic of 2.127 and a P-Value of 0.033. A P-Value less than 0.05 indicates that this influence is significant, meaning that Customer Satisfaction serves as an effective mediator in the relationship between Brand Image and Repurchase Decision. This suggests that a positive Brand Image can enhance customer satisfaction, which in turn encourages higher repurchase decisions. Therefore, it can be concluded that improving Brand Image is crucial for increasing customer satisfaction and, consequently, driving repurchase behavior.

5. Conclusion

This study aims to analyze the influence of brand awareness and brand image on repurchase decisions, with customer satisfaction as a mediating variable at Amboina Restaurant in Bangkalan. The results indicate that both brand awareness and brand image have a significant impact on customer satisfaction. Brand awareness, which reflects the extent to which customers recognize and remember the brand, contributes to increased customer satisfaction. Meanwhile, brand image, which encompasses the positive perceptions and associations that customers have with the brand, also plays a crucial role in creating a positive experience for customers.

Furthermore, customer satisfaction has been shown to function as a mediator that strengthens the relationship between brand awareness and brand image with repurchase decisions. This indicates that customers who are satisfied with their experiences are more likely to make repeat purchases. These findings emphasize the importance of marketing strategies that focus not only on increasing brand awareness but also on managing a positive brand image. In the increasingly competitive culinary business context, understanding and meeting customer expectations is key to maintaining loyalty and encouraging repurchase decisions.

This study also highlights that in the culinary business world, where many options are available to consumers, strong brand awareness and brand image can be determining factors in attracting and retaining customers. Therefore, strategies that focus on improving service quality, product innovation, and effective communication with customers are essential for creating satisfying experiences and building long-term relationships with customers.

FROM FRUGAL LIVING TO FINANCIAL FREEDOM: A CASE STUDY OF WORKERS IN INDONESIA

Rengga Aditya[1], M. Boy Singgih Gitayuda[2]
[1]Faculty of Economics and Business, Universitas Trunojoyo Madura, Bangkalan, Indonesian

Abstract

This study aims to examine the influence of frugal living on financial freedom with personal financial management as a mediating variable. Using a quantitative approach and Partial Least Squares Structural Equation Modeling (PLS-SEM), data were collected through questionnaires distributed to workers in Indonesia. The results show that frugal living has a significant and positive influence on personal financial management. In turn, personal financial management significantly affects financial freedom. However, frugal living does not directly influence financial freedom but has an indirect effect through financial management as a mediating variable. The mediation effect is classified as moderate based on the upsilon v value. The model demonstrates good reliability and validity, with adequate model fit as indicated by R square, Q square, SRMR, and Goodness of Fit (GoF) values. These findings suggest that the practice of frugal living, when supported by effective financial management, can enhance individuals' ability to achieve long-term financial freedom.

Keywords: Frugal Living, Financial Management, Financial Freedom, Personal Finance, PLS-SEM

1. Introduction

In the era of globalization and digitalization, individuals are facing increasingly complex economic challenges. Rising prices of basic necessities, a growing consumerist lifestyle, and uncertainties caused by crises and pandemics have made personal financial management more important than ever (CNBC, 2023; Bank Indonesia, 2023). Particularly in Indonesia, many low-income earners—those earning under two million rupiah monthly—are experiencing significant financial strain, as evidenced by high consumption-to-income ratios and declining savings (Bank Indonesia, 2023). One behavioral response to these conditions is the adoption of frugal living, a lifestyle that emphasizes reducing unnecessary spending, making rational consumption decisions, and prioritizing needs over wants (Gill *et al.*, 2020). Frugal living is not only a cost-saving approach but also a long-term strategy to achieve financial balance and well-being. It encourages self-control and the ability to delay gratification, which are crucial in working toward financial freedom .

Among workers, who typically have stable monthly incomes, the potential to implement frugal living is significant. However, even with regular income, financial stress can persist without effective personal financial management (Lusardi and Mitchell, 2013). Furthermore, research indicates that financial literacy alone does not ensure prudent financial behavior unless it is supported by core values such as simplicity and responsibility (Atkinson, A., & Messy, 2012). The rise of e-commerce in Indonesia, growing by 78% and leading globally in growth (Directorate General of Informatics Applications, 2019), has made online shopping a part of daily life. Although convenient, this trend often encourages impulsive spending, especially when driven by social phenomena like Fear of Missing Out (FOMO) (Anggraeni, 2021). With incomes not increasing proportionally post-pandemic (Kuriyama, 2023), this widens the risk of financial imbalance—particularly for lower-income groups (Inayati, Isnawati Jamilah and Sujianto, 2024).

Overall, frugal living has shown a positive impact not only on financial stability but also on psychological well-being, life satisfaction, and preparedness for financial crises (Lastovicka *et al.*, 1999). Therefore, promoting frugal behavior through practical financial education is essential. It should be seen not merely as a survival mechanism, but as a sustainable strategy toward achieving long-term financial freedom and life balance, especially for professionals and academics.

2. Literature Review

2.1. Frugal Living

Frugal living is a lifestyle that emphasizes managing finances in a thrifty and efficient manner, with a focus on reducing unnecessary expenses (Dwi, 2023). This concept involves prioritizing needs over wants and making rational consumption decisions to maintain financial balance (Soman & Ainslie, 2021). Frugal living is not merely about saving money, but also a long-term strategy aimed at achieving economic stability and improving overall well-beingb (Gill *et al.*, 2020). Individuals who adopt this lifestyle tend to have stronger self-control and are more capable of delaying gratification in pursuit of greater financial goals. In the academic context, particularly among lecturers, frugal living becomes highly relevant as they face a variety of financial demands—from professional needs such as publications and seminars to family responsibilities (Bank Indonesia, 2023).

2.2. Personal Financial Management

Personal Financial Management (PFM) refers to an individual's ability to plan, organize, control, and evaluate personal financial activities in order to achieve desired financial goals (Gitman, 2014). Effective personal financial management includes managing income, expenses, savings, investments, and debt control (Bari & Bari, 2019). PFM plays a crucial role as a moderating variable that can strengthen or weaken the relationship between frugal living and the achievement of financial freedom.

Individuals who practice frugal living but lack strong personal financial management skills tend to face difficulties in achieving financial freedom (Xiao & Porto, 2017). Conversely, effective PFM can maximize the benefits of frugal living, thereby supporting asset accumulation and improving financial risk management (Lusardi and Mitchell, 2013). Therefore, PFM serves as a critical link that determines the success of implementing frugal living in achieving financial freedom.

2.3. Financial Freedom

Financial freedom is defined as a condition in which an individual has full control over their personal finances, allowing them to meet life’s necessities without relying on active income (Gitman & Joehnk, 2005). Financial freedom is achieved through careful financial management, including budgeting, saving, investing, and reducing consumer debt (Xiao & Porto, 2017). Studies have shown that financial freedom significantly contributes to psychological well-being and reduces financial-related stress (Lastovicka et al., 1999).

For lecturers, achieving financial freedom is an important indicator in maintaining quality of life and professional productivity. However, research by Prabawani & Sulistyowati (2020) indicates that long-term financial planning among Indonesian lecturers still needs to be strengthened, particularly in preparing for retirement.

3. Methodology

This study employs a quantitative approach aimed at measuring and analyzing the relationship between Frugal Living (X) and Financial Management (Z) in achieving Financial Freedom (Y). The research is explanatory in nature, as it seeks to explain causal relationships among variables through statistical modeling.

The sampling technique used in this study is probability sampling, with questionnaires distributed online. Given that this research involves three variables (one independent and two dependent variables), it is categorized as multivariate. According to Hair et al. (2021), a minimum of 10 respondents per variable is required for multivariate analysis. Therefore, the minimum sample size for this study is 30 respondents.

Data were collected through a structured questionnaire developed based on indicators for each variable: Frugal Living (X), Personal Financial Management (Z), and Financial Freedom (Y). The questionnaire employed a 5-point Likert scale, ranging from 1 (strongly disagree) to 5 (strongly agree), and was distributed both online and in person to eligible respondents.

The collected data were analyzed using the Partial Least Squares (PLS) method with the help of SmartPLS software. This technique was applied to test the structural relationships among variables and to assess the strength and significance of the hypothesized paths in the research model.

4. Result and Discussion

4.1. Measurement Model Evaluation

The measurement model in this study consists of a reflective measurement model, in which the variables frugal living (X), financial management (Z), and financial freedom (Y) are measured reflectively. According to Chin (1998), the evaluation of a reflective measurement model includes the following criteria: loading factor greater than 0.60, composite reliability greater than 0.70, Cronbach's alpha greater than 0.70, and average variance extracted (AVE) greater than 0.50.

Table.1 Outer Loading

Variabel	Item pengukuran	Outer Loading	Result
Frugal Living	I always clearly distinguish between needs and wants before buying something.	0,643	Valid
	I prefer to buy items for their function, not for their brand.	0,613	Valid
	I avoid consumer debt for purchasing non-urgent items..	0,741	Valid
	I feel content with a simple and modest lifestyle.	0,769	Valid
	I prefer saving money rather than spending it on unnecessary things.	0,704	Valid
Financial Management	I have both short-term and long-term financial plans	0,732	Valid
	I create a monthly budget to manage my expenses.	0,692	Valid
	I record all my expenses to find out where my money is being used	0,620	Valid
	I can control my spending so it doesn't exceed my income.	0,751	Valid
	I set aside a portion of my income to save every month.	0,794	Valid
	I have an emergency fund for	0,821	Valid

	unexpected needs.		
	I regularly review and evaluate my financial situation.	0,700	Valid
	I feel confident in making personal financial decisions.	0,680	Valid
Financial Freedom	I feel financially secure in both the short and long term.	0,701	Valid
	I can make life decisions without worrying too much about the financial aspect.	0,776	Valid
	I have sufficient savings or investments for the future.	0,840	Valid
	I don't experience excessive stress about my financial situation.	0,740	Valid
	I have more free time because I don't have to constantly work for money.	0,623	Valid
	I am free to choose a job because I am not dependent on a specific salary.	0,615	Valid
	I feel I've reached or am working toward the financial freedom I aspire to.	0,862	Valid

Table.2 Cronbach Alpha, Composite Reability, AVE

Variabel	Cronbach Alpha	Composite Reability	AVE
Frugal Living	0,734	0,834	0,510
Financial Management	0,872	0,899	0,520
Financial Freedom	0,864	0,894	0,550

The frugal living variable is measured by five (5) valid measurement items, with outer loadings ranging from 0.613 to 0.741, indicating that all five items are valid indicators of the frugal living construct. The reliability level of the variable is acceptable, as shown by Cronbach's alpha and composite reliability values above 0.70, indicating strong reliability. The level of convergent validity, as indicated by an Average Variance Extracted (AVE) value of 0.510, exceeds the threshold of 0.50, thus meeting the criteria for good convergent validity. Overall, the measurement items explain 51% of the variance within the frugal living variable.

The financial management variable is measured by eight (8) valid measurement items, with outer loadings ranging from 0.620 to 0.821, indicating that these items are valid indicators of financial management. The reliability of the variable is acceptable, supported by Cronbach's alpha and composite reliability values above 0.70. The convergent validity is supported by an AVE value of 0.520, which exceeds the 0.50 threshold, indicating good convergent validity. Overall, the measurement items explain 52% of the variance within the financial management variable.

The financial freedom variable is measured by seven (7) valid measurement items, with outer loadings ranging from 0.615 to 0.862, showing that these items are valid indicators of financial freedom. The variable's reliability is acceptable, with Cronbach's alpha and composite

reliability values above 0.70, confirming its reliability. The convergent validity, indicated by an AVE value of 0.550, also meets the requirement of being greater than 0.50, indicating strong convergent validity. In total, the measurement items account for 55% of the variance within the financial freedom variable.

4.2. Discriminant Validity Evaluation

Discriminant validity evaluation should be conducted by referring to the Fornell and Larcker criterion. Discriminant validity is an evaluation to ensure that the constructs are theoretically distinct and empirically supported through statistical testing. According to the Fornell and Larcker criterion, discriminant validity is established when the square root of the AVE (Average Variance Extracted) for each construct is greater than the correlations between that construct and any other constructs in the model.

Table.3 *Fornell Lacker Criterion*

	Financial Freedom	Financial Management	Frugal Living
Financial Freedom	0,742		
Financial Management	0,719	0,726	
Frugal Living	0,484	0,609	0,697

The financial freedom variable has a square root of AVE (0.742) that is greater than its correlations with Financial Management (0.726) and Frugal Living (0.697). This indicates that the discriminant validity of the financial freedom variable is satisfied. The Financial Management variable has a square root of AVE (0.726) that is greater than its correlation with Frugal Living (0.697). This indicates that the discriminant validity of the Financial Management variable is also satisfied.

Table.4 Cross Loading

Item pengukuran	Frugal Living	Financial Management	Financial Freedom
I always clearly distinguish between needs and wants before buying something.	**0,643**	0,479	0,337
I prefer to buy items for their function, not for their brand.	**0,613**	0,237	0,356
I avoid consumer debt for purchasing non-urgent items..	**0,741**	0,480	0,403
I feel content with a simple and modest lifestyle.	**0,769**	0,406	0,328
I prefer saving money rather than spending it on unnecessary things.	**0,704**	0,467	0,256
I have both short-term and long-term financial plans	0,226	**0,732**	0.622
I create a monthly budget to manage my expenses.	0,363	**0,692**	0,357
I record all my expenses to find out where my money is being used	0,391	**0,620**	0,318
I can control my spending so it doesn't exceed my income.	0,545	**0,751**	0,612
I set aside a portion of my income to save	0,422	**0,794**	0,493

every month.			
I have an emergency fund for unexpected needs.	0,488	**0,821**	0,552
I regularly review and evaluate my financial situation.	0,555	**0,700**	0,404
I feel confident in making personal financial decisions.	0,478	**0,680**	0,654
I feel financially secure in both the short and long term.	0,359	0,584	**0,701**
I can make life decisions without worrying too much about the financial aspect.	0,390	0,487	**0,776**
I have sufficient savings or investments for the future.	0,470	0,698	**0,840**
I don't experience excessive stress about my financial situation.	0,350	0,488	**0,740**
I have more free time because I don't have to constantly work for money.	0,214	0,403	**0,623**
I am free to choose a job because I am not dependent on a specific salary.	0,183	0,252	**0,615**
I feel I've reached or am working toward the financial freedom I aspire to.	0,424	0,634	**0,862**

Based on the table above, it can be seen that the cross-loading values of each indicator on its respective construct are higher than on other constructs. Therefore, it can be concluded that the criteria for discriminant validity have been met.

4.3. Structural Model Evaluation

Structural model evaluation is related to hypothesis testing regarding the influence between research variables. The evaluation of the structural model is carried out in three stages.

First, by examining the absence of multicollinearity between variables using the Inner VIF (Variance Inflation Factor) value. An Inner VIF value below 5 indicates no multicollinearity among variables (Hair, 2021).

Second, hypothesis testing between variables is conducted by observing the t-statistic or p-value. If the calculated t-statistic is greater than 1.96 (the critical value from the t-table) or the p-value is less than 0.05, there is a significant effect between variables. Additionally, the results should include the 95% confidence interval of the estimated path coefficients.

The third step involves evaluating the f square (f^2) value, which represents the effect size of direct relationships at the structural level. The interpretation criteria are: 0.02 = small effect, 0.15 = medium effect, and 0.35 = large effect (Hair, 2021).

Moreover, the f square value for mediation effects, referred to as upsilon v, is calculated by squaring the mediation coefficient. According to Lachowicz et al. (2018), as interpreted in Ogbeibu et al. (2022), the upsilon v values are categorized as follows: 0.02 = weak mediation effect, 0.075 = moderate mediation effect, and 0.175 = strong mediation effect.

Table.5 Inner VIF

	Financial Freedom	Financial Management	Frugal Living
Financial Freedom			
Financial Management	1,591		

Frugal Living	1,591	1.000	

Before conducting hypothesis testing on the structural model, it is necessary to examine whether multicollinearity exists among the variables using the Inner VIF (Variance Inflation Factor) statistic. The estimation results show that the Inner VIF values are less than 5, indicating a low level of multicollinearity between variables. This result strengthens the robustness of the parameter estimates in SEM-PLS, suggesting that they are unbiased.

Table.6 Hypothesis Testing: Direct Effects

Hypothesis	Path Coefficient	p-value	95% Confidence Interval for the Path Coefficient		F square
			Lower Bound	Upper Bound	
H1. Frugal Living Financial Management	0,609	0,000	0,539	0,717	0,591
H2. Financial Management Financial Freedom	0,675	0,000	0,516	0,860	0,596
H3. Frugal Living Financial Freedom	0,073	0,573	-0,193	0,310	0,007

Based on the results of the hypothesis testing above, the following findings are obtained:

1. The first hypothesis (H1) is accepted, indicating that frugal living has a significant effect on financial management, with a path coefficient of 0.609 and a p-value of 0.000 (< 0.05). At a 95% confidence interval, the effect of frugal living on financial management lies between 0.539 and 0.717. Furthermore, frugal living has a strong effect at the structural level on financial management (f square = 0.591).
2. The second hypothesis (H2) is accepted, indicating that financial management has a significant effect on financial freedom, with a path coefficient of 0.675 and a p-value of 0.000 (< 0.05). At a 95% confidence interval, the effect of financial management on financial freedom lies between 0.516 and 0.860. Financial management also has a strong effect at the structural level on financial freedom (f square = 0.596).
3. The third hypothesis (H3) is rejected, meaning there is no significant effect of frugal living on financial freedom, with a path coefficient of 0.073 and a p-value of 0.573 (> 0.05). At a 95% confidence interval, the effect of frugal living on financial freedom lies between -0.193 and 0.310. The effect of frugal living on financial freedom is low at the structural level (f square = 0.007).

Table.7 Uji Mediasi

Hipotesis	Path Coefficient	p-value	95% Confidence Interval for the Path Coefficient		Upsilon V
			Upper Bound	Lower Boung	
H4. Frugal Living Financial Management Financial Freedom	0,411	0,000	0,306	0,576	0,169

4. Based on the calculation results above, the fourth hypothesis (H4) is accepted, indicating that financial management acts as a mediating variable, mediating the indirect effect of frugal living on financial freedom, with a mediation path coefficient of 0.411 and a p-value of 0.000. At the structural level, the mediating role of the mindset transformation has a moderate mediation effect, with an upsilon v value of 0.169, which is slightly below the threshold for a strong effect (0.175).

4.4. Evaluation of Model Goodness and Fit

PLS is a variance-based Structural Equation Modeling (SEM) analysis that focuses on model testing aimed at predictive studies. Therefore, several measures have been developed to determine whether a model is acceptable, such as R square, Q square, SRMR (Hair et al., 2019), and the Goodness of Fit Index (Sarstedt & Henseler, 2013). In addition, model robustness is assessed through linearity testing of the relationships between variables.

Table.8 R Square

	R square	R square adjusted	Q square
Financial Freedom (Y)	0,520	0,504	0,251
Financial Management (Z)	0,371	0,61	0,177

The R square value reflects the proportion of variance in the endogenous variable that can be explained by exogenous and/or other endogenous variables within the model. According to Chin et al. (1996), the quantitative interpretation of the R square value is as follows: 0.19 (weak effect), 0.33 (moderate effect), and 0.66 (strong effect). Based on the data processing results above, it can be stated that frugal living explains 37.1% of the variance in financial management, indicating a moderate effect. Financial management explains 52% of the variance in financial freedom, also indicating a moderate effect.

The Q square value represents predictive accuracy, showing how well changes in exogenous and/or endogenous variables can predict the endogenous variable. This measure serves as a form of validation in PLS to indicate whether the model has predictive relevance. A Q square value greater than 0 indicates that the model has predictive relevance. According to Hair et al. (2019), the quantitative interpretation of the Q square value is as follows: 0 (low predictive relevance), 0.25 (moderate), and 0.50 (high). Based on the data processing results, the Q square value for the financial freedom variable is 0.251 (moderate predictive accuracy), while for mindset transformation it is 0.177 (low predictive accuracy).

Tabel.8 SRMR

	Model Estimation
SRMR	0.072

SRMR (Standardized Root Mean Square Residual) is a model fit measure that represents the difference between the observed correlation matrix and the model-implied correlation matrix. According to Hair (2021), an SRMR value below 0.08 indicates a good model fit. The estimated SRMR value of 0.072 suggests that the model demonstrates an acceptable fit. This implies that the empirical data can adequately explain the relationships among the variables within the model..

Table.9 GoF Index

Rata-rata Communality	Rata-rata R square	GoF Index
0,526	0,445	0,235

The Goodness of Fit (GoF) Index is a global model evaluation that combines the assessment of both the measurement model and the structural model. The GoF Index can only be calculated for reflective measurement models and is computed as the square root of the product of the average communality and the average R square. According to Wetzels et al. (2009), the interpretation of the GoF Index value is as follows: 0.1 (low), 0.25 (moderate), and 0.36 (high). Based on the data analysis, the calculated GoF value is 0.235, which falls within the moderate category.

5. Conclusion

This study concludes that frugal living plays a significant role in enhancing personal financial management among workers in Indonesia. Individuals who adopt a frugal lifestyle tend to manage their finances more effectively by budgeting, saving, and avoiding unnecessary spending. Personal financial management, in turn, has a strong and significant influence on the achievement of financial freedom, indicating that disciplined financial behavior is key to achieving long-term financial stability and independence. However, the study finds that frugal living does not have a direct significant effect on financial freedom. Its influence is realized indirectly through the mediating role of financial management, which shows a moderate mediation effect. This highlights the importance of integrating frugal values with sound financial practices in order to transform cost-saving behavior into real financial outcomes.

In conclusion, fostering frugal living habits alongside improving personal financial management skills can be an effective strategy for individuals particularly workers to achieve greater financial freedom and resilience in the face of economic uncertainty.

THE EFFECTIVENESS OF CORPORATE SOCIAL RESPONSIBILITY IN EVALUATING CORPORATE SOCIAL PERFORMANCE: A SYSTEMATIC LITERATURE REVIEW

Shely Dinar Thamara [1,*], Fauziah Mubaarokah Septiyanti [1], Irna Sulistiarini [1], Nuriya Fadilah[1], Nurita Andriani[1]
[1]Universitas Trunojoyo Madura, Indonesia

Abstract

This study employs a Systematic Literature Review (SLR) to examine the effectiveness of CSR in improving corporate social performance. The analysis highlights CSR's role in strengthening stakeholder relations, supporting green innovation, and enhancing reputation, with leadership and well-planned strategies as key enablers.

Keywords: Corporate Social Responsibility, Social Performance, Systematic Literature Review

1. Introduction

In contemporary business practices, organizational sustainability has become a critical concern among corporate managers. CSR is widely adopted as a strategic instrument not only for cultivating a favorable corporate image but also for contributing to sustainable development. CSR refers to a company's social obligations toward society and the environment (Baden & Wilkinson, 2021). Socially, the public expects companies to operate without neglecting internal social dimensions, such as employee welfare, as well as external societal responsibilities like community empowerment.

CSR strategies are essential to establish harmonious relationships with stakeholders and ensure long-term profitability, thereby enhancing corporate value (Khasanah et al., 2024). CSR contributes positively to public perception and investor confidence by reflecting the company's commitment to addressing social challenges, which can ultimately improve financial performance (Satria & Gunarsih, 2023).

As awareness grows regarding the environmental and social impacts of business operations, CSR has evolved into a core component of strategic corporate commitments, balancing profitability with societal obligations. Transparent CSR implementation has become a benchmark for organizational accountability (Nopriyanto, 2024), while excessive CSR disclosure may lead to financial strain due to increased expenditures (Afifah et al., 2021). Against this backdrop, the present study aims to analyze effective CSR applications that can improve social performance through a comprehensive literature review approach.

2. Literature review

2.1. Corporate Social Responsibility (CSR)

In the context of globalization, CSR has evolved from a peripheral, philanthropic activity to a core element of business strategy. It is now widely recognized that sustainable corporate success is contingent upon a balanced integration of economic, social, and environmental goals. According to Shahzad et al. (2020), CSR significantly contributes to Sustainable Performance (SP), a comprehensive construct that encompasses long-term viability in social, environmental, and financial terms.

Porter and Kramer (2011) have famously emphasized that CSR should be seen not merely as a cost or charitable donation but as an opportunity to create shared value. Stakeholder theory further asserts that corporations bear responsibilities not just to shareholders but to a broader

ecosystem that includes employees, customers, communities, and the environment (Freudenreich et al., 2020).

In high-impact sectors such as tourism and hospitality, particularly in countries like China, CSR has demonstrably contributed to enhanced sustainability performance (Font & Lynes, 2018). Globally, the CSR agenda has motivated firms to engage in strategic planning and adopt stakeholder-centric approaches, promoting long-term social equity and innovation in sustainability practices (Ling et al., 2022; Sharif et al., 2020).

Importantly, CSR is instrumental in building organizational legitimacy, enhancing stakeholder engagement, and fostering public trust—factors that are increasingly vital in a socially aware and environmentally conscious marketplace. As societal expectations rise, companies must embrace CSR as a strategic commitment, rather than a marketing gimmick.

2.2. Corporate Social Performance (CSP)

Corporate Social Performance (CSP) refers to measurable outcomes in environmental, social, and governance (ESG) areas that demonstrate an organization's accountability to its stakeholders (Chen & Delmas, 2010; Orlitzky et al., 2003). CSP is not limited to philanthropic donations or compliance with regulations—it encompasses the entire spectrum of socially responsible actions embedded in corporate strategy and operations.

As stakeholders—from investors to regulatory bodies—increasingly prioritize ESG considerations, companies are under pressure to show tangible progress on social issues such as human rights, diversity and inclusion, employee development, and community engagement. These issues have become key indicators of corporate value and competitiveness.

A robust CSP framework can help organizations mitigate risks, attract top talent, secure capital, and foster innovation. According to Joyce & Paquin (2016), integrating social performance into the core strategy not only meets external expectations but also strengthens internal culture and organizational identity.

2.3. Linking CSR and Social Performance

CSR and CSP are deeply interconnected. CSR acts as the strategic driver, while CSP is the operational outcome. A company's commitment to CSR—reflected in initiatives like environmental stewardship, ethical labor practices, and community involvement—can directly influence its social performance metrics.

Collier and Esteban (2007) argue that CSR commitment, both emotional and intellectual, significantly motivates organizations to engage in meaningful sustainability efforts. These efforts may include waste reduction, carbon emissions control, renewable energy adoption, and inclusive stakeholder participation.

Moreover, CSR participation, which reflects the active involvement of employees and managers in CSR initiatives, serves as a crucial mediator between CSR intent and performance outcomes (Anser et al., 2020; Rivera et al., 2017). Strong leadership, particularly transformational leadership, is essential to align CSR activities with organizational goals and values (Dai et al., 2022).

Ultimately, firms that embed CSR into their core business model gain strategic advantages: enhanced risk management, stronger brand equity, deeper community relations, and long-term financial stability (Dangelico & Pontrandolfo, 2015)..

3. Methodology

This research applies the Systematic Literature Review (SLR) methodology, adhering to the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines. The SLR approach enables comprehensive identification, evaluation, and synthesis of existing scholarly studies to draw generalized insights. Data was collected through the Scopus database and additional scholarly sources using Harzing's Publish or Perish software.

Using a set of refined keywords, 363 articles were identified. After screening using Covidence, 146 articles qualified for eligibility assessment. Ultimately, 12 peer-reviewed publications met the inclusion criteria and were selected for in-depth analysis. The findings derived from this curated sample were systematically categorized to extract dominant themes, identify research gaps, and inform theoretical and practical implications.

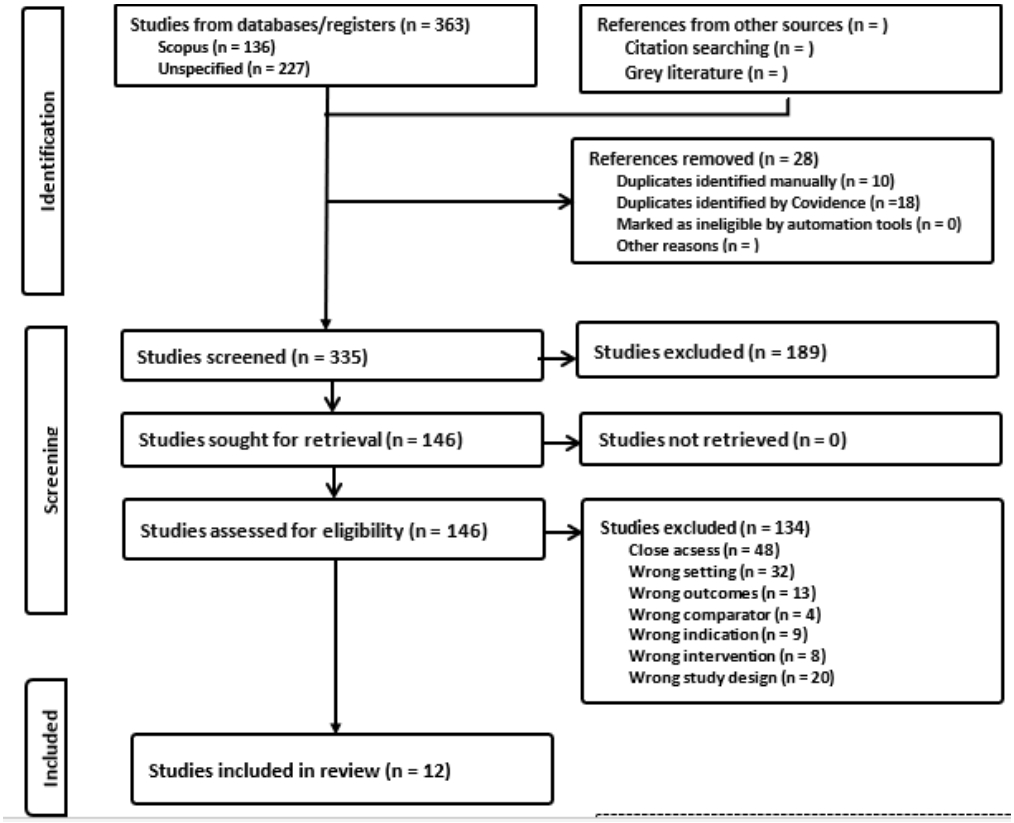

Figure 1. Screening Process

4. Results and discussions

A total of 12 articles related to the effectiveness of Corporate Social Responsibility (CSR) in evaluating Corporate Social Performance were identified through the literature search. These findings are outlined in Table 1.

Table 1. Summary of Journal Article Analysis

No	Literature	Objective	Findings
1	Anser et al., 2020	To analyze the influence of CSR commitment and participation on social performance (SP) and environmental performance (EP), and the mediating role of CSR participation.	CSR commitment positively predicts CSR participation. CSR participation significantly impacts both SP and EP. Furthermore, CSR commitment has a direct and significant effect on SP and EP, with CSR participation acting as a mediator, amplifying the positive influence of CSR commitment on both social and environmental performance.
2	Hussain et al., 2022	To examine the impact of Corporate Social Responsibility	CSR has a moderate effect on environmental performance. The study

No	Literature	Objective	Findings
		on environmental performance using data from ten major industrial organizations in Lahore, Pakistan.	also reveals that green innovation, green capabilities, environmental strategy, and transformational green leadership serve as mediating factors that enhance the relationship between CSR and environmental outcomes.
3	Xie et al., 2022	To explore how CSR can influence sustainable environmental performance.	CSR plays a pivotal role in improving sustainable environmental outcomes. The findings reinforce the view that CSR is not merely a social initiative but also a strategic mechanism for strengthening the linkage between organizational support and environmental performance.
4	Khan & Ahmad Lone, 2023	To explore the influence of various factors—including green accounting, capital structure, and CSR—on corporate value.	CSR policies and environmental practices significantly affect corporate financial performance and overall efficiency. The study underscores the importance of integrating sustainable environmental policies within corporate strategy to enhance firm value and market performance.
5	Cheema & Javed, 2017	To analyze the growing demand for human resource management competencies in green practices, including selection, recruitment, reward systems, and training implementation.	Green human resource management practices exert a strong positive influence on fostering sustainable environmental behavior within organizations.
6	Xiao et al., 2024	To investigate the impact of CSR practices on green innovation (GI) and sustainable performance (SP) in medium and large manufacturing firms in China.	CSR targeting both external and internal stakeholders has a positive effect on the dynamic green capabilities of manufacturing enterprises in China.
7	Dai et al., 2022	To examine the impact of CSR, transactional leadership, and transformational leadership on sustainable performance.	CSR, along with both transactional and transformational leadership, has a positive influence on sustainable corporate performance.
8	Malik et al., 2021	To explore the mediating role of Organizational Citizenship Behavior towards the Environment (OCBE).	OCBE significantly mediates the relationship between CSR and Green Human Resource Management (GHRM) practices. Furthermore, OCBE has a substantial impact on sustainable performance.

		between Green Talent Management (GTM) and Innovative Work Behavior (IWB), as well as between GTM and Green Performance (GP) of employees.	IWB. However, no significant moderation is observed in the relationships between soft GTM and IWB or between GTM and GP.
10	Zhao et al., 2021	To assess the implementation status of GHRM practices in construction firms in Nepal.	Both GHRM and CSR have a positive effect on sustainable organizational performance in construction firms.
11	Yousaf, 2021	To analyze the role of Environmental Management Initiatives (EMI) in defining environmental performance within the hospitality industry.	The authenticity of EMI and CSR are key and significant determinants of environmental performance in the hospitality sector.
12	Ye et al., 2022	To understand how Green Organizational Strategy (GOS) promotes Environmental CSR (ECSR) and Green Technological Innovation (GTI) to achieve Organizational Sustainable Performance (OSP).	GOS exerts a strong positive effect on ECSR, GTI, and OSP. ECSR significantly influences both GTI and OSP. Additionally, GTI acts as a core mediating variable linking GOS and ECSR to sustainable organizational performance.

The implementation of Corporate Social Responsibility (CSR) has been shown to exert a markedly positive influence on a firm's social performance. An in-depth analysis of a range of scholarly studies affirms that CSR engagement serves as a pivotal mechanism for enhancing not only organizational social outcomes but also corporate image and legitimacy. For example, Anser et al. (2020) demonstrated that CSR functions as a mediating conduit, linking a firm's commitment to improved social and environmental performance. Similarly, the active involvement of both internal and external stakeholders in CSR programs significantly contributes to the development of green organizational capabilities and the advancement of social performance (Xiao et al., 2024). Furthermore, interdisciplinary collaboration—particularly those involving behavioral change and innovation—has been empirically proven to substantially elevate social performance and yield enduring, sustainable impact, as highlighted by Hussain et al. (2022) and Malik et al. (2021).

The efficacy of CSR is contingent upon a constellation of internal and external factors. Among them, transformational leadership emerges as a critical determinant in strengthening the nexus between CSR and green innovation, as noted by Umair et al. (2023). Additionally, the strategic integration of CSR with green human resource management (GHRM) practices has been shown to foster deeper employee engagement in advancing the organization's social mission (Malik et al., 2021; Zhao et al., 2021). When CSR is embedded within well-orchestrated environmental strategies or driven by innovation-led initiatives, it yields more profound and enduring impacts on social performance (Hussain et al., 2022; Xie et al., 2022). Moreover, cultivating robust relationships with local communities through CSR has been found to enhance a company's social acceptance and legitimacy, reinforcing its societal license to operate (Xiao et al., 2024).

Despite these promising findings, significant gaps remain within the extant body of CSR literature. A disproportionate number of studies are confined to specific sectors—most notably manufacturing and hospitality—limiting the generalizability of the findings and leaving cross-sectoral insights underdeveloped. Moreover, the cultural dimensions—both local and national—that potentially shape stakeholder perceptions and the effectiveness of CSR initiatives remain underexplored. The methodological diversity in measuring social performance across studies further complicates efforts to draw consistent comparisons and hinders the formulation of unified evaluation standards.

These insights yield critical implications for both corporate practitioners and policy architects. Organizations must ensure that CSR commitments are not merely symbolic, but are operationalized through sustained, cross-functional engagement—particularly through synergy with human resource divisions and transformative leadership. Strategic emphasis should be placed on cultivating transformational leaders capable of aligning CSR with long-term social innovation. From a policy perspective, firms must embed CSR within broader organizational sustainability frameworks while prioritizing green innovation and meaningful community partnerships. To advance the field, future research should aim to standardize indicators of social performance and delve deeper into the contextual and cultural variables that influence CSR efficacy. Expanding the empirical base through cross-sectoral studies will also enrich the understanding of CSR's transformative potential across diverse industrial landscapes.

5. Conclusion

This study underscores the critical role that effective implementation of Corporate Social Responsibility (CSR) plays in enhancing corporate social performance. The success of CSR initiatives is fundamentally driven by active stakeholder engagement—both internal and external—as well as robust cross-functional collaboration that incorporates elements such as green innovation and the integration of CSR into human resource management practices. Transformational leadership further strengthens the synergy between CSR and environmentally driven or socially innovative initiatives. Simultaneously, strong relationships with local communities contribute to improved social legitimacy and public acceptance of the company.

Nevertheless, this study is not without limitations. A major constraint lies in the predominant focus on specific industry sectors, which restricts the generalizability of the findings. Additionally, there is a notable lack of inquiry into cultural influences—both at the local and national levels—that may shape the perception and impact of CSR. The inconsistent use of performance indicators across the reviewed studies also complicates comparative analysis and limits the formulation of cohesive evaluation metrics.

To address these gaps, future research should prioritize cross-sectoral analyses that capture the broader dynamics of CSR application. Further exploration into the role of cultural context is essential to understand how CSR is perceived and operationalized across different sociocultural environments. Moreover, there is a pressing need to develop standardized indicators for measuring social performance, enabling more accurate benchmarking across industries.

THE EFFECT AN EMPIRICAL INVESTIGATION OF MINING COMPANIES LISTED ON THE INDONESIA STOCK EXCHANGE FOR THE 2019–2023 PERIOD EXAMINING THE IMPACT OF CORPORATE SOCIAL RESPONSIBILITY ON FINANCIAL PERFORMANCE

Tanti Dian Pratiwi[1,*], Alexander Anggono[1] , Prasetyono[1], Tito IM Rahman Hakim[1]
[1]Faculty of Economics and Business, Trunojoyo University of Madura, Bangkalan, Madura

Abstract
This study aims to investigate the relationship between corporate social responsibility disclosure and financial performance. Secondary data from sustainability and annual reports that were obtained from the official websites of each firm and the IDX are used in the quantitative approach of the study. The study's population comprises 98 mining businesses listed on the IDX between 2019 and 2023, with a sample size of 66 firms that meet the criteria. The conventional assumption test and descriptive statistical analysis were the analysis techniques employed, The SPSS version 27 program was used to process the hypothesis test and examination of numerous linear regressions. The results of the study show that debt has a detrimental effect on financial performance, corporate social responsibility has an effect on financial performance, and the amount of the organization has no bearing on financial success.
Keywords: mining, financial performance, and corporate social responsibility

1. Introduction

One A company's financial success is a key determinant of its health as it demonstrates its capacity to produce profits and survive market competition (Fajaryani & Suryani, 2018; Li *et al*., 2022). Financial performance can also be a reference to assess the profits obtained reflecting the company's healthy financial condition (Li *et al*., 2022; Marselia & Rivandi, 2023). An optimal financial performance of a company can attract investors attention, prompting them to consider the decision of investing their capital in a company (Costa & Fonseca, 2022; Jao *et al*., 2020). In order to support the business's operational requirements and guarantee investors' well-being by raising The cost of operating capital and the rate of return on investment both support the company's long-term financial health, particularly in the midst of increasingly fierce business competition (Raningsih & Artini, 2018). Companies must also consider the various challenges that exist in each company's industrial sector. Companies need to consider various challenges that arise in their industrial industries, including the mining industry where commodity prices, strict regulations, and high operating costs can hamper financial performance while demanding adaptive and innovative management strategies. (Ingrid, 2018).

The mining industry has its own challenges, one of which is fluctuations in the price of mining products. The commodity value of mining industry products tends to be less stable (Prastyo & Sertiartiti, 2018). Commodity prices can fluctuate significantly in a short period of time due to global factors such as demand, supply, and geopolitical conditions (Simatupang *et al*., 2023). As in 2019 to 2020, coal mining companies at PT. Adaro Energy Indonesia Tbk. experienced a decrease in net profit of 63.56%, in line with the decline at the lowest point in 2020 of coal commodities which was 41.7%. Meanwhile, in gold metal mining commodities at PT. Aneka Tambang Tbk. in the same year experienced a significant increase of 83.13% and the gold commodity itself increased by 17.5% (Economics, 2024). The data can provide an

overview of how fluctuations in commodity prices can significantly impact the financial results of businesses operating in the mining industry.

Numerous facets of the business' operations are significantly impacted by its financial success in the mining industry. The business may engage in operational or non-operational operations, such as current and planned projects (Simaremare & Gaol, 2018). Among these are the company's social and environmental initiatives, including prosper the people affected by mining activities, to protect and the environment around mining activities (Gumanti & Alkahfi, 2021). Planned CSR implementation enhances the company's standing in addition to encourages community empowerment and environmental conservation in the operational area (Mustari *et al*., 2023. The company carries out CSR through various social activities that aim to provide benefits to the community around the company (Li *et al*., 2022; Marthin *et al*., 2017). The company acts as an entity that integrates and balances aspects like social, economic, and environmental (Lubis et al., 2023). Some even consider it a paradigm shift that shifts the focus from just seeking profit to being responsible for society and the environment (Sari *et al*., 2020). The company is obliged to protect the environment and the welfare of the community as a result of mining operational activities, therefore CSR is a necessary program for companies that interact directly with the environment and the community around operations of the business (Qilmi, 2021). CSR disclosure is necessary in order to comply with government regulations based on Law No. 40 of 2007, which mandates that businesses involved Apply social and environmental principles in the natural resources industry initiatives as a way to demonstrate their responsibilities to the community. Helping investors make decisions is another motivation, as investors will also analyze and evaluate CSR-based.

Research conducted Wati *et al*. (2023), Prayanthi & Budiarso (2022), Hakimi *et al*. (2023), Volkova & Kuznetsova (Volkova & Kuznetsova, 2022), and Aspal *et al*. (2023) Show that corporate social responsibility (CSR) affects financial performance. Companies that disclose CSR will be better known by the public. Good CSR will improve the company's image as well as encourage it to get a license to act socially, which will automatically generate profits. This research was conducted in the mining sector because it has a nique characteristic that the company's activities involve more aspects of human resources, the environment and the economy than other sectors (Junianta, 2022). Mining companies are also important in the country's development, this industry supports the fulfillment of energy needs, provides raw materials for the national industry and becomes income through the country's foreign exchange (Pinangkaan *et al.*, 2022). The challenges Given the background information previously supplied, the findings of this inquiry may be expressed as follows. Does corporate social responsibility have an impact on the financial success of mining companies listed on the Indonesia Stock Exchange during the 2019–2023 period disclosure?.

2. Literature review

2.1. Legitimacy Theory

The connection between society and the organization is explained by the notion of legitimacy. Dowling and Pfeffer (1975) revealed that a company must operate in accordance with the norms, values and beliefs carried out by society. Legitimacy is a management system that aims to align companies with the public, governments, people, and neighborhood associations (Adnan *et al*., 2023; Massubagiyo & Widyawati, 2022). Society in the theory of legitimacy is among the crucial elements of a company's long-term success (Prayanthi & Budiarso, 2022). The company is required to communicate its responsibility to the community and stakeholders that The business has operated in line with social, economic, and environmental principles in its operational operations, which can improve the business's financial performance (Faley & Muslichah, 2020). As stated by Prayanthi and Budiarso (2022),

legitimacy theory is a perspective-oriented approach that allows a business to both influence and be impacted by the people it works with. The business has the necessary legitimacy and is required to uphold and expand it in order to get the trust of stakeholders and the public (Irine & Asyik, 2019).

2.2. Corporate Social Responsibility

Businesses must uphold integrity, behave morally, and comply with legal requirements in every aspect of their operations, according to the concept of corporate social responsibility (Lubis et al., 2023; Wei et al., 2020). The World Business Council for Sustainable Development (WBCSD) states that corporate social responsibility (CSR) is a kind of corporate responsibility that promotes sustainable economic growth by working with stakeholders, including communities, workers, and the general public, to build a more affluent world. CSR, according to Permensos No. 9/2020, is a way for businesses to actively participate entities in encouraging sustainable development, both social and environmental aspects, in order to create benefits for companies, local communities, and the wider community. Corporate social responsibility plays a role as a strategy for world businesses to protect and encourage community development (Azumah, 2020; Cahya, 2022). CSR initiatives play a very important role in risk management strategies, especially in providing social security. Through the implementation of CSR, it is anticipated that it will be able to contribute significantly to improving people's welfare and improving environmental quality in a sustainable manner rather than just being oriented towards short-term profits (Maf'ulla & Rachmawati, 2024; Xu, 2023). The formula for calculating corporate social responsibility according to (Wati *et al*., 2023) is as follows:

$$CSRDI = \frac{\sum Xij}{Nj}$$

2.3. Financial Performance

Financial performance is an important indicator to explain the financial status of a business throughout a given time frame (Lestari, 2021). A company's financial performance not only reflects actual growth, but also includes long-term prospects, stability of development, and the capacity to expand sustainably (Adriansyah *et al*., 2023; Costa & Fonseca, 2022). Information on financial performance is useful in predicting The capacity of the business to provide cash flow and maximize the utilization of existing sources of funds (Aspal *et al*., 2023; Ingrid, 2018). The success rate of the business in turning a profit is assessed using a variety of specific ratio measurements (Fitriya & Setyorini, 2019; Tarda *et al*., 2024). In this study, ROE refers to a certain kind of profitability ratio that aims to measure its ability to generate profits from shareholder investments (Rahailjaan & Kaok, 2024; Volkova & Kuznetsova, 2022). The formula for calculating financial performance measured by ROE is based on (Pratiwi *et al*., 2020) as follows:

$$ROE = \frac{Net\ Profit}{Equity\ Total}$$

3. Methodology

The method in this study uses a quantitative approach. The type of data used in this study is secondary data. This method is carried out by collecting data sourced from the annual report and sustainability report of every firm accessible on the Indonesia Stock Exchange's official platform as well as the company's official website. The research focuses on the 98 mining companies that were listed on the Indonesia Stock Exchange (IDX) between 2019 and 2023. Purposive sampling, which uses certain standards to ensure the applicability of the studied data, is used to determine the sample. (1) Mining companies that are listed on the Indonesia Stock

Exchange's 2019–2023 timeframe are the study's criteria. (2) Businesses that provide complete financial accounts for the 2019–2023 timeframe. (3) Businesses that, between 2019 and 2023, fail to report and engage in CSR initiatives. 61 businesses satisfied the sample requirements after the sampling criteria approach was used. This makes use of multiple linear regression analysis work because there is one independent (corporate social responsibility), two control variables (leverage and company size) and one dependent variable (financial performance). The analysis tool chosen to analyze the collected data is the SPSS 27 software.

4. Results and discussions

4.1. Results

Descriptive Statistical Analysis

	N	Minimum	Maximum	Mean	Std. Deviation
ROE	240	-0,508	0,615	0,08466	0,140094
CSR	240	0,067	0,978	0,35790	0,207695
Leverage	240	-3,405	6,358	1,09684	1,281532
Company Size	240	20,542	33,497	27,93264	3,169644

The following explanation is based on the descriptive statistical analysis test results, which are shown in the table 4.2 with 240 observations overall:

1. The Social responsibility of corporations The variable's values vary from a minimum of 0.067 to a maximum of 0.207695, with a mean of 0.35790 and a standard deviation of 0.207695 maximum value range of 0.978.
2. The return of equity (ROE) variable has a lowest value range of -0.508, a mean value of 0.08466, and a standard deviation of 0.140094 to a maximum value range of 0.615.
3. The leverage variable has a standard deviation of 1.281532, an average of 1.09684, and a minimum range of -3.405 to a maximum value range of 6.358.
4. The firm size variable has a standard deviation of 33.497, an average of 27.93264, and a minimum range of 20.542 3.169644.

Multiple Linear Regression Analysis

	Non-standard Coefficients		Coordinated Coefficients	t	Sig.
Variabel	B	Std. Error	Beta		
(Constant)	-0,009	0,058		-0,150	0,881
CSR	0,118	0,045	0,169	2,595	0,010
Leverage	-0,021	0,008	-0,174	-2,709	0,007
Company Size	0,003	0,004	0,050	0,750	0,454

The Since this study satisfies all of the conventional assumption tests for normality, multicollinearity, heteroscedasticity, and autocorrelation, the multiple linear regression model is considered feasible for application in the analysis. Examining table 4.10 The equation for the multiple linear regression model may be found in column B's Unstandardized Coefficients column as follows:

1. The regression coefficient of financial success to corporate social responsibility is 0.118, indicating a favorable trend. This implies that financial performance will rise for every 1% increase in CSR. However, a 1% drop in CSR results with a 0.118 drop in financial performance.
2. The leverage control variable's regression coefficient on financial performance is -0.021, indicating a negative trend. This indicates that financial performance will drop by -0.021

for every 1% rise in leverage. On the other hand, financial performance rises by -0.021 when leverage falls by 1%.

3. The company's size control variable's regression coefficient on financial performance is 0.003, indicating a positive trend. This suggests that for every 1% increase in the company's size, its financial performance increases. Conversely, when the business's size declines.
4.

T test (Partial)

According to the analysis's findings in table 4.10, The hypothesis test is partially described as follows:

1. Table 4.10's t-test analysis computation results indicate that the significance column is 0.010 and Column T's corporate social responsibility variable has a value of 2.595. The t-test's significance value is 0.010 < α (0.05), indicating that the variable has a significant influence, and the t-value of the SPSS test result is 2.595 and in the t-table is 1.651, indicating that the CSR variable has a positive effect on ROE.
2. The results of the t-test analysis computed on the leverage control variable were a t-value of -2.709 and a significance value of 0.007. The SPSS test result's t-value is 1.526, while the t-table's t-value is 1.681. This suggests that the variable has a substantial negative impact. With a significance score of 0.007 < α (0.05) from the t-leverage test, the variable has a significant influence. The findings indicate that the leverage variable significantly impairs ROE.
3. The The t-test analysis computed on the control variable of business size yielded a t-value of 0.750 and a significance value of 0.454. The variable has no significant impact, according to the firm size t-test, which has a significance value of 0.454 > α (0.05). It is possible to conclude that the control variable has no beneficial effects because the t-test results in SPSS are 0.750 and the t-table calculation is 1.651. It was determined that the control variable for business size had no impact on ROE.

Coefficient of Determination Test (R^2)

R	R Square	R-squared adjusted	Standard Deviation from the Estimate
0,251	0,063	0,051	0,118293

Based on Table 4.11, it can be seen that the results of the analysis of the determination coefficient test show that the adjusted R square value is 0.051 or 5.1%. This value indicates that the independent variable, namely CSR as well as the control variable, leverage and company size may account for 5.1% shows how the dependent variable ROE fluctuates, whereas variables account for the remaining 94.9% that are not present in this study.

4.2. Discussions

The Influence *of Corporate Social Responsibility* on Financial Performance

Based on The study's conclusions show that corporate social responsibility considerably raises return on equity, a gauge of financial success, for mining companies listed on the Indonesia Stock Exchange between 2019 and 2023. These results are in line with the legitimacy theory, which maintains that a business gains legitimacy via having good relationships with neighborhood organizations. The financial performance of the business will be greatly enhanced by the legitimacy it gains by engaging in CSR operations.

One The public's ability to see and evaluate the company's duties is one of the elements that contributes to CSR's notable benefits. Businesses that fulfill their obligations in a proper and consistent manner will win the public's trust, which will improve the company's reputation. A favorable reputation will increase public confidence in the company's mining operations, preventing roadblocks to the mining and production process, which will significantly boost the business's financial performance.

With the confidence of investors who put money into the business and set aside a portion of that money to adopt CSR methods that continuously benefit the company, CSR implementation in businesses has the potential to boost financial performance. Businesses that are dedicated to revealing Using corporate social responsibility to demonstrate concern for the environment and society will develop a favorable reputation that seeks to win over customers, investors, and the community, all of which will improve financial performance. Furthermore, businesses that are able to commit to CSR disclosure can prove their ability to address environmental stabilization issues. Although the company will spend a very large amount of capital at the beginning in carrying out CSR activities, the expenditure will be proportional to the results of future profits if the company can implement CSR with careful planning. Therefore, companies must pay more attention to every step of CSR activities that will be carried out to achieve the desired results, namely the reputation of the business and the confidence of stakeholders and the community. However, in the event that the company makes the wrong decision in planning and implementing CSR activities, the company can suffer significant losses.

The The results of the study are in line with research by Wati et al. that indicates corporate social responsibility significantly affects financial success. (2023), Prayanthi & Budiarso (2022), Hakimi et al. (2023), Vlokova & Kuznetsova (2022), and Aspal et al. (2023). achievements. This happens because companies that carry out CSR activities consistently tend to get a positive perception from stakeholders, so that companies have a great opportunity to obtain external funding from investors for the implementation of CSR that can improve financial performance (Prayanthi & Budiarso, 2022). Theoretically, the more CSR programs are implementedincreases the likelihood that the business will enhance its financial performance and that CSR will be a wise investment that can improve stakeholder relations (Aspal et al., 2023). One way that CSR is implemented for staff members is through the company's attempts to offer excellent working conditions and flexibility in the workplace. This practice is able to create incentives that encourage employees to be more productive, thus indirectly contributing to improving the company's financial performance (Hakimi *et al*., 2023).

The Influence of Leverage Control Variables on Financial Performance

Test results from the research demonstrate that financial performance (ROE) is significantly impacted negatively by the leverage control variable. One of the reasons leverage has a major negative impact is that investors and stakeholders are worried that using leverage excessively could have unanticipated consequences if it is not managed properly, which would have a major detrimental impact on the financial success of the business. According to the legitimacy concept, this is in opposition to the quantity of leverage value in a company has no influence on the legitimacy of the community, because the public does not see the legitimacy of a company from the amount of leverage it has.

According to the study's findings, the leverage control variable has no discernible impact on financial performance, which is consistent with research by Gemilang & Wiyoko (2022) and Savira & Hariyati (2021). Businesses with low leverage ratios are less risky; conversely, if a firm has a high leverage ratio, the risk is greater if the company is in a difficult financial situation. Companies that cannot manage leverage properly will create concerns for

stakeholders, thus significantly negatively affecting the company's financial performance business.

The Impact of Control Variables Related to Company Size on Financial Performance

Results of the study's test analysis indicate that there is no significant impact from the firm size control variable. The fact that investors and stakeholders focus on the potential and profitability demonstrated by One possible explanation for why the size of the firm has no appreciable effect on financial success is the company's quarterly financial statements rather than the size of the business. This is consistent with the legitimacy idea, big or small company size does not affect the legitimacy of the community. Companies can gain public legitimacy through CSR activities that are relevant to the community. When the company gains public legitimacy, the trust of investors and partners will increase, which will have a favorable effect on financial results. The results of the study also show that the control variable of the company's size has no appreciable effect on financial success, as reported by Nguyen & Lan (2021) and Fajaryani & Suryani (2018). This is due to the magnitude of the company's overall assets cannot determine financial performance.

5. Conclusion

The study's test results indicate that, for Corporate social responsibility enhances financial performance as determined by the Return on Equity for mining businesses listed on the IDX indicator. According to the study's findings, businesses that fulfill their responsibilities to the community and demonstrate their dedication to implementing CSR initiatives will be among the elements that significantly improve their financial performance down the road. The IDX-listed mining companies' financial performance is negatively impacted by leverage control factors. This is because the high level of leverage reflects a large debt burden, which can reduce investor confidence and hinder the stability of the business's financial results. The financial performance of mining businesses listed on the IDX is unaffected by the control variable of firm size. This has a major impact on financial performance as a large company size is not necessarily linked to high operational efficiency and financial success.

Abstract

Digital transformation is being used by an increasing number of businesses and organizations. Technology is getting more sophisticated, if you don't follow it, you will be left behind. A situation that is often found in companies or organizations is employees who feel worried or unsure about facing technological changes that are applied in their work processes. The goal of this research to ascertain how personnel are affected by the digital transformation and the factors that support the successful adoption of this technology. This Examine uses a Review of Systematic Literature (SLR). The results of this investigation show that Digital Transformation provides favorable and negative responses to both the physical and psychological aspects of employees. The role of the leader is most important in the successful adoption of digital transformation. This study can be used by other researchers as a start by taking certain parts of the research results to be investigated more broadly and in detail and can also be used as input and consideration for top management in managing employees in companies or organizations that adopt digital transformation.

Keywords : Digital Transformation; employees; employee psychology

1. Introduction

The role of digital transformation a crucial part in the activities carried out by company employees . Acceptance of the adoption of digital transformation by companies has various impacts that are felt both physically and psychologically, both positive and negative. A positive response by employees will have a good effect on the company and vice versa. Management support and benefits felt by employees possess a favorable influence on the acceptance of The process of digital transformation by employees (Mutambik and Almuqrin, 2024). When employees feel that digital transformation technology can threaten their jobs, they will resist change, so it is very important for leaders to be aware of these fears and provide employees with an understanding that the process of digital transformation presents a chance for them to improve their skills to accommodate the upcoming market (Tabrizi B *et al.*, 2019). Capabilities, collaboration processes related to Digital Transformation and Customer Service Experience contributes on performance and contextual performance (Guzmán-Ortiz *et al.*, 2020).

Job discomfort in the digital era results in decreased life satisfaction, but in employees who have job engagement, it does not decrease life satisfaction too much (Rafiq and Chin, 2019). Employee performance is affected by Digital Transformation, which can affect many aspects of work and productivity (Alzaabi, 2023) . Digital Transformation improves physical health but mental health can deteriorate (Dengler, Hiesinger and Tisch, 2022) . Employees with a paradoxical mindset are more likely to embrace Digital Transformation (without control variables). Employee attitudes towards change have a favorable and noteworthy effect on the adoption of digital transformation tactics. Business model changes do not moderate the

paradoxical thinking patterns and acceptance of DT. High expected change weakens the relationship between adoption of digital transformation and favorable attitudes toward change (Klein, Spieth and Söllner, 2024). Employees will feel no sense of attachment to the company if leaders are not sensitive to all aspects of change including Digital Transformation from the impact of the digital era (Purba, 2021) . Digital Transformation triggers employees to engage in intrinsically motivated processes (Kensbock and Stöckmann, 2021).

Skills and abilities possess a substantial influence on undergoing The shift to digital journey (Chatterjee *et al.*, 2022). Organizational initiatives that strongly support worker well-being and adaptation mechanisms in facing the challenges of the digital work environment are needed (Chigori, 2024). Digital leaders influence employee creativity (Zhu *et al.*, 2022). The process of developing competencies is dynamic. A higher degree of digital transformation can be attained through employee expertise. In order to facilitate organizational transformation towards digitization, personnel expertise is crucial (Blanka, Krumay and Rueckel, 2022). Teachers (also called employees in the world of education) are required to have technological knowledge, have skills in applying technology, transforming with the digital world, and also be creative in utilizing various devices from existing technology. All the dynamics that have occurred in teachers so far can be overcome by participating in various training and workshops to support teaching abilities (Tafonao, Her and Ditakristi, 2022).

Individuals' beliefs about personal abilities and situational resources influence whether they view emerging technology as chances for career development or as threats to their abilities (Solberg, Traavik and Wong, 2020). Cognitive job insecurity is negatively impacted by digital transformation (Dengler and Gundert, 2021)

A phenomenon often found in companies or organizations is employees who are afraid or hesitant to accept the challenges of technological change applied in their work. Before adopting or adapting to the Digital Transformation, employees feel insecure about their abilities or are reluctant to learn because they feel they cannot be one of the driving forces for researchers to review the impact of Transformation to digital.

A slow, deliberate and more thoughtful approach to the digital transformation of the sales force considers the risks. 71% of salespeople said that new technology greatly supports them in doing their jobs. Only a small percentage of 15% said that they don't like modern technologies for sales. New digital tools are raising fears and concerns among salespeople: 27% feel new technologies threaten their jobs, 25% worry about being replaced, 23% feel threatened by coworkers who are more tech-savvy, and 21% worry about losing their own power as a result of being obliged to share expertise (Alavi and Habel, 2021).

Digital Transformation has a positive impact on employee job satisfaction and affective commitment, which is contrary to the view that Digital Transformation increases stress and job insecurity (Nadeem *et al.*, 2024). The difference in these findings makes researchers interested in conducting a literature study on the topic of Digital Transformation for employees because this topic is a current issue that is still very relevant to be applied in operating a company.

This research attempts to offer a review and present a structured review of current research on how employees are affected by the digital transformation and what supports the successful adoption of this technology. Another objective is to identify research opportunities that can be explored by researchers in the future related to the impact of The Digital Revolution on employees. The study issues covered in this article include the following:

Q1 What are the positive and negative impacts of Digital Transformation on employee psyche?
Q2 What are the positive and negative impacts of Digital Transformation on employee physical appearance?
Q3 What supports The triumphant adoption of Digital Transformation in employees?

2. Literature review

2.1. Digital Transformation

Adopting disruptive technology to boost social welfare, value creation, and productivity is known as digital transformation (Ebert and Duarte, 2018). Digital Transformation, both within companies and within organizations, is the biggest change hitting businesses and organizations today (Baker, 2014). The incorporation of artificial intelligence (AI) and the Internet of Things (IoT) into CRM systems, one of which is Salesforce, is important in digital transformation (Potla, 2023). Cutting-edge digital technologies including AI, automation, robotics, cloud, and IoT, possess the capacity to drastically alter the nature of employment and give rise to worries about its future. Adaptation through business model renewal and transformation is key to staying competitive amidst rapid disruption. (Trenerry *et al.*, 2021). An important prerequisite for Digital Transformation capabilities is Digital Transformation competency, which is derived from the collection of required employee skills, knowledge and expertise. for successful (Osmundsen, 2020). Organizations/ companies can gain by putting into practice Digital Transformation thorough procedures for hiring, choosing, educating, and training as well as upkeep. Employee involvement and performance within the company (Al-Alawi *et al.*, 2023). The Digital Transformation process has reached a high level of implementation, showing positive trends and consistent progress in digitalization (Bikse *et al.*, 2021).

2.2. Positive effects of digital transformation on employees

The process of digital transformation has a favorable impact on leadership, middle management involvement, employee education, corporate social responsibility focus, innovation, knowledge sharing, work-family balance, psychological capital, job happiness, and career commitment (Alieva and Powell, 2023). Digital transformation is beneficial on sustainable performance (Alathamneh and Al-Hawary, 2023).

Higher staff digital literacy will be made possible by IT practices that are more knowledge-sharing oriented. The culture of knowledge sharing has not been able to facilitate The degree of employees' digital literacy. Digital literacy has a positive effect on technological readiness. Digital literacy has no substantial effect on the negative side of technological readiness. Positive technological Actual utilization is positively and significantly impacted by readiness. Actual use is not significantly impacted by negative technological preparedness (Cetindamar, Abedin and Shirahada, 2024).

The effects of significant changes caused by technological leaps, especially the impact of digitalization on all aspects of life. Talent recruitment is critical to the long-term success and survival of an organization. Digital talent screens job candidates more thoroughly than conventional groups prior to applying((Gilch and Sieweke, 2021). Actually, the digital HRM system in digital transformation is easy and fast and also allows employees to improve their abilities, skills and performance (Zhang and Chen, 2024).

2.3. Negative effects of digital transformation on employees

Digital transformation has an effect on employees including, usefulness (39.4%), perceived stress (40.0%), perceived job overload (18.0%), and perceived DT integration (34.6%). Increases perception of usefulness of Digital Transformation and negatively impacts stress. Stress associated with digital transformation is significantly and favorably impacted by workload. Excessive workload is negatively correlated with perceived usefulness of Digital Transformation (Guenzi and Habel, 2020). The uncertainty arising from digital transformation has the potential to trigger higher work stress (Winasis, Wildan and Sutawidjaya, 2020).

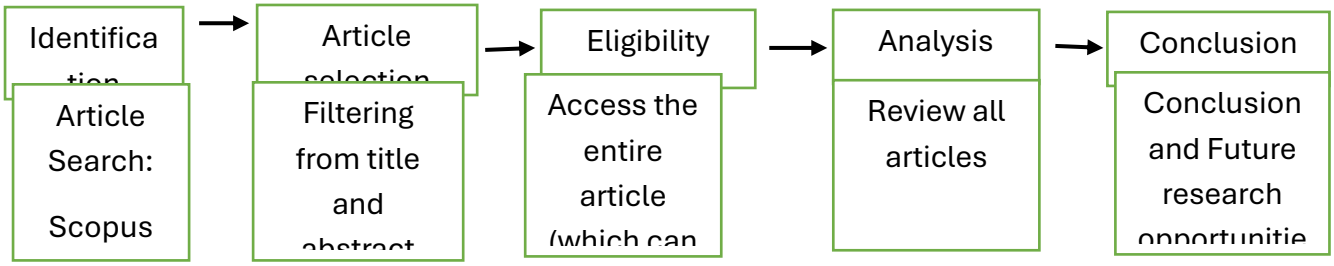
Digital transformation has a detrimental effect on employee proactivity, training, innovation, discretionary effort, and turnover intentions. Digital waste may also arise from staff training, awards, and recognition (Alieva and Powell, 2023)

Technological uncertainty increases technostress which has a negative impact on the subjective well-being of workers. Skills can change the coproduction work context from a work demand to a resource that helps employees face the challenges of digital transformation (Liu, Wang and Lin, 2023)

3. Methodology

The articles collected which were then identified came from articles discussing the effects of digital transformation adoption by companies applied to employees. The articles that have been collected in the analysis come from quantitative and qualitative data. The analysis in this study began by collecting articles from various journals in Scopus through Publish or perish with 200 articles with the keyword Digital Transformation on Employees, and articles with the keyword Digital Transformation on Employee Psychology found 15 articles. The articles used in 2014 to 2024, were then filtered into 27 articles, pertaining to how employees are affected by digital transformation. The articles were identified, selected, analyzed until a conclusion was reached. This study focuses on the findings of the articles obtained, the positive and negative impacts, and the factors that support the successful adoption of digital transformation. The complete process is illustrated in Figure 1, as illustrated by Vemberi (Fitriastuti *et al.*, 2019)as follows:

Figure 1 Review Method



Source: (Fitriastuti *et al.*, 2019)

4. Results and discussions

Based on the results of the review of these articles where the entire study focuses on digital transformation of employees. This study can be used as a preliminary study for academic researchers and practitioners. The articles above are taken from Google Scholar shows a summary of several studies focused on the current issues variable, namely Digital Transformation. considering the focus of the research, the results show that the impact of digital transformation on employees can be positive and negative and also factors that support success in adapting to digital transformation.

Positive employee responses to digital transformation include digital transformation supporting employees in completing their work. Recruitment of digital talent which is an application of digital transformation triggers changes in the company in the success and long-term survival of the organization and its employees. Digital talent screens prospective employees more intensively before applying. Top management leadership that adopts digital transformation will have better leadership, employees will also have a better focus on social responsibility in the company, by adopting digital transformation will create employees who have high innovation in their work, sharing knowledge will be easier if supported by digital transformation, employees who can adapt to digital transformation can easily create work-family balance, job satisfaction can be felt better by employees with the influence of digital transformation and employees who are related to digital transformation have a better career commitment.

Negative responses to the implementation of digital transformation by employees include For certain salespeople, new digital devices cause fear and worry. Salespeople believe that their jobs Could be in danger by new technology, some feel the possibility of being replaced by new technology and the possibility of being swapped out with coworkers with superior technological abilities, fear of the removal of individual authority inside the organization because the forced sharing of knowledge is also felt by employees who already have positions. Excessive workload, stress on employees is also felt as a result of digital transformation. Digital change can trigger the creation of digital waste in employee rewards and recognition and training. Digital transformation also makes employees think about changing jobs Technological uncertainty increases technostress which has a negative impact on employees' subjective well-being.

Digital Transformation can be successful by using a slow and deliberate approach to digitally transforming the sales force given the risks involved. Employees with paradoxical work patterns are more likely to accept digital transformation strategies. Higher information technology or information exchange will enable increased digital literacy among employees, where Technology readiness is positively impacted by digital literacy, and the actual use of cloud technology is positively and significantly impacted by technology readiness and cloud technology is one form of Digital Transformation. Employee capabilities and skills can influence the journey of Digital Transformation. Organizational initiatives can be adaptation mechanisms in facing the difficulties of the digital work environment.

Table 1 Research Results

Adopting digital transformation and its effects	Positive	Negative
Physique	Improving employee skills and performance, can increase productivity, improve physical health, create work-family balance, share knowledge better, help employee selection more effectively.	Digital waste in training, productivity can also decrease if not addressed properly, changing jobs
Psychic	Increased job satisfaction, better social responsibility	Fear and anxiety of being replaced by technology, fear of being stripped of power, stress due to excessive workload, declining mental health, increasing job insecurity, increasing technostress thus decreasing subjective well-being.

Source: Author 2025

Digital Transformation is actually not scary for employees in companies or organizations that adopt Digital Transformation. The role of leaders is needed to provide motivation, explain, provide understanding and guide employees in adapting to Digital Transformation very carefully considering that the human side must be given more attention. Employees who already feel insecure about their ability to use technology from Digital Transformation, many fears are felt with the existence of Digital Transformation, a soft and wise approach is needed by leaders to overcome problems from the psychological side.

5. Conclusion

The impact of digital transformation is substantial impact on all employee activities from various company backgrounds. Digital transformation can have both favorable and unfavorable

impacts on employees, both on their work and their psychology. From the various negative and positive impacts that have been discussed in this study, there are still many other impacts that have not been discussed in this study. This study can serve as a foundation for further investigation by taking certain parts of the research results to be investigated more broadly and in detail and can also be used as input and consideration for top management in managing employees in companies or organizations that adopt digital transformation. Further researchers can add variables that have not been discussed in this study, for example discussing in more detail about employee adaptation to the The impact of digital transformation on their performance, variables that can impact the digital transformation's success can also be studied more broadly. In this study, the employees studied were too broad in their specifications, only a few studies studied sales employees, the rest studied employees in general, so for future research, employee specifications are narrowed down by studying certain employees in detail so that later they can be used as a reference for companies in adopting digital transformation.

COMPARISON OF ONLINE PURCHASE DECISIONS (MARKETPLACE AND SOCIAL COMMERCE) INFLUENCED BY THE MARKETING MIX (7P) IN GENERATION Z

Sri Handayani[1], Gia Rizky[2]
[1]Undergraduate Program in Management, Universitas Teknologi Yogyakarta
[2]Undergraduate Program in Management, Universitas Teknologi Yogyakarta

Abstract

This study aimed to analyze the influence of the marketing mix (7P) on online purchase decisions by Generation Z in Indonesia and Ato compare online purchase decisions between marketplaces and social commerce. The background of this study was the rapid development of e-commerce, with Generation Z as a significant contributor. The sampling technique in this study used purposive sampling with total of 104 respondents. The research method used was quantitative by distributing questionnaires via Google Form, which had been tested for validity and reliability. Data were analyzed using descriptive analysis, instrument tests including validity and reliability tests, classical assumption tests including normality tests, linearity tests, heteroscedasticity tests, and multicollinearity tests, and multiple linear regression analysis, hypothesis tests including t-tests, F-tests, and independent sample t-tests, as well as coefficients of determination. The results showed that simultaneously the marketing mix (7P) variables including product, price, people, promotion, process, and physical evidence had positive and significant effect on online purchase decisions. In addition, there were significant differences in online purchase decisions between marketplaces and social commerce. Further research could deepen the analysis of other factors that influenced online purchase decisions.

Keywords: marketing mix (7P), online purchase decision.

1. Introduction

The rapid advancement of internet technology has significantly transformed Indonesia's business landscape, shifting traditional face-to-face transactions to digital platforms (Nazar et al., 2023; Hasibuan et al., 2023). According to APJII data, internet penetration reached 79.5% in early 2024, with Generation Z contributing 34.4%—surpassing millennials (Santika, 2024). This digital shift has accelerated the growth of e-commerce, enabling businesses to offer products via websites and social media (Karlina et al., 2020; Siahaan et al., 2023). The transformation has reshaped consumer behavior, allowing for faster decision-making and broader access to product information (Rosmawarni et al., 2024; Gamayanto, 2018).

Indonesia's digital commerce sector shows strong potential, with Harbolnas 2023 generating Rp 25.7 trillion in transactions (Kemendag, 2024). BPS data also indicates a 4.46% growth in e-commerce enterprises in 2022. Two dominant models have emerged: marketplaces (e.g., Shopee, Tokopedia) and social commerce (e.g., TikTok Shop, WhatsApp Commerce), each offering distinct consumer experiences (Gulbasi & Taskin, 2024; Nasution & Indria, 2022). Social commerce integrates social media with e-commerce, enabling real-time interaction and personalized shopping experiences (Ong, 2023; Peng & Lu, 2024). Populix (2022) reports that 86% of Indonesians have made purchases via social commerce platforms, with TikTok Shop leading at 46%. In Southeast Asia, Shopee leads in Gross Merchandise Value (GMV) with Rp 897 trillion, followed by Lazada and TikTok Shop (Meilina, 2025). These figures highlight intense competition among platforms, prompting businesses to adopt strategic marketing approaches (Witarisma, 2021; Nabila et al., 2022).

The marketing mix (7P)—product, price, place, promotion, people, process, and physical evidence—is a critical framework for influencing online purchase decisions (Kotler et al., 2017; Pogorelova et al., 2016). Each element plays a role in shaping consumer perceptions and behavior (Mas'ari et al., 2019; Mulyandi & Sani, 2020; Hendriyanto & Saputro, 2023). Empirical studies show mixed results regarding the impact of each 7P component on purchase decisions across platforms. Some research indicates significant influence (Widyastuti et al., 2020; Wahyuni, 2024), while others report negligible effects (Tilawati et al., 2024; Sudjatmika, 2017).

Given the high online spending ratio among Generation Z—averaging 5.4% of monthly income (Lidwina, 2021)—this study aims to fill a research gap by comparing the influence of the 7P marketing mix on online purchase decisions between marketplace and social commerce platforms among Generation Z in Indonesia.

2. Literature Review

2.1. Marketing Mix (7P)

The marketing mix is a strategic framework comprising seven elements: Product, Price, Place, Promotion, People, Process, and Physical Evidence (Kotler & Keller, 2016; Tjiptono, 2019; Pogorelova et al., 2016). Product includes tangible and intangible offerings that fulfill consumer needs (Firmansyah, 2019; Kotler & Armstrong, 2018). Price represents the value exchanged for a product or service, influenced by market dynamics and consumer perception (Tjiptono & Diana, 2022; Pogorelova et al., 2016). Place refers to distribution channels and platforms that facilitate product accessibility (Kotler & Armstrong, 2018; Siregar, 2022). Promotion encompasses communication strategies to highlight product benefits and stimulate purchase decisions (Kotler & Armstrong, 2018; Khotimah & Jalari, 2021). People involve all individuals contributing to service delivery and customer interaction (Wirtz & Lovelock, 2016; Sunyoto & Susanti, 2015). Process denotes the stages consumers undergo from product awareness to purchase (Khotimah & Jalari, 2021; Solin, 2025). Physical Evidence includes tangible and virtual elements that shape customer perceptions and brand image (Fatihudin & Firmansyah, 2019; Pogorelova et al., 2016).

2.2. Online Purchase Decision

Online purchase decision is a multi-stage process involving problem recognition, information search, alternative evaluation, purchase, and post-purchase behavior (Kotler & Keller, 2016; Jayanti, 2015). It is influenced by various factors including product quality, pricing, platform accessibility, and promotional strategies.

2.3. Hypotheses Development

Empirical evidence confirms that each element of the marketing mix (7Ps) significantly influences online purchase decisions among Generation Z in Indonesia. Product attributes positively affect purchase intention (Khotimah & Jalari, 2021; Wahyuni, 2024; Widyastuti et al., 2020; Mulyandi & Sani, 2020). Pricing strategies and payment flexibility enhance decisions (Tilawati et al., 2024; Akbar et al., 2020; Febindra & Artina, 2024; Primaputra & Sudaryanto, 2023; Wahyuni, 2024; Loo et al., 2023; Nadia, 2023). Distribution channels and accessibility are impactful (Khotimah & Jalari, 2021; Tilawati et al., 2024; Wardani & Manalu, 2021; Kholifah et al., 2023). Promotions significantly influence consumer behavior (Daiman et al., 2023; Primaputra & Sudaryanto, 2023; Khotimah & Jalari, 2021; Tilawati et al., 2024; Ramadhan & Jumhur, 2018). Human interaction and responsiveness are key (Nabila et al., 2022; Muliyana & Suyanto, 2019; Verina et al., 2024). Efficient processes enhance purchase decisions (Muliyana & Suyanto, 2019; Wahyuni, 2024; Khotimah & Jalari, 2021). Physical evidence shapes brand image and decisions (Muliyana & Suyanto, 2019; Wahyuni, 2024; Khotimah & Jalari, 2021; Charastrakool, 2020). Collectively, the 7Ps significantly influence

online purchase decisions (Sari & Kusdiyanto, 2024; Dewi et al., 2023; Kusmayadi & Saraswati, 2022; Barcelona et al., 2019; Muliyana & Suyanto, 2019).
H1: Product has a positive effect on online purchase decisions.
H2: Price has a positive effect on online purchase decision.
H3: Place has a positive effect on online purchase decision.
H4: Promotion has a positive effect on online purchase decision.
H5: People have a positive influence on online purchase decision.
H6: Process has a positive effect on online purchase decision.
H7: Physical evidence has a positive effect on online purchase decisions.
H8: The marketing mix (7P) has positive effect on online purchase decisions simultaneously.

Maulana & Asra (2019) identified that free shipping promotions significantly influence Generation Z's purchasing behavior. In contrast, Wiska et al. (2022) highlighted the importance of content marketing and electronic word of mouth (e-WOM) in shaping purchase decisions on social commerce platforms such as TikTok. Following the closure of TikTok Shop, Qisthi et al. (2024) observed a shift among Generation Z consumers toward marketplace platforms, driven by considerations such as pricing, promotional offers, and platform features. Conversely, Carissa (2024) found that Generation Z continues to favor social commerce due to engaging features like live streaming, hedonic shopping experiences, and attractive price discounts.
H9: It is suspected that there is a difference in online purchase decisions between marketplaces and social commerce in Generation Z.

Based on the theoretical framework, prior research, and formulated hypotheses concerning the marketing mix (7Ps) and online purchase decisions, the conceptual framework of this study is illustrated as follows:

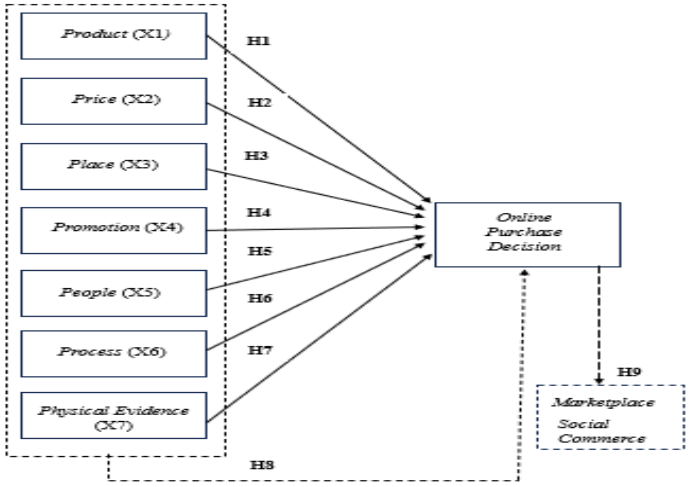

Figure 1 Framework

3. Methodology

This study examines how the marketing mix (7Ps) influences online purchase decisions among Indonesian Generation Z (born 1997–2012), who make up 27.94% of the population. Using purposive sampling and Slovin's formula, 100 respondents with online shopping experience were surveyed through online questionnaires and supported by secondary data.

The research variables include dependent and independent variables. Dependent variable is online purchase decision, measured through indicators such as product choice, brand choice, store choice, purchase quantity, timing, and payment method (Kotler & Keller, 2016). Independent variables is marketing mix (7Ps), comprising product, price, place, promotion, people, process, and physical evidence (Charastrakool, 2020; Ghiffarin, 2019).

Each variable is operationalized with specific indicators and statements to assess respondent perceptions. For instance, product is evaluated based on information availability, trendiness, and after-sales service; price on affordability, ease of comparison, and payment options; and promotion on discounts, sales campaigns, and visit frequency. Data collection utilized a Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree) (Sugiyono, 2022).

The data analysis method used in this research is a quantitative method with the aid of SPSS (Statistical Product and Service Solution) version 30. The regression model in this study is as follows:

$$Y = a + b_1X_1 + b_2X_2 + b_3X_3 + b_4X_4 + b_5X_5 + b_6X_6 + b_7X_7 + \varepsilon$$

Information:

Y = Dependen variable (online purchase decision)
a = Constant number
$b_1, b_2, b_3, b_4, b_5, b_6, b_7$ = Regression coefficient
$X_1, X_2, X_3, X_4, X_5, X_6, X_7$ = Independent variable (marketing mix 7P)
ε = Error

The analytical approach employed in this study is quantitative, utilizing numerical data to test hypotheses and derive generalizable conclusions (Sugiyono, 2022). Data analysis begins with descriptive statistics to summarize respondent demographics, including gender, age, education, employment status, income, and online shopping frequency. Instrument validity is assessed through correlation analysis, comparing calculated r-values against critical values to determine item accuracy (Ghozali, 2021). Reliability is evaluated using Cronbach's alpha, with thresholds indicating acceptable consistency (Qomusuddin & Romlah, 2021). Classical assumption tests are conducted to ensure the robustness of the regression model. Multiple linear regression analysis is applied to examine the influence of the seven marketing mix variables (product, price, place, promotion, people, process, and physical evidence) on online purchase decisions. Hypothesis testing is performed using t-tests for individual variable significance and F-tests for simultaneous effects. Additionally, an independent sample t-test is used to compare online purchase decisions between marketplace and social commerce platforms. The coefficient of determination (R^2) is calculated to measure the explanatory power of the independent variables on the dependent variable.

4. Result and Discussion

4.1. Descriptive Statistics

This study utilizes primary data obtained through questionnaire surveys administered to Generation Z individuals, defined as those born between 1997 and 2012, who have previously engaged in or are currently participating in online shopping via marketplace platforms or social commerce. A total of 104 respondents participated in the survey. The sample was predominantly female (53 respondents, 51.0%), with the majority aged between 19 and 22 years (48 respondents, 46.2%). Most respondents had attained a high school or vocational school education (56 respondents, 53.8%) and were primarily students (59 respondents, 56.7%). In terms of income, a significant portion reported earnings of less than or equal to Rp 1,500,000 (45 respondents, 43.3%). Geographically, the majority resided in Java (72 respondents, 69.2%), and more than half demonstrated frequent online purchasing behavior (57 respondents, 54.8%).

Table 1 Descriptive Statistics

No	Respondents	Characteristics	Total	Percentage
1	Gender	Man	51	49.0%

		Woman	53	51.0%
2	Age	> 13 years - ≤ 16 years	0	0%
		> 16 years - ≤ 19 years	8	7.7%
		> 19 years - ≤ 22 years	48	46.2%
		> 22 years - ≤ 25 years	30	28.8%
		> 25 years - ≤ 28 years	18	17.3%
		> 28 years old	0	0%
3	Education	SMP	0	0%
		SMA/SMK	56	53.8%
		Diploma	9	8.7%
		Masters	39	37.5%
		Magister	0	0%
4	Work	Students	59	56.7%
		Employee	29	27.9%
		Businessman	14	13.5%
		Doesn't work	2	1.9%
5	Income	≤ Rp 1.500.000	45	43.3%
		> Rp 1.500.000 - ≤ Rp 3.000.000	26	25.0%
		> Rp 3.000.000 - ≤ Rp 4.500.000	15	14.4%
		> Rp 4.500.000	18	17.3%
6	Domicile (island)	Papua	0	0%
		NTT	0	0%
		Maluku	0	0%
		Lainnya	0	0%

7	Frequency of online purchase decision	Very Often	37	35.6%
		Often	57	54.8%
		Rarely	10	9.6%

Source: Data Processing

4.2. Classical Assumption

To ensure the validity and reliability of the regression model, this study conducted several classical assumption tests, including normality, linearity, heteroscedasticity, and multicollinearity assessments.

Table 2 Normality Test

One-Sample Kolmogorov-Smirnov Test	**Unstandardized Residual**
N	104
Test Statistic	.077

Asymp. Sig. (2-tailed)[c]	.142

Source: Data Processing

Based on the results presented in Table 2, the Asymptotic Significance (2-tailed) value obtained from the normality test is 0.142, which exceeds the threshold of 0.05. This indicates that the residuals in this study are normally distributed, thereby satisfying the assumption of normality required for regression analysis.

Table 3 Linearity Test

Variables	**Deviation from linearity**	
	F	**Sig**
Product	1,179	0,312
Price	1,441	0,168
Place	1,575	0,119
Promotion	1,132	0,346
People	0,762	0,676
Process	1,155	0,329
Physical evidence	1,603	0,111

Source: Data Processing

All significance values for Deviation from Linearity exceed 0.05, confirming linear relationships between each independent variable and online purchase decisions. Thus, the regression model's linearity assumption is met.

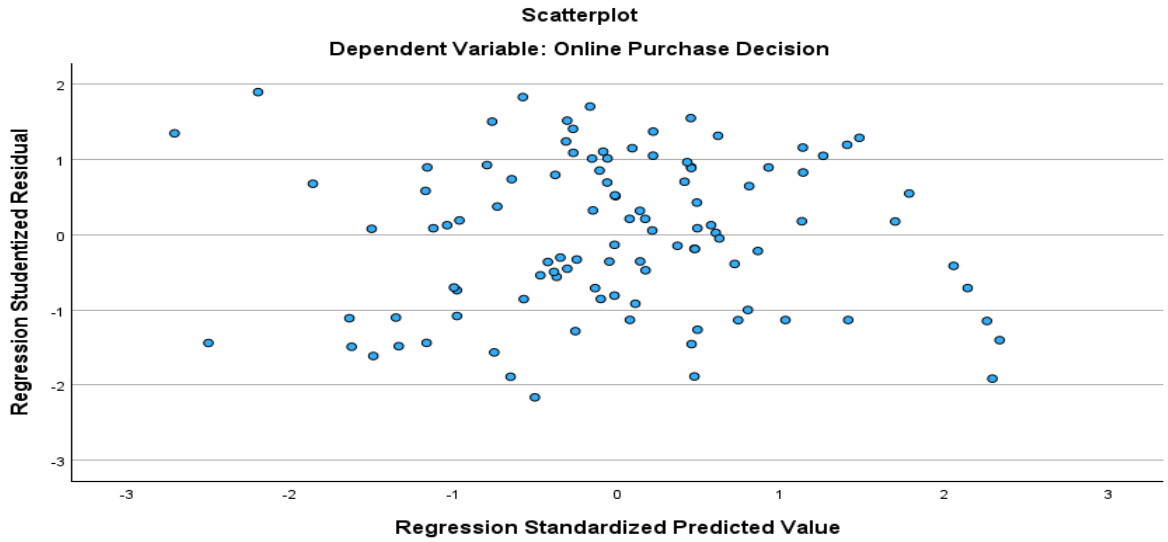

Figure 2 Heteroscedasticity Test

Referring to Figure 2, the scatter plot displays data points that are randomly dispersed and distributed both above and below the zero line on the Y-axis. This pattern suggests the absence of heteroskedasticity in the regression model, thereby confirming that the assumption of homoscedasticity is met in this study.

Table 4 Multicolinearity Test

Coefficients[a]					
Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.	Collinearity Statistics

		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-1.701	2.125		-.800	.718		
	Product	2.232	.092	.702	24.242	<,001	.939	1.065
	Price	1.349	.083	.468	16.333	<,001	.958	1.044
	Place	1.165	.088	.379	13.252	<,001	.961	1.040
	Promotion	.965	.089	.311	10.790	<,001	.947	1.056
	People	.896	.083	.308	10.762	<,001	.959	1.043
	Process	.521	.082	.182	6.327	<,001	.952	1.050
	Physical evidence	.364	.087	.121	4.177	<,001	.933	1.073
a. Dependent Variable: Online Purchase Decision								

Source: Data Processing

As presented in Table 4, all independent variables exhibit Variance Inflation Factor (VIF) values below 10 and tolerance values above 0.10. These results indicate that multicollinearity is not present in the dataset, thereby confirming that the regression model meets the assumption of independence among predictor variables.

4.3. HypothesisTesting

The t-test assesses each independent variable's effect on online purchase decisions. Results show all seven variables have t-values above the critical value of 1.984 and significance levels below 0.001, indicating strong statistical significance. Therefore, each variable positively influences purchase decisions, and hypotheses H1 through H7 are supported and accepted based on Table 5 below.

Table 5 Individual Parameter Significance Test (t-test)

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-1.701	2.125		-.800	.425
	Product	2.232	.092	.702	24.242	<,001
	Price	1.349	.083	.468	16.333	<,001
	Place	1.165	.088	.379	13.252	<,001
	Promotion	.965	.089	.311	10.790	<,001
	People	.896	.083	.308	10.762	<,001
	Process	.521	.082	.182	6.327	<,001
	Physical Evidence	.364	.087	.121	4.177	<,001
a. Dependent Variable: Online Purchase Decision						

Source: Data Processing

The F-test confirms that the seven independent variables—product, price, place, promotion, people, process, and physical evidence—collectively have a statistically significant and positive impact on online purchase decisions. Based on Table 6, with an F-value of 167.692 (above the critical value of 2.11) and a significance level of 0.001, hypothesis H8 is accepted, indicating strong collective influence at the 95% confidence level.

Table 6 Simultaneous Significance Test (F Test)

ANOVA[a]					
Model	Sum of Squares	df	Mean Square	F	Sig.

1	Regression	11423.016	7	1631.859	167.692	<,001[b]
	Residual	934.206	96	9.731		
	Total	12357.221	103			
a. Dependent Variable: Online purchase decision						
b. Predictors: (Constant), Physical evidence, Price, People, Promotion, Place, Product, Process						

Source: Data Processing

The independent samples t-test shows a significant difference between online purchase decisions via social commerce and marketplaces. Based on Table 7, Levene's test confirms equal variances (F = 3.883, p = 0.051). Under this assumption, the t-test yields a t-value of 10.634 with p < 0.001, indicating a statistically significant difference between the two groups. Thus, H9 is accepted.

Table 7 Independent sample t-test

Independent Samples Test							
		Levene's Test for Equality of Variances		t-test for Equality of Means			
						Significance	
		F	Sig.	t	df	One-Sided p	Two-Sided p
Online purchase decision	Equal variances assumed	3.883	.051	10.634	102	<,001	<,001
	Equal variances not assumed			12.509	79.083	<,001	<,001

Source: Data Processing

4.4. Coefficient of Determination

The coefficient of determination (R^2) is used to assess the extent to which the regression model explains the variance in the dependent variable. As shown in Table 8, the R^2 value of 0.924 indicates that the marketing mix (7Ps) explains 92.4% of the variance in online purchase decisions, showing high model accuracy. The remaining 7.6% is influenced by other factors not included in the study.

Table 8 Coefficient of Determination

Model Summary[b]				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.961[a]	.924	.919	3.120
a. Predictors: (Constant), Physical evidence, Price, People, Promotion, Place, Product, Process				
b. Dependent Variable: Online purchase decision				

Source: Data Processing

4.5. Discussion

This study investigates the influence of the marketing mix (7Ps) on online purchase decisions among Generation Z, defined as individuals born between 1997 and 2012. A total of 104 respondents were selected using purposive sampling, and data were collected via an online questionnaire distributed through Google Forms. The research identifies seven key marketing mix variables—Product, Price, Place, Promotion, People, Process, and Physical Evidence—

and examines their individual and collective impact on Generation Z's online purchasing behavior.

The study reveals that several product-related factors—such as product information, trendiness, and after-sales service—significantly impact online purchase decisions, echoing findings by Mulyandi & Sani (2020), Khotimah & Jalari (2021), Wahyuni (2024), and Widyastuti (2021). Competitive pricing, ease of comparison, and diverse payment options also play a key role (Akbar et al., 2020; Febindra & Artina, 2024; Primaputra & Sudaryanto, 2023; Wahyuni, 2024; Loo et al., 2023; Nadia, 2023). Platform accessibility, fast delivery, and convenience are crucial (Khotimah & Jalari, 2021; Tilawati et al., 2024; Wardani & Manalu, 2021; Kholifah et al., 2023). Promotions and frequent platform visits influence Gen Z behavior (Ramadhan & Jumhur, 2018; Daiman et al., 2023; Khotimah & Jalari, 2021; Primaputra & Sudaryanto, 2023; Tilawati et al., 2024). Seller responsiveness and communication clarity matter (Nabila et al., 2022; Muliyana & Suyanto, 2019; Verina et al., 2024). Efficient purchasing, easy claims, and support services are beneficial (Muliyana & Suyanto, 2019; Khotimah & Jalari, 2021; Wahyuni, 2024). Lastly, website quality, social media presence, and app functionality are influential (Muliyana & Suyanto, 2019; Wahyuni, 2024; Charastrakool, 2020; Khotimah & Jalari, 2021).

Collectively, the 7Ps of the marketing mix are found to have a significant simultaneous effect on online purchase decisions, confirming findings from Sari and Kusdiyanto (2024), Kusmayadi & Saraswati (2022), Dewi et al. (2024), Barcelona et al. (2019), Muliyana & Suyanto (2019), and Santosa et al. (2019). Additionally, the study reveals a significant difference in online purchase decisions between marketplace platforms and social commerce. While some studies (e.g., Maulana & Asra, 2019; Qisthi et al., 2024) suggest a preference for marketplaces due to promotions and features, others (e.g., Wiska et al., 2022; Carissa, 2024) highlight the appeal of social commerce driven by content marketing, live streaming, and hedonic shopping experiences.

5. Conclusion, Limitations, and Suggestions

This study finds that all seven marketing mix components (7Ps) significantly and positively influence Generation Z's online purchase decisions. Collectively, the 7P framework shows strong impact, and a notable difference exists between purchases made via marketplaces and social commerce, highlighting platform-specific consumer preferences.

Despite its findings, the study has limitations. The relatively small and potentially non-representative sample size limits the generalizability of the results to the broader Generation Z population. The study does not compare the strength of influence between marketplace and social commerce platforms, which was intentionally excluded to maintain focus.

Business practitioners are encouraged to develop targeted marketing strategies that emphasize the 7P elements, particularly those most relevant to Generation Z, such as product innovation, competitive pricing, and engaging promotional content. Enhancing customer service and leveraging technology to improve the purchasing experience are also advised. Additionally, future researchers should explore other influencing factors beyond the 7P framework, utilize larger and more representative samples, and conduct detailed comparative analyses of purchasing behavior across different online platforms to enrich the understanding of Generation Z's online decision-making processes.

Abstract

This study aims to determine the effect of capital intensity, profitability, and company size on tax avoidance in Energy sector companies listed on the Indonesia Stock Exchange for the period 2019-2023. To determine the sample in this study, purposive sampling was used. Data analysis was conducted using a panel data regression model with Eviews 12, where the analytical methods in this study included testing classical assumptions, panel data regression analysis, and hypothesis testing. The results of this study indicate that, partially, capital intensity (CIR) and company size (SIZE) have an effect on tax avoidance (ETR). Meanwhile, profitability (ROA) does not have an effect on tax avoidance (ETR). The simultaneous test results show that capital intensity (CIR), profitability (ROA), and company size (SIZE) have an effect on tax avoidance (ETR) in energy sector companies listed on the Indonesia Stock Exchange for the period 2019-2023. The research results imply the importance of supervision and monitoring in implementing efficient corporate tax strategies to reduce the level of tax avoidance.

Keywords: Capital Intensity, Profitability, Company Size, Tax Avoidance

1. Introduction

Taxes play an important role as the main source of state revenue to finance government needs (Farhan et al., 2024). If all taxpayers comply, the country's prosperity can be achieved optimally. However, in reality, there are still many taxpayers who have not fulfilled their obligations. According to Law No. 7 of 2021, taxes are mandatory contributions that are compulsory and used for the benefit of the state for the welfare of the people (Noehafizah, 2023).

However, in reality, there are still many taxpayers who have not fully fulfilled their obligations, including among business entities. Taxes are often seen as a burden that can reduce company profits, triggering the emergence of strategies to legally reduce this burden through tax avoidance practices. Tax avoidance is an effort by taxpayers to reduce their tax obligations without violating tax regulations, by exploiting loopholes or weaknesses in the tax system (Ciptaningrum, 2020). One indicator used to measure tax avoidance is the Effective Tax Rate (ETR). ETR reflects the effective tax rate paid by companies based on accounting profits (Sinaga, 2022).

According to a report by Finance.detik.com written by Sugianto on July 5, 2019, titled "Understanding the Tax Avoidance Allegations Against Adaro," PT Adaro Energy Tbk is accused of engaging in transfer pricing through Coaltrade Services International, its subsidiary in Singapore. This activity is reported to have taken place from 2009 to 2017. It is alleged that Adaro manipulated its financial reports to pay only US$125 million or Rp1.75 trillion (at an exchange rate of Rp14,000) in taxes, which is significantly less than what should have been paid in Indonesia.

According to a report by Katadata.co.id written by Sugianto on February 11, 2019, titled "Wave of Tax Avoidance in the Coal Industry," PT. Multi Sarana Avindo (MSA), a coal

mining company, was once involved in a tax avoidance case. The obligation to pay Value-Added Tax (VAT), which constitutes tax evasion, decreases when mining rights are transferred. The Directorate General of Taxes considers PT. MSA to have engaged in tax evasion practices by exploiting loopholes or gaps in tax regulations. The significant discrepancy between the amount of production and the amount of tax paid raises suspicions of tax evasion. According to a Wartalika.id news article dated February 1, 2023, titled "PT Bumi Borneo Inti Suspected of Being an Illegal Coal Mining Company," PT. Bumi Borneo Inti was involved in tax evasion due to the illegal sale of coal. The company has manipulated data and currently does not hold a Mining Business License (IUP) (wartalika.id, 2023).

Based on the latest data, there are 46 companies in the energy sector, which is the main category. Based on the criteria used by the author, namely energy sector companies listed on the Indonesia Stock Exchange with complete data, no losses during the 2019-2023 period, and using the Indonesian rupiah in their financial reports, seven companies were selected: PT Bukit Asam Tbk (PTBA), PT Batulicin Nusantara Maritim Tbk (BESS), PT Sumber Global Energy Tbk (SGER), PT Betonjaya Manunggal Tbk (BTON), PT Steel Pipe Industry of Indonesia Tbk (ISSP), PT Ifishdeco Tbk (IFSH), and PT Cita Mineral Investindo Tbk (CITA).

Based on IDX Capital Intensity Ratio (CIR) data, which shows a company's investment in fixed assets, there was a significant decline from 30% in 2019 to 24% in 2022, then increased again to 25% in 2023. This indicates either improved efficiency in the use of fixed assets or a decline in long-term investment activities; however, companies began to increase their investments in fixed assets again in 2023. Meanwhile, Return On Asset (ROA) increased from 7% in 2019 to 15% in 2022, indicating the company's ability to efficiently utilize its assets to generate profits, then decreased to 12% in 2023. Company Size, proxied by the natural logarithm of assets, showed a consistent increase from 2.823% in 2019 to 2.874% in 2023. Furthermore, the Effective Tax Rate (ETR), as a measure of tax avoidance, has decreased consistently from 28% in 2019 to 15% in 2022 and 2023. The decrease in tax avoidance reflects efforts to avoid taxes.

Based on this explanation, it is necessary to examine how capital intensity, profitability, and company size affect tax avoidance. This study aims to analyze the relationship between these independent variables and tax avoidance in the energy sector on the Indonesia Stock Exchange.

2. Literature Review And Hypothesis Development

2.1 The Effect of Capital Intensity (CIR) on Tax Avoidance (ETR)

The Capital Intensity Ratio (CIR) is a ratio of Capital Intensity. The capital intensity ratio is a company's investment in the form of fixed assets, and capital intensity is used to measure how much of a company's assets are invested in fixed assets. If a company has more fixed assets, it is likely to pay less tax than a company with fewer fixed assets. Fixed assets have an economic life that can result in depreciation expenses, which can affect tax expenses by reducing profits and tax expenses (Sinaga, 2022).

H1: Capital Intensity (CIR) affects tax avoidance (ETR) in Energy sector companies listed on the Indonesia Stock Exchange for the period 2019-2023.

2.2 The Effect of Profitability (ROA) on Tax Avoidance (ETR)

Return on Assets (ROA) is a ratio that measures how much assets contribute to generating net income. A company's performance is considered good if it has a high profit margin, which is measured by comparing income to the estimated benchmark for the company. By utilizing sufficient resources, a company will be able to achieve its goals and earn large profits. The higher a company's profit, the higher its ROA value, indicating that the company's profitability

is increasing. As ROA increases, taxable income also rises, which should cause the Effective Tax Rate (ETR) to increase as well, due to the higher tax burden (Jecky, 2022).

Return on Assets (ROA) is a ratio that measures the contribution of assets to net profit. A company's performance is considered good if it manages a high level of profit, as measured by the ratio of profit to the estimated amount used as a benchmark. By utilizing sufficient resources, a company can achieve its goals and generate substantial profits. The higher a company's profit, the higher its ROA, indicating greater profitability. A higher ROA also increases taxable income, which should lead to an increase in the Effective Tax Rate (ETR) due to the higher tax burden (Jecky, 2022).

H2: Profitability (ROA) affects tax avoidance (ETR) in Energy sector companies listed on the Indonesia Stock Exchange for the period 2019-2023.

2.3 The Effect of Company Size on Tax Avoidance

Company size is a value that describes how large or small a company is, which can be measured through various factors such as total assets, total sales, or market capitalization. The larger the company size, the greater the assets it controls to drive productivity improvements. These productivity improvements will ultimately result in higher profits, which in turn will have an impact on the amount of tax the company has to pay (Sinaga).

H3: Company size affects tax avoidance (ETR) in energy companies listed on the Indonesia Stock Exchange during the period 2019-2023.

2.4 The Influence of Capital Intensity (CIR), Profitability (ROA), and Company Size (SIZE) on Tax Avoidance (ETR)

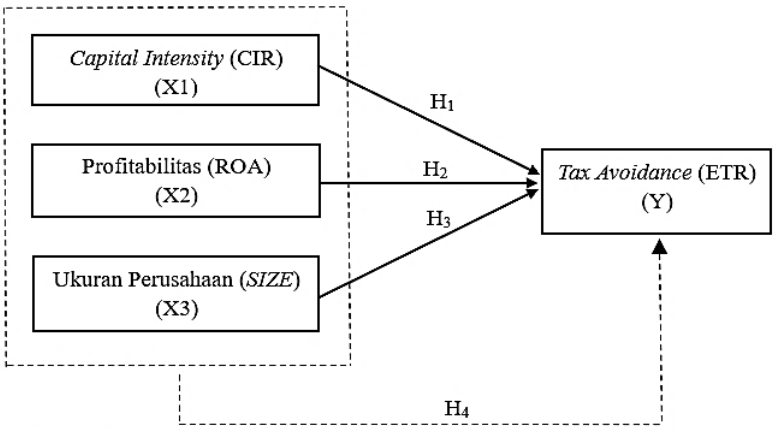
One of the important factors that can influence a company's level of tax avoidance is capital intensity, which reflects the amount of fixed assets allocated in a company's asset structure. The lower the capital intensity, the smaller the depreciation benefits obtained, so companies tend to look for ways to reduce their tax burden through tax avoidance. Profitability shows a company's ability to generate profits. Companies with high profitability have the potential for significant tax burdens, prompting them to adopt tax avoidance strategies to maintain financial efficiency. Meanwhile, company size also plays a role, as larger companies generally have more resources and expertise to design complex tax strategies. However, larger companies are also more closely monitored by the public and tax authorities, so they seek loopholes in tax regulations to avoid damaging their reputation.

H4: Capital Intensity (CIR), Profitability (ROA), and Company Size (SIZE) on Tax Avoidance (ETR)

Based on the above explanation, the author created a conceptual framework with three independent variables, namely capital intensity, profitability, and company size, and one

dependent variable, namely tax avoidance. The following is a diagram of the conceptual framework:

Figure 1. 1 Framework of Thought



Sumber: (diolah oleh penulis, 2024)

3. Research Methods

The type of research used in this study is confirmatory research with an explanatory survey method aimed at testing hypotheses. The unit of analysis used is organizations, namely financial reports of energy sector companies listed on the Indonesia Stock Exchange for the period 2019-2023. The location of the research is energy sector companies listed on the Indonesia Stock Exchange.

The type of data studied is quantitative data, namely net fixed assets, total assets, net income, tax expenses, and income before tax. The source of the research data is secondary data. Secondary data is data obtained indirectly through intermediary media. The data sources are obtained from the Indonesia Stock Exchange website and the websites of the respective companies.

This study used purposive sampling as its sampling method. This sampling method is based on certain characteristics that are considered to be closely related to the characteristics of the population that are already known.

The criteria used to select the sample are as follows: (1) Energy sector companies listed on the Indonesia Stock Exchange (IDX) for the period 2019-2023; (2) Energy sector companies with complete data for the period 2019-2023; (3) Energy sector companies that did not incur losses during the 2019-2023 period; (4) Energy sector companies that use the Indonesian rupiah in their financial statements.

Based on the specified criteria, the sample used in this study is data from companies in the energy sector listed on the Indonesia Stock Exchange, with a population of 46 companies. However, only seven companies met the specified criteria in this study.

The independent variables used in this study are capital intensity, profitability, and company size. The dependent variable is tax avoidance. The operational variables in this study are as follows:

Table 1. 1 Operational Variables

Variables	Sub Variables (Dimensions)	Indicator	Scale Measurement
Capital Intensity (X1)	Capital Intensity Ratio (CIR)	Net Fixed Assets / Total Assets	Ratio

Profitability (X2)	Return on Assets (ROA)	$\frac{\text{Net profit}}{\text{Total Assets}}$	Ratio
Company Size (X3)	SIZE	Natural Logarithm of Total Assets	Ratio
Tax Avoidance (Y)	Effective Tax Rate	$\frac{\text{Tax Burden}}{\text{Profit before tax}}$	Ratio

4. Results And Discussion

4.1 Panel Data Model Selection Results

Based on the Chow test results, a probability value of 0.0531 was obtained in the cross-section chi-square. This value is greater than the significance level of 0.05 (0.0531 > 0.05), so it can be concluded that the selected model is the common effect model.

The Lagrange Multiplier test results show that the p-value for Both is 0.7926, which is greater than the significance value of 0.05 (0.7926 > 0.05). This indicates that the selected model to be used is the common effect model.

4.2 Normality Test

Normality testing on the regression model was conducted to determine whether the residual values produced indicated a normal distribution or not. In this case, the distribution was considered normal if the significance value was greater than 0.05. The following are the results of the normality test processed using Eviews 12.

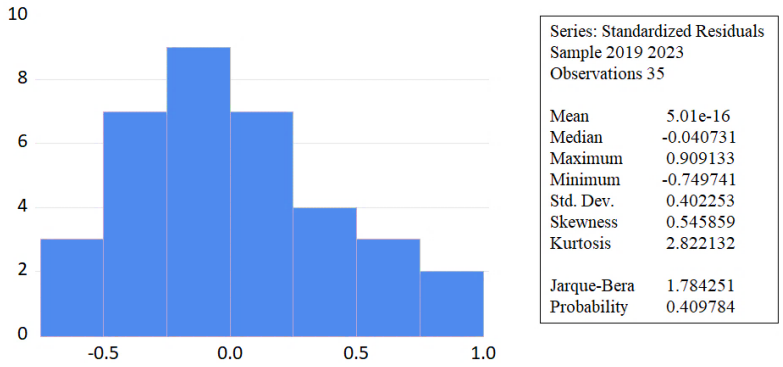


Figure 2. 1 Normality Test Results

Based on Figure 2, it can be seen that the probability value is 0.409784. Since this probability value is greater than 0.05 (0.409784 > 0.05), the residual value has a normal distribution.

4.3 Multicollinearity Test

Table 2. 2 Multicollinearity Test Results

Variable	Coefficient Variance	Uncentered VIF	Centered VIF
C	23.12001	4559.751	NA
CIR	0.026240	8.735819	1.350014
ROA	0.013610	6.987514	1.153117
SIZE	2.113748	4672.030	1.183931

Based on Table 2, it can be seen that the Variance Inflation Factor (VIF) value is less than 10, so it can be stated that there is no multicollinearity problem.

4.4 Panel Data Regression Test

Table 3.1 Panel Data Regression Test Results

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	13.75815	4.808327	2.861318	0.0075
CIR	-0.369033	0.161988	-2.278153	0.0298
ROA	0.049066	0.116662	0.420583	0.6770
SIZE	-4.591251	1.453873	-3.157944	0.0035

In this study, the panel data regression model used is the common effect model (CEM) with the following regression equation:

$ETR = \alpha + \beta 1CIR_{it} + \beta 2ROA_{it} + \beta 3SIZE_{it} + \varepsilon_{it}$

$ETR = 13.75815 - 0.369033 + 0.049066 - 4.591251 + \varepsilon_{it}$

Based on the results of the regression analysis, the constant value is 13.775815, which means that if the Capital Intensity Ratio, Return on Assets, and Size values are 0, the Effective Tax Rate will increase by 13.775815. The regression coefficient value of the Capital Intensity Ratio variable has a negative value of -0.369033, which means that for every one-unit increase in the Capital Intensity Ratio, the Effective Tax Rate will decrease by -0.369033, assuming that the values of other independent variables remain constant. Conversely, the regression coefficient value of the Return on Assets variable has a positive value of 0.049066, meaning that for every one-unit increase in Return on Assets, the Effective Tax Rate will increase by 0.049066, assuming that the values of other independent variables remain constant. Meanwhile, the regression coefficient value of the Size variable has a negative value of -4.591251, which means that for every increase in Size, the Effective Tax Rate will decrease by -4.591251, assuming that the values of other independent variables remain constant. This shows that each independent variable has a different contribution in influencing the rate of change in tax avoidance.

4.5 Coefficient of Determination Test

Table 4.1 Results of the Determination Coefficient Test

R-squared	0.267708	Mean dependent var	-1.241612
Adjusted R-squared	0.196841	S.D. dependent var	0.470064
S.E. of regression	0.421267	Akaike info criterion	1.216111
Sum squared resid	5.501443	Schwarz criterion	1.393865
Log likelihood	-17.28194	Hannan-Quinn criter.	1.277472
F-statistic	3.777616	Durbin-Watson stat	1.894320
Prob(F-statistic)	0.020266		

Based on Table 4, it can be seen that the coefficient of determination (R2) value is 0.267708. This result shows that variations in tax avoidance (Effective Tax Rate) can be explained by capital intensity (Capital Intensity Ratio), profitability (Return on Assets), and company size (Size) by 26.77%, while the remaining 73.23% can be explained by other variables not included in this model.

4.6 t-Test (Partial)

H1: Capital Intensity affects Tax Avoidance in energy sector companies listed on the Indonesia Stock Exchange for the period 2019-2023.

The first hypothesis (H1) tests the effect of capital intensity on tax avoidance, which is proxied by the Capital Intensity Ratio (CIR). Based on the estimation results, the Capital Intensity Ratio variable shows a negative regression coefficient of -0.369033 and a probability value of 0.0298. The t-test probability value of 0.0298 < 0.05 indicates that capital intensity (Capital Intensity Ratio) has a negative effect on tax avoidance (Effective Tax Rate) in energy sector companies listed on the Indonesia Stock Exchange during the 2019-2023 period. Therefore, it can be concluded that research hypothesis H1 is accepted.

H2: Profitability affects tax avoidance in energy companies listed on the Indonesia Stock Exchange during the period 2019-2023.

The second hypothesis (H2) tests the effect of profitability on tax avoidance, which is proxied by Return on Assets (ROA). Based on the estimation results, the Return on Assets variable shows a positive regression coefficient of 0.049066 and a probability value of 0.049066. The t-test probability value of 0.6770 > 0.05 indicates that profitability (Return on Assets) does not have an effect on tax avoidance (Effective Tax Rate) for energy sector companies listed on the Indonesia Stock Exchange during the 2019-2023 period. Therefore, it can be concluded that research hypothesis H2 is rejected.

H3: Company size affects tax avoidance in energy companies listed on the Indonesia Stock Exchange during the period 2019-2023.

The third hypothesis (H3) tests the effect of company size on tax avoidance. Based on the estimation results, the Size variable shows a negative regression coefficient of -4.591251 and a probability value of 0.0035. The t-test probability value of 0.0035 < 0.05 indicates that company size (Size) has a negative effect on tax avoidance (Effective Tax Rate) for energy sector companies listed on the Indonesia Stock Exchange during the 2019-2023 period. Therefore, it can be concluded that research hypothesis H3 is accepted.

4.7 F Test (Simultaneous)

The F-test in this study used a significance level of 0.05 or 5%, with the provision that if the F significance value was less than 0.05, the regression coefficient could be used. The results of the F-test in Table 4 show that the F-significance value is 0.020266, which means that this value is below the significance level of 0.05 (0.020266 < 0.05). Therefore, it can be concluded that the independent variables have a simultaneous effect on the dependent variable, so that research hypothesis H4 is accepted.

4.8 Discussion

4.8.1 The Effect of Capital Intensity (CIR) on Tax Avoidance (ETR)

Based on partial research results, the Capital Intensity Ratio (CIR) is a measure of capital intensity that has a negative effect on tax avoidance, which is proxied by the Effective Tax Rate (ETR). It is known that the average Capital Intensity Ratio (CIR) of companies in the energy sector during the 2019-2022 period experienced a downward trend in several periods before increasing again in the 2023 period. On the other hand, the average Effective Tax Rate (ETR) experienced a significant decline from the beginning to the end of the period. This indicates the presence of tax avoidance practices, as the tax burden paid by companies became increasingly smaller compared to the profits earned.

Capital intensity indicates the extent to which a company invests its capital in fixed assets and inventories. Companies with a large proportion of fixed assets use these assets to engage in tax avoidance. Having large fixed assets results in significant depreciation expenses. In

accordance with tax regulations, depreciation costs are one of the elements because fixed assets have an economic life that can result in depreciation expenses, thereby reducing the company's profits, which in turn can reduce the tax burden that the company must pay. Companies plan to intentionally have a large proportion of fixed assets for the purpose of tax avoidance.

This study is in line with the research conducted by Aryanti and Yazid (2025), Prasetyo and Raphael (2024), Caroline and Fajriana (2025), which shows that the capital intensity variable has an effect on tax avoidance. However, the results of this study are not in line with the research conducted by Syifa and Septanta (2024), Wansu and Dura (2024).

4.8.2 The Effect of Profitability (ROA) on Tax Avoidance (ETR)

Based on partial research results, Return On Assets (ROA), which is a proxy for profitability, has no effect on tax avoidance. It is known that the average Return On Assets (ROA) of companies in the Energy sector during the 2019-2023 period experienced increases and decreases that were not followed by a consistent pattern in the average Effective Tax Rate (ETR) of companies. Even during the 2019-2021 period, the average Effective Tax Rate (ETR) reflects a high level of tax compliance, as it exceeds the applicable tax rate. This increase in assets without a corresponding increase in net profit may be due to a cost-based approach. As a result, the tax burden decreases, leading to a low Effective Tax Rate.

The higher the ROA value, the better the company's performance in increasing profits. Companies in the energy sector can generate profits that are assumed not to engage in tax avoidance because they are able to manage their income and tax obligations.

This study is in line with the research conducted by Jecky (2022), Hastuti (2021), Mailia and Apollo (2020), which shows that the profitability variable has no effect on tax avoidance. However, the results of this study are not in line with the research conducted by Castara (2020), Nurtanto and Wulandari (2024).

4.8.3 The Influence of Company Size (SIZE) on Tax Avoidance (ETR)

Based on partial research results, company size has an effect on tax avoidance. It is known that the average company size has increased every year, while the Effective Tax Rate (ETR) has decreased significantly during the 2019-2023 period. These results show that when the company size is large, the resulting tax avoidance is lower.

Based on the research conducted, large companies tend to apply accounting methods to allocate costs efficiently, thereby reducing reported profits. This occurs because large companies tend to avoid involvement in tax avoidance and other unethical business practices. In addition, the size of smaller companies influences the tax avoidance methods they employ. These findings indicate that large companies in the energy sector, with significant assets and good performance, are able to generate sufficient income to meet their tax obligations, compared to industries with smaller assets. Large assets reflect that these companies have a bright future ahead of them.

This study is in line with research by Aprila and Meihendri (2024) and Suryani (2020), which shows that company size has an influence on tax avoidance. However, the results of this study are not in line with research conducted by Wansu and Dura (2024).

4.8.4 The Influence of Capital Intensity (CIR), Profitability (ROA), and Company Size (SIZE) on Tax Avoidance (ETR)

Based on the results of the F-test in this study, it shows that the variables of capital intensity (CIR), profitability (ROA), and company size (SIZE) simultaneously have a significant effect on tax avoidance in Energy sector companies listed on the Indonesia Stock Exchange for the period 2019-2023. This indicates that the independent variables used in the regression model are able to explain the variation in tax avoidance significantly, or H4 can be accepted.

5. Conclusion

Based on the results of research conducted on Energy sector companies listed on the Indonesia Stock Exchange for the period 2019-2023, it can be concluded that (1) capital intensity, proxied by the Capital Intensity Ratio (CIR), has a negative effect on tax avoidance, proxied by the Effective Tax Rate (ETR). The concurrent decline in CIR and ETR reinforces the influence of capital intensity on tax avoidance; companies with high fixed asset intensity tend to have large depreciation expenses, which ultimately reduce taxable income and decrease the amount of tax paid; (2) Profitability, proxied by Return On Asset (ROA), does not have a positive effect on Tax Avoidance, proxied by Effective Tax Rate (ETR). This indicates that an increase in the number of assets is not followed by an increase in net profit, which may be due to a cost approach. Therefore, the tax burden decreases, resulting in a low Effective Tax Rate. This shows that there is no direct influence and inconsistency between increases or decreases in profitability and tax avoidance. (3) Company size has a negative influence on tax avoidance, which is proxied by the Effective Tax Rate (ETR). This shows that the larger the company size, the lower the effective tax rate paid, reflecting a tendency toward tax avoidance practices. (4) Simultaneously, capital intensity (CIR), profitability (ROA), and company size have a combined effect on tax avoidance. This indicates that although not all independent variables have a simultaneous effect, these independent variables play an important role in contributing to tax avoidance.

6. Suggestion

Based on the results of this study, it is known that profitability has no effect on tax avoidance in the energy sector. Therefore, companies are expected to further improve asset management efficiency so that asset growth can be accompanied by a corresponding increase in net profit. In addition, companies need to pay attention to transparency in recording expenses so that tax expenses are accurately recorded and avoid an unreasonable decrease in the effective tax rate. Management should also strengthen oversight of tax avoidance practices so that the relationship between profitability and tax avoidance becomes more consistent and reflects the actual financial condition.

For future researchers, it is hoped that they can improve on the shortcomings and develop this research further by extending the research period, expanding the scope of the research to include sectors other than the energy sector as research locations, and using variables other than capital intensity, profitability, and company size, or adding new variables such as corporate governance, leverage, ownership structure, liquidity, and other variables to gain a more comprehensive understanding of the factors that may influence tax avoidance. These efforts are expected to yield more accurate results and better explain the relationship between the variables being analyzed.

Abstract

This study aims to examine the influence of profitability, debt policy, and firm size on firm value in property and real estate companies listed on the Indonesia Stock Exchange during the period 2019–2023. The sampling technique used in this study was purposive sampling. The data analysis methods employed include classical assumption testing, panel data regression analysis, and hypothesis testing. The results indicate that, partially, profitability (ROE) and debt policy (DER) do not have a significant effect on firm value, whereas firm size has a significant effect. Simultaneously, profitability, debt policy, and firm size have a significant effect on firm value. The regression analysis also reveals that the high adjusted R-squared value indicates the model's strong explanatory power in accounting for variations in firm value. These findings suggest that profitability, debt policy, and firm size collectively make a significant contribution to the determination of firm value.

Keywords: Profitability, Debt Policy, Firm Size, Firm Value

1. Introduction

In carrying out its operations, a company naturally requires capital, either from internal sources or external parties. Companies in need of external funding often offer shares to investors. The presence of investors is crucial, as their capital investment plays an important role in supporting the company's financing and operational activities.

Firm value can be measured through the stock price, which is formed through the demand and supply mechanism in the capital market and reflects public perception of a company's performance. It is therefore reasonable for investors to expect the highest possible return on their investments (Harmono, 2022). Firm value is reflected in the market price of its shares; companies that demonstrate stronger performance than their peers tend to have higher share prices and are better positioned to attract more capital.

According to a CNBC Indonesia news article by Susi Setiawati, published on July 10, 2023, titled *"Pasar Properti Makin Ketat, Kinerja Sahamnya Kian Bertenaga"* (*The Property Market Tightens, Stock Performance Strengthens*), the property and real estate sector plays a strategic role in driving national economic growth. However, in recent years, this sector has experienced significant financial fluctuations due to both internal and external factors, including the impact of the COVID-19 pandemic. An analysis of financial indicators during the 2019–2023 period reveals notable variations in profitability, capital structure, firm size, and firm value among property and real estate companies listed on the Indonesia Stock Exchange.

As of the latest data, there are 35 companies in the property and real estate sector listed on the IDX's main board. Based on the selection criteria of this study—namely, companies that have consistently published complete financial reports from 2019 to 2023—a total of six companies were selected: PT Ciputra Development Tbk (CTRA), PT Bumi Serpong Damai Tbk (BSDE), PT Pakuwon Jati Tbk (PWON), PT Intiland Development Tbk (DILD), PT Agung Podomoro Land Tbk (APLN), and PT Natura City Development Tbk (CITY).

Based on data from the Indonesia Stock Exchange, Return on Equity (ROE) as a measure of profitability declined sharply from 7.38% in 2019 to its lowest point of 3.03% in 2021, before rising again to 7.47% in 2023. This reflects a decrease in corporate performance during the crisis, followed by a gradual recovery. Meanwhile, the Debt to Equity Ratio (DER) rose from 63.98% in 2019 to 99.14% in 2021, indicating companies' increased reliance on debt financing during periods of uncertainty, before gradually declining to 74.57% in 2023. Firm size, measured by the natural logarithm of total assets, showed a downward trend from 12.93 in 2019 to 10.82 in 2022, before increasing slightly to 11.81 in 2023. Meanwhile, the Price to Book Value (PBV), used as a proxy for firm value, consistently declined from 76.3 in 2019 to 56.7 in 2023, reflecting decreasing market valuations from the perspective of investors.

Given these conditions, it is important to investigate how profitability, debt policy, and firm size influence firm value, especially in the context of post-pandemic economic recovery. This study aims to analyze the relationship between these financial variables and firm value in the property and real estate sector in Indonesia, while also offering empirical contributions for financial decision-making and investment strategy development in emerging markets.

2. Literature Review And Hypothesis Development

2.1. The Influence of Profitability (ROE) on Firm Value

Return on Equity (ROE) is a type of profitability ratio. ROE is used to measure net income after tax in relation to shareholders' equity. This ratio examines how effectively a company uses its equity to generate profit. High profits attract investors because they signal promising future prospects. A company with strong prospects will attract more investor interest, which in turn increases share demand, boosts stock prices, and enhances firm value (Fahmi, 2020).

H_1: Profitability (ROE) affects firm value in Property and Real Estate sector companies listed on the Indonesia Stock Exchange from 2019 to 2023.

2.2. The Influence of Debt Policy (DER) on Firm Value

The Debt to Equity Ratio (DER) is used to determine the proportion between total debt and shareholders' equity. This ratio indicates the extent to which a company's assets are financed by debt. High-growth companies tend to use debt as a source of funding, as it can increase asset efficiency and lead to greater profits. These profits, in turn, attract investors and influence stock prices, thereby enhancing firm value (Kasmir, 2019).

H_2: Debt policy (DER) affects firm value in Property and Real Estate sector companies listed on the Indonesia Stock Exchange from 2019 to 2023.

2.3. The Influence of Company Size on Firm Value

Company size refers to the magnitude of a firm, which can be measured in various ways, including total assets, total sales, and market capitalization (Nurminda, 2017).

Jason Fernando (2024) stated, "Market capitalization is used to measure company size, rather than sales or total asset value." Market capitalization reflects a company's current market worth and serves as a proxy for company size. A company may either fail or succeed, but the larger the market capitalization, the larger the company and the greater its firm value.

H_3: Company size affects firm value in Property and Real Estate sector companies listed on the Indonesia Stock Exchange from 2019 to 2023.

2.4. The Influence of Profitability (ROE), Debt Policy (DER), and Company Size on Firm Value

One of the key considerations for investors in the stock market is a company's fundamental performance. Investors often analyze financial ratios to evaluate expected firm value and associated risks. This analysis serves as a guide in investment decision-making.

Firm value is crucial for attracting investors. Investors' short-term goal is to earn capital gains (profitable changes in stock prices), while both short- and long-term goals relate to obtaining returns on their investment. The higher the expected return, the higher the firm value.

H_4: Profitability, debt policy, and firm size have a significant influence on firm value in property and real estate companies listed on the Indonesia Stock Exchange during the period 2019–2023.

Based on the above explanation, the author constructed a conceptual framework involving three independent variables profitability, debt policy, and company size—affecting one dependent variable, which is firm value.

The following is the conceptual framework diagram:

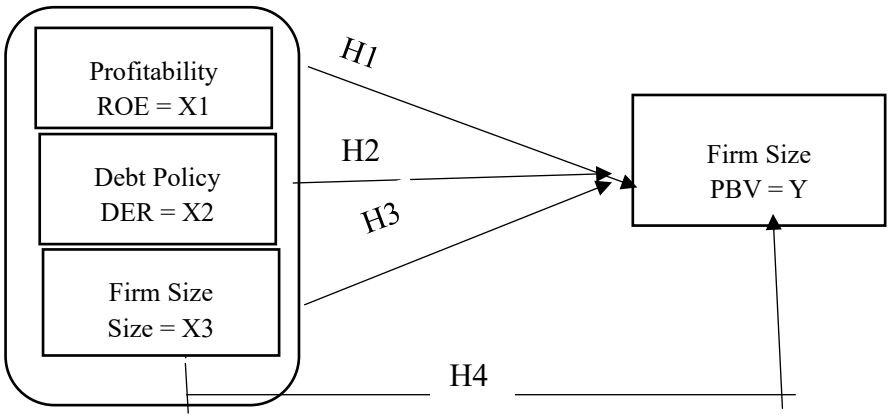

Figure 1. Research Framework

3. Research Method

The type of research used in this study is verificative research employing an explanatory survey method, which utilizes inferential statistical techniques. The unit of analysis in this study is companies, specifically those in the Property and Real Estate sector listed on the Indonesia Stock Exchange (IDX). The research location encompasses Property and Real Estate sector companies listed on the IDX, with data collected from the official IDX website.

The type of data examined is quantitative data, which includes numerical figures representing levels, ratios, and volumes. The data sources used in this research are secondary data, meaning data obtained indirectly by the researcher, typically from media sources, data providers, the stock exchange, or prior research.

The sampling method applied in this study is purposive sampling. This technique involves selecting samples based on specific criteria that are deemed appropriate and relevant to the research problem.

The criteria used to select the samples are as follows: (1) Property and Real Estate sector companies listed on the Indonesia Stock Exchange that clearly present all necessary components in their financial statements for analysis; (2) Companies that published complete annual financial statements audited by a Public Accounting Firm for the 2019–2023 period; (3) Companies that disclosed stock price information from 2019 to 2023; (4) Companies whose financial statements are presented in Indonesian Rupiah (IDR).

Based on these criteria, the sample in this study consists of companies in the Property and Real Estate sector listed on the IDX main board, totaling 35 companies. However, only 6 companies met all the specified criteria and were included in the final sample.

In this study, the independent variables used are profitability and debt policy, while the dependent variable is firm value. The operational definitions of the variables used in this research are summarized in the following table:

Table 1. Variable Operations

Variabel	Indikator	Ukuran	Skala
Profitability	- *Net Income* - *Total Equity*	$\frac{Net\ Income}{Total\ Equity}$	Rasio

(*Return On Equity*)			
Debt Policy (*Debt to Equity Ratio*)	- *Total Liability* - *Total Equity*	$\frac{Total\ Liability}{Total\ Equity}$	Rasio
Firm Size (*Market Capitalization*)	- Number of Outshading Shares - Stock Price	*Jumlah Saham Beredar X Harga Saham*	Rasio
Firm Values (*Price to Book Value*)	- Stock Price - Book Value	$\frac{Harga\ Saham}{Nilai\ Buku}$	Rasio

4. RESULTS AND DISCUSSION

4.1. Best Regression Model Selection

Based on the results of the Chow test, the probability value (p-value) for the cross-section F was 0.0001. Since this value is smaller than the significance level of 0.05 (0.0001 < 0.05), it can be concluded that the fixed effect model is more appropriate than the common effect model.

The results of the Hausman test indicate that the probability value (p-value) for the cross-section random effect was 0.0003, which is also below the 0.05 significance level. This finding suggests that the fixed effect model is more suitable than the random effect model. The significant p-value indicates the presence of correlation between the independent variables and unobserved individual effects in the panel data.

4.2. Normality Test

The normality test in this study was conducted using the Jarque-Bera probability to determine whether the data follows a normal distribution. The data is considered normally distributed if the probability value is greater than 0.05. The results of the normality test were processed using EViews 12.

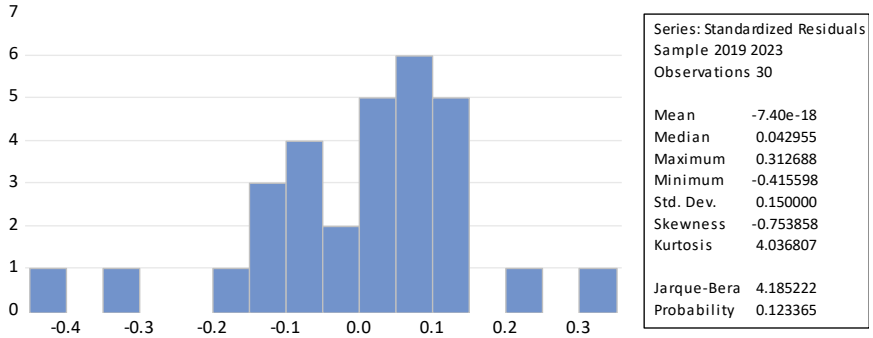

Figure 1. Normality Test Results

Based on Figure 1, the Jarque-Bera probability value is 0.123365, which is greater than 0.05. Therefore, it can be concluded that the regression model is normally distributed.

4.3.Multicollinearity Test

Table 2. Multicollinearity Test Results

	ROE	DER	SIZE
ROE	1,000	-0,065	0,419

DER	-0,065	1,000	-0,201
SIZE	0,419	-0,201	1,000

Source: Processed data using EViews 12, 2025

Based on Table 2, the correlation coefficients for Return on Equity (X1), Debt to Equity Ratio (X2), and Company Size (X3) are all below 0.8. Thus, it can be concluded that there is no multicollinearity problem in this study.

4.4.Panel Data Regression Test

Table 3. Panel Data Regression Results

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-0,185	0,314	-0,587	0,564
ROE	-0,706	0,753	-0,937	0,359
DER	0,177	0,156	1,129	0,272
SIZE	0,063	0,022	2,823	0,010

Source: Processed data using EViews 12, 2025

The panel data regression model used in this study is the Fixed Effect Model (FEM), with the following regression equation:

$$PBV = –0.184549 – 0.706084\ ROE_{it} + 0.176625\ DER_{it} + 0.062748\ Size_{it} + 0.314447$$

Based on the results of the regression analysis, the constant value is -0.185, which means that if Return on Equity (ROE), Debt to Equity Ratio (DER), and firm size are all equal to zero, the firm value, as proxied by Price to Book Value (PBV), would be negative at -0.185. The regression coefficient for ROE is -0.706, indicating that a 1% increase in ROE would decrease PBV by 0.706, assuming other independent variables remain constant. Conversely, the regression coefficient for DER is positive at 0.177, suggesting that a 1% increase in DER would increase PBV by 0.177. Furthermore, the regression coefficient for firm size also shows a positive relationship, with a value of 0.063, meaning that a 1% increase in firm size would raise PBV by 0.063, holding other variables constant. These findings illustrate how each independent variable contributes differently to changes in firm value.

Table 4. Cross-section fixed Result

Cross-section fixed (dummy variables)			
R-squared	0,871	Mean dependent var	0,664
Adjusted R-squared	0,822	S.D. dependent var	0,418
S.E or regression	0,176	Akaike info criterion	-0,390
Sum s quared resid	0,653	Schwarz criterion	0,030
Log likelihood	14,854	Hanna-Quinn criter	-0,256
F-statistic	17,769	Durbin-Watson stat	1,694
Prob (F-statistic)	0,000		

Source: Processed data using EViews 12, 2025

Based on Table 4, the results of the panel data regression analysis show an Adjusted R-Squared value of 0.822. This result indicates that the combined contribution of Return on Equity (ROE), Debt to Equity Ratio (DER), and firm size explains 82.2% of the variation in firm value. The Adjusted R-Squared is used in this context because the model includes more than one independent variable.

4.5.t-Test (Partial Test)

Referring back to Table 3, the results of the t-test (partial test) are as follows:

H_1: Profitability (ROE) has an effect on firm value

The first hypothesis (H1) examines the effect of profitability on firm value, using Return on Equity (ROE) as the indicator. Based on the regression estimation results in Table 3, the t-statistic value is -0.937 with a negative regression coefficient and a probability value of 0.359. Since the significance value is greater than 0.05 ($p > 0.05$), ROE does not have a statistically significant effect on Price to Book Value (PBV). Therefore, hypothesis H1 is rejected. This finding suggests that profitability has not been a determining factor in influencing firm value within the property and real estate sector listed on the Indonesia Stock Exchange (IDX) during the 2019–2023 period.

H_2: Debt Policy (DER) has an effect on firm value

The second hypothesis (H2) tests the effect of debt policy on firm value, measured by the Debt to Equity Ratio (DER). Based on the regression results in Table 3, the t-statistic value is 1.129 with a positive regression coefficient and a probability value of 0.272. As this value exceeds the significance threshold of 0.05 ($p > 0.05$), it can be concluded that DER does not have a significant effect on PBV. Therefore, hypothesis H2 is rejected. This indicates that the company's financing structure through debt does not directly influence market perception of firm value in this sector during the research period.

H_3: Firm size has an effect on firm value

The third hypothesis (H3) tests the influence of firm size on firm value. The regression analysis shows that firm size has a t-statistic value of 2.823 with a positive regression coefficient and a probability value of 0.010. Since the probability is less than 0.05 ($p < 0.05$), this variable has a statistically significant effect on PBV. Thus, hypothesis H3 is accepted. This result indicates that larger firms tend to have higher market values, which can be interpreted as a reflection of investor confidence in the stability and long-term prospects of the company.

4.6.F-Test (Simultaneous Test)

Based on Table 4.6, the F-statistic is 17.769 with a probability of 0.000000. Since the significance value is $0.000000 < 0.05$, this indicates that ROE, DER, and company size simultaneously have a significant effect on firm value (PBV) in Property and Real Estate sector companies listed on the IDX from 2019 to 2023. Conclusion: H4 is accepted.

4.7. Discussion

4.7.1. The Effect of Profitability (ROE) on Firm Value

Based on the partial test results, Return on Equity (ROE), as a measure of profitability, does not significantly affect firm value. This indicates that a lower ROE corresponds to a lower firm value.

Annual ROE calculations show that the number of companies with ROE below the average decreased throughout the study period. In 2019, four companies had ROE below the average, which decreased to three companies during 2020–2022, and only two companies in 2023. Although profitability performance showed an overall improvement, hypothesis testing revealed that ROE does not have a significant effect on firm value; thus, H1 is rejected.

This finding suggests that improvements in ROE are not strong enough to influence investor perception of firm value, particularly in the property and real estate sector. In this industry, firm value tends to be influenced by long-term factors such as asset capacity, project scale, and business sustainability rather than by short-term financial indicators. Furthermore, an increase in ROE does not necessarily reflect operational efficiency, as it may be affected by non-operational factors or net income fluctuations due to external conditions (Nurmatias, 2022).

Additionally, during 2019–2023, the Property and Real Estate sector was affected by global and national economic uncertainty, particularly during the COVID-19 pandemic. This led investors to be more cautious and focus on long-term aspects like company size and financial structure when evaluating firm value.

These results do not align with the initial hypothesis. However, the findings are consistent with prior research by Hakinis & Chandra (2022), Riswandi & Triyowati (2021), Imam H & Khusnul (2022), and Silvia & Sofia Prima (2020), which concluded that profitability does not significantly influence firm value.

4.7.2. The Effect of Debt Policy (DER) on Firm Value

Based on the partial test results, the Debt to Equity Ratio (DER), as a measure of debt policy, does not significantly affect firm value. Annual DER calculations indicate that the number of companies with DER below the average slightly declined. In 2019, four companies were below the average, while from 2020 to 2023, this number remained stable at three companies per year. Nonetheless, hypothesis testing showed that DER does not significantly affect firm value in the Property and Real Estate sector; thus, H2 is rejected.

This indicates that even though there was an improvement in capital structure (with more companies having healthier debt ratios), this did not directly enhance firm value in the eyes of investors. In the property sector, large amounts of debt are common due to the capital-intensive and long-term nature of the business. Real estate projects require significant upfront funding, and returns are typically realized in the medium to long term. Therefore, a high DER is not necessarily viewed negatively by investors as long as the company can manage risks and generate stable income (Buchari, 2021).

These findings are consistent with previous studies by Ni Nyoma et al. (2021), Prasetyo et al. (2021), Mellinda L & Muthia (2020), and Raudhatul et al. (2023), which concluded that debt policy does not significantly affect firm value.

4.7.3. The Effect of Company Size on Firm Value

Based on the partial test results, company size, measured by market capitalization, has a significant effect on firm value. During 2019–2021 and 2023, three companies consistently remained below the average size, while in 2022, only two companies were below average, indicating an improvement in market size for one company.

Based on market capitalization classification, among the companies studied: Three are classified as blue-chip (large-cap), Two are second liners (mid-cap), and One is a third liner (small-cap).

Blue-chip companies typically represent dominant industry players with strong financial stability and high investor confidence.

Hypothesis testing shows that company size has a significant effect on firm value and contributes more than the other variables. This supports the idea that in the property and real estate sector, market size is a primary consideration for investors. This finding aligns with signaling theory, where large companies send positive signals regarding stability, business continuity, and resilience amid economic uncertainty.

These results are consistent with studies by Dita & Sri (2022), Prasetyo et al. (2021), Raudatul et al. (2023), and Imam H & Khusnul Khatimah (2022), which found that company size significantly affects firm value.

4.7.4. The Effect of Profitability (ROE), Debt Policy (DER), and Company Size on Firm Value

Based on the F-test results, profitability (ROE), debt policy (DER), and company size jointly have a significant effect on firm value in Property and Real Estate sector companies listed on the IDX from 2019 to 2023. This indicates that the three independent variables used in the regression model collectively explain variations in firm value, supporting H4.

Although only company size showed a significant effect in the partial tests, the three variables together contribute collectively to firm value. This is further supported by the high Adjusted R-Squared value, indicating that the model has a strong explanatory power. This means that the combination of financial efficiency (ROE), capital structure (DER), and company scale (Size) plays a critical role in shaping investor perceptions of firm value.

These findings are consistent with research by Prasetyo et al. (2021), Raudatul et al. (2023), Dina Shafarina & Vaya Juliana (2019), and Dede Harina et al. (2019), who found that profitability, debt policy, and company size jointly influence firm value.

5. Conclusion

Based on the results of research conducted on property and real estate companies listed on the Indonesia Stock Exchange during the period 2019–2023, several conclusions can be drawn. (1) Profitability, measured by Return on Equity (ROE), does not have a significant effect on firm value. This indicates that fluctuations in earnings relative to equity have not yet become a primary factor considered by investors in assessing firm value; (2) Debt policy, measured by the Debt to Equity Ratio (DER), also does not significantly influence firm value. This finding suggests that the level of company debt does not sufficiently affect market perception of firm value, possibly because investors are more focused on other factors such as long-term growth and future prospects; (3) Firm size has been proven to have a positive effect on firm value. Larger companies tend to have greater competitiveness and investor trust, as they are considered more stable and have better access to external funding; (4) Simultaneously, the three independent variables studied—profitability, debt policy, and firm size—have a significant collective influence on firm value. This indicates that although not all variables are significant individually, together they still play an important role in shaping firm value.

Therefore, it can be concluded that a company's financial performance remains a crucial aspect in determining firm value. Management should consider various financial indicators comprehensively, rather than focusing on a single aspect. For investors, these findings offer insight that firm valuation should be approached holistically by taking into account profitability, capital structure, and firm scale.

6. Sugesstions

Based on the findings of this study, it is evident that profitability and debt policy do not have a significant impact on firm value in the property and real estate sector. Accordingly, company management is advised not to focus solely on increasing profit or managing debt structure, but instead to consider other relevant factors that may contribute to firm value creation. A comprehensive review of current business strategies is necessary, with attention given to aspects such as the quality of managerial leadership, operational efficiency, and market confidence, all of which are likely to have a stronger influence on investor perception and firm valuation.

For current and prospective investors, especially those interested in investing in property and real estate companies listed on the Indonesia Stock Exchange, firm size should be regarded as a key indicator in investment decision-making. Companies with larger size or those classified as high market capitalization (blue-chip) stocks generally exhibit higher firm value and better operational efficiency, thus offering more stable and reliable return potential.

Future research is encouraged to enhance the model by incorporating other financial ratios and expanding the range of variables studied, including macroeconomic factors such as interest rates, inflation, or exchange rates. These variables may provide a more comprehensive understanding of the dynamics influencing firm value and contribute to a richer empirical foundation in the field of corporate finance, particularly within the context of the Indonesian capital market.

THE EFFECT OF CORPORATE SOCIAL RESPONSIBILITY (CSR) DISCLOSURE ON PROFITABILITY RATIOS IN FOOD AND BEVERAGE SUB-SECTOR COMPANIES LISTED ON THE INDONESIA STOCK EXCHANGE (IDX) FOR THE 2019–2023 PERIOD

Dinda Yuniar[1,*], Hari Gursida[1], Amelia Rahmi[1]
[1]Economic and Business Faculty of Pakuan University, Bogor, Indonesia

Abstract

This study aims to examine the effect of Corporate Social Responsibility (CSR) disclosure on profitability ratios, as proxied by Return on Assets (ROA), Return on Equity (ROE), and Net Profit Margin (NPM), in food and beverage sub-sector companies listed on the Indonesia Stock Exchange (IDX) during the 2019–2023 period. The analysis focuses on food and beverage sub-sector companies listed on the IDX, with a sample of 6 companies selected from a population of 24, using secondary data and a purposive sampling technique. The data were analyzed quantitatively through descriptive statistics, classical assumption tests, and hypothesis testing. The results indicate that, partially, CSR disclosure has a significant effect on profitability ratios as measured by ROA, ROE, and NPM.

Keywords: corporate social responsibility, return on assets, return on equity and net profit margin

1. Introduction

In the current business environment, companies are not only expected to focus on profit generation but also to be accountable for their social and environmental impacts (Herliani, 2020). This shift arises from increasing public awareness of corporate activities and their consequences on society and the environment (Syahri & Astrie, 2021). As part of a broader organizational strategy, companies are urged to implement Corporate Social Responsibility (CSR) as a means of aligning business goals with social expectations (Putra, 2015). CSR not only improves corporate reputation but also attracts potential investors and sustains long-term operations by promoting ethical and responsible practices. Particularly in the food and beverage sub-sector, which continues to grow and interacts directly with natural resources and society, CSR disclosure becomes essential (Kemenperin, 2021). Companies in this industry must actively demonstrate accountability for their environmental and social impacts to maintain competitiveness and legitimacy.

Profitability plays a central role in measuring a company's performance and sustainability. Indicators such as Return on Assets (ROA), Return on Equity (ROE), and Net Profit Margin (NPM) are widely used to evaluate a company's ability to generate profit (Kasmir, 2015; Hery, 2015). Previous studies have yielded mixed results regarding the relationship between CSR disclosure and profitability, with some confirming a positive and significant influence (Lestari, 2022; Putra, 2015), while others found either no correlation or a negative impact (Herliani, 2020; Mustafa & Handayani, 2014). This discrepancy highlights the need for further investigation. Therefore, this study aims to examine the influence of CSR disclosure on profitability ratios in food and beverage sub-sector companies listed on the Indonesia Stock Exchange during the 2019–2023 period, to provide empirical evidence on whether CSR initiatives support financial performance.

2. Literature review

5.26. Stakeholder Theory

The concept of stakeholder theory emerged from the work of Freeman (1984), who defined stakeholders as any group or individual that can affect or is affected by the achievement of an organization's objectives. This theory suggests that companies are not merely profit-driven entities serving shareholders but are instead social institutions that must provide benefits to all stakeholders, including investors, employees, customers, suppliers, communities, and regulatory bodies (Chariri & Ghozali, 2007). Hohnen and Blackburn (2010) argue that an organization's long-term survival and success depend heavily on securing support from these various stakeholders, which in turn requires transparent and ethical business practices. Stakeholder relationships are dynamic and interdependent, built on trust, accountability, and mutual respect. Therefore, CSR becomes a strategic tool to communicate value alignment with stakeholders and to ensure social legitimacy.

5.27. Legitimacy Theory

Legitimacy theory, initially proposed by Dowling and Pfeffer (1975), is grounded in the social contract between businesses and society. It asserts that companies must operate within the norms, values, and expectations of the society in which they exist. Gaining and maintaining legitimacy is crucial, as it ensures access to necessary resources and continued acceptance from the public. Deegan (2002) emphasized that legitimacy is particularly significant in developing countries, where cultural pressures shape how companies approach CSR. Disclosure of CSR initiatives through annual or sustainability reports serves as a means to signal legitimacy to stakeholders, helping organizations position themselves positively within increasingly aware and socially sensitive environments. CSR reporting thus bridges the gap between corporate behavior and societal expectations.

5.28. Corporate Social Responsibility (CSR)

Corporate Social Responsibility is defined by Kotler and Lee (2005) as a company's commitment to improving community well-being through discretionary business practices and the allocation of corporate resources. Similarly, the World Business Council for Sustainable Development (WBCSD) describes CSR as a commitment to sustainable economic development while enhancing the quality of life for employees, their families, local communities, and society at large (WBCSD, 2020). CSR extends beyond compliance, encompassing voluntary efforts in areas such as environmental protection, community involvement, ethical labor practices, and customer welfare. The Indonesian legal framework, notably Law No. 25/2007 and Government Regulation No. 47/2012, has reinforced CSR as a mandatory responsibility, especially for natural resource-intensive companies.

For food and beverage sub-sector companies, CSR is particularly vital due to their strong interaction with public health, environmental sustainability, and consumer trust. Implementing CSR initiatives such as safe production processes, environmental conservation, and community engagement not only enhances corporate reputation but also contributes to long-term profitability and competitiveness.

5.29. Corporate Social Responsibility Dimensions and GRI-G4 Disclosure Framework

CSR practices can be categorized into three core dimensions: economic, social, and environmental (Mardikanto, 2014). The economic dimension involves corporate governance, ethical investment, and consumer protection. The social dimension addresses labor practices, community development, and employee well-being, while the environmental dimension focuses on minimizing environmental impact through sustainable resource use, waste reduction, and emission control. These dimensions align with the Global Reporting Initiative (GRI) G4 guidelines, which serve as a comprehensive standard for sustainability reporting. The GRI-G4 framework includes 91 disclosure items covering aspects such as economic performance, labor rights, human rights, environmental footprint, and product responsibility.

CSR disclosure using the GRI-G4 index allows companies to communicate their commitment to sustainability transparently, helping investors and stakeholders evaluate corporate accountability. The CSR disclosure index (CSRI) is often measured through a dichotomous scoring system, assigning a score of 1 for disclosed items and 0 for undisclosed ones. A higher CSRI indicates stronger CSR commitment and is generally associated with a better public image and stronger stakeholder relationships.

5.30. Profitability and Its Relationship with Corporate Social Responsibility

Profitability reflects a company's ability to generate earnings and is a key indicator of financial performance. It is commonly measured using ratios such as Return on Assets (ROA), Return on Equity (ROE), and Net Profit Margin (NPM). ROA assesses the efficiency of asset utilization in generating net income (Kasmir, 2015), while ROE measures the return on shareholder equity, reflecting how effectively the company uses investments to generate profit. NPM indicates how much of the net sales is translated into net income, offering insight into operational efficiency (Hery, 2015).

According to Harahap (2009), profitability provides a basis for evaluating the effectiveness of management and its use of company resources. Brigham and Houston (2006) further describe profitability as the net result of business decisions and policies. Several studies have explored the link between CSR disclosure and profitability, suggesting that strategic CSR can improve financial performance by attracting investor interest, enhancing brand loyalty, and increasing market share (Lestari, 2022; Putra, 2015). However, other studies indicate that CSR may impose financial burdens that negatively affect short-term profits (Herliani, 2020; Mustafa & Handayani, 2014), highlighting the need for further empirical investigation, particularly in industry-specific contexts such as the food and beverage sub-sector.

3. Methodology

This study employs a verificative research design with an explanatory survey method to test hypotheses regarding the effect of Corporate Social Responsibility (CSR) disclosure on profitability ratios, specifically Return on Assets (ROA), Return on Equity (ROE), and Net Profit Margin (NPM). The object of the research is CSR disclosure measured using the GRI-G4 framework, with the unit of analysis being food and beverage sub-sector companies listed on the Indonesia Stock Exchange (IDX). From a population of 24 companies during the 2019–2023 period, six companies were selected through purposive sampling based on specific criteria such as consistent listing, IPO prior to 2019, regular publication of financial and annual reports, CSR disclosure, and positive net income. Data were obtained from secondary sources via documentation methods, including company websites and the IDX portal.

10.4. Theoretical framework

This research is grounded in Stakeholder Theory and Legitimacy Theory. Stakeholder Theory (Freeman, 1984) suggests that companies must be accountable not only to shareholders but also to various stakeholders. CSR disclosure is one way to fulfil these responsibilities, potentially increasing trust and support that may enhance financial performance. Legitimacy Theory (Dowling & Pfeffer, 1975) argues that organizations seek societal approval to maintain their existence. CSR disclosure aligns companies with societal norms and values, helping to sustain legitimacy and improve reputation, which may positively affect profitability. Previous studies show mixed results, with some indicating that CSR disclosure improves profitability through reputation and efficiency, while others suggest it may reduce profits due to associated costs. Based on these theoretical foundations, CSR disclosure is expected to influence financial outcomes. The study tests the following hypotheses:

Hypothesis1: CSR disclosure affects Return on Assets (ROA).
Hypothesis2: CSR disclosure affects Return on Equity (ROE).

Hypothesis3: CSR disclosure affects Net Profit Margin (NPM).

10.5. Conceptual framework

The conceptual framework is built to illustrate the causal relationships between CSR disclosure and three key indicators of corporate profitability: Return on Assets (ROA), Return on Equity (ROE), and Net Profit Margin (NPM). CSR disclosure is measured using the Global Reporting Initiative (GRI) G4 guidelines, which cover economic, environmental, and social aspects.

As illustrated in Figure 1, CSR Disclosure (X) is hypothesized to influence ROA (Y1), which measures how efficiently a company uses its assets to generate profit; ROE (Y2), which reflects the return to shareholders; and NPM (Y3), which represents the proportion of net income to revenue.

10.6. Instrumentation

The study employed secondary data collected through documentation methods, using publicly available financial reports and annual sustainability disclosures from 2019 to 2023, sourced from the Indonesia Stock Exchange (IDX) and official company websites.

Variables and Measurements:

- Independent Variable:

CSR Disclosure (X), measured using a CSR Disclosure Index (CSRI) based on GRI-G4 standards. Each disclosure item is scored dichotomously (1 = disclosed; 0 = not disclosed), then converted into a percentage.

- Dependent Variables:

ROA (Y1) = Net Income / Total Assets
ROE (Y2) = Net Income / Equity
NPM (Y3) = Net Income / Net Sales

Data analysis was performed using simple linear regression, preceded by classical assumption tests to ensure validity. The software SPSS version 25 was used for all statistical testing. This instrument design allows for an objective evaluation of the effect of CSR disclosure on company profitability.

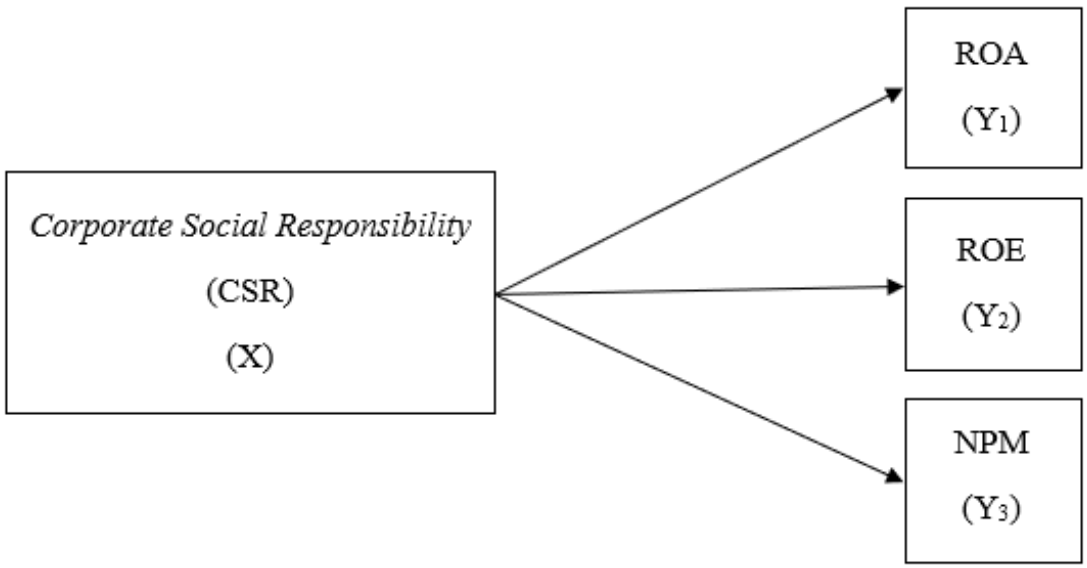

Figure 1. Conceptual Model of the Influence of CSR on Profitability Ratios
(Source: Processed by the author, 2025)

4. Results and discussions

This study employs a quantitative data analysis method using simple linear regression to test the proposed hypotheses. Classical assumption tests were conducted to ensure the validity of the regression model, followed by hypothesis testing to evaluate the relationships between variables. All statistical analyses were carried out using SPSS software.

The normality test was conducted to assess whether the independent and dependent variables in the regression model are normally distributed. The Kolmogorov–Smirnov method was used, with the criterion that if the significance (Sig.) value is greater than 0.05, the data are considered to be normally distributed.

Table 1. Normality test result

One-Sample Kolmogorov-Smirnov Test

		Unstandardized Residual1	Unstandardized Residual2	Unstandardized Residual3
N		30	30	30
Normal Parameters[a,b]	Mean	.0000000	.0000000	.0000000
	Std. Deviation	.45094269	.33364415	.52108200
Most Extreme Differences	Absolute	.142	.074	.111
	Positive	.142	.074	.111
	Negative	-.109	-.064	-.057
Test Statistic		.142	.074	.111
Asymp. Sig. (2-tailed)		.129[c]	.200[c,d]	.200[c,d]

a. Test distribution is Normal.

b. Calculated from data.

c. Lilliefors Significance Correction.

d. This is a lower bound of the true significance.

Based on the Kolmogorov–Smirnov test results, the significance values for the relationship between CSR disclosure and ROA, ROE, and NPM were 0.129, 0.200, and 0.200 respectively. As all values are greater than 0.05, it can be concluded that the data meet the assumption of normal distribution.

Table 2. Heteroscedasticity test result

Correlations

			LNX	LNY1	LNY2	LNY3
Spearman's rho	LNX	Correlation Coefficient	1.000	.318	.403*	-.151
		Sig. (2-tailed)	.	.087	.027	.427
		N	30	30	30	30
	LNY1	Correlation Coefficient	.318	1.000	.922**	.718**
		Sig. (2-tailed)	.087	.	.000	.000
		N	30	30	30	30
	LNY2	Correlation Coefficient	.403*	.922**	1.000	.652**
		Sig. (2-tailed)	.227	.000	.	.000
		N	30	30	30	30
	LNY3	Correlation Coefficient	-.151	.718**	.652**	1.000
		Sig. (2-tailed)	.427	.000	.000	.
		N	30	30	30	30

*. Correlation is significant at the 0.05 level (2-tailed).

**. Correlation is significant at the 0.01 level (2-tailed).

The heteroscedasticity test was carried out using Spearman's Rho correlation to detect any non-constant variance in the residuals. The results showed significance values for CSR's correlation with ROA, ROE, and NPM at 0.087, 0.227, and 0.427, respectively. Since all values are greater than 0.05, it indicates that the regression model does not suffer from heteroscedasticity.

Table 3. Autocorrelation test result on ROA

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.025[a]	.001	-.036	4.05154	1.893

a. Predictors: (Constant), LAG_X

b. Dependent Variable: LAG_Y1

Table 4. Autocorrelation test result on ROE

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.078[a]	.006	-.031	4.02829	1.708

a. Predictors: (Constant), LAG_X

b. Dependent Variable: LAG_Y2

Table 5. Autocorrelation test result on NPM

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.253[a]	.064	.029	4.76562	1.579

a. Predictors: (Constant), LAG_X

b. Dependent Variable: LAG_Y3

Table 3,4 and 5 The Durbin–Watson test was used to identify autocorrelation in the regression residuals. The critical value DU was 1.489, making the upper limit for no autocorrelation 2.511. The Durbin–Watson values for the models were:

- The effect of CSR on ROA is 1.893
- The effect of CSR on ROE is 1.708
- The effect of CSR on NPM is 1.579

All values fall within the acceptable range ($1.489 < d < 2.511$), indicating no positive or negative autocorrelation.

Table 6. Simple linear regression result on ROA

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	-.474	.666		-.712	.482

	LAG_RES_1	.479	.144	.540	3.331	.003

a. Dependent Variable: Unstandardized Residual

Table 7. Simple linear regression result on ROE

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	-.437	.737		-.593	.558
	LAG_RES_2	.461	.154	.500	3.002	.006

a. Dependent Variable: Unstandardized Residual

Table 8. Simple linear regression result on NPM

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	-.902	.871		-1.036	.309
	LAG_RES_3	.569	.112	.699	5.074	.000

a. Dependent Variable: Unstandardized Residual

Simple linear regression was used to assess the effect of CSR disclosure (X) on each profitability ratio

Results:

- For ROA: The regression coefficient was 0.479 (Sig. = 0.003), indicating a significant positive effect of CSR disclosure.
- For ROE: The regression coefficient was 0.461 (Sig. = 0.006), also indicating a significant positive effect.
- For NPM: The regression coefficient was 0.569 (Sig. = 0.000), again showing a significant positive relationship.

Thus, it can be concluded that CSR disclosure positively influences ROA, ROE, and NPM.

Table 9. Adjusted R Square result on ROA

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.337[a]	.114	.082	.45892

a. Predictors: (Constant), LNX

b. Dependent Variable: LNY1

Table 10. Adjusted R Square result on ROE

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.462[a]	.214	.186	.33955

a. Predictors: (Constant), LNX

b. Dependent Variable: LNY2

Table 11. Adjusted R Square result on NPM

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.108[a]	.012	.024	.53031

a. Predictors: (Constant), LNX

b. Dependent Variable: LNY3

The coefficient of determination (R^2) was used to assess how much of the variation in profitability ratios can be explained by CSR disclosure. The findings are as follows:

- ROA: R^2= 0.114; Adjusted R^2 = 0.082

This indicates that 8.2% of the variability in Return on Assets is explained by CSR disclosure, suggesting that while CSR activities do contribute to profitability, other internal and external factors such as cost efficiency, asset management strategies, and economic conditions also play a substantial role.

- ROE: R^2 = 0.214; Adjusted R^2 = 0.186

About 18.6% of the changes in Return on Equity can be attributed to CSR disclosure. This shows a relatively stronger influence, possibly because CSR enhances investor confidence and long-term shareholder value.

- NPM: R^2 = 0.108; Adjusted R^2 = 0.024

Only 2.4% of the variation in Net Profit Margin is explained by CSR, indicating that profitability from revenue conversion is likely affected more by operational and pricing strategies than by social responsibility disclosures.

Table 12. t Test result on ROA

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	-.474	.666		-.712	.482
	LAG_RES_1	.479	.144	.540	3.331	.003

a. Dependent Variable: Unstandardized Residual

Table 13. t Test result on ROE

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	-.437	.737		-.593	.558
	LAG_RES_2	.461	.154	.500	3.002	.006

a. Dependent Variable: Unstandardized Residual

Table 14. t Test result on NPM

Coefficients[a]

Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.

		B	Std. Error	Beta		
1	(Constant)	-.902	.871		-1.036	.309
	LAG_RES_3	.569	.112	.699	5.074	.000

a. Dependent Variable: Unstandardized Residual

The t-test results were used to assess whether CSR disclosure has a statistically significant effect on each profitability ratio when considered individually, the analysis was conducted at a 0.05 significance level, with a t-table critical value of 2.60.

- CSR → ROA: t = 3.331, Sig. = 0.003

This indicates a strong and significant effect of CSR disclosure on ROA. It suggests that CSR activities may improve public image, operational credibility, and stakeholder trust—leading to more efficient use of company assets.

- CSR → ROE: t = 3.002, Sig. = 0.006

The significant influence of CSR on ROE implies that social responsibility contributes to strengthening shareholder returns, potentially by enhancing corporate governance, transparency, and long-term investor appeal.

- CSR → NPM: t = 5.074, Sig. = 0.000

The strongest significance was observed in the NPM model, indicating that CSR has a considerable impact on a company's ability to generate profit from sales. This may stem from increased customer loyalty, brand equity, and market differentiation resulting from CSR efforts.

5. Conclusion

The findings reveal that CSR disclosure has a positive and significant influence on ROA, indicating that CSR initiatives may enhance customer loyalty, attract investors, and improve operational efficiency—contributing to stronger asset performance. Therefore, hypothesis 1 is accepted. However, CSR is not the sole factor influencing ROA; other variables are also likely to play a role. Similarly, CSR disclosure demonstrates a positive and significant effect on ROE. Despite its costs, CSR can be viewed as a long-term strategic investment that enhances corporate reputation and shareholder value through increased profits. Hence, hypothesis 2 is accepted, with the acknowledgment that additional factors may also impact equity returns. Moreover, CSR disclosure has a positive and significant impact on NPM, showing that CSR communicates corporate commitment to social responsibility, thereby boosting investor confidence, market appeal, and overall profitability. Thus, hypothesis 3 is also accepted, although CSR remains one of several variables that influence net profit margins.

In summary, the study supports the argument that CSR disclosure contributes positively to corporate financial performance. These results reinforce the importance of integrating CSR as part of strategic decision-making, while also recognizing the presence of other influencing factors in determining company profitability.

Abstract

This study investigates the effect of digitalization on the profitability of Bank Syariah Indonesia (BSI) and examines how market share moderates this relationship over the period 2019–2024. Grounded in the Resource-Based View (RBV) theory, the research employs panel data regression using fixed effects and robust standard errors to analyze the impact of technological transformation in a post-merger Sharia banking environment. The findings reveal that digitalization has a positive and statistically significant effect on profitability. More importantly, market share strengthens this relationship, acting as a significant moderating variable. This implies that banks with greater market dominance can better leverage digital investments to enhance financial performance. The results highlight the strategic value of aligning internal digital capabilities with external market strength in achieving competitive advantage in Islamic banking.

Keywords: Digitalization; Profitability; Market Share; Islamic Banking; Panel Regression; Sharia Finance; Bank Syariah Indonesia; Resource-Based View (RBV)

1. Introduction

In the era of digital transformation, Islamic banking institutions are increasingly compelled to embrace technology-driven strategies to sustain competitive advantage and profitability. Unlike their conventional counterparts, Sharia-compliant banks operate within a distinct ethical framework that prohibits interest (riba) and emphasizes risk-sharing and social justice, making their digital journey both critical and complex ((Zouari & Abdelhedi, 2021); (Charag et al., 2020)). As global financial ecosystems shift toward fintech integration, Islamic banks must navigate a nuanced path, aligning digital innovation with the principles of Sharia law (Banna et al., 2022) .

Digitalization has been widely recognized as a catalyst for enhancing operational efficiency, customer satisfaction, and cost optimization in banking systems (Mustapha et al., 2023). In Islamic finance, digital adoption, encompassing mobile banking, blockchain, and AI-enabled services, has shown potential to transform customer experiences and streamline compliance procedures ((Jamshed & Uluyol, 2024); (Buana et al., 2020)). Yet, the financial benefits of digitalization are not uniform across institutions; rather, their realization appears to be contingent on organizational scale and reach.

This study explores a pivotal question: Does market share moderate the impact of digitalization on profitability in Sharia-compliant banks? While some scholars suggest that

market dominance amplifies the advantages of technological investment through network effects and customer stickiness (Rosmanidar et al., 2021), others argue that smaller Islamic banks may experience innovation-induced agility and niche market alignment (Setiawan et al., 2023). The mediating or moderating roles of contextual variables such as size, regional coverage, and consumer base remain underexplored in the Islamic finance literature.

Given the limited empirical work analyzing digital transformation outcomes in Islamic banking through a market share lens, this study makes a novel contribution by testing market share as a moderating variable in the relationship between digitalization (independent variable) and profitability (dependent variable). Drawing on a combination of financial performance indicators, digital readiness metrics, and panel regression analysis across select OIC (Organisation of Islamic Cooperation) member states, the research aims to fill critical gaps in both theoretical development and policy guidance.

This investigation responds to recent calls for more granular, evidence-based models in Islamic banking performance research, as emphasized by bibliometric and conceptual reviews ((Biancone et al., 2020); (Charag et al., 2020)). Furthermore, it contributes to the growing discourse on how Islamic banks can balance their religious obligations with technological modernization to foster sustainable financial growth (M. Zafar & Sulaiman, 2020).

2. Literature Review

2.1. Digitalization in Islamic Banking

Digitalization is reshaping the global financial ecosystem, and Islamic banks are no exception. In contrast to conventional banks, Islamic financial institutions must ensure that technological innovations align with Shariah principles. Digital platforms, AI-driven services, and mobile banking tools offer not only operational efficiencies but also improved customer experiences and increased outreach to unbanked Muslim populations ((Andiansyah et al., 2024); (Sihotang & Hasanah, 2021)). However, the degree of success in leveraging these technologies appears to be highly contextual. Studies by Harahap et al., (2023) and Desky & Maulina, (2022) reveal uneven digital adoption across Islamic banks in Southeast Asia and the Middle East due to regulatory, cultural, and institutional limitations.

Digitalization is positively associated with improved profitability through cost reduction, faster service delivery, and customer base expansion. However, Banna et al., (2020) caution that mere adoption of digital tools does not guarantee financial gains unless matched with internal digital capability and strategic scale.

2.2. Profitability in Sharia Banks

Profitability in Islamic banking is influenced by both financial and non-financial factors, such as compliance with Shariah, customer trust, cost efficiency, and technological competence (Zafar & Yasin, 2025). Unlike conventional banks that rely on interest-based lending, Islamic banks utilize profit-sharing contracts (e.g., mudarabah, musharakah), which require careful risk management and relationship-based banking. Performance measures such as ROA, ROE, and net margin are commonly used, but their sensitivity to digital innovation varies (Kurniawan et al., 2024).

Empirical evidence suggests that profitability can improve significantly with digital transformation, but the gains are not homogeneous across all banks ((Siska, 2022); (Rahma & Sofyani, 2024)). This variability invites deeper inquiry into moderating factors.

2.3. Market Share as a Moderator

Market share represents a firm's relative position within the industry and reflects customer base, trust, and resource access. For Islamic banks, a larger market share often implies better brand reputation, greater liquidity, and more resources for digital investment. Research by Nazaritehrani & Mashali, (2020) and Al Arif & Awwaliyah, (2019) indicate that banks with

larger market shares experience higher returns on digital investments due to economies of scale, wider network effects, and stronger data leverage.

Thus, market share may act as a moderator, influencing how effectively digitalization contributes to profitability. High-market-share Islamic banks may convert digital capabilities into profit more efficiently, while smaller banks might struggle to break even on technology spending without a sufficient user base ((Buana et al., 2020)).

2.4. Theoretical Framework: Resource-Based View (RBV)

The Resource-Based View (RBV) serves as a robust theoretical foundation for this study, offering a strategic lens to understand how internal capabilities contribute to firm performance. According to RBV, organizations achieve and sustain competitive advantage when they possess resources that are valuable, rare, inimitable, and non-substitutable (VRIN) (Barney, 1991). In the context of Islamic banking, digitalization can be conceptualized as a strategic internal capability that enhances operational efficiency, customer experience, and service innovation. However, the impact of digitalization on profitability as an organizational performance outcome may vary depending on external conditions such as market share, which functions as a boundary condition influencing how effectively digital resources are deployed and monetized. By integrating these elements, RBV provides a theoretical basis for analyzing the interaction between internal resources (digital capabilities) and external strategic positioning (market dominance) in shaping the financial outcomes of Sharia-compliant banks.

Table 1. Summary Table of Key Literature

Study	Focus	Key Insight	Gap Identified
Banna et al., (2020)	Digital Financial Inclusion	Digital tools enhance economic growth if Sharia-compliant	Lack of moderation analysis
Rosmanidar et al., (2021)	Performance Measurement	Metrics vary in sensitivity to tech	Missing strategic scale discussion
Hamidah et al., (2020)	Bibliometric Review	Growth of Islamic finance studies	Few studies link tech to profitability
Zafar & Sulaiman (2020)	Shariah vs. Convenience	Digital banking success is user-driven	Lacks market-level variables
Azad et al., (2023)	Bibliometric Analysis	Profitability linked to innovation	No integration of market share

Source: Synthesized from various peer-reviewed journals, 2025

To investigate the dynamics between technological advancement and financial performance in Sharia-compliant banks, this study proposes a theoretical model grounded in the Resource-Based View (RBV). According to RBV, internal resources such as digital capabilities can provide a sustained competitive advantage when they are valuable, rare, inimitable, and non-substitutable. In the context of Islamic banking, digitalization through innovations like mobile banking, AI-driven risk management, and compliance automation can improve efficiency and customer experience, thereby enhancing profitability. Prior studies have found that digital transformation contributes positively to financial outcomes in conventional banking, but its direct impact in Islamic finance remains underexplored. Accordingly, the first hypothesis is formulated to test this relationship: H_{11}: Digitalization has a significant positive effect on the profitability of Sharia banks, with the null hypothesis stating that there is no significant effect (H_{01}).

However, the extent to which digitalization leads to profitability may not be uniform across all banks. The effectiveness of digital investment may depend on contextual factors such as market share. Banks with larger market share typically possess broader customer bases,

enhanced operational scale, and stronger reputational trust, enabling them to better monetize technological investments. These factors can amplify the benefits of digitalization, making market share a potential moderating variable. Therefore, the second hypothesis is proposed: H_{12}: Market share significantly moderates the relationship between digitalization and profitability in Sharia banks, such that the relationship is stronger at higher levels of market share. The corresponding null hypothesis is that market share does not significantly moderate this relationship (H_{02}).

To further deepen the analysis, the study also considers the direct effect of market share on profitability. A higher market share often correlates with greater customer loyalty, stronger bargaining power, and better resource allocation, all of which can independently boost profitability. Hence, a third hypothesis is proposed: H_{13}: Market share has a significant positive direct effect on the profitability of Sharia banks, with the null hypothesis being that no such effect exists (H_{03}). These hypotheses will be tested using quantitative methods to provide empirical insight into how internal digital capabilities interact with external market conditions to shape performance outcomes in Islamic banking.

3. Methodology

3.1. Research Design

This study employs a quantitative explanatory research design to examine the impact of digitalization on profitability in a Sharia banking context, with market share as a moderating variable. Anchored in the Resource-Based View (RBV) theory, the research investigates how internal digital capabilities (as strategic resources) interact with external organizational scale (market share) to influence performance outcomes. The approach is deductive, using panel data and statistical modeling to test the proposed hypotheses.

3.2. Population and Sample

The population of this study is Bank Syariah Indonesia (BSI), the largest Islamic bank in Indonesia, which was established through the 2021 merger of three state-owned Sharia banks: Bank Syariah Mandiri, BNI Syariah, and BRISyariah. However, to capture pre- and post-merger performance trends and maintain data continuity, this study uses a time-series sample covering the period 2019–2024. This allows for a longitudinal assessment of how BSI's digital transformation initiatives have evolved and their effects on profitability, as well as how market share moderated these outcomes throughout the merger and consolidation phases.

3.3. Data Collection

This study utilizes secondary data sourced from:

- BSI's annual and sustainability reports (2019–2024)
- OJK (Otoritas Jasa Keuangan) and Bank Indonesia publications
- Press releases and investor presentations
- Public financial databases such as IDX, BankScope, or Orbis

Digitalization and market share indicators are triangulated using both financial reports and public disclosures to ensure accuracy and validity.

Variable Operationalization

Variable	Type	Measurement Approach
Digitalization	Independent	Composite index from BSI's disclosures: number of digital users, % mobile transaction volume, IT investment ratio, and availability of digital products
Profitability	Dependent	Measured using Return on Assets (ROA) and Return on Equity (ROE)

Variable	Type	Measurement Approach
Market Share	Moderator	Measured as BSI's proportion of total Islamic banking assets in Indonesia (%)
Control Variables	Control	Total assets (bank size), financing-to-deposit ratio (FDR), and operational efficiency (BOPO)

Source: Synthesized from various peer-reviewed journals, 2025

3.4. Analytical Model

This study employs time-series regression analysis with interaction modeling to examine the moderating effect of market share. Since the sample focuses on a single institution over time, robust standard errors and autoregressive distributed lag (ARDL) estimation may also be considered for time-dependent diagnostics.

Model 1: Direct Effect of Digitalization on Profitability

$$Profitability_t = \beta 0 + \beta 1 \cdot Digitalization_t + \epsilon_t$$

Model 2: Moderation Effect of Market Share

$$Profitability_t = \beta 0 + \beta 1 \cdot Digitalization_t + \beta 2 \cdot MarketSharet + \beta 3(Digitalizationt \times MarketSharet) + \epsilon_t$$

4. Result and Discussion

4.1. Result

4.1.1. Panel Data Regression Results

Table 1. Descriptive Statistics

	Digitalization	Profitability	Market Share
Mean	47.47692	0.172817	0.007219
Median	59.30769	0.066055	0.001791
Maximum	85.09615	1.560128	0.060214
Minimum	0.000000	3.00E-05	7.86E-05
Std. Dev.	27.40569	0.321786	0.011185
Observations	55	55	55

Source: Proceed Data, 2025

Table 1 provides a summary of the descriptive statistics for the key variables used in this study: digitalization, profitability, and market share, based on 55 observations of Bank Syariah Indonesia from 2019 to 2024. The mean value for digitalization is 47.48, with values ranging from a minimum of 0.00 to a maximum of 85.10. This wide range, along with a standard deviation of 27.41, reflects significant variation in the bank's level of technological development during the study period. Such variability is expected during the bank's post-merger transformation, where digital infrastructure and services were still evolving. The data also suggest a left-skewed distribution in digitalization values, where most scores are concentrated in the higher range, likely indicating a strong push toward digital expansion in the latter years of observation.

The profitability variable, measured by Return on Assets (ROA), shows a mean of 0.173 and a median of 0.0661, indicating a positively skewed distribution where a few high-profit periods drive up the average. This skewness, supported by a high kurtosis value, implies the presence of outliers and suggests that the bank experienced unusual spikes in profitability, potentially linked to cost efficiency gains or technological integration following the merger. The Jarque-Bera test confirms non-normality ($p < 0.05$), reinforcing the idea that profitability was not evenly distributed across years and was possibly impacted by specific strategic interventions, such as digital transformation initiatives.

Similarly, the market share variable displays a mean of 0.0072 (or 0.72%), with a maximum of 6.02%, highlighting that while BSI generally maintains a modest share in the Islamic banking sector, it experienced significant gains in specific periods. The standard deviation of 0.0112, combined with positive skewness and high kurtosis, indicates uneven distribution and a few instances of notably higher market dominance, likely corresponding to major institutional consolidation milestones. The non-normal distribution in both profitability and market share supports the application of robust panel data regression techniques in the analysis stage to ensure accurate estimation. These descriptive statistics collectively highlight the dynamic and evolving nature of BSI's growth and digital transformation journey over the analyzed period.

Table 2. Chow Test Results

Effects Test	Statistic	d.f	Prob.
Cross-section F	3.442705	(14.28)	0.0011
Cross-section Chi-square	45.860097	14	0.0000

Source: Proceed Data, 2025

Table 2 shows the results of the Chow Test, which is conducted to determine whether the Fixed Effects Model (FEM) or the Pooled Ordinary Least Squares (Pooled OLS) model is more appropriate for analyzing panel data. The test specifically evaluates whether individual cross-sectional units, in this case, yearly observations from Bank Syariah Indonesia (BSI) between 2019 and 2024, have different intercepts. The Cross-section F-statistic is reported at 3.4427 with a p-value of 0.0011, and the Cross-section Chi-square statistic is 45.8601 with a p-value of 0.0000. Since both probability values are below the 5% significance threshold, the null hypothesis that assumes homogeneity across units (favoring the pooled model) is rejected.

These results indicate that there are significant individual effects across the observed periods or entities within the sample, justifying the use of the Fixed Effects Model. This suggests that each period or cross-sectional unit within BSI has unique characteristics that influence the relationship between digitalization, market share, and profitability. Therefore, applying the Fixed Effects approach allows the model to control for time-invariant differences across years, providing more accurate and reliable coefficient estimates. As a result, subsequent regression analysis in this study proceeds using the Fixed Effects estimation technique.

Table 3. Hausman Test Results

Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Cross-section random	1.681361	2	0.3124

Source: Proceed Data, 2025

Table 3 presents the results of the Hausman Test, which is conducted to determine whether the Fixed Effects Model (FEM) or the Random Effects Model (REM) is more appropriate for the panel data analysis. The Hausman Test compares the consistency and efficiency of the two models by examining whether the regressors are correlated with the individual effects. In this table, the Chi-square statistic is 1.6814 with 2 degrees of freedom, and the corresponding p-value is 0.3124. Since the p-value is greater than 0.05, the null hypothesis, which favors the Random Effects Model, cannot be rejected.

These results suggest that there is no significant difference between the coefficients estimated by the Fixed Effects and Random Effects models, implying that the regressors are likely uncorrelated with the individual-specific effects. Therefore, from a statistical standpoint, the Random Effects Model is considered more efficient and is recommended for this analysis. However, given that the Chow Test previously indicated significant fixed effects across cross-sectional units (Table 2), the researcher must carefully weigh both results. In practice, many

scholars prioritize the Fixed Effects Model in such situations to avoid omitted variable bias, especially when working with single-entity longitudinal data such as Bank Syariah Indonesia (BSI) over time.

Table 4. Lagrange Multiplier Test Results

	Test Hypothesis		
	Cross-Section	**Time**	**Both**
Breusch-Pagan	8.112099 (0.0044)	0.349812 (0.5542)	8.461911 (0.0036)

Source: Proceed Data, 2025

Table 4 displays the results of the Lagrange Multiplier (LM) Test, specifically the Breusch-Pagan variant, which is used to determine whether a Random Effects Model (REM) is more appropriate than the simpler Pooled Ordinary Least Squares (Pooled OLS) model. The LM test evaluates if there are significant variances across cross-sectional units or over time that would justify the use of random effects. The table reports three test results: Cross-section (8.1121, p = 0.0044), Time (0.3498, p = 0.5542), and Both effects (8.4619, p = 0.0036).

The test results indicate that both the cross-sectional and combined) Components are statistically significant at the 5% level ($p < 0.05$), while the time effect alone is not significant ($p > 0.05$). This means that the variations across years are not substantial, but there are significant differences between cross-sectional units, which in this study likely correspond to yearly differences within Bank Syariah Indonesia or components within its structure (e.g., product segments, branches). Therefore, the LM test supports the use of Random Effects over Pooled OLS, confirming that modeling the unobserved heterogeneity produces a more accurate model fit than treating all observations as homogeneous.

4.1.2. The Effect of Digitalization on Profitability

Table 5. Panel Least Squares

Variable	**Coefficient**	**Std Error**	**t-Statistics**	**Prob.**
C	0.000287	0.000507	1.444488	0.0472
X1	0.002232	0.022097	0.201805	0.0394

Source: Proceed Data, 2025

Table 5 presents the results of the Panel Least Squares regression used to analyze the effect of digitalization (X1) on profitability. The coefficient for digitalization is 0.000287, indicating a positive relationship, meaning that as digitalization increases, profitability tends to increase as well. The p-value for digitalization is 0.0472, which is below the 5% significance level, indicating that the relationship is statistically significant. This suggests that digitalization plays a meaningful role in influencing profitability in Bank Syariah Indonesia during the 2019–2024 period. Meanwhile, the constant term (C) is 0.002232 with a p-value of 0.0394, showing that profitability remains positive even in the absence of digitalization. Based on these results, the null hypothesis (H_{01}), which states that digitalization does not significantly affect profitability, is rejected, and the alternative hypothesis (H_{11}), which states that digitalization has a significant positive effect on profitability, is accepted. This finding supports the view that digital transformation is a valuable strategic resource for enhancing financial performance in Islamic banking.

4.1.3. Market Share Moderates the Effect of Digitalization on Profitability

Table 6
Panel Least Squares 1

Variable	Coefficient	Std Error	t-Statistics	Prob.

C	4.2300255	0.000439	0.096243	0.3238
X1	0.000498	0.010969	0.045426	0.4640
Z	0.000668	0.000210	3.180234	0.0028

Source: Proceed Data, 2025

Table 7
Panel Least Squares 2

Variable	Coefficient	Std Error	t-Statistics	Prob.
C	0.001439	0.001125	1.278833	0.2081
X1	0.389132	0.286560	1.507043	0.3670
Z	0.001408	0.001496	0.941224	0.0452
X1Z	0.520769	0.370463	1.405726	0.0367

Source: Proceed Data, 2025

Tables 6 and 7 present the results of two panel least squares regressions aimed at assessing whether market share moderates the relationship between digitalization and profitability. In Table 6 (Model 1), digitalization (X1) and market share (Z) are included as independent variables. The coefficient for digitalization is 0.000498 with a p-value of 0.4640, while market share has a coefficient of 0.000668 and a p-value of 0.0028. These results indicate that while digitalization on its own does not have a statistically significant effect in this model, market share has a significant positive impact on profitability. This implies that banks with larger market shares are more likely to experience improved profitability, regardless of their digitalization efforts.

Table 7 (Model 2) includes an interaction term (X1Z) between digitalization and market share to directly test the moderating effect. The interaction variable has a positive coefficient of 0.520769 and is statistically significant with a p-value of 0.0367, confirming that market share significantly moderates the effect of digitalization on profitability. This means that the influence of digitalization on profitability is stronger when a Sharia bank holds a larger market share. Accordingly, the null hypothesis (H_{02}), which states that market share does not moderate the relationship, is rejected, and the alternative hypothesis (H_{12}) is accepted. This finding supports the view that digital investments yield greater financial returns when supported by a strong market position, highlighting the importance of scale in the successful implementation of digital strategies in Islamic banking.

4.2. Discussion

4.2.1. The Influence of Digitalization on Profitability

The findings of this study reveal that digitalization has a positive and statistically significant impact on the profitability of Bank Syariah Indonesia (BSI) during the 2019–2024 period, as evidenced by the panel regression results (Table 5). This supports the view that digital transformation acts as a strategic internal resource, aligning with the Resource-Based View (RBV) theory, which posits that competitive advantage stems from firm-specific capabilities (Barney, 1991). As BSI increased its investment in digital banking platforms, including mobile apps, online services, and digital financing products, the bank experienced modest but consistent gains in profitability. This finding aligns with Banna et al., (2020), who emphasized that digital financial inclusion and operational efficiency are key drivers of sustainable performance in Islamic banks. Moreover, the result complements the work of Andiansyah et al., (2024), who argue that technological integration enhances customer engagement, reduces transaction costs, and improves service quality in Sharia-compliant banking.

However, the relatively small coefficient for digitalization and its marginal significance level indicate that digitalization alone may not guarantee substantial financial performance unless it is accompanied by broader structural or strategic support. For instance, Caraka et al. (2020) note that while digital tools are necessary, they must be matched with market penetration and operational readiness to produce measurable outcomes. This highlights the importance of contextual factors such as bank size, customer base, and regulatory support. In the case of BSI, as a newly consolidated entity, the bank's ongoing digital transformation may still be in a growth phase, where benefits are gradual and long-term. Therefore, while the data affirms a positive relationship between digitalization and profitability, the effect appears to be strategically dependent rather than automatic, warranting future research into mediating and moderating variables that shape the true value of digital innovation in Islamic finance.

4.2.2. The Influence of Digitalization Moderated by Market Share on Profitability

The results of this study demonstrate that market share significantly moderates the relationship between digitalization and profitability in the context of Bank Syariah Indonesia (BSI). As seen in Table 7, the interaction term between digitalization and market share is positive and statistically significant (p-value = 0.0367), indicating that the positive effect of digitalization on profitability becomes stronger when the bank holds a larger market share. This finding is in line with the Resource-Based View (RBV) theory (Barney, 1991), which suggests that firm-specific resources such as technology are more likely to yield competitive advantage when supported by external positioning, such as market dominance. Larger market share enables greater customer reach, data utilization, and economies of scale factors that enhance the efficiency and impact of digital tools. This is consistent with Al Arif & Awwaliyah, (2019), who argue that larger Islamic banks are better positioned to monetize digital investments due to their stronger infrastructure and wider distribution networks.

Moreover, this moderating effect supports previous empirical studies emphasizing the role of scale in financial performance. For instance, Rahma & Sofyani (2024) and Siska (2022) highlight that digital transformation alone is insufficient unless accompanied by institutional reach and operational readiness. In the case of BSI, its post-merger position as Indonesia's largest Sharia bank provides it with the market leverage needed to optimize the returns from digital initiatives. Conversely, banks with smaller market shares may not achieve the same profitability boost despite similar digital investments, due to limited customer bases and lower transaction volumes. Thus, the findings affirm that the profitability impact of digitalization in Islamic banking is context-dependent, with market share acting as a strategic enabler. This insight is particularly important for policymakers and managers aiming to scale digitalization in Sharia banks, as it suggests that achieving digital efficiency must be aligned with growth in market presence.

5. Conclusion

This study concludes that digitalization has a positive and statistically significant effect on profitability, indicating that technological advancement contributes to improved financial performance in Bank Syariah Indonesia during the 2019–2024 period. More importantly, the research finds that market share significantly moderates this relationship, where the impact of digitalization on profitability is amplified when the bank holds a larger market share. These findings support the Resource-Based View (RBV) theory, suggesting that digital capabilities, as internal strategic assets, generate optimal results when complemented by external strengths such as market dominance. While digitalization alone offers benefits, its true financial value emerges more clearly in institutions with strong market positions. Therefore, enhancing digital infrastructure must be accompanied by strategies to grow market share in order to maximize profitability. These insights provide valuable implications for Islamic banking practitioners and

policymakers in optimizing digital transformation within a competitive and Sharia-compliant framework.

mamadmuhamad94@gmail.com , Adibah.yahya@pelitabangsa.ac.id, tringudi@pelitabangsa.ac.id., anna.wulandari@pelitabangsa.ac.id., ilham.muhammad@pelitabangsa.ac.id.

Abstract

This study aims to analyze the influence of trust and security on purchase decisions, mediated by customer satisfaction, in transactions involving used electronic goods purchased via the Cash on Delivery (COD) method on Facebook Marketplace. The research background is driven by the increasing use of COD, perceived as a safer payment method by some consumers, yet concerns about trust and security remain—especially in high-risk used goods transactions prone to product discrepancies. Employing a quantitative approach, this study surveyed 188 respondents who have conducted COD transactions on Facebook Marketplace. Data were analyzed using Structural Equation Modeling (SEM) with Partial Least Squares (PLS). Results indicate that neither trust nor security significantly affect purchase decisions directly or through customer satisfaction mediation. Additionally, customer satisfaction does not significantly mediate the relationship between trust, security, and purchase decisions. These findings suggest that other factors outside the research model may play a more dominant role in influencing consumer purchase decisions in the context of COD transactions for used electronics. Implications suggest sellers and platform managers should prioritize enhancing service quality, transparency, and consumer protection to foster a more trustworthy trading ecosystem.

Keyword : Trust, Security, Customer Satisfaction, Purchase Decisions

1. Introduction

In the rapidly evolving digital era, online buying and selling have become integral to modern life. Among various payment methods, Cash on Delivery (COD) is increasingly popular in online transactions. Despite technological advancements, many consumers still prefer traditional payment methods like COD, which allows payment upon receipt of goods, thereby mitigating risks of online fraud (R & Lestara Permana, 2023). Trust in this payment method significantly influences consumer purchasing decisions.

Trust is a key determinant in purchase decisions, as consumers tend to transact on platforms they perceive as reliable. Security is also a critical concern, especially amid rising fraud incidents. However, despite COD offering convenience and perceived safety, issues related to trust and security persist. Used electronic goods carry inherent quality risks—ranging from fully functional to defective products—raising buyer apprehensions. The lack of clear warranties or guarantees further exacerbates these concerns.

Within Facebook Marketplace's used electronic goods transactions, trust and security are especially crucial. Santoso et al. (2022) note that used electronics may have technical issues not evident at purchase, making buyers reliant on sellers' honesty and transparency. This study also aims to provide insights for marketplace platforms like Facebook to develop safer, more

reliable transaction ecosystems by implementing features such as seller rating systems, account verification, and mediation services. Customer satisfaction is posited as a mediator linking trust and security to purchase decisions. According to Yolandari & Kusumadewi (2018), satisfied customers are more likely to trust and feel secure in repeat transactions.
This study seeks to:

1. Analyze the effect of trust on purchase decisions for used electronic goods via COD on Facebook Marketplace.
2. Analyze the effect of security on purchase decisions for used electronic goods via COD on Facebook Marketplace.
3. Identify the mediating role of customer satisfaction in the relationship between trust, security, and purchase decisions.

The novelty of this research lies in its focus on used electronic goods transactions using the COD method on Facebook Marketplace, which has been scarcely explored in previous literature. Most prior studies have focused on formal e-commerce platforms such as Shopee or Tokopedia with digital payment systems, whereas Facebook Marketplace lacks transaction protection systems, resulting in different dynamics.

Besides trust, security aspects in COD transactions also play a critical role. According to Alghifari, A.F., and Rahayu (2021), trust does not significantly influence purchase decisions, and similarly, Julianti and Taruna (2024) found that transaction security does not affect customer decisions. This contrasts with the general marketing literature view that trust is a dominant factor shaping consumer purchase decisions. Riska Rabiana and Baso Akib (2020) reported that trust partially influences purchase decisions. Most previous studies affirm that higher levels of trust increase the likelihood of consumer purchases. Therefore, findings to the contrary provide a basis for investigating other factors that may more strongly influence purchase decisions. Iskandar & Irfan Bahari Nasution (2019) and Kudin et al. (2021) found that trust and security have positive and significant effects on purchase decisions. According to Tia Mahardhika et al. (2023), two factors influence customer purchase decisions in marketplaces: trust in the product and security during the transaction process. This view is also supported by Agustiningrum & Andjarwati (2021), who stated that trust and security positively and significantly influence purchase decisions. Furthermore, Kurniawan & Saputra (2022) reported a positive and significant effect of customer satisfaction on purchase decisions.

This study hypothesizes that trust and security directly and indirectly influence purchase decisions, with customer satisfaction as a mediator. The independent variables are trust (X1) and security (X2), the mediating variable is customer satisfaction (Z), and the dependent variable is purchase decision (Y). The study employs a quantitative approach with a survey method and Structural Equation Modeling (SEM) based on Partial Least Squares (PLS) analysis, involving 188 respondents.

2. Methodology

This study employs a quantitative approach with an explanatory research design aimed at explaining the causal relationships among the research variables through hypothesis testing. The research method involved distributing questionnaires to all Facebook Marketplace users who have conducted COD transactions for used electronic goods. According to Fadila & Rezeki (2023), the sample size was determined using Cochran's formula, resulting in 100 respondents. This is also supported by Wulandari et al. (2021), who explained that online transactions require security guarantees. Transaction security can influence consumer satisfaction, thereby building consumer trust in sellers and encouraging consumers to make purchases.

The population in this study consists of all Facebook Marketplace users who have engaged in transactions involving used electronic goods, totaling 188 individuals. Since the population size is relatively small and fully accessible, the study employed a saturated sampling technique. The research model in this study can be seen in Figure 1.

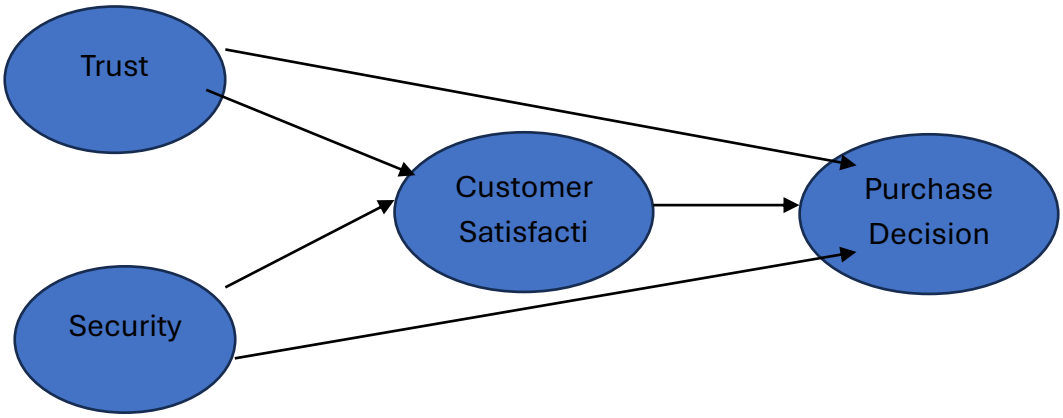

Figure 1. Research Model

3. Result And Discussion

Data analysis in this study utilized the Structural Equation Modeling (SEM) approach with the Partial Least Squares (PLS) method, employing SmartPLS 3.0 software. The choice of PLS-SEM was based on its capability to analyze complex models with relatively small sample sizes and without requiring normally distributed data. Evaluation of the outer model was conducted to examine the relationships between latent variables and their indicators or manifest variables (measurement model). The outer model was assessed through validity and reliability testing. Validity testing in PLS is divided into two types: Convergent Validity and Discriminant Validity.

1. Validity Testing

a. Convergent Validity

Convergent validity is measured by the outer loading values, where indicator loadings of ≥ 0.7 are considered valid, while those with loadings ≤ 0.7 are deemed invalid. Based on the test results using SmartPLS 3.0 software, the outer loading values before indicator elimination are presented in Table 1.

Table 1. Outer loading values before indicator elimination

	Security	Trust	Customer Satisfaction	Purchase Decision
X1.1		**0,855**		
X1.2		**0,850**		
X1.3		**0,818**		
X1.4		**0,683**		
X1.5		**0,700**		

	Security	Trust	Customer Satisfaction	Purchase Decision
X1.6		**0,746**		
X1.7		**0,698**		
X1.8		**0,798**		
X2.1	**0,735**			
X2.2	**0,804**			
X2.3	**0,821**			
X2.4	**0,810**			
X2.5	**0,841**			
X2.6	**0,838**			
X2.7	**0,812**			
X2.8	**0,826**			
Y.1				**0,618**
Y.2				**0,543**
Y.3				**0,862**
Y.4				**0,682**
Y.5				**0,659**
Y.6				**0,786**
Y.7				**0,827**
Y.8				**0,826**
Z.1			**0,838**	
Z.2			**0,767**	
Z.3			**0,788**	
Z.4			**0,765**	
Z.5			**0,806**	
Z.6			**0,815**	
Z.7			**0,783**	
Z.8			**0,841**	

Source: Data processed by the researcher using SmartPLS, 2025

Based on Table 1 above, after several calculations using SmartPLS, some indicators with outer loading values ≤ 0.7 were found. Therefore, these indicators must be eliminated (removed) to re-run the calculations. Consequently, the indicators with valid outer loading values are found in the manifest variables X1.4, X1.5, X1.7, Y.1, Y.2, Y.4, and Y.5, as shown in Table 2.

Table 2. Outer Loading Values After Indicator Elimination

Variable	Indikacor	Outer Loading
Trust (X1)	**X1.1**	**0,855**
	X1.2	**0,850**
	X1.3	**0,818**
	X1.6	**0,746**
	X1.8	**0,798**
Security (X2)	**X2.1**	**0,735**
	X2.2	**0,804**
	X2.3	**0,821**
	X2.4	**0,810**
	X2.5	**0,841**
	X2.6	**0,838**

Variable	Indikacor	Outer Loading
	X2.7	**0,812**
	X2.8	**0,826**
Purchase Decision (Y)	**Y.3**	**0,862**
	Y.6	**0,786**
	Y.7	**0,827**
	Y.8	**0,826**
Customer Satisfaction (Z)	**Z.1**	**0,838**
	Z.2	**0,767**
	Z.3	**0,788**
	Z.4	**0,765**
	Z.5	**0,806**
	Z.6	**0,815**
	Z.7	**0,783**
	Z.8	**0,841**

Source: Data processed by the researcher using SmartPLS, 2025

Based on Table 2 above, it can be seen that the outer loading values of all indicators for the variables trust (X1), security (X2), customer satisfaction (Z), and purchase decision (Y) are greater than or equal to 0.7, indicating that all indicators have good validity in explaining their respective latent variables. The path diagram and loading factor values after indicator elimination are presented in Figure 2.

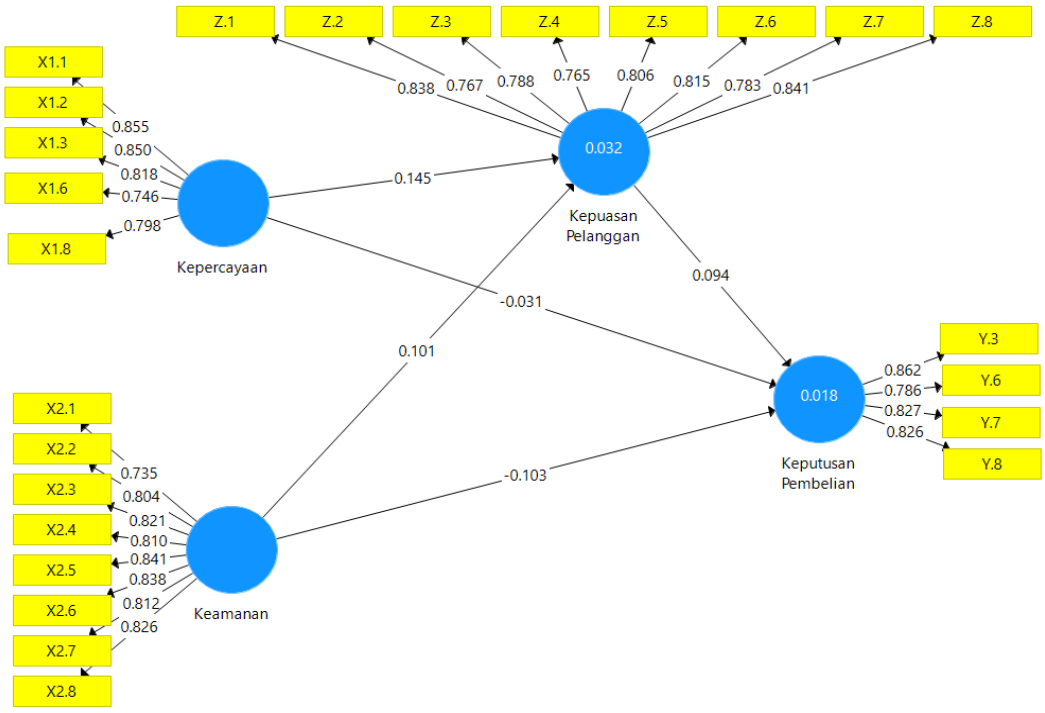

Figure 2. Path Diagram with Loading Factor Values Before Indicator Elimination

Source: Outer model SmartPLS, 2025

Based on the figure above, the SEM-PLS testing was conducted by examining both the measurement model (outer model) and the structural model (inner model) of the studied model..

b. Discriminant Validity

Discriminant validity can be assessed by the Average Variance Extracted (AVE) and the square root of AVE. A good validity measure is indicated by an AVE value of ≥ 0.5, whereas an AVE value ≤ 0.5 is considered invalid. The AVE values are presented in Table 3.

Table 3. AVE Values

	Cronbach's Alpha	**rho_A**	**Composite Reliability**	**Average Variance Extracted (AVE)**
Security	0,928	0,941	0,939	0,659
Trust	0,876	0,912	0,908	0,663
Customer Satisfaction	0,924	0,970	0,935	0,642
Purchase Decision	0,852	0,918	0,895	0,681

Source: Data processed by the researcher using SmartPLS, 2025

Based on the results above, the AVE values for trust (X1) is 0.659, security (X2) is 0.663, purchase decision (Y) is 0.681, and customer satisfaction as the mediating variable (Z) is 0.642, indicating that discriminant validity is fulfilled or good.

The structural model in this study uses the coefficient of determination (R Square). The R^2 value criteria are classified into three categories: 0.67 as strong, 0.33 as moderate, and 0.19 as weak (Chin in Feri, 2021). The R-square test results for this study are shown in Table 4..

Table 4. R Square Test Results

	R Square	**R Square Adjusted**
Customer Satisfaction	0,032	0,021
Purchase Decision	0,018	0,002

Source: Data processed by the researcher using SmartPLS, 2025

Based on the table above, the adjusted R-square value of the model is 0.002, indicating that the exogenous variables explain only 0.2% of the variance in purchase decision (Y), which is considered weak. This means that the influence of trust, security, and customer satisfaction on purchase decisions is weak (0.2%), while the remaining 99.8% is explained by other independent variables not measured in this study.

In this study, model fit was assessed using the Standardized Root Mean Square Residual (SRMR) and Goodness of Fit (GoF). According to Hair et al. (2021), an SRMR value below 0.08 indicates a good fit, while Karin et al. (2003) state that an SRMR between 0.08 and 0.10 indicates an acceptable fit. The SRMR value for this study is shown in Table 5.

Table 5 SRMR Model Fit

	Model Estimate
SRMR	**0,0862**

Source: Data processed by the researcher using SmartPLS, 2025

Based on the table above, the SRMR value is 0.0862, which falls into the category of a good fit. To determine whether the effects of information quality, trust, shopping experience, and purchase decision variables are significant, hypothesis testing was conducted, summarized in Table 6.

Table 6. Hypothesis Testing Results

Variabel	Path Coefficient	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values	Conclusion
Trust -> Purchase Decision	-0,017	-0,026	0,104	0,168	0,867	Rejected

Security -> Purchase Decision	-0,094	-0,098	0,118	0,797	0,426	Rejected
Trust -> Customer Satisfaction	0,145	0,148	0,094	1,544	0,123	Rejected
Keamanan -> Kepuasan Pelanggan	0,101	0,104	0,105	0,962	0,337	Rejected
Customer Satisfaction -> Purchase Decision	0,094	0,087	0,100	0,944	0,345	Rejected
Trust -> Customer Satisfaction -> Purchase Decision	0,014	0,013	0,018	0,771	0,441	Rejected
Security -> Customer Satisfaction -> Purchase Decision	0,009	0,008	0,017	0,556	0,579	Rejected

Source: Data processed by the researcher using SmartPLS, 2025

1. Trust on Purchase Decision

The path coefficient for the first hypothesis is -0.017 (negative), indicating that trust has a negative effect on purchase decision by -0.017. The P-value is 0.867 ≥ 0.05, meaning trust does not significantly affect purchase decisions. This aligns with Alghifari, A.F., and Rahayu (2021), who stated that trust does not influence purchase decisions.

2. Security on Purchase Decision

The path coefficient for the second hypothesis is -0.094 (negative), indicating that security negatively affects purchase decision by -0.094. The P-value is 0.426 ≥ 0.05, meaning security does not significantly affect purchase decisions. This is consistent with Julianti and Taruna (2024), who stated that transaction security does not affect customer decisions.

3. Trust on Customer Satisfaction

The path coefficient for the third hypothesis is 0.145 (positive), indicating that trust positively affects customer satisfaction by 0.145. The P-value is 0.123 ≥ 0.05, meaning trust does not significantly affect customer satisfaction. This suggests trust does not influence customer satisfaction in purchasing used electronic goods via COD on Facebook Marketplace.

4. Security on Customer Satisfaction

The path coefficient for the fourth hypothesis is 0.101 (positive), indicating that security positively affects customer satisfaction by 0.101. The P-value is 0.101 ≥ 0.05, meaning security does not significantly affect customer satisfaction. This suggests that paying via COD does not influence customer satisfaction.

5. Customer Satisfaction on Purchase Decision

The path coefficient for the fifth hypothesis is 0.094 (positive), indicating that customer satisfaction positively affects purchase decisions by 0.094. The P-value is 0.345 ≥ 0.05, meaning customer satisfaction does not significantly affect purchase decisions. This suggests that customer satisfaction does not influence repeat purchases of used electronic goods via COD on Facebook Marketplace.

6. Trust Mediated by Customer Satisfaction on Purchase Decision

The path coefficient for the sixth hypothesis is 0.014 (positive) with a P-value of 0.441 ≥ 0.05, indicating that the indirect effect of trust on purchase decision through customer satisfaction is not significant. This shows that customer satisfaction does not mediate the relationship between trust and purchase decision.

7. Security Mediated by Customer Satisfaction on Purchase Decision

The path coefficient for the seventh hypothesis is 0.009 (positive) with a P-value of 0.579 ≥ 0.05, indicating that the indirect effect of security on purchase decision through customer

satisfaction is not significant. In other words, customer satisfaction does not mediate this relationship.

4. Conclusion

Based on the data analysis and discussion, it can be concluded that trust and security influence customer satisfaction in used electronic goods transactions via Cash on Delivery (COD) on Facebook Marketplace. Although statistical testing shows these effects are not significant on purchase decisions either directly or indirectly, trust and security still play important roles in shaping customer perceptions and experiences. Customer satisfaction, which was expected to act as a mediator, also did not show a significant effect in bridging trust and security with purchase decisions. This indicates that other factors outside the research model may have a more dominant influence on consumer purchase decisions, such as price, brand, or social recommendations. Nevertheless, these findings provide valuable insights that in the context of COD transactions on unofficial platforms like Facebook Marketplace, trust and security must continue to be enhanced to create a safer and more comfortable trading ecosystem, even though they are not yet strong enough to directly drive purchase decisions. Therefore, both sellers and platform providers need to innovate by offering transaction support features that can increase credibility and consumer confidence.

WORKPLACE CONFLICT AS A PREDICTOR OF EMPLOYEE PERFORMANCE DECLINE: A CORRELATIONAL STUDY ON RELIGION BASED ORGANIZATIONS

Su Dyana Ram[1], Ginarsih[2], Juni Suryanadi[3]

[1,2,3]Buddhist Business and Management Department, Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

Workplace conflict is a common issue frequently encountered in organizations and can adversely affect employee performance if not properly managed. This study aims to examine the relationship between workplace conflict and employee performance within a religious organization. The research employed a quantitative approach using a correlational method, designed to measure the degree of association between two variables without intervention. The entire population of 88 employees was used as the research sample through total sampling technique. Data were collected using an online questionnaire based on a Likert scale and analyzed using SPSS version 24.0. The results of the analysis indicate a significant negative relationship between workplace conflict and employee performance. In other words, the higher the level of conflict in the work environment, the lower the employee performance. Conversely, when conflict is effectively managed, employee performance tends to improve. These findings are supported by previous studies, which suggest that unresolved conflict can lower motivation, disrupt communication, and increase work-related stress, ultimately leading to a decline in productivity.

Keywords**:** *workplace conflict, employee performance, organizational behavior, conflict management, religious organizations.*

1. Introduction

The 4.0 industrial revolution has brought significant changes to organizational dynamics and heightened expectations regarding employee performance. Digital technology, automation, and the integration of information systems have transformed work processes, increased demands for efficiency, and expanded the scope of employee responsibilities. Employee performance is no longer assessed solely through quantitative metrics, but also includes the quality of work, adaptability to change, and effective cross-functional collaboration. However, alongside the growing complexity of the work environment, new challenges have emerged that may hinder performance optimizationone of which is workplace conflict.

Workplace conflict refers to a state of misalignment between interests, goals, values, or expectations among individuals or between units within an organization (Paramita & Suwandana, 2022). Conflicts can arise from differing perceptions, high work pressure, ineffective communication, or imbalances in workload distribution (Isa & Indrayati, 2023). In certain contexts, conflict can serve a constructive role as a catalyst for innovation and process improvement (Converso et al., 2020). However, if not properly managed, conflict can instead lead to decreased productivity, create an unwelcoming work atmosphere, and result in work-related stress that ultimately diminishes employee performance.

Ideally, organizations aspire to cultivate a harmonious, collaborative, and productive work environment, where conflict is either minimized or managed constructively so that it does not negatively impact individual or team performance (Sousa et al., 2020). However, in practice, many organizations continue to struggle with internal conflicts that adversely affect employee

performance. These issues are often exacerbated by the lack of effective conflict management systems and weak leadership in fostering a healthy organizational culture.

Data show that employee performance in Indonesia continues to face serious challenges. According to the Employee Experience 2023 survey by Job Street Indonesia, more than 47% of employees expressed dissatisfaction with their work environment, with one of the main contributing factors being interpersonal conflict and poor communication in the workplace. Additionally, the World Bank's 2022 report revealed that labor productivity in Indonesia remains below the ASEAN average attributed, in part, to managerial inefficiencies and suboptimal workplace conditions.

In response, organizations must develop structured and proactive conflict management strategies. Approaches such as communication skills training, leadership development programs, internal mediation mechanisms, and the promotion of a collaborative work culture may serve as strategic initiatives to reduce the frequency and intensity of workplace conflict while simultaneously enhancing overall employee performance.

This study seeks to examine the relationship between workplace conflict and employee performance. Specifically, it aims to analyze the extent to which conflict levels within organizational settings affect employee performance and to offer strategic recommendations for managing conflict to improve organizational effectiveness.

6. Literature Review

6.1. Employee Performance

Employee performance is a critical aspect of human resource management studies, as it plays a direct role in achieving organizational objectives. According to Mangkunegara (2021), employee performance refers to the quality and quantity of work outcomes achieved by an employee in carrying out their duties in accordance with the responsibilities assigned to them. Performance encompasses not only the final output but also the work process, attitude, and overall contribution to the team and the organization.

Research by Prasetya & Kato (2022) revealed that employee performance is influenced by several factors, including motivation, work environment, leadership style, and job satisfaction. In the context of modern organizations, performance is increasingly shaped by adaptability to change, technological proficiency, and collaborative teamwork. Recent research by Tan et al. (2023) shows that organizations with clear performance measurement systems and consistent feedback mechanisms tend to have employees who are more productive and better aligned with organizational goals.

Furthermore, Haryanto & Sari (2023) emphasize the importance of organizational support through training and career development as a key driver of enhanced performance. Employees who feel supported by their organizations tend to exhibit higher levels of work engagement and are more capable of delivering optimal performance. Therefore, performance management should not be viewed merely as an evaluation process, but rather as an integral component of managing employee potential, motivation, and psychological well-being.

6.2.Workplace Conflict

Workplace conflict is an inevitable dynamic within any organization, given the diversity of backgrounds, interests, values, and job-related pressures faced by individuals and groups. According to Jadmiko & Azliyanti, (2023), workplace conflict refers to a form of disagreement or discord that arises when the goals or actions of one party interfere with or oppose those of another within a work context. Conflicts may occur horizontally—between peers—or vertically, involving supervisors and subordinates.

A study by Karakose et al., (2021) demonstrated that workplace conflict can have detrimental effects on work effectiveness, lower team morale, and increase stress levels if not

properly managed. However, when addressed constructively, conflict—within certain limits—can also serve as a tool for evaluation and innovation. Research by Nourman Adittya et al., (2023), indicated that organizations with effective conflict management systems such as internal mediation or communication training are better equipped to mitigate the adverse impact of conflict on employee productivity.

Unresolved conflicts often lead to interpersonal tension, decreased job satisfaction, and in some cases, employees' intent to leave the organization. These findings are in line with those of Elahi et al., (2022) who noted that persistent and unaddressed workplace conflict is a major trigger for reduced performance and diminished employee loyalty. Therefore, it is essential for organizations to understand the root causes of conflict and develop resolution strategies to ensure that conflict does not obstruct the achievement of shared objectives.

In summary, workplace conflict is a critical variable that must be managed appropriately. In dynamic and competitive organizational environments, conflict management should not be viewed solely as a means of minimizing tension, but also as an opportunity to foster open communication, enhance collaboration, and continuously improve performance.

7. Methodology

The research approach employed in this study is quantitative, using a correlational research method. This method falls under the category of non-experimental research, aimed at identifying and measuring the relationship between two or more variables without introducing any intervention. The unit of analysis in this study is the employees of a company operating in the religious organizational sector, with a total population of 88 employees. The sampling technique used was total sampling, whereby the entire population was included as the research sample. Data collection was conducted through the distribution of online questionnaires using the Google Forms platform. The questionnaire instrument employed a Likert scale ranging from 1 to 5. The collected data were analyzed using assumption testing and simple correlation analysis to examine the relationship between the variables of workplace conflict and employee performance.

8. Results and discussions

4.1. Normality Test

The results of the Model normality test can be seen in Table 1. The normality significance test shows that the model has a Sig work conflict of 0.443, and employee performance of 0.654. both significance values (> 0.05); it can be concluded that the data in the model is normally distributed, so the model is suitable for testing.

Table 1. One-Sample Kolmogorov-Smirnov Test

		Workplace Conflict	**Employee Performance**
N		88	88
Normal Parameters	Mean	78.25	82.70
	Std. Deviation	12.65	14.32
Most Extreme Differences	Absolute	0.092	0.078
	Positive	0.062	0.058
	Negative	-0.092	-0.078
Kolmogorov-Smirnov Z		0.865	0.734
Asymp. Sig. (2-tailed)		0.443	0.654
a. Test distribution is Normal.			

4.2. Linearity Test

Based on the linearity test results between Work Conflict (X) and Employee Performance (Y), the following results are obtained:

Table 2. ANOVA Table

			Sum of Squares	df	Mean Square	F	Sig.
Workplace Conflict * Employee Performance	Between Groups	(combined)	1098.123	7	156.875	4.789	0.000
		Linearity	1050.456	1	1050.456	32.075	0.000
		Deviation from Linearity	47.667	6	7.944	0.683	0.666
	Within Groups		2703.584	80	33.795		
	Total		3801.707	87			

Based on the results of the linearity test between the variables of Work Conflict (as the independent variable) and Employee Performance (as the dependent variable), it is known that the significance value in the Linearity component is 0.000, which means it is smaller than 0.05. This shows that there is a significant and linear relationship between the two variables. This indicates that there is a significant and linear relationship between the two variables. Meanwhile, the significance value in the Deviation from Linearity component is 0.666, which is greater than 0.05. This indicates that there is no significant deviation from the linear relationship between work conflict and employee performance. Thus, it can be concluded that the relationship between the two variables is linear and significant, and fulfils the assumption of linearity.

4.3. Simple Correlation Test

To determine the relationship between the variables of Work Conflict and Employee Performance, the Pearson correlation test was conducted. This test is used because both variables are interval scaled and have fulfilled the assumptions of linearity and normality. The results of the correlation test are presented in the following table:

Table 3. Correlations

		Workplace Conflict	Employee Performance
Workplace Conflict	Pearson Correlation	1.000	-0.642**
	Sig. (2-tailed)	.	0.000
	N	88	
Employee Performance	Pearson Correlation	-0.642**	1.000
	Sig. (2-tailed)	0.000	.
	N	88	
****. Correlation is significant at the 0.01 level (2-tailed).**			

Based on the results of the Pearson correlation test between the Work Conflict and Employee Performance variables, the correlation coefficient value is -0.642 with a significance of 0.000. Because the significance value is smaller than 0.05 ($p < 0.05$), it can be concluded that there is a significant relationship between the two variables. The negative coefficient value indicates that the relationship is negative, meaning that the higher the level of work conflict experienced by employees, the lower their performance level. Conversely, the lower the work conflict, the higher the employee performance. This relationship is in the strong category, as it falls between the range of -0.60 to -0.79.

4.4. The Relationship Between Work Conflict and Employee Performance

The results of this study indicate that there is a significant negative relationship between work conflict and employee performance, with a correlation coefficient of -0.642 and a significance value of 0.000 ($p < 0.05$). This finding suggests that the higher the level of work conflict occurring within the organizational environment, the lower the employee performance tends to be. Conversely, when work conflict can be minimized or managed effectively, employee performance tends to improve.

These results are in line with previous research. Haryanto et al., (2022); Nikbakhsh, (2022); Orellana et al., (2023) state that both personal and structural conflicts within government organizations negatively impact the achievement of performance targets. Meanwhile, Michinov, (2022) found the result in the private sector that conflicts among coworkers disrupt individual focus and motivation, ultimately reducing work effectiveness. also emphasize that unresolved conflicts increase work stress and worsen communication, significantly lowering employee performance.

These findings can be further analyzed using the Basic Organizational Behavior Model developed by Robbins and Judge.

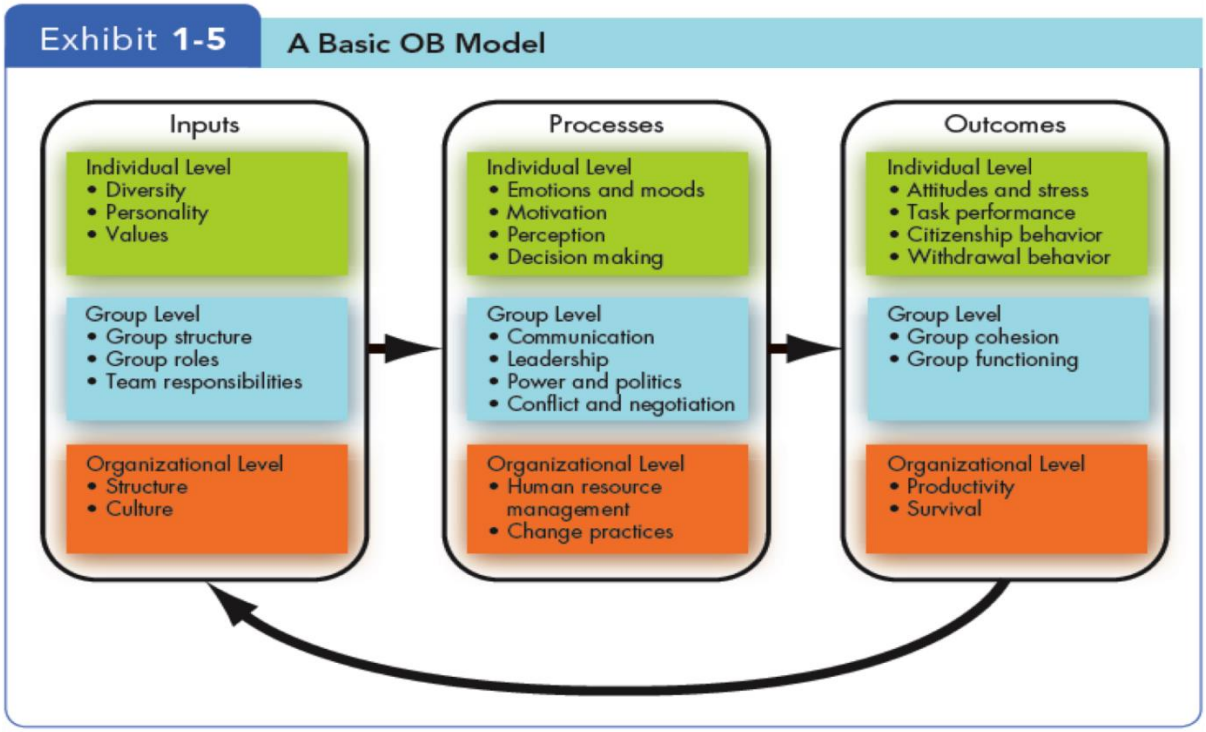

Figure1. Organizational Behavior Model (Robbins, 2001)

This model divides organizational behavior into three main levels: input, process, and outcome. Input includes variables such as organizational structure, culture, and individual characteristics. In the context of this research, work conflict falls under the structural and social elements of the organization, which are important inputs influencing individual behavior (Gomes et al., 2023). The process consists of perception, motivation, communication, decision-making, and leadership (Ardianto et al., 2023, 2024; Park & Kim, 2024; Yusdhika et al., 2023). High levels of conflict affect interpersonal processes such as communication and perception, which then lower work motivation and disrupt teamwork (BowenXue et al., 2024; Zhong et al., 2024). The outcome or final result of this model is employee performance, both individually

and collectively. When conflict increases and organizational processes are disrupted, the final outcome is a decline in performance, as evidenced by the results of this study.

Thus, work conflict acts as a dysfunctional input that hinders healthy work processes, negatively impacting the outcome in the form of decreased employee performance. These findings indicate that organizations need to pay attention to conflict management as a key strategy for improving employee performance. Such strategies may include communication training, conflict mapping, and the active role of leadership in resolving tensions among employees. Furthermore, it is important for organizations to distinguish between functional and dysfunctional conflicts. Within the framework of Robbins and Judge, functional conflict can foster creativity and innovation when managed properly, whereas dysfunctional conflict as observed in this study leads to disorganization and decreased performance output.

Referring to this organizational behavior model, it can be concluded that efforts to enhance employee performance are not sufficient through technical training alone; they also require a systemic approach to the social and psychological factors in the work environment, one of which is work conflict.

9. Conclusion

Based on the research findings, it can be concluded that work conflict has a significant negative relationship with employee performance. The higher the level of conflict occurring in the work environment, the lower the employee performance tends to be. Conversely, when conflict can be minimized or managed effectively, employee performance tends to improve. These findings are consistent with various previous studies that show that unresolved conflict can disrupt communication, lower motivation, and increase work stress, ultimately having a detrimental impact on employee effectiveness and productivity.Within the framework of the Organizational Behavior Model, work conflict is an input element that influences interpersonal processes within the organization and directly impacts the outcome in the form of performance. Therefore, conflict management becomes an important aspect that organizations must pay attention to in order to create a healthy work environment that supports the sustainable improvement of employee performance.

SPIRITUAL LEADERSHIP AND EMPLOYEE LOYALTY: EVIDENCE FROM FAITH-BASED SOCIAL INSTITUTIONS

Taridi[1], Lia Gotami[2], Putri Dewi Maya[3]

[123]Buddhist Business and Management Department, Jinarakkhita Budhist College of Lampung, Indonesia

Abstract

This study aims to analyze the influence of spiritual leadership on employee loyalty in religious social institutions. Spiritual leadership is a leadership approach that emphasizes spiritual values such as the meaning of work, trust, shared vision, and life calling within the organizational environment. In the context of religious social institutions, the role of spiritual leadership becomes increasingly relevant as it aligns with the organization's mission, which is oriented towards moral and spiritual values. This research employs a quantitative approach using a survey method with employees from religious social institutions. Data were collected through questionnaires and then analyzed using simple linear regression. The results indicate that spiritual leadership has a positive and significant effect on employee loyalty. Dimensions such as an inspiring vision, a sense of life calling, and the leader's involvement in the spiritual lives of employees have been shown to enhance employees' commitment and loyalty to the institution. These findings suggest that the application of spiritual values in leadership can create a strong emotional bond between employees and the institutions.

Keywords: *spiritual leadership, employee loyalty, religious social institutions*

1. Introduction

In the context of current organizational dynamics, spiritual leadership has emerged as a critical paradigm that bridges managerial aspects and transcendental values (Budiyanto et al., 2020; Saad et al., 2015; Slavik et al., 2015). This approach not only focuses on achieving organizational targets but also on creating meaning in work, developing well-being, and building emotional bonds based on spiritual values such as integrity, compassion, and shared purpose (Siregar et al., 2024). Particularly in religious social institutions and educational organizations whose missions are rooted in moral and spiritual principles, spiritual leadership becomes increasingly relevant as it aligns with the characteristics of organizations that emphasize service and achievement (Polat, 2011). Currently, although many studies have examined its impact in the corporate or healthcare sectors, empirical research on its influence on employee loyalty in religious institutions, especially in Indonesia, remains limited, particularly concerning religious organizations.

In the modern organizational world, the role of leadership is not only confined to managerial aspects but also encompasses the ability to influence, inspire, and build meaningful relationships with organizational members (Wahab et al., 2016). One leadership approach that is gaining attention is spiritual leadership, which focuses on spiritual values such as integrity, vision, life meaning, and service (Saad et al., 2015). Spiritual leadership provides individuals with the space to find meaning in their organizational activities and feel part of something greater than merely achieving organizational targets (Fry et al., 2011). Additionally, spiritual leadership is implemented based on compassion and attentiveness to actions taken to achieve the goals set within any organization or institution (Burmansah et al., 2020; Siregar et al., 2024).

Religious social institutions, as organizations grounded in moral and spiritual values, are highly suitable as subjects of study in the context of spiritual leadership. The characteristics of these institutions demand leaders who are not only technically competent but also capable of providing spiritual exemplification that inspires. In many cases, employee loyalty in religious social institutions is influenced not only by material incentives but also by the extent to which employees feel appreciated, find meaning, and are emotionally and spiritually engaged in their work (Reave, 2005a).

Employee loyalty is a crucial aspect of organizational sustainability (Zhu et al., 2023). Loyal employees tend to demonstrate high dedication, low turnover rates, and increased productivity (Maryati et al., 2019). In religious social institutions, loyalty is also closely related to commitment to the organization's vision and mission, which are often idealistic in nature. Therefore, leaders with a spiritual approach are believed to be able to foster long-term loyalty through empathetic communication, empowerment, and exemplification of religious values (Greasley & Bocârnea, 2014).

Employee loyalty, as a multidimensional construct (McGhee & Grant, 2015; Michalová et al., 2024) is no longer solely influenced by material incentives but also by psychological and spiritual factors such as a sense of meaning, social connectedness, and alignment of personal values (Wang et al., 2023). In the context of religious institutions, where employees are motivated by a life calling, loyalty to the organization is significant (Greasley & Bocârnea, 2014). However, challenges in the digital era, such as the demand for work-life balance and a more pragmatic younger generation (Reave, 2005b) require institutions to reevaluate traditional leadership practices.

Nevertheless, empirical studies on the influence of spiritual leadership on employee loyalty, particularly in the context of religious social institutions, remain limited. Most research has been conducted in business-oriented companies (Jayanti & Wati, 2019). This study is important to fill this gap in the literature and provide a deeper understanding of how spiritual leadership practices can be effectively implemented in organizations based on religious values. Thus, the results of this study are expected to serve as a reference for leaders and managers of religious social institutions in enhancing employee loyalty and performance through a spiritual approach. Additionally, this research aims to analyze the extent to which spiritual leadership can maintain or even increase employee loyalty amid these complexities, while also offering an adaptive implementation framework for religious social institutions in society.

2. Literature Review

2.1.Spiritual Leadership

Spiritual leadership is an approach that combines transcendental values, ethics, and the meaning of life within the organizational context (Yang et al., 2019). Spiritual leadership emphasizes the fulfillment of spiritual needs, self-awareness, and social connection to achieve sustainable performance (Benefiel et al., 2014). According to (Fry et al., 2017) spiritual leadership includes an inspiring vision, altruistic love, and resilience.

Meanwhile, altruistic love is a key factor in building trust and collaboration, as found in the study by Wang et al. (2021) in the healthcare sector, where spiritual leaders were able to reduce employee burnout through an empathetic approach. The third indicator, resilience, refers to the leader's ability to maintain mental and spiritual fortitude in the face of crises (Chiu et al., 2023). These findings are particularly relevant in the post-pandemic era, where high uncertainty requires leadership that is not only technically effective but also psychologically soothing.

Another study (Yang et al., 2019) Hassan et al. (2022) identified mindfulness as an additional indicator of spiritual leadership. Leaders who practice mindfulness tend to be more

reflective, capable of making decisions with full awareness, and reducing workplace conflict. A further study Karakas & Sarigollu (2021) found that work-life balance and holistic well-being are important outcomes of spiritual leadership in today's digital era, where the boundaries between work and personal life are increasingly blurred.

Overall, spiritual leadership contributes not only to organizational performance but also to the holistic development of individuals (Dent et al., 2020). This approach is becoming increasingly relevant in a high-pressure world, where employees seek not only material rewards but also meaning, purpose, and human connection in their work.

2.2.Employee Loyalty

Employee loyalty is a critical factor in achieving organizational sustainability in today's competitive era (Krampe et al., 2025). Employee loyalty can be understood through three main components: emotional attachment, attachment based on perceived benefits, and attachment based on norms (Chaparro & Halcomb, 1990; Lukito et al., 2025). Recent research by (Albrecht et al., 2018; Efrat et al., 2025) indicates that amid changes in the work environment, effective commitment is becoming increasingly important as employees value flexibility and organizational values that align with their needs. Meanwhile, a study by (Citra & Fahmi, 2019) suggests that job satisfaction, transformational leadership, and an inclusive organizational culture significantly contribute to increased loyalty.

Technological advancements also influence the dynamics of employee loyalty. Research by (Albrecht et al., 2018) ound that companies that implement a good digital employee experience (DEX), such as the use of digital collaboration tools, tend to have higher loyalty levels. However, challenges arise regarding work-life balance, as research by (Haar et al., 2024) shows that millennial and Gen-Z employees are more loyal to organizations that support work-life balance through flexible work policies. Additionally, the role of employer branding is reinforced by (Na-Nan et al., 2025) state that companies with a positive image and strong social values are better able to retain talented employees.

3. Methodology

This type of research is associative descriptive research with a quantitative approach. The data obtained in this study is a closed questionnaire. Collecting data with a questionnaire distributed to employees or administrators of Buddhist religious institutions via google form. This research was conducted by Buddhist religious institutions. The population in this study is the total number of administrators and employees at Buddhist religious institutions in Bandar Lampung.

3.1. Sample

Sampling was carried out with a preliminary study in the form of observations conducted in Bandar Lampung with 35 respondent.

3.2. Analysis Method

The analysis was used to describe the data and test the hypothesis, namely inferential analysis to test the hypothesis using multiple regression tests and simple correlation with the help of the SPSS for Windows version 25.0 program.

4. Results and Discussions

4.1. Data Normality

The results of the normality test are carried out to determine that the data is normally distributed so that data testing is eligible.

Table 1. Data normality One-Sample Kolmogorov-Smirnov Test

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		35
Normal Parameters[a]	Mean	.0000000
	Std. Deviation	6.18427403
Most Extreme Differences	Absolute	.199
	Positive	.199
	Negative	-.125
Kolmogorov-Smirnov Z		1.175
Asymp. Sig. (2-tailed)		.126

The results of the normality test analysis show that the Asymp. Sig. (2-tailed) of 0.126, which is greater than the significance level (α) of 0.05. Based on the decision-making criteria in the normality test, if the Asymp. Sig. > α, then the null hypothesis (H_0) which states that the data is normally distributed cannot be rejected. Thus, it can be concluded that the data in this study are normally distributed. These results fulfil the basic parametric assumptions, so statistical analysis techniques that require a normal distribution.

4.2. Descriptive Statistics

Table 2. Descriptive Statistics

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
Spiritual Leadership	35	37	55	49.43	4.877
Employee Loyalty	35	71	99	86.77	8.303
Valid N (listwise)	35				

The results of the descriptive statistical analysis show that the spiritual leadership variable among 35 respondents has a value range of 37-55, with a mean score of 49.43 and a standard deviation of 4.877. The mean value, which is close to the midpoint of the scale (46 from the range of 37-55), indicates that the level of spiritual leadership in the organization is categorized as moderate. The standard deviation of 4.877 suggests a significant variation in respondents' perceptions of spiritual leadership practices within the organization.

In the employee loyalty variable, a wider value range (71-99) is observed, with a mean of 86.77 and a standard deviation of 8.303. The mean value, which is close to the maximum score (99), reflects a generally high level of employee loyalty. However, the relatively large standard deviation (8.303) indicates a considerable disparity in loyalty levels among employees, with some employees demonstrating very high loyalty while others exhibit lower levels of loyalty.

4.3. Regression Results

The results of the regression analysis indicate that the multiple regression equation that can be written from the output data is as follows: $Y = 34.037 + .974X$

Table 3. *Coefficients*[a]

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	34.037	4.977		6.839	.000
	X	.974	.011	.998	89.198	.000

a. Dependent Variable: Y

Based on the results of the linear regression analysis presented, it can be interpreted that the independent variable, spiritual leadership (X), has a highly significant effect on the dependent variable, employee loyalty (Y). The resulting regression equation is Y = 34.037 + 0.974X. The constant value of 34.037 indicates that when the variable X equals zero, the predicted value of Y is 34.037. The regression coefficient of 0.974 suggests that each one-unit increase in the spiritual leadership variable (X) will be followed by an increase of 0.974 units in the employee loyalty variable (Y).

The significance test results show a t-value of 89.198 with a significance level of 0.000 ($p < 0.01$), indicating that the influence of variable X on Y is statistically highly significant. The standardized coefficient beta value of 0.998 indicates that variable X contributes greatly to predicting variable Y, with a positive relationship. This means that the higher the value of X, the higher the predicted value of Y.

Table 4. Anova

ANOVA[b]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	6872983.259	1	6872983.259	7.956E3	.000[a]
	Residual	28506.940	33	863.847		
	Total	6901490.200	34			

Based on the results of the ANOVA analysis presented, it can be concluded that the regression model used is statistically highly significant in predicting the dependent variable. The ANOVA table shows an extremely large F-value of 7,956 (or 7.956E3) with a significance level of 0.000 < 0.05. This indicates that the regression model as a whole is highly significant and suitable for predicting the dependent variable. In other words, considering the significance value, spiritual leadership has a significant effect on employee loyalty. To further examine the magnitude of this effect, one can refer to Table 5.

Table 5. Model Summary

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.998[a]	.996	.996	29.391

The results of the regression analysis presented in the table show that the correlation coefficient (R) is 0.998, indicating a very strong relationship between the independent variable (spiritual leadership, X) and the dependent variable (employee loyalty, Y). This suggests that the independent variable explains a significant portion of the variation in the dependent variable. The R Square value of 0.996 indicates that this regression model explains 99.8% of the variance in employee loyalty (Y).

Discussion

This research confirms that spiritual leadership has a positive and significant influence on employee loyalty within religious social institutions. The regression coefficient of 0.974 ($p < 0.01$) indicates that a one-unit increase in spiritual leadership will result in a 0.974-unit increase in employee loyalty. These findings align with the theory proposed by Fry et al. (2017) which states that spiritual leadership focused on visionary inspiration, unconditional compassion, and spiritual resilience can foster a strong emotional bond between employees and the organization. An R^2 value of 0.996 further indicates that 99.6% of the variation in employee loyalty can be explained by spiritual leadership, emphasizing the dominant role of this variable within the context of faith-based organizations.

However, the relatively high standard deviation observed in the employee loyalty variable (8.303) suggests the existence of other factors outside of spiritual leadership that may influence loyalty, such as organizational culture, reward systems, or work-life balance. This reinforces the argument that, although spiritual leadership plays a role in fostering loyalty, a holistic approach that incorporates both material and non-material aspects remains essential (Jayanti & Wati, 2019). Moreover, the characteristics of the research unit may limit the generalizability of these findings, thereby necessitating further studies with more diverse samples to validate these results.

The practical implications of this study highlight the importance of integrating spiritual values into leadership practices within religious social institutions. Leaders should develop meaningful visions, demonstrate empathy, and create work environments that support employees' spiritual growth. Nonetheless, organizations must also consider other supporting factors such as career development and work-life balance, especially for younger generations who are more sensitive to these issues (Lukito et al., 2025). Thus, a combination of spiritual leadership and inclusive organizational policies will sustainably strengthen employee loyalty.

5. Conclusion

This research provides empirical evidence that spiritual leadership is a key factor in enhancing employee loyalty within religious social institutions. These findings not only enrich the literature on value-based leadership but also offer valuable insights for religious organization managers to strengthen employee commitment through a spiritual approach. For future research, exploring the role of mediator variables such as job satisfaction or employees' spiritual engagement may provide a deeper understanding of the underlying mechanisms of this influence.

ETHICAL LEADERSHIP, ORGANIZATIONAL CULTURE, AND INNOVATIVE BEHAVIOR: AN INTEGRATED ANALYSIS

Puspita Sari[1*], Taridi[2], Ditha Kurniawan[3]

[1,2,3] Buddhist Business and Management Department, Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

This study aims to analyze the influence of ethical leadership on organizational culture and innovative behavior within the Indonesian Buddhayana Council (MBI) of Lampung Province. Using a quantitative approach, data was collected from 100 respondents who are administrators and active members of MBI. The analytical method used is multiple regression analysis to test the effect of ethical leadership, organizational culture on innovative behavior, both simultaneously and partially. The sampling technique used was a total sample because the population members totaled 100 people. Data were collected using a five-point Likert scale questionnaire that had been tested for validity and reliability. Data analysis was carried out using descriptive and inferential statistics through multiple linear regression tests at a significance level of 0.05 with the help of SPSS 24. The results showed that both Ethical Leadership and Organizational Culture had a positive and significant effect on Innovative Behavior. This finding confirms the importance of the role of leaders who uphold moral values and adaptive organizational culture in shaping innovative behavior in the workplace. This research provides practical implications for the development of leadership policies in faith-based organizations to remain relevant and adaptive in the face of changing times.

Keywords: *Ethical leadership, organizational culture, innovative behavior, religious organization, MBI Lampung*

1. Introduction

In the dynamics of modern organizations, leadership has a strategic role in shaping organizational culture and encouraging innovative employee behavior. One leadership approach that has received increasing attention is ethical leadership, which is a leadership style that emphasizes moral values, justice, integrity, and social responsibility (Brown & Treviño, 2006). Ethical leadership not only builds trust between individuals, but also creates a healthy and productive work environment (Yidong & Xinxin, 2013). In addition, ethical leadership provides more meaning in doing every activity in a religious social organization or in the field of education (Gutiérrez-González et al., 2023; Mohammad & Borkoski, 2024; Muadzin & Sunarto, 2025).

Religious organizations such as Majelis Buddhayana Indonesia (MBI) face great challenges in maintaining their existence in the midst of rapid social change. In this context, leadership that upholds ethical values becomes very important to strengthen organizational culture based on noble values, while encouraging innovation in religious and social services (Rompas[l] et al., 2018). Organizational culture itself is a system of values, norms, and beliefs that develop in organizations and influence the attitudes and behaviors of organizational members (Azila-Gbettor et al., 2024; Donaldson & Villalobos, 2024).

Previous research shows that ethical leadership has a positive relationship with innovative behavior, either directly or indirectly through organizational culture (Akanpaadgi et al., 2024). Innovative behavior includes the creation, introduction, and implementation of new ideas that

are useful for increasing organizational effectiveness (Harto et al., 2023) In religious organizations, innovation is not only limited to technological aspects, but also includes methods of counseling, education, and social services based on religious values (Adu-Marfo et al., 2024).

In addition, some studies state that ethical leadership has a significant effect on organizational culture and innovative behavior (Gutiérrez-González et al., 2023). Research by (Depoers et al., 2016) shows that ethical leaders create a work environment that supports creativity and innovation. On the other hand, a healthy organizational culture is an important factor and mediator in strengthening the relationship between leadership and organizational goals (Carey & Haralambous, 2024; Ferdiansyah & Lestari, 2023; Ridho et al., 2018).

However, there are still few studies that specifically examine the relationship between ethical leadership, organizational culture, and innovative behavior in the context of religious organizations in Indonesia, especially Buddhist religious organizations. In fact, a deeper understanding of these factors is very important to formulate relevant and effective leadership strategies in the management of religious organizations. Therefore, this study aims to analyze the influence of ethical leadership on organizational culture and innovative behavior in MBI Lampung. This research is expected to make a theoretical contribution to the development of human resource management and organizational leadership, as well as provide practical implications for leaders of religious organizations in creating an adaptive, ethical, and innovative work culture.

2. Literature Review

2.1 Ethical Leadership

Ethical leadership is defined as leader behavior that demonstrates appropriate personal and professional norms through actions and interpersonal relationships, while promoting ethical behavior among subordinates through communication, reinforcement, and decision-making (Brown & Treviño, 2006; Fischer et al., 2024). Ethical leaders are viewed as possessing high integrity, honesty, fairness, and moral courage (Albarracin & Shavitt, 2018). Studies show that ethical leadership contributes to the creation of a positive and ethical organizational climate (Azila-Gbettor et al., 2024). According to (Gutiérrez-González et al., 2023), ethical leadership can enhance organizational trust and work commitment. In the digital era, ethics in leadership is increasingly important due to the growing complexity of decision-making (Berhanu, 2024; Mer et al., 2024).

2.2 Organizational Culture

Organizational culture is a system of shared values, beliefs, and norms that influence how individuals behave within an organization (Ode, 2019). According to (Maudul et al., 2018) organizational culture not only creates organizational identity but also serves as a mechanism of social control. A strong organizational culture can enhance employee productivity and proactive behavior (Kurniati & Rojuaniah, 2023). Another study on organizational culture by (Maharani, 2019) states that an adaptive organizational culture plays a vital role in organizational sustainability and innovation. An organizational culture built on ethics, trust, and open communication can create a work environment that supports the development of new ideas (Ibrahim, 2022).

2.3. Innovative Behavior

Innovative behavior refers to an individual's efforts to introduce and implement new ideas in the workplace to improve both personal and organizational performance (Firdausiah & Etikariena, 2021). This behavior includes the search for, creation, and implementation of new solutions to organizational problems (Rufaidah & Kodri, 2020). According to (Balven et al., 2018; Masyiatul, 2020), innovative behavior is greatly influenced by contextual factors such

as leadership style, organizational support, and work culture. A study by Carey & Haralambous (Carey & Haralambous, 2024) shows that ethical leadership can foster innovative behavior by enhancing intrinsic motivation and trust among team members.
The following research hypotheses were carried out:

1. There is a significant influence of Ethical Leadership on Innovative Behavior (H1)
2. There is a significant influence of Organizational Culture on Innovative Behavior (H2)
3. There is a significant influence of Ethical Leadership and Organizational Culture on Innovative Behavior (H3)

3. Methodology

This study employs a quantitative approach with an explanatory research design. This approach was chosen to clarify the causal relationships between the variables of ethical leadership, organizational culture, and innovative behavior (Sugiono, 2019). Explanatory research is highly suitable for statistically testing the influence of one variable on another (Creswell, 2015). The population in this study consists of all administrators and active members of the Indonesian Buddhayana Assembly (MBI) in Lampung Province. The sampling technique used is purposive sampling, selecting respondents based on specific criteria, such as active involvement in organizational activities and a minimum membership duration of one year. The sample size determined was 100 individuals. Data were analyzed using multiple regression analysis with the assistance of SPSS version 24.0.

4. Results and Discussions

This study involved 100 active respondents from the Indonesian Buddhayana Assembly (MBI) in Lampung Province. The data collected through questionnaires were analyzed using multiple linear regression to examine the relationships between ethical leadership (X1), organizational culture (X2), and innovative behavior (Y).

4.1. Data Normality Test

In this study, a normality test was conducted to examine the distribution characteristics of the data before proceeding with further analysis. The results of this test served as the basis for subsequent tests. Below are the normality test results using the One-Sample Kolmogorov-Smirnov Test:

Table 1. One-Sample Kolmogorov-Smirnov Test

		Unstandardized Residual
N		100
Normal Parameters[a]	Mean	.0000000
	Std. Deviation	6.15854859
Most Extreme Differences	Absolute	.056
	Positive	.035
	Negative	-.056
Kolmogorov-Smirnov Z		.558
Asymp. Sig. (2-tailed)		.915
a. Test distribution is Normal.		

The results of the data analysis (Table 1) show that the Asymp. Sig. (2-tailed) value is 0.915, meaning the significance value is greater than 0.05, which indicates that the data are normally distributed.

4.2. Homogeneity Test

Table 2: Homogeneity Test Results

Test of Homogeneity of Variances				
	Levene Statistic	df1	df2	Sig.
Ethical Leadership	.725	8	88	.669
Organizational Culture	2.455	8	88	.059

The results of the homogeneity test on the Ethical Leadership variable show a Levene Statistic value of 0.725 with a significance of 0.669 ($p > 0.05$). This indicates that the variance of the data between groups is homogeneous, as the significance value exceeds the critical threshold of 0.05. Thus, the assumption of homogeneity for further analysis is met. Furthermore, the Organizational Culture variable obtained a Levene Statistic of 2.455 with a significance of 0.059 ($p \approx 0.05$). Although close to the critical threshold, this value is still above 0.05, so it can be statistically considered to meet the assumption of homogeneity.

4.3. Regression Testing

4.3.1 The Effect of Ethical Leadership on Innovative Behavior

The test results of the effect of Ethical Leadership on Innovative Behavior using regression analysis are as follows:

Table 3. Coefficients[a]

		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	129.603	6.879		18.840	.000
	Ethical Leadership	.641	.081	-.625	-7.934	.000

a. Dependent Variable: Y

The results of the linear regression analysis indicate a statistically significant positive effect of the Ethical Leadership variable on the dependent variable Y ($B = 0.641$; $\beta = 0.625$; $p < 0.01$). This finding suggests that every one-unit increase in the Ethical Leadership score is followed by an increase of 0.641 units in variable Y, assuming all other variables in the model remain constant. The standardized beta coefficient of 0.625 positions Ethical Leadership as a fairly strong predictor of innovative behavior, with approximately 62.5% of the variation in innovative behavior explained by variations in Ethical Leadership.

Table 4. ANOVA[b]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	3124.747	1	3124.747	62.949	.000[a]
	Residual	4864.643	98	49.639		
	Total	7989.390	99			

Table 4 presents the results of the ANOVA test, confirming that the regression model developed has excellent statistical validity ($p < 0.001$), with the ability to explain approximately 39.1% of the variance in the dependent variable. The Mean Square Residual value of 49.639 indicates the level of error in the model's predictions. These findings support the use of this linear regression model to explain the relationship between Ethical Leadership and innovative behavior.

Table 5. Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.625[a]	.391	.385	7.046

Table 5 presents the results of the regression analysis, showing an R value (correlation coefficient) of 0.625, indicating a strong and positive influence between the independent variable (Ethical Leadership) and the dependent variable (innovative behavior). The R Square (R^2) value of 0.391 means that 39.1% of the variation in innovative behavior can be explained by Ethical Leadership, while the remaining 60.9% is influenced by other factors outside the model.

4.3.2 Effect of Organizational Culture on Innovative Behavior

Tabel 6. Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	128.004	7.611		16.818	.000
	Organizational culture	.615	.088	.575	6.956	.000

The results of the linear regression analysis show a statistically significant positive effect of organizational culture on the dependent variable, innovative behavior ($B = 0.615$; $\beta = 0.575$; $p < 0.01$). This finding indicates that every one-unit increase in the organizational culture score is followed by an increase of 0.615 units in innovative behavior, assuming all other variables in the model remain constant.

Table. 7 ANOVA[b]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	2640.734	1	2640.734	48.384	.000[a]
	Residual	5348.656	98	54.578		
	Total	7989.390	99			

The analysis results in Table 7 show a significance value of 0.000, which is less than 0.05, indicating that organizational culture has a significant effect on innovative behavior. To further examine the magnitude of this effect, refer to Table 8 (Model Summary).

Table 8. Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.575[a]	.331	.324	7.388

The regression analysis results show an R value of 0.575, indicating a moderate relationship between the independent and dependent variables in this model. The R Square (R^2) value of 0.331 indicates that 33.1% of the variation in the dependent variable can be explained by the independent variable in the model, while the remaining 66.9% is influenced by other factors not included in the analysis. The Adjusted R Square value of 0.324 (which is close to the R Square) suggests that the model is not overfitted and is relatively stable when applied to a broader population.

4.3.3 The Influence Of Ethical Leadership And Organizational Culture On Innovation Behavior

Tabel 9. Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	153.627	7.552		20.342	.000
	Ethical Leadership	.492	.077	.480	6.417	.000
	Organizational culture	.428	.080	.400	5.354	.000

This multiple regression model shows that both Ethical Leadership and Organizational Culture have a positive and significant effect on the dependent variable (Y). The constant value (153.627) indicates that when both independent variables are zero, the predicted value of Y is 153.627. Ethical Leadership contributes positively with a regression coefficient (B = 0.492), meaning that every one-unit increase in this variable will increase Y by 0.492 units, with a relatively strong effect (Beta = 0.480) that is statistically significant ($t = 6.417$, $p < 0.001$). Meanwhile, Organizational Culture also has a positive effect (B = 0.428), where each one-unit increase in this variable raises Y by 0.428 units, with a relatively strong effect (Beta = 0.400) that is likewise significant ($t = 5.354$, $p < 0.001$). Together, these two independent variables make a strong contribution to the dependent variable, with a very small significance value ($p < 0.001$), indicating that this relationship is not due to chance. These results reinforce the importance of ethical leadership and organizational culture in enhancing variable Y, while also confirming the validity of the regression model used.

Table. 10 ANOVA[b]

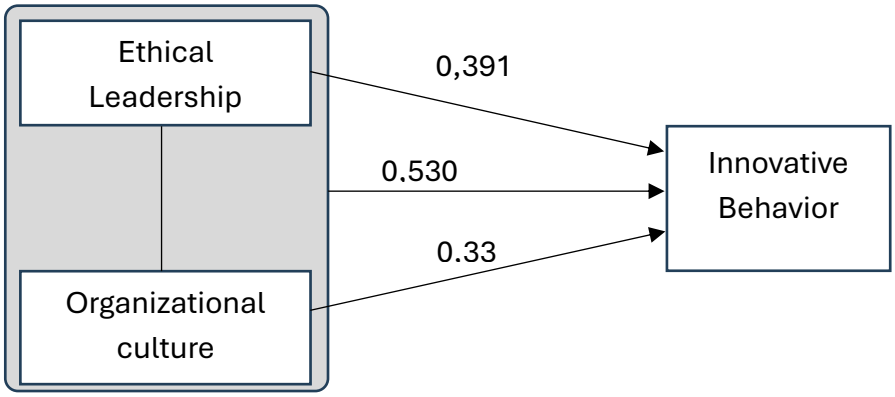
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	4234.546	2	2117.273	54.696	.000[a]
	Residual	3754.844	97	38.710		
	Total	7989.390	99			

Based on the ANOVA table presented, it can be concluded that the multiple regression model consisting of the variables Ethical Leadership and Organizational Culture is statistically highly significant in predicting the dependent variable (Y). This is evidenced by the F-statistic value of 54.696, which is significant at the $p < 0.001$ level (Sig. = .000a). The Sum of Squares Regression value of 4234.546 indicates the amount of variation in the dependent variable that can be explained by the regression model, while the Sum of Squares Residual of 3754.844 reflects the variation that cannot be explained by the model. With a total Sum of Squares of 7989.390, we can calculate that this model explains approximately 53% of the variance in the dependent variable (4234.546 / 7989.390 = 0.53). The Mean Square Residual value of 38.710 indicates the level of prediction error in the model. Overall, the ANOVA test results confirm that the regression model involving these two independent variables has excellent statistical validity and is suitable for predicting the dependent variable Y.

Table 11. Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.728[a]	.530	.520	6.222

The analysis results show that this multiple regression model has very strong predictive power, with a multiple correlation coefficient (R) of 0.728. This value indicates a strong relationship between the combination of independent variables (Ethical Leadership and Organizational Culture) and the dependent variable (Y). Furthermore, the R Square value of 0.530 reveals that 53% of the variation in variable Y can be jointly explained by the two independent variables in this model.



Source: Data Processing

4.3.4. Discussions

The regression analysis results in this study reveal that ethical leadership and organizational culture significantly influence the innovative behavior of members of the Indonesian Buddhayana Assembly (MBI) in Lampung Province. The coefficient of determination (R^2) of 0.530 indicates that 53% of the variation in innovative behavior can be explained by these two independent variables, with ethical leadership contributing more ($\beta = 0.480$) compared to organizational culture ($\beta = 0.400$). These findings align with the theory of Brown & Treviño (2006), which states that ethical leadership creates a climate of trust that serves as the foundation for innovation. The statistical significance ($p < 0.001$) of both variables strengthens the validity of the model, although there remains 47% of other factors to be explored, such as intrinsic motivation or resource support.

A deeper analysis reveals the role of organizational culture as an effective mediator. The simple regression coefficient between ethical leadership and innovative behavior (B = 0.641) decreases to 0.492 when organizational culture is included in the multiple regression model. This indicates that 23.3% of the influence of ethical leadership on innovation is carried out through the formation of organizational culture, consistent with the findings of Afsar et al. (2019). The organizational culture shaped by the leader's ethical values facilitates members to confidently propose new ideas without fear of making mistakes, as reflected in an increase of 0.428 units in innovative behavior for every one-unit increase in organizational culture.

The practical implications of this study emphasize the importance of developing ethical leadership training programs for MBI administrators, particularly focusing on distributive justice and transparent communication. On the other hand, the finding of a relatively low Standard Error of Estimate (6.222) indicates the accuracy of the predictive model but also suggests the need to integrate other variables, such as reward systems or individual characteristics, in future research. Theoretically, these results enrich the literature on the psychological-organizational mechanisms linking leadership ethics with innovation within the context of religious organizations, an area that has so far been limited.

5. Conclusion

This study reveals that ethical leadership significantly influences the organizational culture and innovative behavior of members of the Indonesian Buddhayana Assembly (MBI) in Lampung Province. The findings indicate that leaders who emphasize honesty, fairness, and integrity play a vital role in shaping an organizational culture that fosters collaboration, trust, and collective values. This organizational culture, in turn, serves as an important foundation for encouraging members to actively demonstrate innovative behaviors, such as generating new ideas, engaging in creative collaboration, and initiating change.

These results support and extend previous literature, which asserts that ethical leadership functions not only as a moral factor but also as a strategic driver in creating an innovative organizational climate (Brown et al., 2005; Afsar et al., 2019; Cameron & Quinn, 2017). Moreover, identifying organizational culture as a mediating variable underscores the importance of collective values in bridging the influence of leadership on member behavior.

Practically, the findings recommend strengthening the capacity for ethical leadership within socio-religious organizations like MBI, as well as fostering an organizational culture that is open to learning and innovation. For future research, it is suggested that this model be tested across different organizational populations using longitudinal or mixed-method approaches to deepen the understanding of the dynamics among ethics, culture, and innovation in a broader context.

THE EFFECT OF PRODUCT INNOVATION AND DIGITAL MARKETING STRATEGY ON THE SUCCESS OF MICRO, SMALL AND MEDIUM ENTERPRISES (MSMES)

Adelia Mahayani Putri[1*], Nanda Aditiya[2], Taridi[3]

[1,2,3] Buddhist Business and Management Department, Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

This study aims to analyze the effect of product innovation and digital marketing strategies on the success of Micro, Small, and Medium Enterprises (MSMEs) in Bandar Lampung. The research method employs a quantitative approach, with data collection techniques using questionnaires distributed to 25 MSME owner respondents. The data were analyzed using multiple linear regression to test the relationship between independent variables (product innovation and digital marketing strategies) and the dependent variable (MSME success). The results indicate that both product innovation and digital marketing strategies have a positive and significant impact on MSME success. Product innovation enhances competitiveness and product value, while digital marketing strategies expand market reach and improve customer interaction. The implications of this research emphasize the importance for MSMEs to continuously develop product innovations and leverage digital marketing to enhance business growth.

Keywords: *Product Innovation, Digital Marketing, MSME Success*

1. Introduction

The development of technology and the dynamics of the global market have created both challenges and opportunities for Micro, Small, and Medium Enterprises (MSMEs) (Indrajaya et al., 2022; Kementerian, 2025; Prabowo et al., 2023; Soelton & Ramli, 2017). In Indonesia, MSMEs play a vital role in the economy, contributing approximately 60% of the GDP and absorbing 97% of the workforce (Kemenkop UKM, 2022). However, increasing competition requires MSMEs to adapt through product innovation and effective marketing strategies, especially in the digital era. The growth of MSMEs has been quite rapid, but many still face challenges in increasing sales and market expansion (Jalunggono et al., 2023). Additionally, according to data from the ministry regarding MSMEs, their contribution to national entrepreneurship is 3.47%, a figure that is quite significant when viewed alongside other indicators.

Table 1. Contribution of MSMEs to the National Economy

Indicator	Percentage/Score
Total Employment	99,9%
Contribution to National GDP	60,5%
Total National MSME Investment	60,0%
Partnerships between MSMEs and Large Enterprises (UMB)	7%
Contribution to Non-Oil and Gas Exports	15,6%
Participation in Global Value Chains	4,1%
National Entrepreneurship Ratio	3,47%

Source: MSMEs of the Republic of Indonesia

Given the contribution of MSMEs to entrepreneurship, it is essential to observe the development of the economy, particularly the products created by MSMEs today (Aidhi et al., 2023; Putri & Widadi, 2024). Therefore, the utilization of the digital world and collaboration between the government and society become crucial factors in enhancing product innovation. Product innovation is one of the keys to the competitiveness of MSMEs in meeting the ever-evolving consumer needs. According to (Desi & Tambunan, 2020; Setyowati et al., 2012) product innovation encompasses not only physical changes to products but also value-added improvements such as packaging, quality, and uniqueness. MSMEs that can innovate tend to survive better in the market because they can meet the increasingly dynamic expectations of customers. However, innovation alone is not sufficient without being supported by appropriate marketing strategies, especially in an era where consumers are increasingly active on digital platforms.

Digital marketing strategies have become a fundamental necessity for MSMEs to expand their market reach. Research (Li Pira et al., 2025) shows that the use of social media, e-commerce, and digital advertising significantly enhances business visibility and customer interaction. In other words, although many MSMEs have utilized platforms like Instagram and WhatsApp, not all have maximized the potential of digital marketing optimally. In fact, a study (Brown et al., 2025) demonstrates that MSMEs adopting digital marketing experience increased sales and promotional cost efficiency. The success of MSMEs is not only measured by revenue growth but also by their ability to survive, expand their market, and foster customer loyalty (Ismanu, S., Kusmintarti, A., & Riwajanti, 2021; Suhairi et al., 2024; Zahoor et al., 2023). According to (Astuti et al., 2020; Damayanti et al., 2023; Herlinawati & Machmud, 2020; Lita et al., 2018) the combination of product innovation and digital marketing can create a competitive advantage for MSMEs. Despite the contributions of product innovation and digital marketing strategies being recognized in previous studies, there is still limited research specifically examining the impact of these two factors on the success of MSMEs. Therefore, this study aims to analyze the extent to which product innovation and digital marketing strategies contribute to the success of MSMEs in society.

2. Literature Review

2.1. Product Innovation

Product innovation is a key factor in enhancing the competitiveness of MSMEs. According to (Fuetsch, 2022), product innovation is not limited to the development of new goods or services but also includes improvements in features, quality, packaging, or other value additions that can meet consumer needs. MSMEs that successfully innovate tend to be more capable of surviving in market competition as they can attract new customers while retaining existing ones. Research (Camel et al., 2025; Ismanu, S., Kusmintarti, A., & Riwajanti, 2021) shows that product innovation significantly impacts the increase in MSME sales, especially when supported by good market research. In the context of MSMEs in Indonesia, innovation is often carried out simply, such as modifying flavors, designs, or packaging, yet it has a substantial impact on product differentiation. Another study Rosenbusch et al. (2011) states that despite limited resources, MSMEs focusing on incremental innovation (gradual improvements) can achieve significant business growth.

2.2. Marketing Strategy

Digital marketing strategies have become a primary driver of MSME growth in the modern era. According to (Stawicka, 2021) digital marketing encompasses the use of social media, email marketing, SEO, and e-commerce to reach consumers more effectively and efficiently. For MSMEs, this strategy provides opportunities to compete with larger businesses due to its

relatively low cost and wide reach. A research (Kurnia & Suharjito, 2018) ound that MSMEs adopting digital marketing experienced increases in sales and brand awareness. Social media platforms like Instagram and Facebook have become primary channels due to their ease of access and direct interaction with customers. Additionally, studies Gbandi & Iyamu, (2022); Kyriaki, (2015); Septiani et al., (2024) indicate that MSMEs utilizing marketplaces like Tokopedia and Shopee tend to experience faster growth as they can reach national and even international markets.

2.3. The Success of MSMEs

The success of MSMEs can be measured through various indicators, such as sales growth, market expansion, profitability, and business sustainability. According to (Putri & Widadi, 2024), UMKM successful MSMEs typically have a combination of quality products, appropriate marketing strategies, and good financial management. Furthermore, adaptation to market and technological changes is also a determining factor for success. Research conducted by (Huang et al., 2021) shows that MSMEs that can survive and grow generally have access to financing, government support, and innovation capabilities. Other studies Achmad, (2023); Franco, (2020); Vuchkovski et al., (2023); Ardianto et al., (2024); Taridi et al., (2024) state that entrepreneurial orientation, including innovation and proactivity, has various supporting factors and is positively correlated with MSME performance. Thus, the success of MSMEs does not rely on a single factor but on the integration of various business aspects.

3. Methodology

This study employs a quantitative approach with data collection methods through closed questionnaires distributed to Micro, Small, and Medium Enterprises (MSMEs) in Bandar Lampung. The population for this research consists of all MSMEs in the area, while the sampling was conducted through a preliminary study involving direct observation of 25 MSMEs. The data obtained were analyzed to describe the findings and test hypotheses using inferential analysis, specifically multiple regression and simple correlation using SPSS for Windows version 25.0.

4. Results and Discussions

4.1 Data Normality

The normality test is carried out to determine that the data is normally distributed so that data testing is eligible. The normality test was carried out using the Kolmogorov-Smirnov normality test.

Table 1. *One-Sample Kolmogorov-Smirnov Test*

		Unstandardized Residual
N		25
Normal Parameters[a]	Mean	.0000000
	Std. Deviation	1.64706213
Most Extreme Differences	Absolute	.153
	Positive	.079
	Negative	-.153
Kolmogorov-Smirnov Z		.766
Asymp. Sig. (2-tailed)		.599

Based on the results of the Kolmogorov-Smirnov normality test on unstandardised residuals, it can be concluded that the residuals are normally distributed. This is indicated by

the value of Asymp. Sig. (2-tailed) value of 0.599, which is much greater than the general significance level of 0.05. Thus, the null hypothesis that the residuals are normally distributed cannot be rejected. In addition, the most extreme differences between the empirical and theoretical distributions are relatively small, with a maximum absolute value of 0.153. The Kolmogorov-Smirnov Z value of 0.766 also indicates no significant deviation from normality. With the mean of the residuals close to zero (mean = 0.0000000) and a standard deviation of 1.647, it can be concluded that the model fulfils the assumption of normality of the residuals, so that the results of the regression or statistical analysis used can be considered valid.

4.2 Descriptive statistics

Table 2. Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
MSME Success (Y1)	25	37	56	47.23	4.512
Product Innovation (X^1)	25	37	59	48.72	4.967
Digital Marketing Strategy (X^2)	25	39	58	50.11	4.475
Valid N (listwise)	25				

Based on the data obtained from 25 respondents, it can be seen that MSME success (Y1) has a minimum value of 37 and a maximum of 56, with an average (mean) of 47.23 and a standard deviation (std. deviation) of 4.512. This shows that the level of success of MSMEs in the sample tends to vary, but most are concentrated around the mean value. Product Innovation (X1) has a value range of 37-59, with a mean of 48.72 and a standard deviation of 4.967. The variability of this data indicates that the level of product innovation among MSMEs is quite varied, but most respondents are in the range close to the mean value. Digital Marketing Strategy (X2) has the lowest value of 39 and the highest of 58, with an average of 50.11 and a standard deviation of 4.475. The higher mean value compared to other variables indicates that digital marketing strategies tend to be better implemented by MSMEs in this sample.

4.3 Regression results

The results of the regression analysis show that the multiple regression equation can be seen from the output data of the analysis results as follows:

Table 3. *Coefficients*[a]

		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	3.947	4.038		.977	.339
	Product Innovation (X1)	.618	.219	.680	2.827	.010
	Digital Marketing Strategy (X2)	.263	.243	.261	1.084	.290

Based on the results of linear regression analysis, the regression equation Y = 3.947 + 0.618 (X_1) + 0.263 (X_2) is obtained, which describes the effect of product innovation and digital marketing strategies on the success of MSMEs. The results of the analysis show that product innovation (X_1) has a positive and significant effect on the success of MSMEs with a regression coefficient of 0.618 and a significance value of 0.010 ($p < 0.05$), meaning that every one-point increase in product innovation will increase the success of MSMEs by 0.618 points, assuming other variables remain constant. The standardized beta coefficient of 0.680 indicates that product innovation is a more dominant predictor than other variables.

On the other hand, although the digital marketing strategy (X_2) shows a positive influence with a coefficient of 0.263, it is not statistically significant ($p = 0.290 > 0.05$) so it cannot be said to affect the success of MSMEs meaningfully. The insignificant constant value of 3.947 ($p = 0.339$) indicates that when both independent variables are zero, MSME success is not significantly different from zero. This finding indicates that product innovation plays an important role in driving MSME success, while digital marketing strategy in this study has not shown a significant effect. To strengthen these findings, it is recommended to further examine the classical assumptions of the regression and consider adding other variables that may have an effect.

Table 4. *Anova*

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	423.402	2	211.701	71.534	.000[a]
	Residual	65.108	22	2.959		
	Total	488.509	24			

The anova test results on the regression model show that the model as a whole is significant in predicting the success of MSMEs. This can be seen from the calculated F value of 71.534 with a significance level of 0.000 ($p < 0.05$), which means that this regression model is statistically highly significant. The Sum of Squares Regression value (423,402) illustrates the total variation in the dependent variable (MSME success) that can be explained by the independent variables (product innovation and digital marketing strategy). Thus, it can be concluded that product innovation and digital marketing strategies affect the success of MSMEs. To see the magnitude of the influence can be seen in (Table V. Summary Model*).*

Table 5. Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.931[a]	.867	.855	1.720

a. Predictors: (Constant), x2, x1

Based on the results of the regression analysis, an R value of 0.931 was obtained, indicating a very strong relationship between the independent variables (product innovation and digital marketing strategy) and the dependent variable (MSME success). The R Square value (coefficient of determination) of 0.867 indicates that 86.7% of the variation in MSME success can be explained by the two independent variables, while the remaining (13.3%) is influenced by other factors outside the model. Overall, these results reinforce previous findings

that the regression model is significant and feasible, with the ability to explain most of the variation in MSME success through product innovation and digital marketing strategies. However, there are still 13.3% of other factors that have not been measured in this study, so it is recommended to explore additional variables to improve the predictive power of the model.

4.4 Discussion

The results of this study indicate that product innovation has a positive and significant impact on the success of MSMEs, while digital marketing strategies, although positively influential, do not show statistical significance. Nevertheless, both product innovation and marketing strategies collectively influence the success of MSMEs. These findings align with research by (Lorensa & Hidayah, 2022; Ratner et al., 2025; Soekandar & Pratiwi, 2023) which states that product innovation, particularly in the form of quality improvement and differentiation, can enhance the competitiveness of MSMEs. However, the insignificant results of digital marketing strategies may be attributed to imperfections in implementation or limitations in the research sample. As noted by (Clarysse et al., 2022; Nikmah & Magfiroh, 2022), the effectiveness of digital marketing heavily depends on MSMEs' ability to optimally utilize platforms, which may not have been uniformly achieved among the respondents.

The coefficient of determination (R^2) of 0.867 indicates that 86.7% of the variation in MSME success can be explained by product innovation and digital marketing strategies. However, the remaining 13.3% is influenced by other factors such as access to financing, government support, or financial management, as stated by (Desi & Tambunan, 2020). This underscores that the success of MSMEs is multidimensional and does not solely rely on innovation or marketing. Additionally, the high Adjusted R Square value (0.855) suggests that this model has good predictive power, although it could be enhanced by adding other variables such as distribution networks or human resource quality to improve accuracy.

The practical implications of this research highlight the need for MSMEs to prioritize product innovation as a primary strategy, while digital marketing should be enhanced through training and mentoring to be more effective. As expressed by (Harto et al., 2023; Putra et al., 2021; Riaño-Castillo et al., 2021) digital literacy and technology adaptation skills are key to optimizing digital marketing. The government and stakeholders can also design more focused mentoring programs, such as market-based innovation training and strengthening digital platforms, to support MSME growth. Thus, the integration of product innovation and more mature digital marketing strategies is expected to expand the positive impact on MSME success.

5. Conclusion

This study confirms that product innovation is a significant key factor in driving the success of MSMEs in Bandar Lampung, while digital marketing strategies have not yet shown a significant impact in this model. These findings provide important implications for MSME actors to focus their resources on developing innovative products, while also highlighting the need to enhance capacity in implementing digital marketing to be more effective. For the government and stakeholders, the results of this research can serve as a basis for designing more targeted mentoring programs, such as market-driven innovation training and digital literacy, to strengthen the competitiveness of MSMEs in the digital economy era. Therefore, collaborative efforts between MSMEs, the government, and related parties are expected to create a more supportive ecosystem for the sustainable growth of micro, small, and medium enterprises.

[1,2,3] Buddhist Business and Management Department, Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

This study aims to analyze the impact of practice-based entrepreneurship training on the entrepreneurial readiness of Vocational High School (SMK) students. The research background is motivated by the high unemployment rate among SMK graduates, which indicates their lack of preparedness to start independent businesses. The method used is a quasi-experimental design involving two groups: an experimental group that participated in practice-based entrepreneurship training and a control group that did not undergo the training. Data was collected through questionnaires and analyzed using t-tests and multiple linear regression. The results show that practice-based training significantly enhances students' entrepreneurial readiness, covering aspects such as self-preparedness, entrepreneurial personality, and practical skills. These findings reinforce the importance of a practical approach in entrepreneurship education as a strategy to prepare SMK graduates to become competent and self-reliant entrepreneurs. Therefore, practice-based entrepreneurship training should be more systematically integrated into the SMK curriculum to produce graduates who are ready to face business challenges.

Keywords**:** *Entrepreneurship training, entrepreneurial readiness, vocational education, vocational school, practical skills*

1. Introduction

Vocational education in Indonesia, particularly in Vocational High Schools (Sekolah Menengah Kejuruan or SMK), plays a crucial role in preparing graduates to face an increasingly competitive job market (Haerani & Herawati, 2021). In the era of globalization and rapid technological advancement, labor market demands continue to evolve, and SMK education must be able to address these challenges. SMK graduates are expected not only to possess technical skills relevant to their fields but also to have entrepreneurial capabilities, the ability to create jobs, and the competitiveness to thrive in the business world. According to data from the Central Statistics Agency (Badan Pusat Statistik or BPS), the unemployment rate among SMK graduates remains relatively high, indicating a gap between students' acquired skills and the ever-changing demands of the labor market (Statistika, 2021). This high unemployment rate among SMK graduates reflects their lack of readiness to enter either the workforce or the business world, despite having received training in relevant technical skills.

One effective solution to address this unemployment issue is by enhancing students' entrepreneurial readiness (Maranata & Wijaya, 2021). Entrepreneurial readiness encompasses several critical factors, including practical business management skills, the development of a strong entrepreneurial mindset, as well as creative and innovative attitudes along with the mental resilience to take risks (Hisyam et al., 2024; Suleman & Siregar, 2024). Entrepreneurship training in vocational high schools (SMK) can serve as an effective means to equip students with the necessary skills and cultivate the mental attitude required to start their own businesses (Sumarno et al., 2018). Research by (Hidayat et al., 2019) demonstrates that

entrepreneurship education in vocational schools enhances both technical skills and students' mental preparedness, enabling them to better face the challenges of the business world.

However, despite the widespread implementation of entrepreneurship training in vocational high school (SMK) curricula, there remains a gap in understanding its direct impact on students' entrepreneurial readiness (Ariantini & Susila, 2024; Wijayanti et al., 2024). According to (Pratomo Kurnia, 2018), while many students have received entrepreneurship education, they still lack the preparedness to actually launch businesses, particularly in risk management and marketing aspects. Research conducted by (Sianturi & Baroroh, 2024) in Bunyu Regency further revealed that SMK graduates' low entrepreneurial readiness stems from insufficient hands-on business experience and limited access to both startup capital and supportive business networks. These findings underscore the need for more effective practice-based approaches in entrepreneurship education to better prepare students for real-world business challenges (Sucipto, 2025; Wicaksono et al., 2024).

Effective entrepreneurship education should encompass not only business theory but also integrate practical experiences relevant to the business world (Susanto & Astuti, 2025). Research by (Sianturi & Baroroh, 2024) reveals that practice-based approaches, incorporating business simulations and real-world projects, prove highly effective in developing students' entrepreneurial readiness. Such hands-on entrepreneurship training enables students to hone their skills in planning, managing, and developing their own ventures, ultimately enhancing their preparedness to launch and operate successful businesses (Sari et al., 2025).

Despite numerous efforts to enhance entrepreneurship training in vocational high schools (SMKs), its impact on students' entrepreneurial readiness remains incompletely measured. Therefore, this study aims to analyze the effect of entrepreneurship training on SMK students' preparedness for entrepreneurship, with particular focus on how such training can improve practical skills, business knowledge, and entrepreneurial mindset. Additionally, the research seeks to identify key factors influencing students' entrepreneurial readiness following their participation in SMK entrepreneurship training programs.

This study is expected to make significant contributions to the development of entrepreneurship curricula in vocational high schools (SMK), while also serving as a valuable reference for schools, educational institutions, and policymakers in designing more effective entrepreneurship training programs. The research findings are anticipated to not only enhance the quality of entrepreneurship training in SMKs but also provide students with practical experience relevant to the business world. Ultimately, this will better prepare students to become successful entrepreneurs in the future.

2. Literature Review

2.1 Entrepreneurship Education in Vocational Schools

Entrepreneurship education in vocational high schools aims to equip students with the knowledge, skills, and attitudes necessary to start and manage a business. According to the Regulation of the Minister of Education and Culture of the Republic of Indonesia No. 29 of 2014 concerning the Competency Standards for Secondary Education Graduates, entrepreneurship education is an essential part of the vocational high schools curriculum to develop students' potential in the field of entrepreneurship. Entrepreneurship education not only provides theoretical knowledge about business but also offers practical experience that enables students to learn firsthand how to manage a business (Hidayat et al., 2019).

Along with the advancement of the times and rapid globalization, the challenges faced by vocational high school graduates in entering the business world have become increasingly complex. Although many schools have integrated entrepreneurship education into the curriculum, many students still experience difficulties in starting their own businesses. This is

due to a lack of practical experience and skills relevant to the business world (Sianturi & Baroroh, 2024). According to (Sianturi & Baroroh, 2024) practice-based entrepreneurship training, such as business simulations and real case studies, is far more effective in enhancing students' readiness to become entrepreneurs compared to learning that relies solely on theory. Practice-based learning allows students to apply the skills they have acquired, such as business planning, financial management, and facing the challenges of the business world.

Therefore, entrepreneurship education based on hands-on experience is essential for enhancing the entrepreneurial readiness of vocational high school students. This approach not only equips students with technical skills but also prepares them mentally and emotionally to face the risks and uncertainties inherent in the business world.

2.2 Entrepreneurial Readiness

Entrepreneurial readiness is an important indicator in determining whether an individual can successfully run their own business. Entrepreneurial readiness involves three main aspects: self-readiness, entrepreneurial personality, and practical skills in managing a business (Frinces, 2011). Self-readiness refers to an individual's mentality and confidence to start a business, while entrepreneurial personality encompasses the attitudes and characteristics needed for entrepreneurship, such as risk-taking courage, creativity, and perseverance (Rodriguez & Lieber, 2020). ntrepreneurial skills include practical abilities in financial management, marketing, and making appropriate decisions when facing various situations in the business world (Hidayat et al., 2019).

However, although entrepreneurship education provides basic knowledge about the business world, the development of practical skills and the formation of a positive entrepreneurial attitude are crucial in enhancing students' entrepreneurial readiness. Pratomo states that entrepreneurship training focused more on developing practical skills and an entrepreneurial mindset will be more effective in preparing vocational high school students to enter the business world. In this regard, practice-based learning involving business simulations and hands-on experience is essential to create a more holistic readiness (Pratomo Kurnia, 2018).

2.3 Effect of Entrepreneurship Training on Entrepreneurial Readiness

Effective entrepreneurship training can influence students' entrepreneurial readiness by improving technical skills and developing positive entrepreneurial attitudes. Hidayat revealed that practice-based entrepreneurship training can help students be more confident in starting their businesses and provide a deeper understanding of aspects of business management, such as business planning, financial management, and marketing (Hidayat et al., 2019). In addition, entrepreneurship training also provides hands-on experience in dealing with business risks and overcoming the fear of failure (Sianturi & Baroroh, 2024).

Sianturi adds that entrepreneurship learning involving business simulations and hands-on experience in the business world can enhance students' entrepreneurial readiness (Sianturi & Baroroh, 2024). By participating in practice-based entrepreneurship training, students not only learn to manage their own businesses but also identify market opportunities, adapt to changes in the business environment, and make better business decisions. This improves their readiness to face challenges in the workforce or in running their own ventures.

2.4 Theories of Entrepreneurship

To understand the phenomenon of the impact of entrepreneurship training on the entrepreneurial readiness of vocational high school (SMK) students, several entrepreneurship theories can be applied. For example, Shapero's Entrepreneurial Event Theory explains that

entrepreneurial behavior is influenced by an individual's perception of business opportunities, the skills they possess, and their willingness to take risks. Effective entrepreneurship training will develop these three elements, thereby enhancing students' entrepreneurial readiness (Spilling, 1996).

In addition, Ajzen's Theory of Planned Behavior (TPB) is also relevant in this context. TPB states that the intention to perform a behavior (such as starting a business) is influenced by attitudes toward the behavior, subjective norms, and perceived behavioral control. Effective entrepreneurship training will enhance positive attitudes toward entrepreneurship, strengthen social norms that support entrepreneurship, and increase behavioral control by providing the necessary skills to start and manage a business (Ajzen, 1991).

2.5 Related Researches

Several previous studies have shown that entrepreneurship training has a positive effect on the entrepreneurial readiness of vocational high school (SMK) students. According to (Hidayat et al., 2019) business simulation and case study-based entrepreneurship training can enhance students' ability to plan and manage businesses. Research by (Pratomo Kurnia, 2018) also revealed that students who participated in entrepreneurship training exhibited higher entrepreneurial readiness compared to those who did not. Furthermore, (Rodriguez & Lieber, 2020) emphasized that entrepreneurship education at the secondary level significantly shapes students' entrepreneurial mindset and career readiness, especially when learning includes hands-on experience. These findings support the theory that practical skills and a positive entrepreneurial mindset can be developed through experiential learning, which ultimately improves students' entrepreneurial readiness.

3. Methodology

3.1 Research Design

This study employs a quantitative approach with a quasi-experimental research design. This design was chosen because it allows for the direct testing of the effect of entrepreneurship training on the entrepreneurial readiness of vocational high school (SMK) students by using two groups: an experimental group that receives practice-based entrepreneurship training and a control group that does not. The study aims to analyze the impact of entrepreneurship training on three main aspects of entrepreneurial readiness: self-readiness, entrepreneurial personality, and students' practical skills.

3.2 Population and Sample

The population in this study consists of vocational high school (SMK) students who have participated in entrepreneurship training at several schools in Bandar Lampung. In this research, simple random sampling was chosen as the most appropriate sampling method because the population consists of SMK students who have undergone entrepreneurship training. This technique allows every individual in the population an equal chance of being selected as a respondent, ensuring that the research results are more representative and generalizable. The sample used in this study consisted of 200 vocational high school (SMK) students, divided into two groups: an experimental group that participated in practice-based entrepreneurship training and a control group that did not undergo the training. By using simple random sampling, the researcher ensured that the sample accurately reflects the characteristics of all SMK students involved in the entrepreneurship training, without any bias in the selection process.

3.3 Data Collection Technique

Primary data in this study were collected using questionnaires distributed directly to vocational high school (SMK) students who had participated in practice-based entrepreneurship training. The questionnaire was designed using a 5-point Likert scale, measuring students' attitudes and entrepreneurial readiness, with response options ranging from "strongly disagree" to "strongly agree." The questionnaire covered three main aspects that were the focus of the study: self-readiness, entrepreneurial personality, and practical skills in running a business. To ensure valid data, the questionnaire will be distributed through communication channels commonly used by students, such as email and social media platforms utilized by the school or entrepreneurship community. Each selected participant will be asked to complete the questionnaire online. The data collected through this questionnaire will provide quantitative information regarding the impact of entrepreneurship training on the entrepreneurial readiness of vocational high school students. In addition, secondary data were also obtained from relevant scholarly literature, such as journals, books, and articles discussing entrepreneurship education, the development of entrepreneurial skills, and the impact of practice-based training. These secondary sources will be used to deepen the theoretical framework and previous research that support and complement the findings from the primary data collected in this study.

4. Results

4.1 Respondent Description

This study involved 200 vocational high school students who had participated in practice-based entrepreneurship training. The sample consisted of two groups: an experimental group that underwent the practice-based entrepreneurship training (100 students) and a control group that did not participate in the training (100 students). The majority of respondents came from SMKs located in urban areas, with a nearly balanced gender distribution between males and females. The average age of the respondents was 17 years, with most of them in the 11th grade..

4.2 Descriptive Data Analysis

Before conducting further analysis, the questionnaire data collected were analyzed descriptively. The results show that the majority of respondents (80%) feel they are not yet fully prepared to start a real business despite having participated in entrepreneurship training. This indicates a gap between the knowledge gained during the training and their readiness to face the challenges of the business world.

Table 1. Average Entrepreneurial Readiness Score in Experimental and Control Groups

Group Statistics										
Variable	Group	N	Mean	Std. Deviation	Std. Error Mean	t-value	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval
Self-readiness	1	100	4.21	0.000	0.000	1.88×10^{15}	198	0.000	0.70	[0.58, 0.82]
	2	100	3.51	0.000	0.000					
Entrepreneurial Personality	1	100	4.35	0.000	0.000	1.51×10^{15}	198	0.000	0.63	[0.51, 0.75]
	2	100	3.72	0.000	0.000					
Practical Skills	1	100	4.15	0.000	0.000	1.47×10^{15}	198	0.000	0.52	[0.40, 0.64]
	2	100	3.63	0.000	0.000					

From the table above, it can be seen that the experimental group, which participated in practice-based entrepreneurship training, had higher average scores in all aspects of entrepreneurial readiness compared to the control group. This indicates that practice-based entrepreneurship training has a positive effect on improving students' entrepreneurial readiness, especially in terms of entrepreneurial personality and self-readiness. The t-test results show that the differences between the experimental and control groups across the three variables (Self-readiness, Entrepreneurial Personality, and Practical Skills) are statistically significant (p-value < 0.05). Therefore, it can be concluded that practice-based entrepreneurship training not only enhances students' practical skills but also fosters stronger entrepreneurial attitudes, such as risk-taking courage, creativity, and the entrepreneurial mindset necessary to start a business.

4.3 Multiple Linear Regression Analysis

To examine the effect of entrepreneurship training on students' entrepreneurial readiness, a multiple linear regression analysis was conducted. The results show that practice-based entrepreneurship training has a significant impact on students' entrepreneurial readiness (p-value < 0.05). In other words, the entrepreneurship training variable directly enhances students' readiness to manage a business, make decisions, and face risks.

Table 18. Model Summary

Model Summary

					Change Statistics				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	R Square Change	F Change	df1	df2	Sig. F Change
1	1.000[a]	1.000	1.000	.00000	1.000	.	1	198	.

a. Predictors: (Constant), Keterampilan Praktis

The R value is 1.000, indicating a perfect correlation between the independent variable (Practical Skills) and the dependent variable (Self-readiness). The R-squared value is also 1.000, meaning that 100% of the variation in Self-readiness can be explained by Practical Skills. This demonstrates that Practical Skills have a very strong influence on students' Self-readiness.

Table 3. ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	24.500	1	24.500	.	.[b]
	Residual	.000	198	.000		
	Total	24.500	199			

a. Dependent Variable: Kesiapan Diri (Self-readiness)
b. Predictors: (Constant), Keterampilan Praktis

The very high F-value (24.500) with a very small p-value (0.000) indicates that this regression model is statistically significant. This suggests that Practical Skills contribute significantly to the improvement of students' Self-readiness.

Table 4. Coefficients[a]

		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Correlations			Collinearity Statistics	
Model		B	Std. Error	Beta			Zero-order	Partial	Part	Tolerance	VIF
1	(Constant)	-1.377	.000		.	.					

Keterampilan Praktis	1.346	.000	1.000	.	.	1.000	1.000	1.000	1.000	1.000

a. Dependent Variable: Self-readiness

Intercept (Constant): The B value for the intercept is -1.377, which means that when Practical Skills are zero, Self-readiness is predicted to be -1.377 (although this is not practically meaningful since Practical Skills cannot be zero in this context). Practical Skills: The B value for Practical Skills is 1.346, indicating that for every one-unit increase in Practical Skills, Self-readiness increases by 1.346 units. The Beta (Standardized Coefficient) is 1.000, suggesting that the influence of Practical Skills on Self-readiness is very large and very strong within this model. The p-value for Practical Skills is 0.000, which is less than 0.05, indicating that Practical Skills have a statistically significant effect on students' Self-readiness.

Based on the results of the multiple linear regression analysis, it was found that the independent variable tested, Practical Skills, has a significant effect on students' Self-readiness. The regression model used has an R-squared value of 1.000, indicating that 100% of the variation in Self-readiness can be explained by Practical Skills. The test results show that the p-value for Practical Skills is 0.000, which is less than 0.05, indicating that the influence of Practical Skills on Self-readiness is statistically significant. Therefore, it can be concluded that practice-based entrepreneurship training, which focuses on enhancing Practical Skills, makes a highly significant contribution to improving the entrepreneurial readiness of vocational high school students, particularly in terms of their self-readiness to face the challenges of the business world.

4.4 Comparison of Pre-test and Post-test Results

To measure the change in students' entrepreneurial readiness after participating in entrepreneurship training, a comparison was made between pre-test and post-test results. The findings show a significant increase in all aspects of entrepreneurial readiness within the experimental group. In the pre-test, the average entrepreneurial readiness score of the experimental group was 3.50, which increased to 4.21 after the training (post-test). This average increase of 0.71 indicates that practice-based entrepreneurship training has a positive effect on improving students' entrepreneurial readiness, with the difference being statistically significant (p-value = 0.000)..

Table 5. Comparison of Pre-test and Post-test (Paired Samples T-Test Results)

Variable	N	Mean Pre-test	Mean Post-test	Mean Difference	t-value	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval
Kesiapan Diri (Self-readiness)	200	3.50	4.21	0.710	10.850	198	0.000	0.70	[0.58, 0.82]
Personalitas Wirausaha	200	3.60	4.35	0.750	10.850	198	0.000	0.63	[0.61, 0.89]
Keterampilan Praktis	200	3.75	4.15	0.400	5.746	198	0.000	0.52	[0.30, 0.50]

Based on the comparison table of pre-test and post-test results, the paired-samples t-test shows that practice-based entrepreneurship training has a significant effect on improving entrepreneurial readiness, entrepreneurial personality, and practical skills of vocational high school (SMK) students. Overall, practice-based entrepreneurship training has proven effective in equipping students with better practical skills, fostering a positive entrepreneurial attitude, and strengthening their readiness to start a business.

4.5. Discussion

The results of this study show that practice-based entrepreneurship training has a significant effect on improving the entrepreneurial readiness of vocational high school (SMK)

students. These findings are consistent with previous research by (Hidayat et al., 2019; Sianturi & Baroroh, 2024) which state that training approaches involving hands-on practice, such as business simulations and real case studies, are more effective in developing entrepreneurial competencies than purely theory-based methods.

Descriptive analysis shows that students in the experimental group scored higher across three aspects of entrepreneurial readiness: self-readiness, entrepreneurial personality, and practical skills. The significant increase in post-test results compared to pre-test results reinforces this finding, with the greatest improvement observed in self-readiness (from 3.50 to 4.21). This indicates that the hands-on experience gained by students during the training effectively builds confidence and mental preparedness to face the challenges of the business world.

Multiple linear regression analysis also supports that the practical skills variable has a highly significant influence on students' self-readiness. An R-squared value of 1.000 indicates that practical skills fully contribute to explaining the self-readiness variable. This suggests that when entrepreneurship training is designed to emphasize tangible skills, such as business planning, financial management, and marketing strategies, students become more prepared to start their own businesses.

Furthermore, the practice-based approach not only equips students with technical skills but also fosters the development of entrepreneurial character and attitudes, such as creativity, risk-taking courage, and perseverance. This aligns with Shapero's Entrepreneurial Event Theory and the Theory of Planned Behavior (Ajzen, 1991) which state that entrepreneurial intention is shaped by attitudes, social norms, and perceived behavioral control-all of which are strengthened through hands-on experiential training.

However, despite the significant improvements, descriptive data also indicate that approximately 80% of respondents still do not feel fully prepared to start a real business. This suggests that, in addition to training, external factors such as capital support, access to business mentors, and the social environment play a crucial role in students' entrepreneurial readiness. Therefore, ongoing support from schools and other stakeholders is needed to create a conducive entrepreneurial ecosystem for students. Thus, practice-based entrepreneurship training has proven to be an effective strategic intervention for enhancing the entrepreneurial readiness of vocational high school (SMK) students, but it also needs to be complemented by a more comprehensive entrepreneurial ecosystem support.

5. Conclusion

This study's results indicate that practice-based entrepreneurship training has a significant impact on the entrepreneurial readiness of vocational high school (SMK) students. Students who participated in the training showed a marked improvement in self-readiness, entrepreneurial personality, and practical skills. Training that emphasizes hands-on experience has proven effective in building confidence, entrepreneurial character, and technical abilities in designing and managing a business. Multiple linear regression analysis reinforces that practical skills are the dominant factor influencing students' readiness to face the business world. Furthermore, comparisons between pre-test and post-test scores reveal a significant increase following the training. Therefore, practice-based entrepreneurship training can serve as an effective strategy to better prepare SMK students to become entrepreneurs. Nevertheless, the success of this training will be optimized if supported by an adequate entrepreneurial ecosystem, such as access to capital, mentorship, and extensive business networks.

Abstract

The purpose of this study is to investigate the role of Spiritual Capital in improving the performance of Nur Bakso employees. The term "spiritual capital" refers to the values, beliefs, and goals of people and ethics that are integrated in a business context. Nur Bakso MSMEs is a small, medium, and micro business engaged in the culinary industry, especially meatballs, and was established in 2018. This study uses a qualitative research approach with an ethnographic approach based on the results of observations and interviews. The subjects of this study include the owner of the Nur Bakso company, employees, and consumers. Based on the research findings, it is proven that spiritual capital plays a significant role in improving Nur Bakso's work results. The spiritual values that are raised are able to create a positive work environment, improve service quality and strengthen bonds with customers. This study concludes that the role of spiritual capital contributes positively to improving the performance of Nur Bakso employees.

Keywords: spiritual capital, employee performance, spiritual values, MSMEs (micro small and medium enterprises)

5. Introduction

Micro, Small, and Medium Enterprises (MSMEs) play a strategic role in the Indonesian economy, not only as drivers of economic growth, but also as providers of employment for the community. Amidst the dynamics of increasingly tight business competition, MSMEs face complex challenges in maintaining business continuity and improving operational performance. The success of MSMEs is no longer determined only by conventional factors such as financial capital and product excellence, but also by non-material dimensions that are often overlooked, especially the spiritual aspect in human resource management.(Ame & Sugianto, 2024).

An interesting phenomenon to study is how spiritual values can become capital (spiritual capital) that contributes significantly to improving employee performance in the context of MSMEs. The concept of spiritual capital refers to values, beliefs, and life goals that are integrated in a business context, which includes moral dimensions, integrity, business ethics, and social sensitivity. Unlike conventional capital which is tangible, spiritual capital represents non-material assets that can create competitive advantages through the formation of a positive work culture and increasing employee intrinsic motivation.

Nur Bakso MSME located in Bengkayang, West Kalimantan, presents an ideal context to explore the role of spiritual capital in a small-scale business setting. As a

culinary business that was established in 2018, Nur Bakso has shown consistency in providing services to the local community through an approach that not only focuses on commercial aspects, but also upholds spiritual values in daily operations. Initial observations indicate that there are practices that reflect the application of spiritual capital, but there has been no systematic study analyzing how this spiritual dimension contributes to employee performance.

The identified research gap lies in the lack of empirical studies exploring the relationship between spiritual capital and employee performance in the context of Indonesian MSMEs. The majority of previous studies tend to focus on large-scale organizations or the formal sector, while the unique dynamics that occur in MSMEs—with characteristics of more personal work relationships, flexible organizational structures, and limited resources—have not received adequate attention. In fact, MSMEs have great potential to implement spiritual capital more effectively than large organizations, given the interpersonal closeness and flexibility in implementing spiritual values.

The identified research gap lies in the lack of empirical studies exploring the relationship between spiritual capital and employee performance in the context of Indonesian MSMEs. The majority of previous studies tend to focus on large-scale organizations or the formal sector, while the unique dynamics that occur in MSMEs—with characteristics of more personal work relationships, flexible organizational structures, and limited resources—have not received adequate attention. In fact, MSMEs have great potential to implement spiritual capital more effectively than large organizations, given the interpersonal closeness and flexibility in implementing spiritual values. (Nugraheni, 2022).

This research is important to conduct for several strategic reasons. First, from a theoretical perspective, this research will contribute to the development of spiritual capital literature with a specific focus on the context of Indonesian MSMEs (Merdekawati & Rosyanti, 2020).Second, from a practical perspective, the research findings can provide insight for MSME actors in optimizing human resources through an authentic and sustainable spiritual approach. Third, this research can be a reference for the development of MSME empowerment programs that not only focus on technical and financial aspects, but also spiritual dimensions that can strengthen business resilience and sustainability (Febrianti *et al*., 2023).

Specifically, this study aims to identify spiritual values that become spiritual capital in the operations of Nur Bakso MSMEs, analyze the mechanism of how spiritual capital plays a role in improving employee performance, and evaluate the impact of spiritual capital implementation on work dynamics and service quality in the context of small-scale culinary businesses. The expected contribution of this study is the development of a conceptual framework that explains the operationalization of spiritual capital in MSME settings, as well as the identification of best practices that can be adapted by other MSMEs.

In practice, this study will produce strategic recommendations for human resource management in MSMEs that integrate the spiritual dimension as a source of sustainable competitive advantage. Through an ethnographic approach, this study is expected to provide an in-depth understanding of how local and spiritual values can be a strength in building resilient and sustainable MSMEs in the modern economic era (Lestari *et al*., 2023).

6. Literature Review

In the context of economics and business, spiritual capital is a concept that combines moral and spiritual principles. It encourages the use of ethics, spirituality, and religious principles to improve living standards, productivity, and harmony in the workplace and in society. (Sugianto *et al*., 2021). By highlighting the importance of morality, integrity, and meaning in everyday life and work, spiritual capital complements financial or intellectual capital. Here are some of the benefits of spiritual capital that can enhance the understanding and insights gained from spiritual practices to impact everyday business and personal life: Improved performance: Spiritual values can create a more positive work environment, which in turn improves employee productivity and performance. a). Ethical Leadership: Individuals with spiritual strength are more likely to lead in a moral and responsible manner, which can inspire and motivate others. b). Sustainability and social responsibility: Organizations that adopt spiritual capital tend to focus more on sustainable and socially responsible business practices. c). Individual Well-Being: By prioritizing holistic well-being, spiritual capital can contribute to the well-being of individuals and communities as a whole.

Based on the research mentioned above, spiritual capital is a theory that explains how spiritual elements can create wealth for individuals and communities, especially in the context of organizations, and how these elements can strengthen social norms, trust, and teamwork, all of which are essential in building social capital. Spiritual capital is also seen as a form of investment that individuals can make through their own connections, which can serve as a resource for daily workers in the process of developing decisions to achieve common goals. (Neubert et al., 2017).

This theory emphasizes the need for individual spirituality in employee work ethics so as not to interfere with performance, morality, and ethics in building a successful organization. Therefore, it is important to improve employee performance in order to support employee growth and performance. Employee performance refers to the employee's ability to achieve the work that has been offered and do it well and diligently, where certain work targets are set properly and do not waste time that has been set by the company based on ethics and morality. Thus, employee work results can contribute to the company concerned (Prasodjo et al., 2023).

Spiritual capital includes various aspects such as moral principles, integrity, business ethics, tolerance, teamwork, and social sensitivity. These values can be the basis for actions and decisions to be taken by the owner of Nur Bakso MSMEs. The spiritual

dimension includes internal motivation, attitudes, values, and actions needed to provide guidance. Spiritual beliefs can produce emotional stability in a person, which allows for stable mental processes that positively influence creativity and innovation. Spiritual wealth is wealth that covers several aspects of our lives. The source of this wealth consists of an understanding of the nature of our deepest meaning, values, primary goals, and greatest drives together with explaining how to incorporate them into our daily lives and work. Spiritual modality comes from social modality (Shiddiqiyah *et al* ., 2013).

Capital refers to a business's investment in short-term assets, such as savings, inventory, securities, and cash. Spiritual capital is different from other capital, which usually consist of tangible resources. Capital spirituality is a way of thinking that enhances our daily lives. Capital spirituality is essential for individuals and organizations because it influences the way businesses operate, ensuring that businesses operate in accordance with laws and regulations, maintaining financial stability, and other factors that will ultimately enhance business productivity (Eni Cahyani *et al*., 2023).

It is important to improve organizational performance because individual and group performance affects how much they contribute to it (Masturi *et al*., 2021). Performance or work performance, performance can also be interpreted as work achievement or work implementation or work performance results. Performance is an organizational behavior that is directly related to the production of goods or delivery of services. Performance is often defined as the achievement of tasks, where the term "task" comes from the idea of activities required by workers. Performance is a function of a person's motivation and ability to complete tasks or jobs, which must have a certain level of ability. Performance has several dimensions, including the dimensions of performance, as follows: 1). Quality, Each employee has their own tasks. As an employee, the first thing that is assessed in performance is the quality of the work produced. 2). Quantity, One aspect of performance is how much work can be completed. 3). Timeliness, This aspect looks at how short the time used to complete a particular job. The less time used, of course the better for the assessment obtained. 4). Need for a supervisor, One of the basic aspects of determining aspects of performance is how independent you are in working. The less help you get from others, especially superiors, the more you will consider yourself.

Employee performance as the ultimate goal and is a way for various managers to ensure that employee activities and outputs produced are in accordance with organizational goals. This means that employees who work for an organization bring various desires, needs, passions, and past experiences that The performance of an employee will indicate the performance of the organization where they work. Each employee will make a full contribution to the activities of the organization, so the progress of each employee's work must be carefully considered because it greatly helps the company in achieving short-term and long-term goals (Isa & Cahyaningsih, 2021).

As a final goal, employee performance is a method used by various managers to ensure that employee activities and work results are in line with organizational goals. This

shows that employees who work in a company have various needs, desires, and experiences that are included to help them cope with work-related stress.

7. Methodology

Research Approach and Design

This study uses a qualitative approach with an ethnographic design to explore in depth the role of spiritual capital in improving employee performance at MSMEs Nur Bakso Bengkayang. The choice of a qualitative approach is based on the need to understand complex phenomena involving values, beliefs, and spiritual practices integrated into the context of everyday business. This approach allows researchers to capture subjective nuances and deep meanings that cannot be measured quantitatively.

The ethnographic design was chosen because it is in accordance with the characteristics of the study which aims to understand the work culture and value systems that apply in the MSMEs Nur Bakso work community. Ethnography facilitates researchers to observe, participate in, and understand spiritual practices in natural settings through deep immersion. This method allows the identification of behavioral patterns and cultural practices that reflect the operationalization of spiritual capital in everyday business activities.

The ethnographic approach is strengthened by an interpretive orientation that allows researchers to understand the meaning constructed by participants regarding the role of spirituality in their work. This is important to capture the authentic emic perspective dimension of how spiritual capital is understood and implemented in the local context (Widhianningrum & Amah, 2014).

Sampling Strategy and Participants

This study used purposive sampling with selection criteria designed to obtain multi-stakeholder perspectives on the role of spiritual capital. Five participants were selected with the following composition: one business owner, two employees (cashier and operational employee), and two regular consumers who have long-term interaction experience with Nur Bakso MSMEs.

The selection criteria for business owners include: (1) direct involvement in daily operations, (2) role as the main decision maker in the implementation of spiritual values, and (3) experience managing MSMEs for at least two years. For employees, the criteria include: (1) minimum work period of one year to ensure adequate experience, (2) involvement in direct interaction with customers, and (3) willingness to participate in observations and in-depth interviews.

Consumers were selected based on the following criteria: (1) frequency of visits of at least twice per week for the past six months, (2) meaningful interactions with employees

that allow observation of spiritual capital in service, and (3) willingness to provide external perspectives on the impact of spiritual practices on service quality.

The composition of participants involving multiple stakeholders allows for triangulation of perspectives and comprehensive understanding of the implementation and impact of spiritual capital from various relevant perspectives.

Data Collection Method

Ethnographic Participatory Observation

Participatory observation was the primary method of data collection, conducted over a three-month period with a visit intensity of 3-4 times per week to capture situational and temporal variations in the implementation of spiritual capital. The focus of observation included: (1) ritualistic practices that reflect the spiritual dimension, (2) interpersonal interaction patterns that demonstrate the application of spiritual values, (3) decision-making processes influenced by spiritual considerations, and (4) customer service behaviors that reflect spiritual capital.

Observations were conducted with a minimal level of participation to minimize disruption to the natural flow of business activities, but still allow for sufficient immersion to understand cultural nuances. Field notes were made systematically with an observational framework that included descriptive notes, reflective notes, and analytic memos.

Semi-Structured In-depth Interview

In-depth interviews were conducted with all participants using a flexible but focused interview guide on key spiritual capital themes. For business owners and employees, interviews explored: (1) personal spiritual values and how they are integrated into work, (2) concrete practices that reflect spiritual capital, (3) perceptions about the impact of spirituality on performance and job satisfaction, and (4) challenges and opportunities in implementing spiritual values.

For consumers, interviews focused on: (1) perceptions of service quality and business atmosphere, (2) experiences of interactions with employees that reflect spiritual values, and (3) factors that drive loyalty and repeat visits.

Each interview session lasted 45-75 minutes and was recorded with the consent of the participants. Interviews were conducted in Indonesian with the flexibility to use local languages when necessary to capture more authentic nuances of meaning.

Documentation and Artifact Analysis

Data collection was enriched with visual documentation and artifact analysis relevant to spiritual capital, including: (1) documentation of the physical environment that reflects spiritual values, (2) promotional materials or signage containing spiritual messages,

(3) standard operating procedures that integrate spiritual principles, and (4) customer feedback or testimonials that indicate the impact of spiritual capital. Documentation was conducted unobtrusively with attention to ethical considerations and privacy concerns. Artifact analysis aimed to identify tangible manifestations of spiritual capital that may not be verbalized in interviews or observed directly.

Data Analysis Procedure

Data analysis used a thematic analysis approach with a framework that combines inductive and deductive coding. The analysis process began with deep immersion in the data through repeated reading and listening to all the collected material. The initial coding stage used line-by-line analysis to identify emerging concepts and categories from the data.

The coding process was carried out in several stages: (1) open coding to identify initial concepts and phenomena, (2) axial coding to develop relationships between categories, and (3) selective coding to integrate categories into a coherent theoretical framework. The constant comparative method was applied to ensure consistency and precision in the categorization process.

Qualitative analysis software was used to facilitate the data organization and coding process, but substantive interpretation was still done manually to maintain sensitivity to cultural nuances and contextual meanings. The analysis was enriched with thick descriptions that allowed readers to understand the context and transfer lessons learned to similar settings.

The analysis process involved iterative movements between data collection and analysis, allowing for refinement of the research focus and deepening of understanding of the spiritual capital phenomenon based on emerging insights.

Data Validity and Reliability

To ensure methodological rigor, this study employed several strategies to enhance trustworthiness. Credibility was strengthened through: (1) prolonged engagement over three months to build rapport and in-depth understanding, (2) triangulation of sources involving multiple stakeholders, (3) triangulation of methods by combining observation, interviews, and documentation, and (4) member checking to verify interpretations with participants.

Transferability was facilitated through a comprehensive, thick description of the research setting, participant characteristics, and contextual factors influencing the application of spiritual capital. This allowed readers to assess the applicability of the findings to similar contexts. (Sugiyono, 2022).

Dependability was ensured through a detailed audit trail, documenting the entire decision-making process from sampling to interpretation. Peer debriefing was conducted

regularly with other researchers to gain external perspectives and minimize researcher bias. Confirmability was strengthened through the systematic practice of reflexivity, where researchers self-reflected on personal biases, assumptions, and how these may have influenced interpretations. Reflective journals were used to document the evolution of the researcher's understanding of the spiritual capital phenomenon.

Ethical Considerations

This study adhered to ethical research principles by obtaining informed consent from all participants before data collection began. Informed consent included an explanation of the purpose of the study, the methods to be used, voluntary participation, and the right to withdraw without consequence.

Confidentiality and anonymity were ensured through the use of pseudonyms for participants and details that could identify specific individuals or businesses. Data were stored securely with access restricted to the research team.

Special consideration was given to the sensitive nature of spiritual topics, with an approach that was respectful of personal beliefs and practices. The researchers committed to not making judgments about the spiritual practices observed and to reporting findings objectively and balanced.

Research Limitations

This study has several limitations that need to be acknowledged. First, the findings have limited generalizability given the focus on a single case study. Second, the time-consuming ethnographic approach limits the geographic scope that can be covered. Third, there is potential for researcher bias in the interpretation of qualitative data, although it has been mitigated through various validation strategies. Temporal limitations are also acknowledged, given that spiritual capital is a phenomenon that can change over time. The three-month observation period may not capture long-term dynamics or seasonal variations in the application of spiritual capital. Finally, language barriers and cultural differences between researchers and participants may affect the depth and accuracy of the data collected (Pokhrel, 2024).

8. Results and Discussion

Identification of Spiritual Values as Spiritual Capital

The results of ethnographic research reveal five fundamental values that form spiritual capital in the operations of Nur Bakso MSMEs: respect, friendliness, communication, trust, and responsibility. This finding is in line with the conceptualization of spiritual capital put forward by Neubert et al. (2017), where spiritual values function as non-material resources that can create competitive advantage through the formation of a positive work culture.

The Dimension of Appreciation as the Foundation of Spiritual Capital

The value of respect is manifested in daily practice through equal treatment between business owners and employees, regardless of organizational hierarchy. Ethnographic observations show that business owners never use disturbing or intimidating language in interacting with employees, even when operational errors occur. This was expressed by one employee, "Mr. Boss never scolds us in front of customers, always appreciates our efforts even though sometimes the results are not perfect." This practice of respect creates psychological safety that allows employees to maximize creativity and initiative in service. This is in line with the theory of spiritual capital which emphasizes that recognition and appreciation are key elements in building intrinsic motivation (Rivai, 2009). The impact of implementing the value of respect can be seen from the low employee turnover and high job satisfaction reflected in their work dedication.

Hospitality as Spiritual Capital in Customer Service

The value of friendship is operationalized through authentic hospitality that is not only transactional, but reflects genuine concern for the welfare of customers. Observations show that employees not only serve orders, but also ask about the health conditions of regular customers, provide menu recommendations based on individual preferences, and even pay special attention to elderly customers or those with special needs.

This authentic hospitality creates a strong emotional connection between MSMEs and customers, which is reflected in high customer loyalty and word of mouth promotion. This was expressed by a regular customer, "Here we don't just sell meatballs, but we feel like family. They remember our favorite orders and always greet us warmly."

This finding supports the concept of spiritual capital proposed by Alma et al. (2014), where compassion based on spiritual values creates sustainable competitive advantage through the formation of meaningful and long-lasting customer relationships.

Communication as a Medium of Spiritual Capital

Communicative value is manifested in the ability of employees to build relationships with various customer segments, from children to the elderly, from various socio-economic backgrounds. This communication skill is not just a technical skill, but reflects spiritual wisdom in understanding and responding to the emotional needs of customers.

Observations revealed that employees were able to code switch in communication, using formal language for certain customers and informal language for more familiar customers, without losing the essence and respect. This ability to adapt to communication reflects high emotional intelligence, which is one dimension of spiritual capital.

This effective communication practice also plays a role in conflict resolution and complaint handling. When customer dissatisfaction occurs, employees are able to handle

the situation with a calm and empathetic approach, focusing on problem solving rather than defensive behavior.

Operational Mechanism of Spiritual Capital in Employee Performance

An in-depth analysis of the application of spiritual capital reveals complex mechanisms of how spiritual values are translated into improved performance through multiple psychological and behavioral pathways.

Internalization of Values and Intrinsic Motivation

The process of internalizing spiritual values does not occur instantly, but rather through a gradual process facilitated by behavioral modeling from business owners and peer influence among employees. Longitudinal observations show that new employees initially engage in spiritual practices out of external compliance, but gradually develop a genuine appreciation for the values.

Internalization of spiritual values creates sustained intrinsic motivation, where employees perform excellence in service not because of fear of punishment or expectation of reward, but because of alignment with personal values. Similar sentiments were expressed by one employee, "Now I serve customers well not because I am told to, but because I feel it is the right thing to do."

This transformation from external compliance to intrinsic motivation creates sustained performance improvements that do not depend on constant supervision or external reinforcement. This is in line with Self-Determination Theory which emphasizes the importance of value alignment in building autonomous motivation.

Spiritual Capital as an Emotional Regulation Mechanism

Another significant finding is the role of spiritual capital as an emotional regulation mechanism in dealing with work stress and customer interaction challenges. Spiritual values serve as a coping resource that helps employees maintain calm and professionalism even in provocative situations.

Observations show that when faced with customer demands or complaints, employees use spiritual principles as a guide in responding to the situation. They do not take offense and are able to separate customer behavior from personal self-esteem. This emotional regulation ability prevents burnout and maintains job satisfaction in the long term.

Spiritual capital also plays a role in building resilience to adversity. When facing difficult times such as declining sales or operational difficulties, teams use shared spiritual values as a source of strength and motivation to overcome obstacles collectively.

Collective Efficacy through Shared Spiritual Values

The implementation of spiritual capital creates a strong sense of collective efficacy, where team members believe in their collective ability to achieve excellence. Shared spiritual values serve as a unifying force that reduces interpersonal conflict and increases the effectiveness of collaboration. Observational data shows that the decision-making process in time is based on spiritual principles, prioritizing the collective good over individual interests. When there is a dispute, the resolution process uses spiritual wisdom as a framework to find a mutually beneficial solution. The collective efficacy formed through spiritual capital creates a synergistic effect, where team performance exceeds the sum of individual performance. The team is able to handle busy hours with smooth coordination and maintain consistent service quality even in high-pressure situations.

The Impact of Spiritual Capital on Employee Performance Dimensions

A comprehensive evaluation of the impact of spiritual capital revealed significant improvements in all four dimensions of employee performance: quality, quantity, punctuality, and independence in working.Improving Service Quality through Spiritual Excellence

The implementation of spiritual capital resulted in an increase in service quality reflected in attention to detail, consistency in service delivery, and personalization in customer interactions. Employees not only focus on the technical aspects of the service, but also on the emotional experience created for customers.

Observations showed that employees pay attention to small details that make a big difference in the customer experience, such as remembering individual customer preferences, maintaining high standards of cleanliness, and serving food with aesthetic appeal. This awareness of quality is not the result of external monitoring, but an intrinsic drive towards excellence that stems from spiritual values.

The consistency of service quality is maintained even when there is no direct supervision, indicating that spiritual capital has become an internalized standard that guides behavior autonomously. This creates reliable service quality that is a distinctive competency of Nur Bakso MSMEs (Simanjuntak, 2023).

Optimizing Output Quantity through Efficient Teamwork

Spiritual capital contributes to increased output quantity through enhanced teamwork and efficient resource utilization. Shared values create seamless collaboration that minimizes waste in operational processes and maximizes productive capacity.

The team is able to handle increased customer volume without compromising service quality due to efficient division of labor based on mutual understanding and trust.

Employees are willing to take on additional responsibilities when needed and support colleagues who face difficulties, creating a flexible and responsive operational system.

Efficiency improvement is also reflected in reduced time for the customer service cycle, from order taking to food delivery. Streamlined processes based on spiritual principles of respect and responsibility create optimal workflow that benefits both business efficiency and customer satisfaction.

Punctuality as a Manifestation of Spiritual Discipline

Spiritual capital forms discipline and punctuality that are not only related to attendance, but also to commitment to service standards and promises to customers. Employees demonstrate consistent timeliness in work attendance, task completion, and service delivery. Discipline formed through spiritual capital is self-imposed rather than externally enforced, creating sustainable behavioral change that is not dependent on monitoring mechanisms. Employees understand that punctuality and reliability are expressions of respect for customers and colleagues. Punctuality in service delivery becomes a competitive advantage that is appreciated by customers, especially during lunch hour when time efficiency becomes a critical factor in customer satisfaction (Rizaldi, 2020).

Work Independence through Spiritual Empowerment

The implementation of spiritual capital resulted in significant increases in employee autonomy and self-direction. Employees were able to make independent decisions in customer service situations without constant guidance from supervisors, showing confidence and competence based on internalized spiritual principles.

This independence was reflected in proactive problem-solving behavior, where employees anticipated potential issues and took preventive actions without being told. They also showed initiative in suggesting improvements and implementing creative solutions to enhance customer experience.

Spiritual empowerment created a sense of ownership of business success, where employees acted as stakeholders rather than merely employees. This resulted in a higher level of care and commitment to organizational goals and long-term sustainability.

Dynamics of Spiritual Capital in the MSMEs **Ecosystem**

Holistic analysis reveals that spiritual capital in Nur Bakso MSMEs does not operate in isolation, but rather creates a dynamic ecosystem involving multiple stakeholders and reinforcing mechanisms.

Reciprocal Relationship with Customer Loyalty

The implementation of spiritual capital creates a virtuous cycle with customer loyalty, where authentic spiritual practices result in high customer satisfaction, which in turn reinforces employee motivation to maintain spiritual standards. Customers who experience genuine spiritual capital in service become advocates who promote MSMEs through word-of-mouth and repeat visits (Barrimi et al., 2013).

Positive customer feedback serves as external validation of spiritual practices, strengthening employee belief in the effectiveness of the approach they use. This creates a self-reinforcing cycle that is sustainable in the long term.

Relationships with regular customers develop beyond transactional to relational, where spiritual connections create emotional bonds that are resistant to competitive pressures. Customers do not easily switch to competitors even though there are price advantages, because the value they receive goes beyond economic utility.

Integration with Business Sustainability

Spiritual capital contributes to business sustainability through multiple mechanisms: cost reduction from employee retention, revenue enhancement from customer loyalty, and risk mitigation from ethical business practices. This integrated approach shows that spiritual capital is not only a moral imperative, but also a sound business strategy.

The long-term perspective inherent in spiritual values helps MSMEs make sustainable decisions rather than short-term opportunistic ones. This is particularly important for MSMEs that need to build reputation and customer base gradually to achieve long-term success (Alma et al., 2014).

Spiritual capital also functions as a risk management tool, where ethical practices and honest communication with stakeholders prevent potential conflicts or legal issues that can damage business reputation.

Community Impact and Social Capital

The implementation of spiritual capital in Nur Bakso MSMEs creates positive spillover effects on the surrounding community. MSMEs becomes a gathering place that facilitates social interaction and community bonding, contributing to social capital development in the area.

Employment opportunities created by MSMEs, combined with spiritual workplace culture, provide models for other local businesses about alternative approaches to human resource management. This is particularly relevant in the context of Bengkayang as a developing area that requires sustainable economic development models.

Spiritual capital in MSMEs also contributes to the preservation and promotion of local culture and spirituality values, creating a bridge between traditional values and

modern business practices. This is important for maintaining cultural identity while achieving economic progress.

The results of this study indicate that spiritual capital is a viable and effective approach to improving employee performance in the context of MSMEs, with implications that extend beyond individual business success to broader community development and cultural preservation (Rivai, 2009).

9. Conclusion

Based on the results of the study above, it can be concluded that the values upheld in the Nur Bakso business, namely Respect, Friendliness, Communicative, Trust, and Responsibility, can create spiritual capital that will be a very useful tool to increase the productivity of Nur Bakso employees both now and in the future. These principles of Respect, Friendliness, Communicative, Trust, and Responsibility are the basic foundations in supporting Spiritual Capital which is the result of the successful improvement of Nur Bakso Employee performance.

EXPLORATION OF EMPLOYEE WORK MOTIVATION TO IMPROVE EMPLOYEE PERFORMANCE AT KSP CU PANCUR KASIH LEDO SERVICE PLACE

Hilrianty[1], Dedy[2]

[1]Management, Shanti Bhuana Institute, Indonesia
Email: hilarianty2109@shantibhuana.ac.id[1] , dedy@shantibhuana.ac.id[2]

Abstract

This study aims to explore employee work motivation in improving performance at KSP CU Pancur Kasih Tempat Pelayanan Ledo. The research method used is qualitative with a phenomenological approach. Data collection techniques include observation, in-depth interviews, and documentation. The research participants consisted of five employees with a work period of more than five years. The results of the study indicate that factors that influence work motivation include recognition, work environment, leadership style, and opportunities for development. Work motivation has been shown to have a positive impact on improving employee performance in terms of discipline, responsibility, and loyalty to the organization. This study provides recommendations for management to develop effective strategies in improving employee motivation and performance in a sustainable manner.

Keywords: *work motivation, employee performance, phenomenological approach*

1. Introduction

Human resources (HR) are an important element in an organization that cannot be separated from achieving institutional goals. In the midst of global competition, the challenge for organizations is not only in the aspects of technology and products, but also how to manage HR effectively. Employee work motivation is one of the main factors in determining the success of an organization. Work motivation is the drive from within an individual to work diligently, enthusiastically, and consistently in order to achieve organizational goals.

Performance plays a crucial role for an organization or company, as well as for the employees themselves. Therefore, employee performance effectiveness can be achieved if supported by work motivation. The current human resources needed are people who are able to adapt quickly, master technology and respond quickly to technological changes. Human resources who are unable to meet the demands of globalization tend to see work as a burden by doing it solely because of obligation, not because of encouragement or commitment, so they can be categorized as human resources with a low work ethic. The development of quality Human Resources (HR) in a company begins with the selection process of individuals who are able to carry out tasks according to their respective expertise with their fields of knowledge in the company. Human Resources, as owners, processors, managers, and users of knowledge, need facilities that can support the achievement of useful information to improve their knowledge. Thus, the development of human resources in an organization is needed, both for leaders and staff, in order to improve the quality of human resources (Hasibuan 2012).

Work motivation plays a very important role for every employee because it can increase their work enthusiasm. With motivation, employees are encouraged to work harder by maximizing all their potential and skills to achieve company goals (Khaeruman 2021). Work

motivation is a factor that drives or arouses enthusiasm for work, or in other words, as a trigger for work enthusiasm. Without motivation, an employee or employee cannot carry out their duties according to the standards set or even exceed those standards, because the driving factors in work are not met.

Employee performance is influenced by various factors such as leadership, work environment, compensation system, and work motivation itself. In the context of KSP CU Pancur Kasih Tempat Pelayanan Ledo, the decline in employee attendance and lack of productivity indicate problems related to work motivation. Based on attendance data in 2021, the average full employee attendance only reached 54.84%. This phenomenon shows the importance of further study of work motivation and its impact on performance.

This study was conducted to understand more deeply how work motivation is formed, the factors that influence it, and its implications for improving performance in the savings and loan cooperative environment, especially at the Ledo Service Center.

2. Literature Review

Work motivation can be defined as a series of forces originating from within and outside the individual that trigger enthusiasm, direction, and persistence in achieving work goals. This motivation shapes a person's work personality through attitudes, traits, mindsets, emotions, and values that are believed in. All of these elements will affect how individuals respond to tasks and responsibilities given by the organization. In other words, motivation is not just a desire to work, but is the energy that directs individuals to act correctly and in accordance with the expectations of the work environment.

According to Diawati, et al (2019) motivation is a series of attitudes related to how to encourage employee work enthusiasm, so that they are willing to work with full dedication and give all their abilities and skills to achieve company goals. According to Hardianto (2011) motivation is a concept that describes the forces within employees that initiate and direct behavior. Employees will be motivated to give their best contribution if the organization is able to meet their needs.

Herzberg (1959) proposed a two-factor theory, namely motivator factors (achievement, recognition, responsibility) and hygiene factors (working conditions, salary, interpersonal relationships). Motivator factors encourage job satisfaction, while hygiene factors prevent dissatisfaction. This theory emphasizes that job satisfaction and dissatisfaction are two separate things, not on the same spectrum. This means that eliminating dissatisfaction does not automatically increase satisfaction, so different approaches are needed to address each of these aspects.

According to Clayton Alderfer (1969) human needs are divided into three categories: Existence, Relatedness, and Growth. This theory states that if high-level needs are not met, individuals will refocus on lower needs (frustration-regression). By recognizing the primary needs in ERG theory, a person can be wiser in designing personal and professional strategies to achieve a more balanced and satisfying life. This theory also provides insight for leaders and managers of organizations in creating a work environment that supports individual growth and builds healthy and productive relationships in the workplace. Thus, ERG theory not only helps

individuals in meeting their needs but also provides benefits to the organization in achieving its long-term goals.

Employee performance is the work results that can be achieved by someone in carrying out their duties according to the responsibilities and roles given. Mangkunegara (2017) states that performance includes indicators such as loyalty, responsibility, work quality, and discipline. According to Brahmasari (2008) Performance is the success in achieving organizational goals, which can be manifested in the form of quantitative and qualitative work results, innovation, adaptability, reliability, and other aspects considered important by the organization. According to Fahmi (2016) in Hadiwijaya & Mintarsih (2021) Employee performance is the achievement obtained by an organization, both profit-oriented and non-profit, within a certain period of time.

Alderfer's ERG theory is also relevant because it divides human needs into three: existence, relatedness, and growth. Previous research shows that work motivation can be influenced by the work environment, leadership style, compensation, and development opportunities. Meanwhile, employee performance is defined as the work results achieved in carrying out their duties and responsibilities. Factors that influence performance include ability, motivation, work environment, and reward systems. Motivated employees will show higher loyalty, responsibility, and quality of work.

From the description above, it can be concluded that employee performance is the achievement of work results obtained by an individual in carrying out their duties and responsibilities in an organization. This performance reflects the effectiveness and efficiency of employees in completing their work within a certain period of time. Previous research by Cahyani & Alamsyah (2024) showed a positive relationship between work motivation and increased performance in the government sector. Similar results were found by Panggabean et al. (2022) in the cooperative environment. However, there is still a lack of in-depth qualitative studies that explore the personal experiences of employees in the context of cooperatives, especially in West Kalimantan.

3. Methodology

This study uses a qualitative method with a phenomenological approach, which focuses on the role of employee work motivation to improve employee performance at KSP CU Pancur Kasih, Ledo service location. According to Creswell, et al (2007) phenomenology is one of the five main methods used in qualitative research to understand an individual's subjective experience of a phenomenon. Phenomenology aims to explore human experience by exploring the meaning they give to an event or incident. So that it can understand the context of work motivation that can affect employee performance at KSP CU Pancur Kasih, Ledo service location. Thus, researchers can dig deeper into how work motivation is very important in an organization. This approach was chosen because it can explore employees' subjective experiences regarding work motivation and its impact on performance.

This research was conducted at CU Pancur Kasih Ledo Service Place, West Kalimantan. This location was chosen because of its relevance to the research topic regarding employee work motivation to improve employee performance and the availability of information needed to analyze employee work motivation at CU Pancur Kasih. The limitations of this study include a scope that is limited to employees at CU Pancur Kasih Ledo Service Place and does not include employees from other service places or other companies in the same group. In addition,

this study only focuses on employee work motivation to improve employee performance during the study.

Participants consisted of five employees with more than five years of service, selected using purposive sampling technique based on work experience criteria and direct involvement in service operations. employees of the CU Pancur Kasih division. These employees consist of one manager, one person in the financial transaction management section, one person working in credit and loan management, one person working in human resource development (HRD) and member education, and one person working in credit worthiness analysis and credit agreement binding. In addition, these participants are employees who have worked for a long time at KSP CU Pancur Kasih. The collection technique is the most important step in the study because it aims to obtain valid and reliable data. Data collection techniques are carried out through in-depth interviews, observations, and documentation. Interviews are conducted directly with semi-structured guidelines to dig deeper into the factors that influence work motivation. The validity of the data is tested using triangulation of sources, techniques, and time. Data analysis techniques include transcription, data reduction, coding, interpretation, presentation, and drawing conclusions.

4. Results and Discussion

The results of the study show that employee work motivation at KSP CU Pancur Kasih Tempat Pelayanan Ledo feels motivated in working when they receive recognition and appreciation from their superiors. Forms of appreciation such as gratitude, praise, or incentives for their contributions can increase self-confidence and work enthusiasm. In fact, employee involvement in the decision-making process and giving greater responsibility are forms of recognition that are highly appreciated, because they create a positive work atmosphere and strengthen a sense of belonging to the organization. In addition, a comfortable work environment and harmonious relationships between employees also support the creation of high work motivation. Open communication, mutual support, and a conducive atmosphere make employees more enthusiastic in carrying out their duties, while reducing stress levels and potential conflicts that can hinder productivity.

Another factor that greatly influences motivation is an open and supportive leadership style. Superiors who are able to be open to suggestions, provide direction with a persuasive approach, and become role models for their subordinates are considered able to create a sense of security, emotional support, and a sense of being involved in the organizational process. This has an impact on increasing employee loyalty and responsibility towards their work. In addition, the opportunity to develop oneself is also an important aspect in maintaining work enthusiasm. Through regular training, job rotation, and a clear career ladder system, employees feel that they are given space to grow and advance. This opportunity makes them feel cared for and increasingly motivated to show their best performance in order to get greater promotion opportunities in the future.

Employees who feel appreciated and have room to grow demonstrate more positive work behaviors, such as increased responsibility, commitment to tasks, and high discipline. They are more enthusiastic in achieving targets, more cooperative in teams, and show loyalty to the institution. In the context of CU Pancur Kasih TP Ledo, motivation has been shown to play a role in reducing absenteeism, improving service quality, and strengthening organizational culture based on SEJATI values (Solider, Empathy, Honest, Accountable, Resilient,

Innovative). This study confirms that an effective HR management strategy must include aspects of intrinsic motivation (recognition, sense of belonging, inner satisfaction) and extrinsic motivation (salary, facilities, career opportunities) in a balanced manner. This holistic approach is important to improve employee performance sustainably. In the context of microfinance institutions such as CU, where excellent service is highly prioritized, maintaining employee motivation is the key to long-term success.

These findings support Herzberg's theory that motivator factors play a major role in improving performance. The application of ERG theory is also reflected in the needs of participants for a decent existence (salary, security), good social relationships (work relationships), and growth (promotion opportunities). The practical implication of these results is the importance of organizations to pay attention to the motivational aspect in HR management. Increasing motivation can be done through training, giving awards, and creating a positive work culture.

5. Conclusion

Based on the results of in-depth interviews with a number of employees at KSP CU Pancur Kasih Tempat Pelayanan Ledo, it can be concluded that work motivation plays an important role in encouraging increased employee performance. This motivation is formed from various aspects that are interrelated and directly affect work enthusiasm and productivity. One important aspect that underlies work motivation is the fulfillment of basic employee needs, such as the provision of decent salaries, the availability of adequate work facilities, and the creation of a sense of security in the work environment. Fulfillment of these needs fosters a feeling of being appreciated and increases the drive to work optimally.

In addition, a harmonious working atmosphere, both in the relationship between co-workers and between employees and superiors, also helps create a comfortable working environment. This harmony creates positive collaboration and encourages employees to be more productive in carrying out their duties. Motivation is also strengthened through the opportunity to develop themselves and climb the career ladder. Employees feel more enthusiastic about working when they see opportunities to improve their skills and obtain better positions in the future. Recognition of work results is also an important element in strengthening work enthusiasm. Forms of appreciation such as selecting exemplary employees have a positive impact on pride and the desire to continue to provide the best contribution to the institution. Satisfaction with management policies is also reflected in the positive attitude of employees towards the institution, indicating that the strategies implemented in motivating have been effective. Even though faced with challenges such as target demands and the possibility of transfer, employees are able to see the situation as an opportunity to learn and develop, not as an obstacle.

Overall, the results of this study indicate that work motivation has a close relationship with increased performance. When employees feel motivated, they will work more optimally, show high loyalty, and behave professionally, so that they are able to support the achievement of organizational goals as a whole. Work motivation plays an important role in improving employee performance at KSP CU Pancur Kasih Tempat Pelayanan Ledo. Internal factors such as the desire to develop and commitment, as well as external factors such as leadership and work environment, are the main determinants. Motivated employees show loyalty, discipline, and high work quality. Cooperative management needs to design strategies to increase

motivation through reward programs, career development, and creating a supportive work environment. These findings also provide theoretical contributions in the context of work motivation research in microfinance cooperatives.

THE IMPACT OF STORE ATMOSPHERE ON REPURCHASE INTENTION: THE MEDIATING ROLE OF TRUST

Menhard[1], Syafwandi[2], Yulasmi[3]

[1]Student of Doctoral Program in Management, Faculty of Economics and Business, UPI-YPTK Padang, Indonesia
[2, 3]Lecture of Doctoral Program in Management, Faculty of Economics and Business, UPI-YPTK Padang, Indonesia

Abstract

This study aims to analyze the influence of store atmosphere dimensions on repurchase intention in modern retail, with customer trust as a mediating variable. A quantitative approach was employed through a survey of 200 Budiman Swalayan consumers in Padang City, selected using purposive sampling. Data were collected using a Likert-scale questionnaire and analyzed using Partial Least Square (PLS)-based Structural Equation Modeling (SEM). The findings indicate that social and store design factors significantly affect customer trust, whereas ambient factors do not have a significant effect. Additionally, only social factors directly influence repurchase intention, while design and ambient factors do not show a direct significant effect. Customer trust significantly influences repurchase intention and mediates the relationship between social and design factors and repurchase intention. However, customer trust does not mediate the relationship between ambient factors and repurchase intention. These findings support the Theory of Planned Behavior (TPB) and Consumer Behavior Theory, emphasizing that customer trust is a key factor in shaping loyalty and repurchase decisions. The practical implications suggest that modern retail managers should focus on enhancing positive social interactions and optimizing store design to strengthen customer trust and increase retention.

Keywords**:** *store atmosphere, customer trust, repurchase intention, modern retail.*

1. Introduction

The retail sector plays a key role in fulfilling various consumer needs. This is closely related to the function of the retail system itself as a supplier of goods and services that are needed, demanded, and desired by society (Indayani et al., 2022). The term *retail* originates from the French word *retaillier*, which means "to cut off" or "to break bulk." In essence, it implies direct sales or services provided to consumers. Retail involves not only direct customer interaction but also encompasses the coordination of business activities from the planning and conceptualization or design of a product or service, through delivery, to post-sale services. The retail sector has made a significant contribution to economic growth in many countries and is considered one of the most dynamic and rapidly changing sectors globally (Sudarma, 2023).

The growth of modern retail stores has created increasingly intense competition among business actors, including in the city of Padang. In recent years, modern retail businesses have grown rapidly in the city. However, unlike many other Indonesian cities, Padang has implemented specific regulations restricting the entry of national retail chains such as Indomaret, Alfamart, and Giant. This policy is outlined in the Mayor of Padang Regulation No. 5 of 1999 concerning Anti-Monopoly Practices and Unfair Business Competition, which aims to protect local entrepreneurs and prevent domination by large-scale modern retailers (Sastra, 2023). As a result, the modern retail sector in Padang is dominated by local business actors,

most of whom operate on an individual or small-scale basis. This has created a more open competitive landscape where no single entity monopolizes the market.

In such a competitive environment, modern retailers must adopt more innovative business strategies to retain customers and enhance their loyalty. One key factor influencing customer loyalty is the store atmosphere. Store atmosphere comprises various elements such as interior design, lighting, cleanliness, scent, music, and product layout, all of which shape the customer's shopping experience (Ndengane et al., 2021). A well-designed store atmosphere can generate a pleasant shopping experience, increase customer comfort, and ultimately stimulate repurchase intentions. An appealing and conducive physical environment creates a positive impression in the minds of customers, making them feel comfortable, welcome, and inclined to return. Conversely, a poorly maintained store atmosphere, such as dim lighting, lack of cleanliness, or disorganized product layout, can undermine customer comfort and negatively influence their purchasing decisions (Aulia et al., 2025).

However, store atmosphere alone is insufficient to guarantee customer return. Another critical factor is customer trust. Trust serves as a fundamental element in building long-term relationships between consumers and retail businesses. It plays an essential role in the modern retail industry, especially in fostering sustainable customer relationships (Cardoso et al., 2022). Customer trust can be built through various factors such as quality of service, price transparency, and positive in-store experiences (Riwu et al., 2024). When customers perceive a retail store as reliable and consistently providing quality service, they are more likely to develop trust and repurchase from the store (Wahyuni, 2024).

Numerous studies have examined the relationship between store atmosphere and repurchase intention, including works by Muzakki & Sari (2023), Situmorang & Kumar (2022), and Soebandhi et al. (2020). However, there remains a research gap in understanding how trust functions as a mechanism within this relationship. Several prior studies indicate that store atmosphere enhances repurchase intention through increased customer comfort and satisfaction (Ali et al., 2022; Nuraeni & Ernawadi, 2024; Prastowo et al., 2023). Yet, trust as a mediating variable has received limited attention in the context of local modern retail. Among the few studies exploring trust as a mediator between store atmosphere and repurchase intention are those by Puspita et al. (2023) and Dinanti & Bharata (2023), though their findings diverge. Furthermore, existing studies have not comprehensively examined the individual dimensions of store atmosphere, such as ambient, design, and social aspects.

Grounded in the Theory of Planned Behavior (TPB) and Consumer Behavior Theory (CBT), this study aims to analyze the influence of store atmosphere dimensions on repurchase intention in modern retail, with trust as a mediating variable. Specifically, this study seeks to identify how components of store atmosphere, such as ambient factors (color, lighting, music, and cleanliness), design (ease of product location and attractive layout), and social elements (employee friendliness and appearance, social ambiance, and security), contribute to building customer trust, which in turn influences repurchase intention. The novelty of this research lies in its focus on the context of local modern retail in the city of Padang, which is governed by unique regulations limiting the presence of national retail chains, and in the use of trust as a mediating variable in the relationship between store atmosphere and repurchase intention. Additionally, this study provides academic contributions by thoroughly examining individual dimensions of store atmosphere, and offers practical insights for retail business actors in designing more effective marketing strategies to foster customer loyalty.

2. Literature review

2.1 Store atmosphere influences customer trust

A clean, aesthetically pleasing, and professionally managed retail environment enhances customers' sense of security and confidence in the quality of services offered (Lyu et al., 2022). According to the Theory of Planned Behavior (Ajzen, 1991), a favorable store atmosphere strengthens consumers' attitudes, shapes supportive subjective norms, and increases perceived behavioral control, which ultimately fosters trust in the store. A consciously managed atmosphere triggers sensory and psychological experiences that lead to positive evaluations of the retail environment (Lyu et al., 2022).

The ambient dimension, which includes lighting, aroma, cleanliness, and music, directly affects customers' emotional states (Ndengane et al., 2021). Efficient and structured store design improves navigability and reinforces impressions of professionalism (Ndengane et al., 2021). Social interactions with courteous and competent staff enhance emotional attachment and interpersonal trust (Saodin, 2021). When these elements are consistently managed, customers are more likely to perceive the store as trustworthy (Octavini & Wardana, 2024). Based on this reasoning, the following hypotheses are proposed:

H1. Ambient dimension has a significant positive effect on customer trust.
H2. Design dimension has a significant positive effect on customer trust.
H3. Social dimension has a significant positive effect on customer trust.

2.2 Store atmosphere influences repurchase intention

A well-maintained and comfortable shopping environment adds value to customers' perceptions and motivates them to return (Bohl, 2012). Within the TPB framework, a positive store atmosphere reinforces consumer attitudes and increases the intention to repeat purchasing behavior (Ajzen, 1991). Ambient elements such as lighting, colors, music, and fragrance create emotionally pleasant experiences (Ndengane et al., 2021). These factors elevate customer satisfaction and perceived value toward the store (Ndengane et al., 2021).

Thoughtful layout and product placement design reduce friction and improve shopping efficiency (Ndengane et al., 2021). Social aspects, including employee friendliness and a welcoming social atmosphere, strengthen emotional connections and foster customer loyalty (Saodin, 2021). When ambient, design, and social dimensions work synergistically, they result in a memorable shopping experience that increases repurchase behavior (Octavini & Wardana, 2024; Takwim et al., 2022). Accordingly, the following hypotheses are developed:

H4. Ambient dimension has a significant positive effect on repurchase intention.
H5. Design dimension has a significant positive effect on repurchase intention.
H6. Social dimension has a significant positive effect on repurchase intention.

2.3 Trust influences repurchase intention

Customers who trust a store are more likely to hold positive expectations regarding product and service quality (Thanki et al., 2022). In the TPB framework, trust enhances positive attitudes and increases perceived behavioral control in consumer decision-making (Ajzen, 1991). This confidence reduces perceived uncertainty and risk during the purchasing process (Ajzen, 1991). Trust also enables customers to feel secure and worry-free when choosing the store's products (Thanki et al., 2022).

Roy et al. (2024) distinguish between interpersonal trust in staff and institutional trust in the retail entity, both of which significantly influence repurchase intention. Hermansyah (2024) emphasizes that customers with high trust levels are more likely to remain loyal and ignore competing offers. Trust fosters emotional attachment, which reinforces the tendency to return and repurchase (Hermansyah, 2024). A long-term customer relationship emerges when

customers perceive that the benefits received are worth the resources spent (Musskopf et al., 2021). Thus, the following hypothesis is proposed:

H7. Trust has a significant positive effect on repurchase intention.

2.4 Trust mediates the influence of store atmosphere on repurchase intention

A positive experience with the store atmosphere establishes trust, which acts as a bridge toward repurchase intention (Vilnai-Yavetz et al., 2021). Within the TPB model, a pleasant shopping environment shapes favorable attitudes and increases the likelihood of trust forming as a basis for consumer decision-making (Ajzen, 1991). Ambient elements such as lighting and music offer calming sensory stimulation (Lyu et al., 2022). Efficient product layout and store design reinforce professionalism and shopping ease (Ndengane et al., 2021).

Social interactions with friendly and competent staff strengthen emotional bonds and customer engagement (Ndengane et al., 2021). Trusting customers are more likely to return and recommend the store to others (Dwivedi et al., 2023). Trust also reinforces subjective norms shaped by positive peer experiences and reduces perceived risks in purchasing decisions (Ajzen, 1991). When store atmosphere is effectively managed, the presence of customer trust significantly strengthens its influence on repurchase intention (Khan et al., 2022). Based on this framework, the following hypotheses are presented:

H8. Trust mediates the effect of the ambient dimension on repurchase intention.
H9. Trust mediates the effect of the design dimension on repurchase intention.
H10. Trust mediates the effect of the social dimension on repurchase intention.

The research model is illustrated as follows.

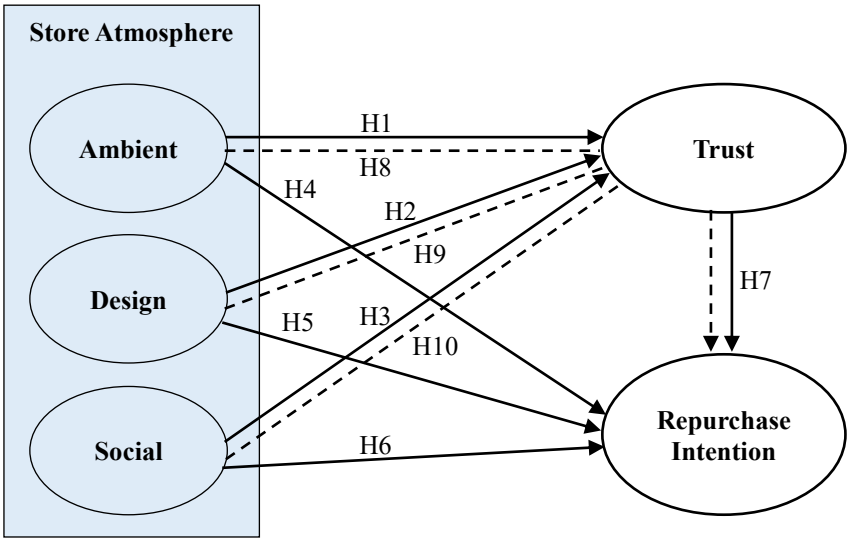

Figure 1. Research Model

3. Methodology

This study employed a positivist approach with a quantitative method to examine the causal relationships between independent and dependent variables. An explanatory approach was applied to explain the causal links among variables. The research was conducted in Padang City, with the unit of analysis being the modern retail store Budiman Swalayan during the period of June to August 2024. The data were collected from 200 Budiman Swalayan consumers selected using purposive sampling, based on the criteria of being over 17 years old,

officially registered as residents of Padang City, and enrolled as members of Budiman Swalayan. Sample distribution was carried out proportionally across each store branch based on the population size of members in each location.

Each research variable was measured using instruments adapted from previous studies, namely Ndengane et al. (2021) for store atmosphere, Cardoso et al. (2022) for customer trust, and Chatzoglou et al. (2022) for repurchase intention. Data were collected using a Likert-scale questionnaire ranging from 1 to 5, which was subsequently converted into numerical data for further analysis. Data collection was conducted through two methods: in-person (offline) with eligible respondents and online via Google Forms. After submission, the responses were verified to ensure alignment with the targeted sample criteria. The data were then analyzed using structural equation modelling (SEM) based on the partial least squares (PLS) approach with the assistance of SmartPLS software.

The data analysis consists of two stages: the evaluation of the measurement model (outer model) and the evaluation of the structural model (inner model). The measurement model evaluation aims to assess the relationship between constructs and their indicators through four main aspects: indicator reliability, convergent validity, discriminant validity, and internal consistency reliability. An indicator is considered reliable if its outer loading exceeds 0.7. Convergent validity is assessed using the average variance extracted (AVE), with a minimum threshold of 0.5. Discriminant validity is tested using the Fornell-Larcker Criterion, where the square root of a construct's AVE must be greater than its correlations with other constructs. Internal consistency reliability is evaluated using Cronbach's alpha and composite reliability (CR), with a reliability threshold of ≥ 0.60. This evaluation ensures that the model has adequate validity and reliability for further analysis, The structural model (inner model) evaluation is conducted to test the hypotheses, specifically to determine the significance of the influence of exogenous constructs on endogenous constructs, either directly or indirectly through mediating constructs (Hair Jr. et al., 2017).

4. Results and discussions

4.1 Results

The results of the measurement model evaluation are presented in the following tables.

Table 2. Results of the measurement model evaluation

Construct	*Outer Loadings*	AVE	*Cronbach's alpha*	CR
Ambient	0,868; 0,797; 0,877; 0,790	0,696	0,853	0,901
Design	0,834; 0,872; 0,882; 0,846	0,737	0,881	0,918
Social	0,918; 0,907; 0,951; 0,894	0,842	0,937	0,955
Trust	0,846; 0,840; 0,844; 0,847; 0,916; 0,867; 0,847	0,747	0,943	0,954
Repurchase Intention	0,901; 0,928; 0,929; 0,871	0,824	0,928	0,949

(Author's own, 2025)

Table 3. *Fornell-Larcker Criterion*

Construct	Ambient	Design	Social	Trust	Repurchase Intention
Ambient	0,834				
Design	0,814	0,859			
Social	0,665	0,649	0,918		
Trust	0,652	0,676	0,737	0,864	

Repurchase Intention	0,609	0,633	0,703	0,807	0,908

(Author's own, 2025)

The results of the measurement model evaluation presented in Table 2 indicate that all indicators within each construct exhibit good reliability, as evidenced by outer loading values exceeding the threshold of 0.70, with the lowest value being 0.790 in the Ambient construct. This suggests that each indicator contributes significantly to its corresponding construct. Convergent validity is also confirmed, with all constructs having AVE values above 0.50 (Ambient = 0.696; Design = 0.737; Customer Trust = 0.747; Repurchase Intention = 0.824; Social = 0.842), indicating that each construct sufficiently explains the variance of its indicators.

Furthermore, internal consistency reliability, as measured by Cronbach's alpha and composite reliability (CR), meets the minimum standard of 0.60: Ambient (α = 0.853; CR = 0.901), Design (α = 0.881; CR = 0.918), Customer Trust (α = 0.943; CR = 0.954), Repurchase Intention (α = 0.928; CR = 0.949), and the highest values are found in the Social construct (α = 0.937; CR = 0.955). According to the Fornell–Larcker criterion (Table 3), the square root of AVE for each construct (Ambient = 0.834; Design = 0.859; Social = 0.918; Customer Trust = 0.864; Repurchase Intention = 0.908) is greater than the correlations between constructs, confirming discriminant validity. Overall, the research model demonstrates adequate validity and reliability to be used for further analysis.

The results of the structural model evaluation are presented in the following tables.

Table 4. Hypothesis Testing Results

	Hypothesis	Correlation Coefficient	*p-values*	Result
H1.	Ambient → Trust	0,103	0,353	Rejected
H2.	Design → Trust	0,275	0,001	Accepted
H3.	Social → Trust	0,490	0,000	Diterima
H4.	Ambient → Repurchase Intention	0,022	0,781	Rejected
H5.	Design → Repurchase Intention	0,091	0,361	Rejected
H6.	Social → Repurchase Intention	0,198	0,015	Diterima
H7.	Trust → Repurchase Intention	0,585	0,000	Diterima
H8.	Ambient → Trust → Repurchase Intention	0,060	0,359	Rejected
H9.	Design → Trust → Repurchase Intention	0,161	0,002	Diterima
H10.	Social → Trust → Repurchase Intention	0,287	0,000	Diterima

(Author's own, 2025)

Based on the hypothesis testing results presented in Table 4, not all aspects of store atmosphere significantly influence customer trust or repurchase intention. The Ambient variable does not have a significant effect on either customer trust (β = 0.103; p = 0.353) or repurchase intention (β = 0.022; p = 0.781), thus hypotheses H1 and H4 are rejected. In contrast, the Design variable has a significant positive effect on customer trust (β = 0.275; p = 0.001), but no direct effect on repurchase intention (β = 0.091; p = 0.361), leading to the acceptance of H2 and the rejection of H5. The Social variable demonstrates a significant positive effect on both customer trust (β = 0.490; p = 0.000) and repurchase intention (β = 0.198; p = 0.015), thus both H3 and H6 are accepted.

Furthermore, customer trust has a significant positive effect on repurchase intention, with a coefficient of β = 0.585 (p = 0.000), confirming H7. In the mediation path testing, customer trust does not mediate the relationship between Ambient and repurchase intention (β = 0.060; p = 0.359), resulting in the rejection of H8. Conversely, customer trust significantly mediates the relationship between Design and repurchase intention (β = 0.161; p = 0.002) as well as

between Social and repurchase intention (β = 0.287; p = 0.000), thus H9 and H10 are accepted. Since Design does not have a significant direct effect on repurchase intention, the mediation is classified as full mediation. Meanwhile, as Social still has a direct effect on repurchase intention, the mediation is considered partial mediation.

4.2 Discussion

The findings of this study indicate that the social factor significantly influences the development of customer trust and encourages their intention to repurchase. Social interactions within the store, whether with staff or fellow customers, have been shown to play a crucial role in fostering trust, which ultimately contributes to customer loyalty. This finding aligns with the Theory of Planned Behavior (Ajzen, 1991), which posits that subjective norms, or the social influences from one's environment, are among the key determinants of an individual's attitudes and behavioral intentions. In the retail context, a positive social atmosphere can create a more enjoyable shopping experience and shape customers' perceptions of store credibility, thereby strengthening their intention to return.

Conversely, the ambient factor, which includes sensory elements such as lighting, fragrance, and background music, was found to have no significant effect on either customer trust or repurchase intention. This finding contrasts with several previous studies that suggested store atmospheric elements enhance shopping experience and encourage repeat purchases (Ali et al., 2022; Muzakki & Sari, 2023; Situmorang & Kumar, 2022; Soebandhi et al., 2020; Sucahoyo et al., 2022). This discrepancy may be attributed to the characteristics of the respondents in this study, the majority of whom were women in the young adult to middle-aged demographic. This group tends to be more influenced by functional and social aspects of the shopping experience rather than purely sensory elements (Muhammad et al., 2014).

In addition to the social factor, the study also found that store design significantly influences customer trust. Good design, including a comfortable layout, appealing aesthetics, and easy in-store navigation, can enhance customers' confidence in the quality of services and products offered. However, design does not directly contribute to repurchase intention. Rather, its influence on repurchase intention occurs through the trust that is first established. This suggests that customers view visual and functional aspects of the store as factors that strengthen their confidence in the store's credibility, which in turn fosters loyalty. This result is consistent with prior studies which stated that retail environment design enhances store image and builds customer trust (Dinanti & Bharata, 2023; Minerva & Kusumowidagdo, 2024; Seong & Kim, 2022; Septiani et al., 2020).

Furthermore, the study confirms that customer trust serves as a mediator in the relationship between both store design and repurchase intention, as well as between social factors and repurchase intention. In other words, trust functions as a key element that bridges the influence of the store environment on customers' decisions to continue shopping at the same place. In Consumer Behavior Theory, trust is one of the primary factors affecting customer loyalty (Hoyer et al., 2021). High levels of trust not only drive repeat purchases but also increase the likelihood that customers will recommend the store to others (Cardoso et al., 2022). However, the study did not find any mediating effect of trust in the relationship between ambient factors and repurchase intention. This further reinforces the conclusion that ambient elements do not play a critical role in building customer loyalty in the context of this study. Customers appear to prioritize social and design aspects over sensory ambiance when evaluating their retail experiences.

Theoretically, these findings strengthen the Theory of Planned Behavior by demonstrating that subjective norms, in the form of social interactions in the store, play a vital role in shaping both trust and customers' intention to repurchase. Additionally, the study contributes to

Consumer Behavior Theory by highlighting that customer trust serves as a mediating factor linking the physical store environment to customer loyalty. This research also enriches the literature on store atmosphere in the modern retail context by demonstrating that not all atmospheric elements, such as ambient factors, directly impact customer loyalty. Moreover, it offers a new perspective on store design by showing that good design not only enhances the shopping experience directly but more importantly builds customer trust that subsequently drives loyalty. Thus, the study provides fresh insight that, in managing the retail environment, social and design aspects contribute more to fostering customer loyalty than ambient elements.

These findings also have several practical implications for modern retail store managers. First, managers should improve the quality of in-store social interactions by ensuring that staff provide friendly, responsive, and professional service. Staff training in communication and customer service can be a crucial investment in building customer trust. Additionally, creating an environment that facilitates positive interactions among customers, such as seating areas or small community spaces, can enhance comfort and loyalty. Second, store design should focus on comfort and functionality. A clear layout, easy accessibility, and appealing aesthetics can boost customers' positive perceptions of the store. The use of color, lighting, and other visual elements should be designed to convey professionalism and trustworthiness. Third, even though ambient factors were not found to significantly impact loyalty, they can still be used as supporting elements to create a pleasant shopping experience. Fourth, retail marketing strategies should emphasize social and design aspects over ambient atmosphere. Marketing campaigns can focus on community-building and in-store social interactions, such as special events, workshops, or customer meetups, which can strengthen brand-customer relationships and increase trust in the store.

5. Conclusion

Based on the findings, social factors play the most influential role in building customer trust and enhancing loyalty in modern retail stores, especially in Padang City. Store managers should focus on improving employee service quality, creating a welcoming environment, and encouraging positive customer interactions. Well-designed store layouts also enhance customer perceptions and trust, while ambient elements like lighting and music were not found to significantly influence loyalty. Thus, store atmosphere can support the shopping experience but should not be the primary focus in building trust and loyalty.

Marketing strategies that highlight social engagement and effective store design are more effective for customer retention than those relying solely on sensory elements. Retailers should enhance customer interaction, optimize store design, and provide meaningful shopping experiences to gain competitive advantage. Future research should involve more diverse demographic samples and consider mixed-method approaches to explore psychological drivers of trust and repurchase intention. Advanced analytical models and external factors like retail digitalization and e-commerce should also be examined to understand their interaction with physical store atmospheres in shaping customer loyalty.

THE DETERMINANTS OF CASH HOLDING: EVIDENCE FROM PROPERTY AND REAL ESTATE COMPANIES LISTED ON THE INDONESIA STOCK EXCHANGE

Aditya R. Sujana[1], Beny[2]

[1,2]Trisakti School of Management, Jakarta, Indonesia

Abstract

This study was conducted to examine the factors that influence cash holding in property and real estate sector companies. These factors include leverage, cash flow, firm size, liquidity, and profitability. The population used by researchers in this study is property and real estate sector companies listed on the Indonesia Stock Exchange for the 2018-2023 period. The sample used by researchers in this study was 174 data using the purposive sampling method. In addition, this study used regression analysis in hypothesis testing. The results of this study show that firm size has a positive effect on cash holding, while other variables (leverage, cash flow, liquidity, and profitability) have no influence on cash holding. This research can be used as input for the firms to consider in optimizing cash holding so that it can increase the value of the firm itself.

Keywords**:** *cash holding, leverage, cash flow, firm size, liquidity, profitability*

1. Introduction

The increasingly competitive business environment demands companies to continuously grow and enhance their operational activities to achieve their main objective–maximizing shareholder wealth (Kusumawati et al., 2020). Financial managers must also understand that the primary goal of a company is to increase its firm value (Maulana et al., 2022).

Determining a company's cash holding level is a critical decision for financial managers to enhance the firm's value in the eyes of investors. Companies must optimize the available cash to avoid financial difficulties in operations (Alicia et al., 2020). Almustafa and Kalash (2022) stated that managing capital structure and cash holdings based on a trade-off between costs and benefits will enhance operating cash flows, which play a crucial role in creating shareholder value.

Keynes, as cited in Simanjuntak and Wahyudi (2017), identified three motives for cash holding. (1) Transaction motive: Holding cash to meet short-term cash inflow and outflow needs. (2) Precautionary motive: Holding cash to cover unforeseen future obligations. (3) Speculative motive: Holding cash to take advantage of potential interest rate increases or investment opportunities.

To determine an ideal level of cash holding, managers can refer to the company's internal factors via financial statements, which serve as the fundamental guide for financial decision-making (Santioso & Daryanto, 2023).

This study replicates Almustafa and Kalash's (2022) work on cash reserves and financial leverage in MENA markets and builds on Maulana et al. (2022), focusing on cash holding in consumer goods companies. However, this research differs in its variables, model, and object of study, targeting IDX-listed property and real estate companies from 2018 to 2023.

2. Literature review

2.1 Trade-off theory

This theory explains that companies tend to use debt as a source of external financing because it is considered the cheapest option to achieve their long-term goals (Gunadhi and Putra, 2019). The use of debt provides benefits in the form of tax savings (tax shield), making it an attractive alternative in the company's financing structure.

However, the greater the use of debt, the higher the risk that the company must bear. Therefore, according to Septiani and Suaryana (2018), companies with high risk should limit their use of debt to reduce the risk of bankruptcy. Companies with high risk tend to have difficulty obtaining loans from creditors because they are considered risky in fulfilling their obligations. In this situation, companies will minimize the use of debt and maintain sufficient cash and cash equivalents to maintain financial stability.

2.2 Pecking order theory

According to this theory, companies prefer internal financing over external funding (Zutter & Smart, 2022). If internal funds are insufficient, they prefer debt issuance over equity, since issuing equity is more costly (Saif-Alyousfi et al., 2020).

Additionally, according to Lestari and Wirawati (2021), companies tend to prioritize funding sources based on risk preference, starting from the lowest to the highest. Internal funds are seen as a lower-risk funding source, making them more preferred than debt, which carries relatively higher risk. This sequence indicates that funding decisions are not solely based on cost but also on the associated risk level.

2.3 Cash holding

Cash holding refers to the cash available to a company that can be used for investments or distributed to shareholders (Margaretha & Dewi, 2020). It indicates a company's ability to meet obligations on time (Romadhoni et al., 2018). Therefore, the existence of cash is an important indicator in maintaining the company's financial stability.

Cash holdings can be measured using the ratio of cash and cash equivalents to total company assets (Almustafa and Kalash, 2022). Thus, it can be concluded that cash holdings describe the proportion of cash and cash equivalents held by a company to finance business activities, such as making investments and meeting financial obligations.

2.4 Leverage and cash holding

Leverage is a tool for measuring the extent to which a company uses debt to finance its assets (Silaen and Prasetiono, 2017). Leverage can be measured using the Debt to Asset Ratio (DAR), which is a ratio that shows the comparison between a company's total debt and total assets (Almustafa and Kalash, 2022).

Thus, it can be concluded that leverage reflects the composition of debt usage as a source of funds used to finance company assets, with the expectation of increasing potential profits for shareholders. However, a high level of debt will also impact cash requirements, as the company must provide funds to pay interest on the debt (Alicia et al., 2020).

H_1: there is an effect of leverage on cash holding in property and real estate companies listed on the Indonesia Stock Exchange for the 2018-2023 period.

2.5 Cash flow and cash holding

Cash flow is the inflow and outflow of cash from a company during a certain period (Mawarti et al., 2020). This cash flow is an important element because it provides information about the company's financial condition, both in terms of revenue and expenditure (Basheer, 2014). To measure cash flow, a formula comparing pre-tax profit plus depreciation to the company's total assets can be used (Almustafa and Kalash, 2022).

Thus, it can be concluded that cash flow reflects the financial condition of a company derived from business activities. Healthy cash flow is an important indicator in supporting operations and investments. According to Powell (2018), companies with investment opportunities are advised to hold large amounts of cash to anticipate future cash flow uncertainties. Thus, effective cash flow management is key for companies to maintain stability and meet investment needs.

H_2: there is an effect of cash flow on cash holding in property and real estate companies listed on the Indonesia Stock Exchange for the 2018-2023 period.

2.6 Firm size and cash holding

Company size is a scale used to indicate the size of a company based on various approaches, such as total assets, sales, and equity value (Elnathan and Susanto, 2020). This size can be grouped into three main categories, namely large, medium, and small companies (Astuti et al., 2020). Company size can be measured using the natural logarithm of total assets (Alicia et al., 2020).

Thus, it can be concluded that company size reflects the scale of a business entity based on internal and external factors. Larger companies tend to have more cash due to their larger assets and higher income from operational activities (Aftab et al., 2018). However, findings from Flugum et al. (2021) show that large companies actually rely more on loans as a source of funding, which can ultimately result in relatively less cash.

H_3: there is an effect of firm size on cash holding in property and real estate companies listed on the Indonesia Stock Exchange for the 2018-2023 period.

2.7 Liquidity and cash holding

Liquidity is a ratio used to measure a company's ability to meet its short-term obligations (Santioso and Daryatno, 2023). These short-term obligations include obligations to external and internal parties (Batuman et al., 2022). Liquidity can be measured by comparing net working capital, which has been reduced by cash and cash equivalents, to the company's total assets (Almustafa and Kalash, 2022). Thus, liquidity reflects a company's ability to meet its obligations using its current assets.

An increase in net working capital can lead to an increase in the company's cash balance, thereby strengthening liquidity (Sari and Hastuti, 2020). However, according to research conducted by (Simanjuntak and Wahyudi, 2017), if a company has low net working capital, the high financing needs from debt to meet working capital requirements can actually lead to an increase in cash due to loan disbursements.

H_4: there is an effect of liquidity on cash holding in property and real estate companies listed on the Indonesia Stock Exchange for the 2018-2023 period.

2.8 Profitability and cash holding

Profitability is a measure of a company's ability to achieve its main objective, which is to generate profits (Aftab et al., 2018). Profitability reflects the relationship between income and costs arising from the use of company assets, both current assets and fixed assets (Flugum et al., 2021). One of the tools used to assess the level of profitability is Return on Assets (ROA), which is a ratio that compares profit before interest and taxes with the total assets owned by the company (Almustafa and Kalash, 2022).

Thus, profitability can be defined as a company's ability to generate profits from the optimal use of assets in its operations. Companies with high profitability tend to have larger cash balances because increased profits will add to the company's cash (Simanjuntak and Wahyudi, 2017). However, high profitability also indicates good company performance and can encourage companies to invest, so companies will not hold large amounts of cash (Aftab et al., 2018).

H_5: there is an effect of profitability on cash holding in property and real estate companies listed on the Indonesia Stock Exchange for the 2018-2023 period

3. Methodology

The population includes property and real estate firms listed on IDX during 2018–2023. Out of 93 listed companies, 29 were selected using purposive sampling, totaling 174 data points.

Table 1

Criteria for Sample Selection

Criteria for Sample Selection	Total
Property and Real Estate companies consistently listed on the IDX during 2018-2023	45
Property and Real Estate companies that released annual reports during 2018-2023	42
Outlier data	(13)
Property and Real Estate sector companies that meet the criteria	29
Period (2018-2023)	6
Data	174

3.1. Cash holding

Cash holding refers to the cash held by a company as available funds for investment in physical assets, with the returns distributed to investors (Fajar and Retno, 2024). According to Almustafa and Kalash (2022), cash holding is measured using the following formula:

$$\textbf{\textit{Cash holding}} = \frac{\textbf{\textit{Cash and equivalents}}}{\textbf{\textit{Total assets}}}$$

3.2. Leverage

Leverage is a tool used to measure the extent to which a company utilizes debt to finance its assets (Silaen and Prasetiono, 2017). According to Almustafa and Kalash (2022), leverage is measured using the debt to asset ratio with the following formula:

$$\textbf{\textit{Leverage}} = \frac{\textbf{\textit{Total liabilities}}}{\textbf{\textit{Total assets}}}$$

3.3. Cash flow

Cash flow refers to the inflow and outflow of cash within a company over a specific period (Kartikahardi et al., 2017). It is an essential element that serves to provide information about a company's financial condition, including both incoming and outgoing cash (Basheer, 2014). According to Gunawan (2016), cash flow can be calculated using the following formula:

$$\textit{Cash flow} = \frac{\textit{EBT} + \textit{Depreciation}}{\textit{Total assets}}$$

3.4. Firm size

Firm size is a scale used to determine the size of a company based on various aspects such as total assets, sales volume, and equity value (Elnathan and Susanto, 2020). It can be classified into three categories: large companies, medium-sized companies, and small companies (Restuwulan, 2013). According to Saniamisha and Jin (2019), firm size can be measured using the following formula:

$$\textit{Firm size} = \textit{Ln (Total assets)}$$

3.5. Liquidity

Liquidity is a ratio that measures a company's ability to meet its short-term obligations (Hanafi and Halim, 2016). These short-term obligations include liabilities to both external and internal parties of the company (Kasmir, 2014). According to Suherman (2017), liquidity can be measured using the following formula:

$$\textit{Liquidity} = \frac{\textit{Net working capital - Cash and equivalents}}{\textit{Total assets}}$$

3.6. Profitability

Profitability is a tool used to measure a company's ability to achieve one of its main objectives, which is to generate profit (Ali et al., 2016). It reflects the relationship between revenue and expenses resulting from the use of the company's assets, including both current and fixed assets (Gitman and Zutter, 2015). According to Almustafa and Kalash (2022), profitability can be measured using the following formula:

$$\textit{Profitability} = \frac{\textit{EBIT}}{\textit{Total assets}}$$

4. Results and discussions

Table 2

Source: Results of Data Processing Eviews 10

Based on table 3, there is a multiple regression equation from this study, as follows:

CASH HOLDING = -0.398673 + 0.030000DEBT_TO_ASSET_RATIO - 1.152483CASH_FLOW + 0.015307FIRM_SIZE - 0.005857LIKUIDITAS + 1.338570RETURN_ON_ASSET + e

The results of the first hypothesis test indicate that H_1 is rejected. Therefore, leverage has no effect on cash holding. The level of debt held by a company does not influence the amount of cash it holds. A company with a high level of debt tends to rely more on external financing, thus reducing the need to consider how much cash it holds (Octavian et al., 2022). These findings are consistent with the studies of Kusumawati et al. (2020) and Simanjuntak and Wahyudi (2017). However, they are not in line with the findings of Santioso and Daryanto (2023), Maulana et al. (2022), Almustafa and Kalash (2022), Oktafiana and Hidayat (2022), Batuman et al. (2022), Flugum et al. (2021), and Sari and Hastuti (2020).

The results of the second hypothesis test indicate that H_2 is rejected. Therefore, cash flow has no effect on cash holding. Companies with sufficient free cash flow are more likely to distribute dividends to their shareholders, thus opting not to increase their cash holdings (Irawati, 2018). These findings are consistent with the study by Rini et al. (2022). However, they are not consistent with the studies by Aftab et al. (2018), Sethi and Swain (2019), Diaw (2021), and Batuman et al. (2022).

The results of the third hypothesis test indicate that H_3 is accepted. Therefore, there is a positive influence of firm size on cash holding. Larger companies tend to hold more cash because they possess greater assets and generate higher transaction revenues, which in turn increases the amount of cash retained (Aftab et al., 2018). These findings are consistent with the studies conducted by Batuman et al. (2022), Diaw (2021), and Alicia et al. (2020). However, they contradict the findings of Almustafa and Kalash (2022), Flugum et al. (2021), and Sethi and Swain (2019).

The results of the fourth hypothesis test indicate that H_4 is rejected. Therefore, liquidity has no effect on cash holding. Companies with high levels of debt financing do not need to hold large amounts of cash, as debt can serve as a substitute to finance transactions and various business activities (Rahman, 2020). These findings are consistent with the study by Aulia (2020). However, they contradict the findings of Astuti et al. (2020), Aftab et al. (2018), Batuman et al. (2022), Flugum et al. (2021), and Sari and Hastuti (2020).

The results of the fifth hypothesis test indicate that H_5 is rejected. Therefore, profitability has no effect on cash holding. This is because companies tend to prefer using retained earnings as additional capital (Aulia, 2020). These findings are consistent with the studies by Levina and Sha (2021) and Namirah (2022). However, they contradict the findings of Almustafa and Kalash (2022), Oktafiana and Hidayat (2022), Sari and Ardian (2019), Angelia and Dwimulyani (2019), and Simanjuntak and Wahyudi (2017).

5. Conclusion

This study was conducted to obtain empirical evidence regarding the influence of independent variables, including leverage, cash flow, firm size, liquidity, and profitability, on the dependent variable, namely cash holding, in property and real estate companies listed on the Indonesia Stock Exchange during the period 2018–2023. The results of the study show that firm size has a positive effect on cash holding, while the other variables (leverage, cash flow, liquidity, and profitability) have no significant effect on cash holding. This research is expected to provide information to companies regarding the factors that might affect cash holding so that companies can evaluate and improve company performance to achieve the company's main goals. For investors, this study can serve as a consideration in the investment decision-making process. Investors can use the findings of this research to more accurately assess the potential of a company. Recommendations for further studies might focus on cash holding to initiate comparative studies and use other variables, such as growth opportunity and capital expenditure to measure how capable in managing companies' cash holding.

Abstract

This study investigates the interrelationships between supply chain collaboration (SCC), collaborative advantage (CA), and hospital performance (HP) among Class C hospitals in Java, Indonesia, with particular attention to the moderating role of government subsidies (GS). By employing Partial Least Squares Structural Equation Modeling (PLS-SEM), the research evaluates how collaborative practices influence strategic capabilities and organizational outcomes in healthcare institutions. The findings demonstrate that supply chain collaboration contributes significantly to the development of collaborative advantage, particularly through mechanisms such as joint planning, resource sharing, and inter-organizational trust. However, the direct effect of supply chain collaboration on hospital performance is negative, indicating that without proper alignment, collaboration may lead to inefficiencies or fragmented execution. Collaborative advantage emerges as a key driver of hospital performance, underscoring its role as a strategic mediator in enhancing service quality and operational effectiveness. Moderation analysis reveals that government subsidies significantly reinforce the relationship between supply chain collaboration and collaborative advantage. However, the moderating effects of subsidies on the links between supply chain collaboration and hospital performance, and between collaborative advantage and hospital performance, are not statistically significant. These findings highlight that while government support can enhance collaborative capabilities, its impact on performance depends on institutional readiness and governance structures. To improve hospital performance in resource-constrained settings, healthcare leaders must combine financial support with internal capability development, strategic alignment, and consistent policy implementation.

Keywords*: collaborative advantage, hospital performance, supply chain collaboration, government subsidies, PLS-SEM.*

1. Introduction

The COVID-19 pandemic accelerated a fundamental transformation in healthcare systems, compelling hospitals to adopt more collaborative and digital strategies to maintain competitive operational performance (Widodo et al., 2024; Yu et al., 2024). Amid this disruption, the urgency to develop collaborative advantage has become increasingly evident as a strategic source of value creation across Indonesia's healthcare landscape. Collaborative advantage refers to the added value generated through synergy among actors especially via digital service integration, supply chain collaboration, and technological adoption (Liu et al., 2023; Al-Amin et al., 2024).

This study examines six key hypotheses from the structural model: the effect of supply chain collaboration on collaborative advantage (H1), the effect of supply chain collaboration on hospital performance (H2), the effect of collaborative advantage on hospital performance (H3). Additionally, it investigates the moderating effect of government subsidies on three strategic pathways: between supply chain collaboration and collaborative advantage (H4),

supply chain collaboration and hospital performance (H5), and collaborative advantage and hospital performance (H6).

Before assessing the structural model, the study tested the validity and reliability of the measurement model. All constructs demonstrated acceptable internal consistency, with composite reliability values above 0.70 and AVE values exceeding 0.50 confirming convergent validity (Hair et al., 2021). Discriminant validity was also established using Fornell-Larcker and HTMT criteria, ensuring the distinctiveness of each construct.

The structural model was tested using Partial Least Squares Structural Equation Modeling (PLS-SEM), which revealed the strength and statistical significance of each hypothesized relationship. Results show that collaborative advantage plays a pivotal mediating and outcome role, significantly impacting hospital performance consistent with the findings of Widodo et al. (2024) and Shen et al. (2024). The path from Supply Chain Collaboration (SCC) to Collaborative Advantage (CA) (H1) aligns with the view that inter-organizational coordination enables hospitals to build mutual trust, share knowledge, and develop joint capabilities that are essential for achieving collaborative advantage (Cao & Zhang, 2011; Liu et al., 2023). Furthermore, the relationship between SCC and Hospital Performance (HP) (H2) reflects the operational reality in resource-constrained hospitals, where collaboration enhances supply availability, process integration, and service responsiveness factors that significantly impact hospital outcomes (Widodo et al., 2024; Shen et al., 2024). Lastly, the positive effect of collaborative advantage on hospital performance (H3) supports the argument that hospitals with high levels of collaboration are better positioned to implement innovation, improve care quality, and strengthen institutional reputation (Al-Amin et al., 2024; Liu et al., 2023).

Moderation analysis provides additional insights: government subsidies do not exert a uniform influence. Instead, their effects depend on the organizational context, selectively amplifying or dampening key relationships (Zhou, 2022; Liu et al., 2023). In public hospitals, subsidies often act as compensation for bureaucratic rigidity and limited institutional flexibility but may not lead to improved performance unless accompanied by adaptive managerial strategies.

In sum, this analysis supports the hypotheses that collaborative strategies enabled by supply chain collaboration and properly designed subsidy mechanisms can significantly enhance competitive advantage and long-term performance across Indonesian hospitals.

2. Literature review

2.1 Supply Chain Collaboration and Collaborative Advantage

Supply chain collaboration (SCC) is foundational for service continuity, particularly in resource-constrained healthcare systems. SCC involves inter-organizational coordination to ensure effective resource flows, information transparency, and synchronized service delivery (Cao & Zhang, 2011). In Indonesian hospitals, SCC supports joint procurement processes, real-time inventory monitoring, and responsive emergency logistics especially vital for Class C hospitals with limited internal resources. Such collaborative practices reduce redundancies and operational delays, thereby laying the groundwork for the emergence of collaborative advantage (CA).

The development of CA through SCC is closely linked to relational mechanisms such as mutual trust, shared accountability, and aligned goals. According to Shen et al. (2024), hospitals that engage in joint planning and cross-institutional performance tracking are more likely to cultivate durable partnerships and improve knowledge exchange across boundaries.

Widodo et al. (2024) emphasize that trust-based collaboration strengthens integration between internal departments and external suppliers, which in turn accelerates innovation and process improvement within hospital operations. When SCC is effectively institutionalized, hospitals can transition from transactional supplier relationships to strategic alliances that generate shared value.

Additionally, SCC nurtures an environment conducive to joint learning and adaptive capabilities. Hospitals involved in long-term collaborative supply chain practices often benefit from increased agility, resource optimization, and better alignment with evolving healthcare demands. Liu et al. (2023) argue that CA emerges when structural collaboration is supported by digital integration and learning routines between partners. In Indonesia, SCC has allowed smaller hospitals to leverage the logistical strength of partners and external platforms to co-create innovations, thus reinforcing competitive positioning. Therefore, SCC acts as both an enabler and a prerequisite for collaborative advantage in achieving sustainable healthcare excellence.

2.2 Supply Chain Collaboration and Hospital Performance

Supply Chain Collaboration (SCC) has emerged as a critical component of hospital strategic management, particularly in enhancing operational efficiency and service quality. SCC refers to the coordinated efforts among hospitals, suppliers, and other healthcare stakeholders to align supply and demand, share critical information, and integrate logistics functions (Cao & Zhang, 2011). In the healthcare context, SCC supports accurate forecasting of medical supplies, streamlined procurement, and timely distribution of essential resources all of which directly affect hospital performance outcomes such as service availability, patient satisfaction, and cost control (Widodo et al., 2024; Shen et al., 2024).

The effectiveness of SCC depends on trust, transparency, and the level of information sharing between collaborating entities. Hospitals that establish strong collaborative ties with external partners tend to reduce redundancy, eliminate bottlenecks, and enhance service responsiveness. Studies by Liu et al. (2023) and Yu et al. (2024) confirm that SCC improves decision making accuracy and reduces the risk of supply disruption, particularly during emergencies like the COVID-19 pandemic. These benefits contribute directly to hospital performance by improving service continuity, supporting patient safety and optimizing resource utilization.

Moreover, SCC facilitates long-term strategic benefits through integration with digital platforms and performance monitoring systems. Hospitals leveraging digital tools to manage collaborative supply networks have demonstrated higher agility, faster adaptation to demand shifts, and improved stakeholder coordination (Alabdaly et al., 2024). In developing healthcare systems like Indonesia, SCC is instrumental in bridging systemic resource gaps, particularly in Class C hospitals that often face logistical and financial constraints. Therefore, strong supply chain collaboration is not merely operational, but a strategic driver of sustained hospital performance.

2.3 Collaborative Advantage and Hospital Performance

Collaborative advantage (CA) in the healthcare sector refers to the value generated through strategic alliances and resource integration across stakeholders. As posited by Liu et al. (2023), CA plays a pivotal role in enhancing service innovation, information sharing, and patient-centered outcomes. In Indonesia, where fragmentation in healthcare provision is common, achieving CA leads to better hospital agility, responsiveness, and performance metrics (Widodo et al., 2024). Al-Amin et al. (2024) emphasized that CA significantly correlates with competitive positioning and hospital reputation.

CA facilitates joint problem solving, learning, and innovation capacity, which positively influences hospital performance across dimensions such as operational efficiency, care quality, and stakeholder satisfaction (Shen et al., 2024). Hospitals that adopt CA principles benefit from enhanced coordination among departments, external medical networks, and suppliers. This synergy leads to quicker problem resolution, reduced redundancy in services, and the ability to adapt to dynamic patient needs and regulatory demands. Additionally, CA supports the development of knowledge-sharing cultures that contribute to continuous improvement and adaptive learning. From a strategic management perspective, embedding collaborative advantage into hospital operations strengthens institutional resilience and creates long-term value. The integration of relational capabilities with digital platforms enables real-time data access and joint decision-making, further aligning efforts across the care continuum. In the Indonesian context, where disparities in resource access remain prominent, hospitals that cultivate strong CA are more likely to meet service benchmarks and outperform competitors, especially in patient-centered care, innovation speed, and network responsiveness (Yu et al., 2024; Teece, 2018). Therefore, CA is not only a relational outcome but a strategic enabler of hospital performance

2.4 Moderating Role of Government Subsidies: Supply Chain Collaboration → Collaborative Advantage

Government subsidies (GS) are strategic instruments employed to reduce disparities in resource access between public and private healthcare institutions. Subsidies enable hospitals to improve infrastructure, invest in digital platforms, and enhance human resources necessary for cross-institutional collaboration. Zhou (2022) emphasized that GS can amplify the effectiveness of supply chain collaboration (SCC) by increasing operational readiness, reducing transaction costs, and enabling smaller hospitals to participate in inter-organizational networks. In line with this, Liu et al. (2023) found that in highly regulated environments, subsidies help underfunded hospitals reach baseline standards for technology integration and collaborative capacity.

However, the moderation effect of government subsidies is not unconditional. Yu et al. (2024) suggest that if subsidy allocations are misaligned with institutional needs or poorly monitored, they may produce dependency without sustainable value creation. In such cases, SCC may proceed nominally but fail to produce real collaborative advantage (CA). In the Indonesian context, Widodo et al. (2024) reported that some public hospitals receive financial support without corresponding improvements in integration, transparency, or joint decision-making with supply partners. This misalignment can weaken the intended impact of SCC and hinder the emergence of sustainable CA.

In this study, GS is hypothesized to moderate the relationship between SCC and CA by alleviating resource limitations, enhancing trust, and strengthening organizational capacity for joint innovation. Especially among Class C public hospitals, subsidies serve as external enablers that allow collaboration to go beyond transactional exchanges and foster deeper relational integration. When well-targeted, subsidies reduce structural asymmetries that typically prevent public hospitals from engaging equally in supply chain ecosystems (Shen et al., 2024; Al-Amin et al., 2024). Thus, GS functions not only as financial input but as a lever that shapes the institutional environment where collaboration can flourish into a strategic advantage.

2.5 Moderating Role of Government Subsidies: Supply Chain Collaboration → Hospital Performance

The effectiveness of supply chain collaboration (SCC) in enhancing hospital performance is significantly influenced by the availability of government subsidies (GS), particularly in resource-constrained public hospitals. Targeted subsidies that address systemic gaps such as outdated logistics infrastructure, limited human capital, or technology shortages can unlock the full potential of collaborative networks. According to Widodo et al. (2024), hospitals receiving consistent government support demonstrated better performance outcomes through SCC driven efficiencies, including reduced lead times, increased availability of medical supplies, and improved interdepartmental coordination.

However, the moderating role of GS is complex and contingent on hospital specific factors such as leadership capacity, institutional culture, and readiness for change. Wang et al. (2022) observed that while financial subsidies can create favorable conditions for collaboration, their actual impact depends on the hospital's internal innovation capability and willingness to institutionalize collaborative practices. In other words, subsidies may support SCC structures, but without strong governance and execution mechanisms, performance gains may be limited. Similarly, Shen et al. (2024) argued that subsidy efficacy is highest in environments where managerial accountability and data driven decision making are embedded. In this study, GS is hypothesized to moderate the positive relationship between SCC and hospital performance by acting as a catalyst for systemic integration. In many Class C hospitals in Indonesia, limited funding often leads to fragmented procurement, siloed operations, and inefficient supply chains. When subsidies are well-targeted, they not only alleviate these structural deficiencies but also enable hospitals to scale up collaborative initiatives and invest in digital solutions that boost performance (Al-Amin et al., 2024; Liu et al., 2023). As such, government subsidies play a strategic role in transforming SCC from a logistical function into a performance oriented capability.

2.6 Moderating Role of Government Subsidies: Collaborative Advantage → Hospital Performance

Collaborative advantage (CA) enhances hospital performance through mechanisms such as integrated service delivery, innovation capacity, and stakeholder alignment. However, the degree to which CA contributes to performance outcomes often depends on external enabling factors particularly financial support. Liu et al. (2023) observed that hospitals with strong collaborative networks but insufficient funding often struggle to implement or scale their initiatives effectively. Collaborative practices alone may not be sufficient to drive meaningful change without adequate infrastructure, human capital, and technological support.

In this study, GS is hypothesized to moderate the positive effect of CA on hospital performance by addressing resource gaps that limit the impact of collaborative strategies. This is particularly relevant for hospitals in rural or underdeveloped regions where disparities in infrastructure and access to capital are more pronounced. When financial resources are available to support collaborative ventures such as multi-hospital networks, cross-training programs, or public–private partnerships the performance gains from CA become more sustainable and inclusive (Al-Amin et al., 2024; Shen et al., 2024). Therefore, GS serves not only as a financial lever but as a strategic amplifier of CA's contribution to hospital excellence. Despite the growing literature on healthcare supply chains, limited studies have explored the moderating role of government subsidies in the Indonesian public hospital context.

3. Methodology

This study adopts a quantitative, cross-sectional research design using a descriptive and explanatory approach to examine the structural relationships among Supply Chain Collaboration (SCC), Collaborative Advantage (CA), and Hospital Performance (HP), and to

evaluate the moderating role of Government Subsidies (GS) within Indonesian Class C hospitals. The analysis focuses on testing six hypotheses (H1, H2, H3, H4, H5, and H6) using Partial Least Squares Structural Equation Modeling (PLS-SEM), which is particularly appropriate for complex predictive models with latent constructs, small-to-medium sample sizes, and non-normal data distributions (Hair et al., 2021). A structured questionnaire was developed based on validated constructs adapted from prior research and expert consultation, targeting high-level management personnel in 48 Class C hospitals across the island of Java. A total of 168 valid responses were collected using purposive and stratified sampling, ensuring a balanced representation between public and private hospitals. The instrument contained 31 indicators representing the core constructs (SCC, CA, HP, and GS), all measured on a 5-point Likert scale ranging from strongly disagree (1) to strongly agree (5). Data analysis was conducted using SmartPLS 4 software. The measurement model was evaluated for construct validity through outer loading analysis, internal consistency reliability via Composite Reliability and Cronbach's Alpha, and convergent validity using Average Variance Extracted (AVE). The structural model was tested using bootstrapping with 5000 subsamples, assessing the significance of path coefficients, t-values, and p-values. Multi-group analysis (MGA) was also employed to assess the moderating effects of government subsidies across hospital groups. The use of PLS-SEM aligns with the study's aim to prioritize prediction and explanation over model fit, especially in healthcare research contexts involving formative indicators and limited sample sizes.

10.7. Theoretical framework

This study is anchored in the integration of the Resource-Based View (RBV), Dynamic Capabilities Theory, and the Relational View, which together offer a robust explanation for how healthcare organizations achieve superior performance through inter-organizational collaboration and strategic resource utilization. The Resource-Based View posits that organizations gain competitive advantage by leveraging valuable, rare, inimitable, and non-substitutable (VRIN) resources (Barney, 1991; Wernerfelt, 1984). In the context of healthcare, Supply Chain Collaboration (SCC) and Collaborative Advantage (CA) are considered strategic intangible resources that support hospitals in enhancing operational efficiency and patient-centered care (Liu et al., 2023; Widodo et al., 2024). The Dynamic Capabilities Theory further extends this view by emphasizing the organization's capacity to integrate, build, and reconfigure internal and external competencies in response to a rapidly changing environment (Teece et al., 1997). Hospitals that develop dynamic capabilities such as joint innovation, real-time information sharing, and adaptive logistics can generate Collaborative Advantage that significantly improves Hospital Performance (HP) (Shen et al., 2024; Al-Amin et al., 2024). As healthcare systems face uncertainty and complexity, particularly during health crises or policy shifts, these capabilities become critical for maintaining service continuity and quality. In addition, this framework incorporates Institutional Theory, which explains the role of external pressures, such as government policies, in shaping organizational behavior. Government Subsidies (GS) function as institutional supports that help hospitals especially Class C public hospitals in developing regions overcome structural limitations and participate more effectively in collaborative ecosystems. When GS are aligned with SCC and CA initiatives, they enable hospitals to pursue more ambitious integration strategies and resource commitments, thereby amplifying the positive effect of CA on performance (Zhou, 2022; Wang et al., 2022). Accordingly, this study hypothesizes that SCC influences CA, which then enhances HP, and that GS positively moderates the relationships SCC → CA, SCC → HP, and CA → HP by reducing institutional and operational constraints

10.8. Conceptual framework

The conceptual framework in this study integrates key latent variables drawn from contemporary healthcare management literature to investigate the factors influencing hospital performance. It emphasizes the role of Supply Chain Collaboration (SCC) and Collaborative Advantage (CA) as strategic antecedents to Hospital Performance (HP). The model proposes three direct hypotheses: (H1) Supply Chain Collaboration positively affects Collaborative Advantage, (H2) Supply Chain Collaboration directly influences Hospital Performance, and (H3) Collaborative Advantage enhances Hospital Performance. These hypotheses reflect the growing recognition that both operational collaboration and relational synergy are crucial drivers of organizational outcomes in hospital settings.

In addition to direct effects, the model incorporates Government Subsidies (GS) as a moderating variable to examine how external financial support alters the strength of the proposed relationships. Specifically, it tests whether government subsidies moderate the influence of SCC on CA (H4), SCC on HP (H5), and CA on HP (H6). This moderating mechanism allows for the assessment of contingent effects and policy relevance, providing insights into how funding environments may amplify or weaken the strategic benefits of collaboration. Overall, the framework contributes to theory and practice by demonstrating how internal collaborative capabilities interact with external institutional factors to shape performance outcomes in healthcare organizations.

10.9. Instrumentation

The study used a structured questionnaire developed based on validated constructs from previous literature. The instrument measured 3 constructs: supply chain collaboration (15 items), collaborative advantage (13 items), and hospital performance (3 items). The questionnaire underwent expert review and back-to-back translation. Reliability and validity were evaluated using Composite Reliability (CR) and Cronbach's Alpha, with all constructs exceeding the threshold of 0.70 (Hair et al., 2021), as shown in Table 1. Average Variance Extracted (AVE) values were all above 0.50, confirming convergent validity, while Fornell-Larcker and HTMT tests confirmed discriminant validity. These metrics indicate that the instrument is psychometrically sound and suitable for further SEM-PLS analysis of the structural model and moderation effects.

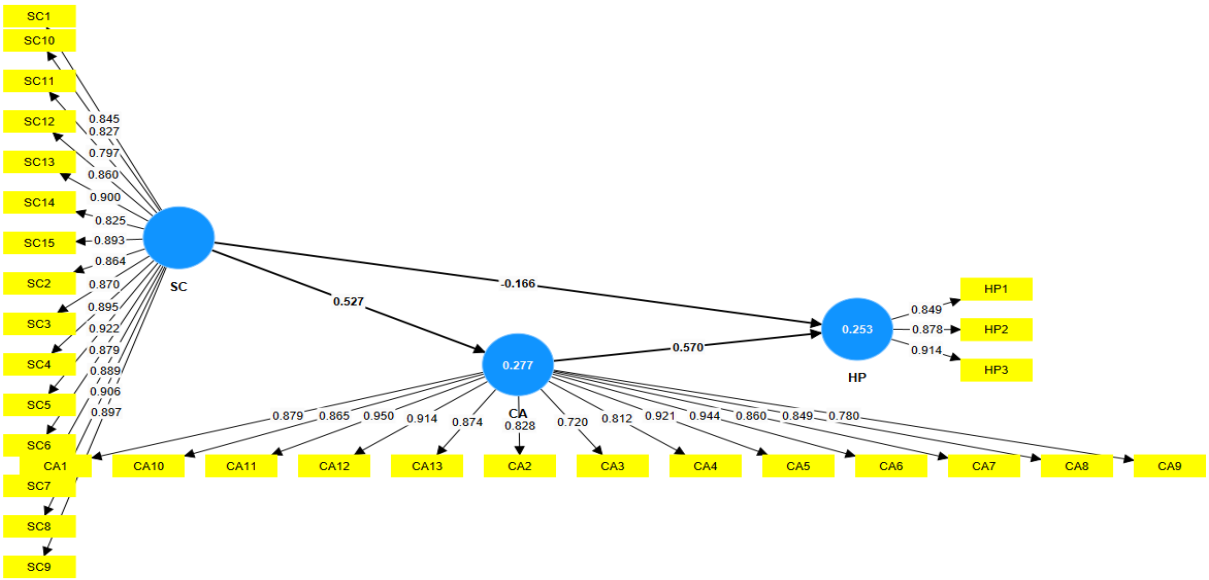

Figure 1. PLS Model

4. Results and discussions

This study tested six hypotheses (H1–H6) involving direct and moderating relationships among supply chain collaboration (SCC), collaborative advantage (CA), hospital performance (HP), and government subsidies (GS). The analysis was conducted using Partial Least Squares Structural Equation Modeling (PLS-SEM) through SmartPLS 4. PLS-SEM was selected due to its suitability for predictive modeling, small to medium sample sizes, and exploratory model testing involving latent constructs (Hair et al., 2021), as shown in Table 2.

Table 1. Instrument's Validity and Reliability Test

Construct	Cronbach's Alpha	Composite Reliability	AVE
Supply Chain Collaboration	0.978	0.982	0.760
Collaborative Advantage	0.971	0.973	0.746
Hospital Performance	0.856	0.867	0.775

All constructs meet minimum standards for convergent validity and internal consistency, suggesting the measurement model is acceptable for hypothesis testing.

Table 2. Path Coefficients and Hypothesis Testing

Hypothesis	Path	Coefficient (β)	t-value	p-value	Result
H1	Supply Chain Collaboration → Collaborative Advantage	0.527	9.650	0.000	Supported
H2	Supply Chain Collaboration → Hospital Performance	-0.166	2.469	0.014	Supported
H3	Collaborative Advantage → Hospital Performance	0.570	7.920	0.000	Supported

The findings revealed that all three direct relationships tested were statistically significant. Collaborative Advantage had the strongest effect on Hospital Performance, supporting its mediating role. Supply Chain Collaboration significantly influenced both Hospital Performance and Collaborative Advantage, indicating its dual pathway impact.

Moderating Effect of Government Subsidies

To evaluate the moderating effect of Government Subsidies, a multigroup analysis (MGA) was performed by grouping hospitals into "high-subsidy" and "low-subsidy" categories, as shown in Table 3.

Table 3. Multigroup Analysis (MGA) – Government Subsidies as Moderator

	β (non subsidies)	β (subsidies)	Difference	P value	Moderation
CA -> HP (H4)	0.535	0.593	0.057	0.357	Not sig
SCC -> CA (H5)	0.482	0.655	0.173	0.039	Signifikan
SCC -> HP (H6)	-0.172	0.051	0.223	0.096	Not sig

Based on the multigroup analysis (MGA), the relationship between Collaborative Advantage (CA) and Hospital Performance (HP) [H4] shows a path coefficient of 0.535 for the non-subsidized group and 0.593 for the subsidized group, with a difference of 0.057 and a p-value of 0.357. Since the p-value is greater than 0.05, this difference is not statistically significant, indicating that government subsidies do not significantly moderate the relationship between Collaborative Advantage and Hospital Performance. In contrast, the relationship between Supply Chain Collaboration (SCC) and Collaborative Advantage (CA) [H5] reveals a coefficient of 0.482 for the non-subsidized group and 0.655 for the subsidized group. The difference of 0.173 is statistically significant ($p = 0.039$), suggesting that government subsidies significantly moderate this relationship. This finding implies that the positive impact of supply chain collaboration on collaborative advantage is stronger in hospitals that receive government subsidies.

For the relationship between Supply Chain Collaboration and Hospital Performance [H6], the coefficient is -0.172 for the non-subsidized group and 0.051 for the subsidized group, with a difference of 0.223 and a p-value of 0.096. Although the magnitude and direction differ noticeably between groups, the p-value exceeds the threshold of 0.05, indicating that the moderating effect of government subsidies on this relationship is not statistically significant. In summary, out of the three paths tested for moderation, only the path from Supply Chain Collaboration to Collaborative Advantage is significantly moderated by government subsidies.

Discussion

These results align with previous findings in health management literature (Yu et al., 2024; Widodo et al., 2024; Liu et al., 2023), which suggest that collaboration and shared innovation significantly enhance performance outcomes. The significant path from supply chain collaboration (SCC) to collaborative advantage (CA) confirms the relational view theory, which emphasizes that inter-organizational relationships when built on trust, joint planning, and shared knowledge become strategic assets that generate synergistic benefits (Cao & Zhang, 2011; Liu et al., 2023). Hospitals that actively engage in supply chain partnerships are more capable of building capabilities that lead to higher levels of collaboration and innovation, ultimately resulting in improved hospital agility and responsiveness. Moreover, the strength of the CA → hospital performance (HP) relationship supports the resource-based and dynamic capability perspectives, which hold that organizational advantages gained through

collaborative ecosystems can be transformed into measurable institutional outcomes such as better service quality, increased patient satisfaction, and operational efficiency (Shen et al., 2024; Al-Amin et al., 2024). Collaborative advantage not only facilitates internal coordination but also amplifies external value through innovation diffusion and alignment with stakeholder needs, both of which are crucial in enhancing hospital competitiveness, particularly in a resource-limited context. The moderation role of government subsidies (GS) in these relationships further highlights the importance of institutional support and policy alignment. While GS significantly strengthens the SCC → CA link, it weakens the SCC → HP direct relationship, implying that subsidy effectiveness depends on how well hospitals internalize collaborative routines. Institutions that rely on public subsidies but lack internal governance or coordination may not realize performance benefits. This nuanced finding emphasizes that subsidies must not only be allocated but also integrated strategically to enable innovation and sustainability in collaborative practices across hospitals in developing regions (Zhou, 2022; Liu et al., 2023).

5. Conclusion

It can be concluded that inter-organizational collaboration, particularly through supply chain collaboration (SCC), plays a critical role in shaping hospital performance outcomes. Hospitals that engage in strategic partnerships and resource sharing are more likely to generate collaborative advantage, which in turn significantly enhances performance in terms of service efficiency, patient satisfaction, and institutional competitiveness. The findings also revealed that government subsidies serve as a double-edged sword: while they are intended to support hospitals, especially in the public sector, the moderation analysis showed that such subsidies may dampen the direct effect of SCC on performance if not strategically governed. This reinforces the view that public financial support should be accompanied by accountability and capability development to translate external inputs into internal performance gains. Furthermore, the positive influence of collaborative advantage on hospital performance confirms the theoretical premise that intangible resources such as trust, synergy, and innovation within collaborations are vital assets in healthcare management. The mediating role of collaborative advantage underscores its importance as a strategic capability. From a managerial perspective, this study recommends that healthcare organizations continuously invest in strengthening their collaboration frameworks, digital infrastructure, and innovation ecosystems to maintain performance sustainability. Moreover, policymakers must consider designing subsidy policies that incentivize not just compliance, but collaboration, innovation, and patient centric outcomes. Moving forward, future research may further explore the dynamics between government interventions and organizational learning in healthcare, particularly in a post-pandemic and digitalized context.

THE MEDIATING ROLE OF E-SERVICE QUALITY IN THE RELATIONSHIP BETWEEN MOBILE APP USAGE AND E-SATISFACTION: EVIDENCE FROM PLN JAYAPURA, INDONESIA

Uturestantix[1]*, Agustinus Numberi[2]

[1,2] Faculty of Economics and Business, Universitas Cenderawasih, Indonesia

Abstract

This study investigates how e-service quality mediates the influence of PLN Mobile App usage on customer e-satisfaction at PT. PLN (Persero) ULP Jayapura. Grounded in the Technology Acceptance Model (TAM) and e-service quality theory, the study employs a quantitative SEM-PLS approach with 160 app users as respondents. Findings reveal that while app usage directly influences perceived e-service quality, it is this perceived quality that significantly drives e-satisfaction. The study contributes to digital service literature in public utilities and offers practical insights for enhancing digital transformation in state-owned enterprises.

Keywords: PLN Mobile, E-Service Quality, E-Satisfaction, Digital Public Service, SEM-PLS

1. Introduction

Digital transformation in public service delivery has become a critical agenda in developing economies, particularly in sectors providing essential utilities such as electricity. PT. PLN (Perusahaan Listrik Negara), Indonesia's state-owned electricity provider, has responded to these challenges through the launch of PLN Mobile, a mobile application aimed at enhancing service accessibility, efficiency, and responsiveness for its 80 million customers. However, while technological deployment is expanding, customer satisfaction has not always followed suit, especially in underdeveloped or geographically remote regions such as Jayapura, Papua.

In Jayapura, complaints regarding app accessibility, unresolved service issues, and system glitches continue to surface across customer feedback platforms, despite high growth in user acquisition. This presents a paradox: digital tools are being used, yet digital satisfaction is lagging. The PLN Mobile app, although technically rich—with features including electricity token purchases, real-time outage updates, chatbot assistants, and self-meter recording—is not delivering the expected customer experience outcomes. This disjunction raises a fundamental question: what explains the gap between technology usage and user satisfaction in public digital platforms?

This study explores e-service quality as the potential missing link in this equation. Drawing from the Technology Acceptance Model (TAM) and e-service quality frameworks, we argue that digital satisfaction does not emerge solely from usage or access, but from perceived service performance—how well the app responds, fulfills, and supports the customer journey. While the TAM model emphasizes perceived usefulness and ease of use, this study brings service quality into the forefront as a mediating factor that translates usage into meaningful satisfaction.

The context of this study—Jayapura, the administrative and economic capital of Papua—adds an additional layer of significance. With electricity demand rising alongside infrastructure growth, PLN's service performance has wide-reaching implications for household stability, business continuity, and government trust. Furthermore, in a digital divide setting,

understanding what drives satisfaction with digital utilities is critical for equitable public service innovation.

Therefore, this study aims to examine the mediating role of e-service quality in the relationship between PLN Mobile usage and e-satisfaction, using empirical evidence from PT PLN (Persero) ULP Jayapura. In doing so, the study contributes to the growing literature on public sector digitalization by emphasizing quality perceptions as a necessary condition for satisfaction in mobile-enabled service environments. It also provides grounded insights for practitioners on where to focus service improvements in regions where infrastructure and user readiness may vary widely.

Digital transformation has been increasingly recognized as a key enabler of improved public sector performance (OECD, 2018). Particularly in utility sectors, digital platforms offer scalable solutions to service coverage and administrative efficiency (Affairs, 2022). In Indonesia, the role of mobile applications in delivering government-related services has grown significantly, aligning with national digital transformation agendas such as SPBE (Sistem Pemerintahan Berbasis Elektronik) (Kementerian Pendayagunaan Aparatur Negara dan Reformasi Birokrasi, 2024). However, research also shows that technology implementation without parallel investment in service quality can result in weak adoption and low user satisfaction (Duan et al., 2019; Linders, 2012).

Statement of Contribution

This study contributes to the literature on digital public service innovation by positioning e-service quality not merely as an output of system design but as a critical mediator between technology adoption and user outcomes in the public utility context. While prior studies often assume a direct path from mobile app usage to satisfaction, our model highlights the conditional nature of that relationship—dependent on how users perceive the performance of the system along multiple quality dimensions such as responsiveness, efficiency, and reliability. This approach extends the TAM framework by integrating service quality as a behavioral bridge that connects system use to emotional and attitudinal user responses.

In methodological terms, the study applies Structural Equation Modeling – PLS to empirically test the strength and significance of the mediating pathway. The analysis, based on real users of PLN Mobile in a critical service delivery setting in Papua, Indonesia, provides both conceptual refinement and practical clarity in understanding what drives satisfaction in mobile-based public services.

Research Significance

The findings of this study hold practical significance for state-owned enterprises and public service managers aiming to implement digital service platforms, particularly in geographically marginalized and infrastructure-challenged regions. The research offers actionable insight: enhancing app usage alone is insufficient unless it is coupled with improvements in perceived service quality. As such, PLN and similar providers should invest not only in feature expansion, but also in interface usability, error reduction, complaint handling, and customer support responsiveness to ensure that the digital transformation efforts truly deliver citizen-centric value.

2. Literature Review

Prior studies have significantly shaped the understanding of digital service adoption and satisfaction. Davis (1989) laid the foundation with the Technology Acceptance Model (TAM), which has since been extended to include additional variables such as trust, perceived risk, and system quality in e-government contexts (Hidayat, 2024; Venkatesh et al., 2012). Zeithaml et al. (2002) advanced the e-service quality model, highlighting the multi-dimensional nature of online service delivery, which has been empirically tested across various sectors including banking, healthcare, and public utilities (Santos, 2003; Zavareh et al., 2012). However, few have focused specifically on its mediating role in government-mandated mobile applications, especially in underserved regions like Papua. This study aims to fill that theoretical and contextual gap.

This study is grounded in two key theoretical frameworks: the Technology Acceptance Model (TAM) and the e-service quality model. The TAM framework, introduced by Davis, (1989), emphasizes two primary drivers of user technology adoption: perceived usefulness and perceived ease of use. In the context of mobile public service applications, these dimensions remain crucial, yet they do not fully capture the experience quality once adoption occurs.

To address this gap, we incorporate the e-service quality model, as defined by Kementerian Pendayagunaan Aparatur Negara dan Reformasi Birokrasi (2024), which highlights seven core dimensions: efficiency, system availability, fulfillment, privacy, responsiveness, compensation, and contact. These dimensions move beyond adoption and into user evaluation of service performance, enabling us to understand why users remain satisfied—or not—after engaging with digital systems like PLN Mobile.

Empirical studies reinforce the relevance of these constructs. Revi et al. (2025) found that e-service quality significantly predicts customer satisfaction in state utility contexts. Dewi & Praswati (2024) emphasized that responsiveness and perceived system reliability directly enhance satisfaction with mobile apps in BUMN services. However, some researchers (e.g., A. S. Dewi et al., 2023; M. K. Dewi & Praswati, 2024; Rita et al., 2019) argue that not all dimensions are equally important across different regions, suggesting contextual mediation effects are worth exploring.

Despite this growing literature, few studies have examined the mediating role of e-service quality between app usage and customer satisfaction in developing, infrastructure-challenged regions like Papua. Our study addresses this gap by examining how e-service quality functions as a bridge between user interaction and emotional/attitudinal outcomes.

3. Methodology

This study employs a quantitative approach using Structural Equation Modeling with Partial Least Squares (SEM-PLS) to examine the mediating role of e-service quality between PLN Mobile usage and e-satisfaction. This method is well-suited for exploratory research involving latent variables and complex inter-variable relationships.

The research was conducted at PT PLN (Persero) ULP Jayapura, with data collection carried out between February and March 2025. The target population comprised active users of the

PLN Mobile application within the Jayapura service area. Using simple random sampling, 160 respondents were selected to ensure generalizability and statistical power.

Measurement instruments were adapted from validated previous studies. App usage was measured via indicators of ease of use, access speed, feature completeness, and information clarity. E-service quality was measured based on seven dimensions: efficiency, fulfillment, system availability, privacy, responsiveness, compensation, and contact. E-satisfaction was assessed through indicators of convenience, merchandising, site design, security, and serviceability.

Each item was measured using a five-point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). The reliability of the instruments was tested using Cronbach's alpha and composite reliability, while validity was assessed via convergent and discriminant validity. SEM-PLS analysis was conducted using SmartPLS 4.0 to estimate direct and indirect effects, including mediation testing.

This methodology enables a robust evaluation of the hypothesized relationships and offers nuanced insights into how perceived digital service quality can influence satisfaction in utility service contexts.

4. Results and Discussion

The structural model was analyzed using SEM-PLS based on responses from 160 PLN Mobile users in Jayapura. The model demonstrated good fit indices, with all factor loadings exceeding the recommended threshold of 0.70 (Hair et al., 2022), indicating high convergent validity across constructs. Composite reliability values ranged from 0.82 to 0.91, confirming internal consistency of the latent variables.

The results show a significant positive relationship between PLN Mobile usage and e-service quality ($\beta = 0.601$, $p < 0.001$). This suggests that better app design, usability, and functional completeness enhance users' perception of service quality, corroborating prior findings by A. S. Dewi et al. (2023); Hidayatullah & Hidayah (2023).

Moreover, e-service quality had a strong positive effect on e-satisfaction ($\beta = 0.654$, $p < 0.001$), aligning with Zeithaml et al. (2000), who emphasized responsiveness and reliability as key drivers of perceived digital service excellence. This finding is also in line with the study by M. K. Dewi & Praswati (2024), who found that perceived responsiveness, availability, and system stability increase digital satisfaction in state-owned utility services.

Notably, the direct effect of PLN Mobile usage on e-satisfaction was insignificant when the mediating variable was introduced ($p > 0.05$), while the indirect effect via e-service quality remained significant (Sobel $z = 4.12$, $p < 0.001$). This supports a full mediation model, highlighting the role of perceived quality as the primary pathway to customer satisfaction.

These results emphasize that even in technologically underdeveloped regions such as Papua, users are able to form clear evaluations of service quality based on their digital interactions. Where the technical infrastructure is constrained, perceived responsiveness and reliability may even outweigh feature-richness as sources of satisfaction (Hidayat, 2024; Utama et al., 2024).

In practice, these findings suggest that investments in user education, interface improvement, and more robust complaint resolution mechanisms are likely to yield greater satisfaction gains than merely expanding technical features. Furthermore, ensuring app uptime, minimizing bugs, and streamlining processes will directly influence service perception and retention in digitally transforming public utilities (Ananda & Hapsari, 2024; Nasri, 2019; Revi et al., 2025).

5. Conclusion and Implications

This study confirms the central mediating role of e-service quality in the relationship between mobile application usage and customer e-satisfaction within the context of public utilities. While the widespread adoption of apps like PLN Mobile marks a positive step in Indonesia's digital service agenda, user satisfaction is ultimately shaped by perceived performance dimensions—especially responsiveness, reliability, and usability.

From a theoretical standpoint, the study extends the Technology Acceptance Model (TAM) by showing that actual satisfaction is not guaranteed by technology use alone. E-service quality acts as a behavioral bridge between system usage and value perception. The research also deepens our understanding of the multidimensionality of digital service experiences, incorporating critical dimensions such as fulfillment, privacy, system availability, and user interaction.

Importantly, the research contextualizes digital service transformation within a geographically constrained environment. This offers a significant contribution to the literature on digital government by revealing how socio-technical conditions—like infrastructure readiness and digital literacy—moderate service outcomes.

From a managerial perspective, digital transformation strategies in state-owned enterprises such as PLN must be accompanied by targeted efforts to enhance service reliability, interface design, and problem resolution workflows. These are the aspects of service that users tangibly experience and which directly shape trust and satisfaction.

Furthermore, investment in customer education and digital onboarding should be prioritized in regions with lower digital penetration. A technologically advanced platform is insufficient if the users are ill-prepared to navigate it confidently. Therefore, human-centered design and inclusive service planning must complement technical rollouts.

Future research should explore longitudinal designs to track the evolution of service perceptions over time, especially during key rollout phases of new features. Comparative studies across different regions and demographic profiles will also enrich the theory by accounting for heterogeneous expectations and barriers in digital service adoption.

THE INFLUENCE *OF* FOMO (*FEAR OF MISSING OUT*) ON IMPULSIVE PURCHASE DECISIONS IN GENERATION Z

Gabrielle Christiena Petra[1], M.Y Dwi Hayu Agustini[2]

[1]Soegijapranata Catholic University Semarang, Indonesia
gabby.christiena9@gmail.com

Abstract

Fear of Missing Out (FoMO) referring to anxiety that an exciting or interesting event may currently be happening elsewhere motivates consumers to buy or try a viral thing for not to miss out on it. FoMO relates highly to the use of social media. This study aims to analyze the extent to which FoMO influences impulsive purchase decisions on Generation Z in Semarang City, The respondents are individuals born between 1995 and 2010, are active on social media, and have previously engaged in impulsive purchases. Data was collected using an Google Form questionnaire distributed via WhatsApp and Instagram to 97 persons. The 4-point Likert scale questionnaire was tested for its validity and reliability before the data collection. The collected data was tested for normality prior to being analyzed using simple linear regression with the help of SPSS 16.0. The result demonstrates a positive and significant influence of FoMO on impulsive purchase decisions among Generation Z in Semarang City. The result expectedly provides Generation Z with an understanding on the importance of managing their FoMO tendencies to prevent negative impacts on their shopping behavior.

Keywords*: fear of missing out, FoMO, impulse buying, purchase decision, generation Z*

1. Introduction

Fear of Missing Out or FoMO is a term that is widely recognized today among Generation Z. FoMO refers to a person's feeling of fear or anxiety when they miss or are afraid of missing out on a valuable moment in an event that is trending in the environment (Ghinarahima & Idulfilastri, 2024) so they tend to worry when someone else knows more or gets the information early or first (Syamer & Setyawati, 2024). This phenomenon often occurs on social media, where consumers are encouraged to join the bandwagon of buying or trying things that are going viral so as not to feel left behind. With the existence of FoMO, it will encourage Generation Z to make impulse purchases on products that are viral or being talked about on social media (Ulfa, 2024). The development of social media allows a person to connect with other people's lives, so FoMO is closely related to the use of social media because it will have an impact on society (Aji et al., 2025).

FoMO affects a person's psychological condition triggered by factors that are not only internal, but also external and social pressure (coercion) (Maysitoh et al., 2020). These three factors make individuals who experience FoMO tend to have a desire to always improve themselves so as not to lose to others.

FoMO is closely related to Generation Z, which was born in 1995-2010 because this generation is a generation that grew up in the digital era. The rapid development of information technology and affects the behavior and personality of Generation Z (Nurhalim, 2022). Generation Z was born in an environment that is fully integrated with technology, which makes the boundaries between the virtual world and the real world increasingly faint (Cahyadi, 2021). With technology, communication between people in various cities and countries can be done more easily than 10 years ago through various existing social media platforms, such as Facebook, Instagram, X, WhatsApp, Line, Tiktok, and others. Not only is communication much easier, but in accessing information, doing activities in their daily lives, playing games

online or offline, making transactions, shopping online, and other activities using cellphones (Widiayanti et al., 2024).

Generation Z is always connected to social media, so they are always exposed to various information, activities, or trends carried out by others. This is one of the triggers for the emergence of FoMO in Generation Z and encourages them to always be up-to-date and not be left behind by others. Social media and digital technology make Generation Z more adaptable to change, influencing the way they communicate, think, and live their lifestyles, as well as making it easier for them to choose the products or brands they want.

High curiosity about what is happening, the desire to try new things, and being easily influenced by the environment (Ayuningtyas & Wiyono, 2020) are characteristics of Generation Z that result in Generation Z having a fear of being left behind by important information or moments. This is what always drives Generation Z to want to always know and follow what is happening.

The digital lifestyle makes FoMO a phenomenon that is very relevant to Generation Z and a driver for impulsive puchase decisions. The fear of being left behind by existing trends can encourage them to buy products quickly, without any real consideration or what is called impulse buying (Harahap & Amanah, 2022). So, it can be concluded that impulsive purchase decisions make consumers become influenced and motivated in a particular product for a consumer in consumer activities in buying a product (Martianto et al., 2023).

This research was conducted by looking at the relationship between Generation Z and the FoMO phenomenon which will encourage a person to behave consumptively and impulsively. Therefore, this study aims to analyze the influence of FoMO on impulsive purchase decisions in Generation Z. Thus, the results of this study will provide insights to Generation Z regarding how they manage their FoMO impulses. Thus, the results of this study will provide results in the form of insights to Generation Z regarding how they manage the FoMO impulse properly, so that it does not have a negative impact on their purchasing decisions.

2. Literature Review

Purchasing decisions are consumer behavior carried out by purchasing products that are triggered by various factors that influence and motivate a person to buy certain products (Martianto et al., 2023). There are 4 (four) factors that influence a consumer's purchasing decisions, namely cultural factors, social factors, personality factors, and psychological factors (Suhartini & Maharani, 2023). The first factor is cultural factors. Here, cultural factors play an important role in influencing society by shaping a person's perceptions, preferences, and behavior on a product or brand which can be seen through culture (values), sub-culture (nationality, religion, race), and social class (homogeneous, permanent, hierarchical). The second factor is social factors which can be seen from interactions between individuals and groups so that they can influence a person's behavior towards certain products and brands, usually coming from family, friends, and their social environment. The third factor is personality factors. Personality factors consist of a person's age, a person's job, a person's income, a person's level of education, and others that will become a person's decision to buy a product and brand. The last factor is psychological factors which include the level of emotion, motivation, and individual perceptions that play a role in determining a person's view of a product and brand so that they get a motivational push to own certain products and brands (Utami, 2021).

Of the four factors that influence purchasing decisions above, psychological factors play a major role in encouraging a person's impulsive purchase decisions when facing certain situations that stimulate spontaneous emotional responses (Sholawati et al., 2022) Impulsive purchase decisions are purchasing decisions that occur without a plan from a person, causing

consumers to have an urgent desire to buy certain products that are trending in the environment (Rahayu et al., 2025).

Impulsive purchase decisions will occur in Generation Z when influenced from the outside, namely the existence of emotional conditions such as not being able to think maturely, situational, and social that make Generation Z have to conform to the behavior of their friends (Sholawati et al., 2022). These conditions greatly influence Generation Z in impulse buying because of products that attract one's attention or even influence from someone to encourage buying certain products (Ghinarahima & Idulfilastri, 2024). Impulsive purchase decisions that occur in Generation Z are usually due to attractive products so that impulsive puchase decisions are considered that the product purchases made are actually not really needed. This is because Generation Z grew up in the development of technology, making Generation Z involved in using technology in their lives (Mudjiyanto et al., 2025). The four factors of purchasing decisions and the three factors of impulse buying are external and internal factors to see a person's behavior so that these two things become stronger to shape a person's behavior on a brand and encourage someone to buy a product without a plan. Thus, the indicators of impulsive purchase decisions are spontaneity, namely sudden desire, out of control, namely it is difficult to refuse satisfaction, psychological conflict, namely the consideration of the benefits of satisfaction with long-term consequences, and non-cognitive evaluation, namely reducing cognitive evaluation of something that is viral (Sandra & Anjaningrum, 2021).

Impulsive purchase decisions are often triggered by momentary emotional impulses, and one of the factors that trigger these impulses is the feeling of FoMO (Maruapey et al., 2025). FoMO occurs because of the feeling of someone who does not want to be left behind for something and has high curiosity and even tends to be dissatisfied with something (Utami, 2022). Thus, FoMO indicators are fear, worry, feelings of annoyance, feelings of inadequacy, and low self-confidence (Lim et al., 2024). The existence of this FoMO phenomenon will encourage Generation Z to have impulsive purchase decisions without a long thought of one's purchasing actions that prioritize fulfillment of their emotions rather than urgent needs (Maruapey et al., 2025).

Thus, the behavior of Generation Z affected by the FoMO phenomenon can be classified into 2 (two) dimensions, namely self, which is a feeling of anxiety that is possessed when it is difficult to communicate, and relatedness, which is the state of a person who must be tied to another environment, even usually has an unequal feeling and feels excluded (Rahayu et al., 2025). The FoMO condition that occurs is also reinforced by the influence of social media and rapidly developing trends that make Generation Z feel the need to immediately keep up with the current developments so as not to feel left behind by something that is happening. In this case, FoMO greatly influences Generation Z in impulsive purchase decisions because in this context, external and internal factors of impulsive purchase decisions play a role in encouraging one's behavior in making impulsive purchases for a person and it is necessary to control so that impulsive purchasing behavior does not occur in one's life (Ghinarahima & Idulfilastri, 2024). In addition, Generation Z affected by FoMO will be more easily influenced and more prone to impulsive purchase decisions on products that are going viral which aims to avoid feelings of anxiety (Kartika et al., 2025).

Research conducted by (Kartika et al., 2025); (Anggraini et al., 2025); (Khafidah et al., 2025); (Maruapey et al., 2025); and (Mudjiyanto et al., 2025) which examines the attachment of FoMO to impulsive purchase decisions by Generation Z has the same results, namely FoMO has a positive and significant influence on impulsive purchase decisions made by Generation Z. Thusstudy will prove whether it is true that FoMO has a positive and significant effect on impulsive purchase decisions made by Generation Z. Thus, this study will prove whether it is

true that FoMO has a positive and significant effect on impulsive purchase decisions in Generation Z.

3. Research Methods

This study was conducted with the aim of knowing the effect of Fear of Missing Out (FoMO) on impulsive purchase decisions in Generation Z. The research was conducted on Generation Z in Semarang City. The reason is because Generation Z in Semarang City has a lifestyle that is easily influenced by trends due to the development of the creative economy so it is very relevant to examine the influence of FoMO on impulsive purchase decisions (Widiastuti et al., 2023). However, the exact population of Generation Z in Semarang City is unknown, so in collecting data, 96.04 respondents were needed, rounded up to 97 respondents taken from the Cochran formula with a sample error rate (e) of 10%, a true chance (p) of 50%, and a false chance (q) of 50% (Sugiyono, 2024).

This research is a survey and data is collected using an online questionnaire (Anugraheni et al., 2023) (Google Form) to be more effective in the use of time and the questionnaire will be distributed via WhatsApp and Instagram to get respondents according to the criteria for active use of social media. In searching for data, questions related to FoMO and impulsive purchase will be given in the form of a Likert Scale 1-4. The Likert scale is a tool for measuring individual behavior by giving 4 options for each question given to avoid indecision, such as strongly agree (4), agree (3), disagree (2), and strongly disagree (1) (Sugiyono, 2024b).

To ensure the feasibility of the instrument, validity and reliability tests are carried out so that the data is suitable for further analysis (Janna & Herianto, 2021). The validity test is carried out using the Pearson Bivariate correlation and is declared valid if r count > r table, and if it is invalid, it must remove the invalid statement (Anggraini et al., 2022). Meanwhile, the reliability test is seen from the Cronbach's Alpha value and the instrument is said to be reliable if it is greater than 0.6 (Kartika et al., 2025). Thus, the following are the results of the validity test and reliability test that have been processed:

Table 3.1. Validity Test Result

Dimension	Statement	r count	Description
FoMO or *Fear of Missing Out* (X)			
Fear	Fear of missing out on trends if you don't buy something	0,664	Valid
	Fear of not being able to keep up with friends	0,677	Valid
Concern	Worry for fear of being considered not "updated"	0,806	Valid
	Worry and rush to buy something for fear of running out	0,796	Valid
Feeling of annoyance	Annoyed if you don't buy something	0,679	Valid
Feeling of lack	There is always something missing if you don't buy	0,852	Valid
Low self-confidence	More confident when following trends	0,735	Valid
Impulsive Purchase Decision (Y)			
Spontaneity	Buying suddenly	0,776	Valid

Out of Control	It's hard to refrain from buying a product even though you don't need it	0,816	Valid
	Buying without thinking about the consequences	0,846	Valid
Psychological conflict	Guilt after an unplanned purchase	0,716	Valid
Non Cognitive Evaluation	Buying without considering quality and benefits	0,766	Valid
	Buying based on temporary feelings and impulses	0,774	Valid

Table 3.1 shows that there are 7 statements on the FoMO or Fear of Missing Out (X) variable and 6 statements on the Impulsive Purchase Decisions (Y) variable, all of which have a value of r count > r table of 0.197 so that the 13 instruments above are declared valid and can proceed to the reliability test.

Table 3.2. Reliability Test Result

	Cronbach's Alpha	**Description**
FoMO (X)	0,947	Reliable
Impulse Buying Decision (Y)	0,873	Reliable

Table 3.2 shows that the FoMO (X) has a Cronbach's Alpha value of 0.947 and the Impulsive Purchase Decisions (Y) has a Cronbach's Alpha value of 0.87 so that this questionnaire is declared reliable because the Cronbach's Alpha value is > 0.6.

The data that has been collected will then be tested for normality using the Kolmogorov-Smirnov method because the sample to be used is a large sample whose respondents are more than 40 people (Ahadi & Zain, 2023). The provisions of this normality test to determine whether the data will be normally distributed if the p value > 0.05 (Kartika et al., 2025).

Data that has been normally distributed will be tested for linearity with the F test which aims to determine whether there is a simultaneous influence between variable X on variable Y with a significant standard < 0.05 or can also be seen through F count > F table (Yusuf et al., 2024). After the linearity test was carried out, the research continued with the coefficient of determination (R^2) test which aims to assess the magnitude of the influence of the independent variable on the dependent variable (Sonya & Saputra, 2025). When associated with the F test, the greater the coefficient of determination (R^2), the better the model fit (Marita & Hermanto, 2021).

After that, it is continued with a correlation test using Pearson Product Moment (r) to see the relationship between one variable and another with the standard interpretation of the correlation coefficient: (1) 0.00 - 0.199 = very low; (2) 0.20 - 0.399 = low; (3) 0.40 - 0.599 = medium; (4) 0.60 - 0.799 = strong; and (5) 0.80 - 1.000 = very strong (Sugiyono, 2024c).

Furthermore, it can continue to conduct a simple regression analysis which aims to test the direction of the positive and significant influence of FoMO (X) on the impulsive purchase decision variable (Y) in Generation Z (Nurhaswinda et al., 2025). The criterion for determining the significance of the effect will be the t test with an assessment measure of p < 0.05 (Iba & Wardhana, 2024). All data processing was done with the help of SPSS 16.0.

4. Results and Discussion

Profile of the Respondents

Table 4.1, shows that the majority respondents (65 persons) were women. The respondents have the highest average age, which is around 20-24 years old as many as 62 respondents, followed by 20 respondents aged 15-19 years, and 25-30 years old as many as 15 respondents. The number of respondents aged 20-24 years shows that their last education is at the SHS/Vocational school level by 56 respondents and the last education is then followed by S1, JHS, S2, and Elementary school. Thus, the majority of their occupations are as students with 67 respondents and followed by private employees, entrepreneurs, housewives, not working, and civil servants. Furthermore, the highest monthly income is < IDR 1,000,000 filled in by 45 which shows that most respondents have a low income, which is likely to still depend on parents or not yet working fully. In the expenditure per month section, the highest result is also the expenditure of < Rp 1,000,000 per month because the majority of their employment status is as students.

Table 4.1. The Respondents Profile

No	Profile	Description	Frequency	Percentage (%)
1.	Gender	Female	65	67
		Male	32	33
2.	Age	20-24 y.o.	62	63,9
		15-19 y.o.	20	20,6
		25-30 y.o.	15	15,5
3.	Education	SHS/Vocational School	56	57,7
		S1	32	33
		JHS	6	6,2
		S2	2	2,1
		Elementary School	1	1
4.	Occupation	Student	67	69,1
		Private employee	17	17,5
		Self-employed	6	6,2
		Housewife	3	3,1
		Unemployed	2	2,1
		Civil servant	2	2,1
5.	Income per month	<Rp 1.000.000	45	46,4
		Rp 1.000.000 – Rp 3.000.000	29	29,9
		Rp 3.000.001 – Rp 5.000.000	13	13,4
		>Rp 5.000.000	10	10,3
6.	Expenses per month	<Rp 1.000.000	49	50,5
		Rp 1.000.000 – Rp 3.000.000	37	38,1
		Rp 3.000.001 – Rp 5.000.000	8	8,2
		>Rp 5.000.000	3	3,1
7.	Knowledge of FoMO	Yes	94	96,9
		No	3	3,1
8.	Understanding of FoMO	Fear of being left behind	47	-
		Social pressure	39	-
		Recent needs	2	-
		Pleasure	6	-
		Yes	67	69,1

9.	Follow popular/trendy things	No	30	30,9
10.	Social media as a popular/trendy information source	Instagram	87	89,7
		Tiktok	84	86,6
		X/Twitter	31	32
		WhatsApp	30	30,9
		YouTube	29	29,9
		Telegram	11	11,3
		Facebook	10	10,3
		Others	5	5,2

To get into the core of the research, 94 respondents already knew the concept of FoMO. In their understanding of FoMO, it can be divided into 4 (four) themes and various keywords and the number of each keyword. The following is the data:

Table 4.2. Understanding of FoMO

Keyword	Theme	Number	Percentage (%)
Fear of not following the trend	Fear of being left behind	1	48,4
Fear of missing out		32	
Worry		3	
Anxious		11	
TOTAL		**47**	
Follow the trend	Social pressure	32	40,2
Immitate others		2	
Action		3	
Jealous		1	
Trend		1	
TOTAL		**39**	
Update	Recent needs	1	2,1
Curious		1	
TOTAL		**2**	
Crowded/Congested/Busy	Pleasure	3	6,2
Public		1	
Interesting		1	
Fun		1	
TOTAL		**6**	
No answer		3	3,1
TOTAL		**97**	**100**

The majority of respondents described FoMO as the fear of being left behind in a trend that occurs, be it information, goods, activities, and so on with a total of 47 respondents. Furthermore, social pressure and environmental influences, current needs, and fun were also mentioned by respondents according to their understanding of FoMO.

Back in Table 4.1, the majority of respondents answered yes. This shows that most Generation Z respondents in Semarang City keep up with current trends. Here, respondents can choose more than 1 social media to get trending/popular information. The highest social media used by respondents to find out what is popular/trendy is Instagram, which is then followed by Tiktok, X/Twitter, WhatsApp, YouTube, Telegram, Facebook, and other categories as platforms to get information that is currently popular/trendy.

Normality Test

The following are the results and their interpretation:

Table 4.3. Normality Test Results

One-Sample Kolmogorov-Smirnov Test

		Unstandardized Residual
N		97
Normal Parameters[a]	Mean	.0000000
	Std. Deviation	2.80798690
Most Extreme Differences	Absolute	.054
	Positive	.054
	Negative	-.044
Kolmogorov-Smirnov Z		.532
Asymp. Sig. (2-tailed)		.940

a. Test distribution is Normal.

Table 4.3 shows that the significance value (Asymp. Sig. 2-tailed) is 0.940. Based on the requirements of the Kolmogorov-Smirnov method, the p value is > 0.05 so that the data can be normally distributed. Thus, this research data is declared normally distributed which is an important requirement before proceeding to the linearity test and regression test.

Linearity Test

Furthermore, the linearity test is carried out as follows:

Table 4.4. Linearity Test Results

ANOVA[b]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	744.380	1	744.380	93.424	.000[a]
	Residual	756.940	95	7.968		
	Total	1501.320	96			

a. Predictors: (Constant), SKOR_FOMO

b. Dependent Variable: SKOR_IMPULSIVEPURCHASEDECISIONS

In the linearity test, using the F test, the significance value is 0.000 while the requirement for the instrument to be declared linear is the significance value < 0.05. In addition, it can also be seen from the calculated F value is 93.424 > F table of 3.940 which is calculated from F table = (1; 97-1). Thus, the instrument above is declared linear because there is a simultaneous influence and the model is considered fit between FoMO (X) on Impulsive Purchase Decisions (Y).

Test of the Coefficient of Determination

The following are the test results of the coefficient of determination between FoMO (X) on Impulsive Purchase Decisions (Y):

Table 4.5. Test Results of the Coefficient of Determination

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.704[a]	.496	.491	2.823

a. Predictors: (Constant), SKOR_FOMO

The results in Table 4.5 show that the Adjusted R Square value is 0.491. Thus the FoMO (X) variable affects the Impulsive Purchase Decisions (Y) variable by 49.1%, which means that almost half of the variation in impulsive purchase decisions is due to FoMO, while the remaining 50.9% has been influenced by other variables or factors outside FoMO which are not examined in this study. The implication is that FoMO is an important factor, but not the only determinant of impulsive purchase decisions.

Correlation Test

After the linearity test is carried out, proceed with testing the correlation as follows:

Table 4.6. Correlation Test Results

Correlations

		SKOR_FOMO	SKOR_IMPULSIVEPURCHASEDECISIONS
SKOR_FOMO	Pearson Correlation	1	.704**
	Sig. (2-tailed)		.000
	N	97	97
SKOR_IMPULSIVEPURCHASEDECISIONS	Pearson Correlation	.704**	1
	Sig. (2-tailed)	.000	
	N	97	97

**. Correlation is significant at the 0.01 level (2-tailed).

From table 4.6, it shows that the significance value is 0.704 of the two variables, namely FoMO (X) and Impulsive Purchase Decisions (Y) so that the coefficient of the level of relationship found is that there is a strong relationship between FoMO and impulsive purchase decisions because 0.704 is between 0.60 - 0.799. In other words, if one variable changes, then changes will also be followed in other variables.

Simple Regression Analysis

After testing the coefficient of determination, a simple regression analysis can be carried out as follows:

Table 4.7. Simple Regression Results

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	6.475	1.186		5.460	.000
	SKOR_FOMO	.610	.063	.704	9.666	.000

a. Dependent Variable: SKOR_IMPULSIVEPURCHASEDECISIONS

From the results above, SKOR X is the score of FoMO and SKOR Y is the score of the Impulsive Purchase Decisions. Table 4.7 shows that the Constant (a) value is 6.475 with a regression coefficient (b) value of 0.610. In the sense that the constant value indicates that if FoMO is 0 or not at all, then the value of the Impulsive Purchase Decisions (Y) is 6.475. In the regression coefficient, FoMO has a positive effect on Impulsive Purchase Decisions (Y) because the regression coefficient is plus (+).

After it is known that FoMO has a positive effect on Impulsive Purchase Decisions, then to test its significance value, a t test can be done by looking at the t value on FoMO (X) of 9.666 which is greater than the t table, namely 1.661 with a significant value of 0.000 < 0.05

so that the result is that FoMO (X) has a positive and significant effect on Impulsive Purchase Decisions (Y).

The results of this study indicate a positive and significant influence of FoMO on Impulsive Purchase Decisions made by Generation Z which is in line with the results of the previous research. FoMO encourages Generation Z to purchases impulsively because they are fear of being left behind by the current trend.

5. Conclusion

The research concludes that FoMO has a positive and significant influence on impulsive purchase decisions among Generation Z in Semarang City. The results also show that there is a simultaneous influence between FoMO and Impulsive Purchase Decisions. This means that the higher the level of concern that a person will be left behind from a trend or activity that is currently popular, the greater the tendency of Generation Z to make sudden purchases without prior planning. This phenomenon shows that Generation Z's consumptive behavior is often triggered by an emotional drive for having connected feeling and being recognized in their environment. Impulsive purchase is not only for fulfilling needs, but also maintaining existence and social identity in the midst of fast-changing trends.

In relation to these findings, it is suggested that Generation Z can increase their self-awareness in using social media, especially filtering information and trends so that they are not easily influenced by the contents that may triggers impulsive behavior. It is also important for Generation Z to build their skills in self-control, digital and financial literacy in order to be more rational in their purchasing decisions, and not just considering social pressure or following a momentary trend. Better self-control, can expectedly minimize consumptive behavior that possibly cause negative impacts such as waste or personal financial instability.

THE EFFECTIVENESS OF SOCIAL MEDIA PROMOTION ON PURCHASING DECISIONS OF DAVIENA COSMETICS: BRAND IMAGE AS A BRIDGE OF INFLUENCE (CASE STUDY ON FEB UNISMA STUDENTS)

Melly Isnulsari[1], Nur Hidayati[2], M. Tody Arsyianto[3]

Universitas Islam Malang
Email: mellyisnulsari01@gmail.com

Abstract

The purpose of this study was to determine the effect of Social Media Promotion on Purchasing Decisions for Daviena Cosmetic Products through Brand Image as an intervening variable. Data was collected using purposive sampling from 95 respondents through questionnaires with a Likert Scale. Data analysis was performed using path analysis, Sobel test, and hypothesis testing (t-test) with the IBM SPSS 25 program. The results showed that partially, Social Media Promotion had a positive and significant effect on Purchasing Decisions (significance 0.000 < 0.05), Brand Image had no effect on Purchasing Decisions (significance 0.323 > 0.05), and Social Media Promotion had a positive and significant effect on Brand Image (significance 0.000 < 0.05). Meanwhile, from the Sobel test results, Brand Image was not able to mediate between the Social Media Promotion and Purchasing Decision variables (Two-tailed probability value 0.32212151 > 0.05).

Keywords: Social Media Promotion, Purchasing Decisions, Brand Image, Intervening Variable

1. Introduction

In recent years, Indonesia's cosmetics industry has experienced significant growth, due to increasing public awareness of the importance of self-care and appearance. Along with increasing per capita income, urbanization, and increasingly modern consumer lifestyles, the cosmetics market in Indonesia is expected to continue growing rapidly, according to data from Euromonitor International. In addition, globalization and social media culture are impacting users' preferences in choosing cosmetics. Many cosmetic brands, both local and international, are struggling to meet the increasingly diverse needs and wants of consumers.

Daviena is a fairly well-known cosmetic brand in Indonesia that has managed to capture the attention of the market, offering a variety of beauty products that are tailored to different skin types and customer appearances. The brand is known for beauty products that cater to diverse skincare and beauty needs. In the highly competitive cosmetic industry in Indonesia, Daviena has strived to build a reputation as a brand that prioritizes quality, safety, and innovation in every product it makes. Daviena's product collection includes face, body and decorative cosmetics. Daviena is a brand that is currently becoming more selective in choosing cosmetics. Cosmetic products that focus on natural and eco-friendly ingredients have become a more popular trend in recent years.

Social media promotion is a marketing strategy carried out through a third party, namely a social media-based website. Social media promotion is not always related to buying

and selling directly, it can also be done through website posts, images, and videos. Brands should also be talked about when talking about image because brands serve as a characteristic that distinguishes one company from another. Brand images are designed to influence customers' perceptions, so that the brand can be remembered in their minds with a name or symbol that distinguishes the brand from other goods or services.

The reason researchers chose this title "**The Effectiveness of Social Media Promotion on Purchasing Decisions of Daviena Cosmetics: Brand Image as a Bridge of Influence**" is because this research is important in providing strategic insights for Daviena as a new cosmetic brand to understand how social media promotion affects consumer purchasing decisions. In addition, this research also provides a broader understanding of how new cosmetic brands can build image, increase competitiveness, and gain a stronger position in the highly competitive cosmetics market.

2. Literature Review

Social media promotion is one of the digital marketing media that uses social media platforms through website links in the network, for the purpose of promoting a product. The existence of social media promotion makes it very easy in terms of information for potential customers who want to buy certain products. An effective way to promote in the media is to determine target consumers, be consistent in promotion, and be responsive in serving consumers. Social media promotion is one part of the type of marketing through internet media, with the aim of achieving the goals of those participating in the social media network. (Calistarahma & Saputro, 2020)

In choosing goods, consumers prioritize brand image over other things (Andika & Prisanto, 2019). So that producers brand their products so that consumers can always remember the product brands they have. Brand image can be defined as a person's belief, idea or impression of a brand, because brands influence consumer choices to determine which products they will buy and use (Kotler & Armstrong, 2018).

Purchasing decisions are very important to pay attention to because a company's success in influencing consumers in buyer decisions to be supported by building trust communication with consumers. Purchasing decisions have the meaning of a return decision that involves determining a choice of purchasing a product or service that appears to be a process of a stage in a problem-solving approach process consisting of problem recognition, searching for information, several alternative values, making buying decisions, and behavior after buying that consumers go through (Calistarahma & Saputro, 2020).

3. Metodology

The method used in this research is quantitative. Data collection is done with research instruments and data analysis is done quantitatively or statistically to test the hypothesis that has been made (Sugiyono, 2016). This research was conducted on students of the Faculty of Economics and Business, Islamic University of Malang Jl Mayjen Haryono No.193, Dinoyo, Kec.Lowokwaru, Malang City, East Java 65144. Research time: This research was conducted from December 2024 to April 2025.

The population of this study were FEB students at the Islamic University of Malang. The purposive sampling technique was used to determine the characteristics of the sample. The

research will later conduct sampling on FEB students at the Islamic University of Malang, this study uses the Slovin formula, based on the calculation results, the number of samples that can be used is 95.29 respondents rounded up to 95 respondents. This study uses the type of primary data directly obtained from the main source of research, namely from the results of distributing questionnaires to all students of the Faculty of Economics and Business, UNISMA. The data collection technique in this study is by distributing questionnaires to FEB Unisma students.

4. Result and Discussion

Tabel 1 Validity Test Results

Variable	Indicators	r Count	r Tabel	Result
Social Media Promotion (X1)	X1.1	0,782	0,2017	Valid
	X1.2	0,764	0,2017	Valid
	X1.3	0,820	0,2017	Valid
	X1.4	0,799	0,2017	Valid
	X1.5	0,770	0,2017	Valid
Purchasing Decision (Y)	Y.1	0,842	0,2017	Valid
	Y.2	0,824	0,2017	Valid
	Y.3	0,863	0,2017	Valid
	Y.4	0,777	0,2017	Valid
	Y.5	0,751	0,2017	Valid
Brand Image (Z)	Z.1	0,798	0,2017	Valid
	Z.2	0,823	0,2017	Valid
	Z.3	0,763	0,2017	Valid
	Z.4	0,852	0,2017	Valid

Based on the results of the r table, it is known that it is 0.2017, so referring to the results of the validity test that all instruments starting from the Social Media Promotion variable (X1), Purchasing Decisions (Y) and Brand Image (Z) also produce an r value greater than r table. So the statement items in this research questionnaire are significantly correlated with the total score so it can be said that the data is valid.

Tabel 2 Reability Test Results

X 1	**Reliability Statistics**	**Y**	**Reliability Statistics**

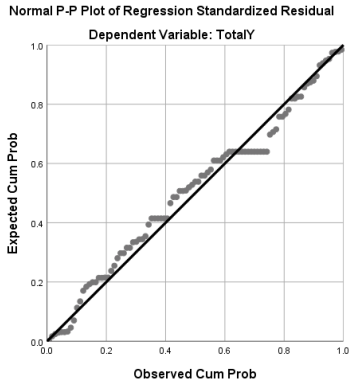
	Cronbach's Alpha	N of Items
	.846	5

Cronbach's Alpha	N of Items
.867	5

Z

Reliability Statistics	
Cronbach's Alpha	N of Items
.823	4

Based on table 2 above, it can be concluded that all indicators used have an Alpha Cronbach value> 0.6. This shows that all instruments in this study can be considered reliable.



Based on the probability graph above, it can be seen that the residual points are spread around the diagonal line. This indicates that the residuals are normally distributed. Therefore, the assumption of normality can be said to be fulfilled.

Tabel 3 Path Analysis Results

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.384	1.067		-.360	.720
	TotalX1	.773	.049	.855	15.875	.000

a. Dependent Variable: TotalZ

Tabel 4 Results of Path Analysis Model Summary

Model Summary[b]				
5rd Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.855[a]	.730	.728	1.309
a. Predictors: (Constant), TotalX1				
b. Dependent Variable: TotalZ				

Referring to the output of Regression Model I in the "Coefficients" table, it can be seen that the significance value of the variable X1 = 0.000 is smaller than 0.05. These results provide the conclusion that Regression Model I, namely variable X1, has a significant effect on Z. The magnitude of the R Square value contained in the Model Summary table is 0.730, this indicates that the contribution of the influence of X1 on Z is 73% while the remaining 27% is the contribution of other variables not included in the study. Meanwhile, the value of e1 can be found with the formula e1 = (1-0.730)=0.519. Thus, the structure model I path diagram is obtained as follows:

Figure Model I Path Analysis Diagram

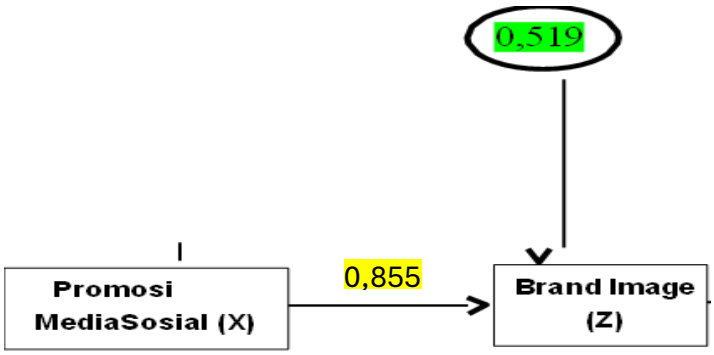


Table 5 Path Analysis Results

Coefficients[a]				
Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.

		B	Std. Error	Beta		
1	(Constant)	3.990	1.296		3.078	.003
	TotalX1	.918	.114	.918	8.058	.000
	TotalZ	-.125	.126	-.113	-.993	.323

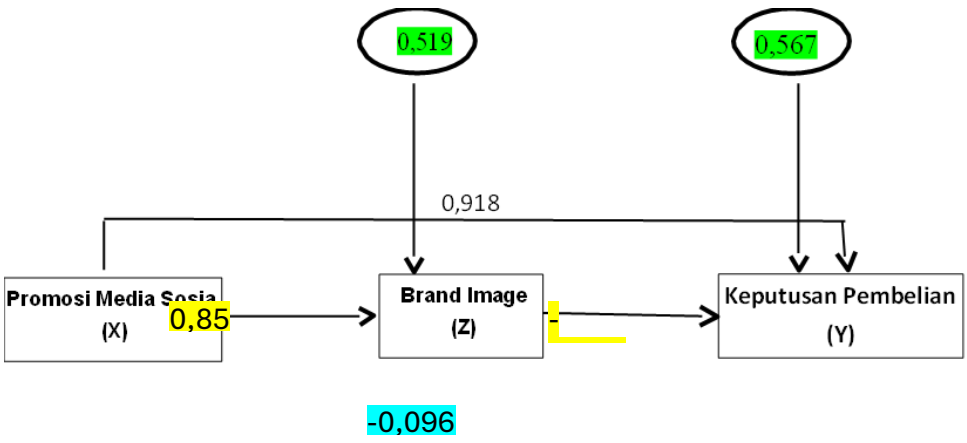
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.823[a]	.678	.671	1.589
a. Predictors: (Constant), TotalZ, TotalX1				

Based on the Regression Model II output in the "Coefficients" table section, it can be seen that the significance value of the variable X1 = 0.000 is smaller than 0.05 and Z = 0.323 is greater than 0.05. This result gives the conclusion that Regression Model II, namely variable X1 has a significant effect on Y, while variable Z has no significant effect on Y. The magnitude of the R Square value contained in the Model Summary table is 0.678, this indicates that the contribution of the influence of X1 and Z on Y is 67.8% while the remaining 32.2% is the contribution of other variables not included in the study. Meanwhile, the value of e2 can be found with the formula e2 = √(1-0.678)=0.567. Thus, the path diagram of structure model II is obtained as follows:

Figure Diagram of Model II Path Analysis



Description:

Direct influence

Indirect influence

Total effect

Table 7 Result of t test (partial)

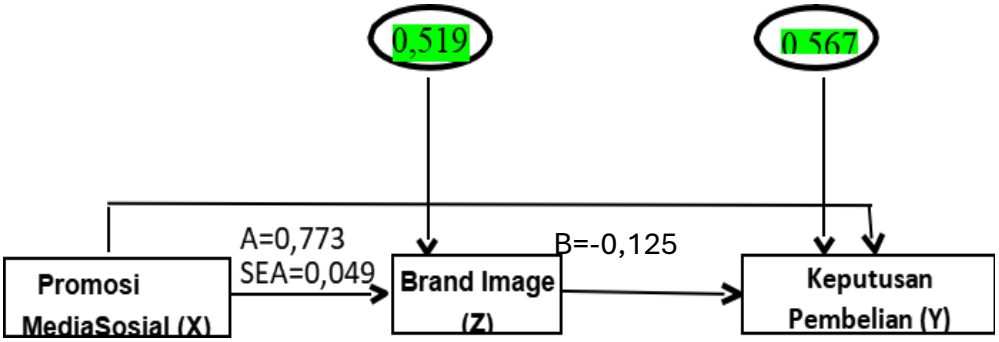
Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	3.990	1.296		3.078	.003
	TotalX1	.918	.114	.918	8.058	.000
	TotalZ	-.125	.126	-.113	-.993	.323
a. Dependent Variable: TotalY						

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.384	1.067		-.360	.720
	TotalX1	.773	.049	.855	15.875	.000
a. Dependent Variable: TotalZ						

The Social Media Promotion variable shows the t value of 8.058 and the t table value of 1.661 with a significance value of 0.000 smaller than 0.05, thus this test shows that H1 is accepted, so it can be concluded that the Social Media Promotion variable (X1) has a positive and significant effect on Purchasing Decisions. the Brand Image variable shows the t value of

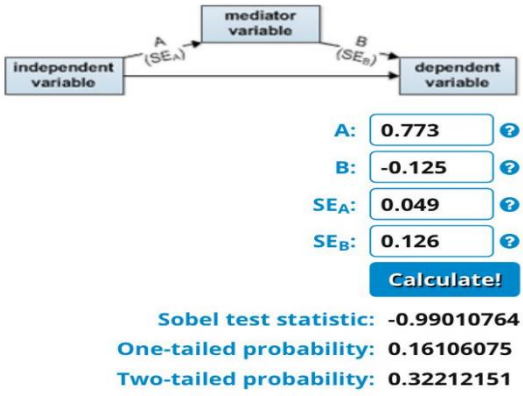
-0.993 and the t table value of 1.661 with a significance value of 0.323 higher than 0.05, thus this test shows that H2 is rejected, so it can be concluded that the Brand Image variable (Z) has no positive and significant effect on purchasing decisions (Y). The Social Media Promotion variable shows the t value of 15.875 and the t table value of 1.661 with a significance value of 0.000 less than 0.05, thus this test shows that H1 is accepted so it can be concluded that the Social Media Promotion variable (X1) has a positive and significant effect on Brand Image (Z).

Figure Sobel test analysis



From the results of the t test analysis (partial) above, it shows that it is known that the value of A = 0.773, the value of B = 0.125, the value of SEA = 0.049 and the value of SEB = 0.126. Furthermore, to find out whether the Brand Image variable (Z) mediates between the Social Media Promotion variable (X1) and the Purchasing Decision (Y) can be calculated using the Sobel Test Calculator, shown in the following figure:

Sobel Test Calculation Figure



From the picture above, it can be seen that the Two-tailed probability value of 0.32212151 is greater than 0.05, so the Brand Image variable (Z) is unable to mediate between the Social Media Promotion variable (X1) and the Purchasing Decision (Y).

Table 8 R2 Determination Test Results

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.821[a]	.675	.671	1.589
a. Predictors: (Constant), TotalX1				

Based on the table above, the Adjusted R square number is 0.671 or 67.1%. Thus the ability of the Social Media Promotion variable to explain the Purchasing Decision variable is 67.1%, while the other 32.9% value is influenced by variables not included in the study.

5. Conclusion

From the results of the above research, it shows that Social Media Promotion partially has a significant effect on Purchasing Decisions on Daviena cosmetics, which means H1 is accepted. Specifically, the results of this study indicate that promotions carried out through social media are not only a tool to increase sales or awareness, but also have a very large role in building a positive brand image. By using social media effectively, companies can convey a consistent message about the values, quality, and uniqueness of their brand, which in turn shapes consumers' perceptions and views of the brand. The results of this study are in line with research conducted by Sulistyo et al (2020) on the effect of Instagram social media marketing on the brand image of The Bunker Café, Tangerang. The results showed that The Bunker Café's ability to carry out marketing through Instagram with good interactions had a positive and significant effect on The Bunker Café's brand image.

Based on the results of this study, it shows that the relationship between Brand Image and purchasing decisions partially has an insignificant effect, which means that the second hypothesis (H2) is rejected. This shows that, although brand image plays an important role in shaping customer perceptions of a brand, other factors besides brand image may be more dominant in influencing purchasing decisions for Daviena cosmetic products. This can be due to various factors, such as product price, product quality, user experience, or the influence of other people's recommendations and social media, which often have a slow effect. Daviena should re-evaluate their marketing and branding strategies, noting that while brand image plays an important role in attracting customers' attention, other factors may influence customers' final purchase decisions more. Therefore, Daviena should focus more on other elements that can improve purchasing decisions, such as improving product quality, increasing communication about product benefits and advantages, and optimizing sales stratification. This research is not in line with previous research researched by Anam, Agama, et al. (2021) examining the Effect of Product Quality, Price and Brand Image on Purchasing Decisions for Citra Brand Hand and Body Lotion Products. The target audience of this survey is consumers of Citra Brand Hand and Body Lotion products who are students of IAIN.

The results of this study indicate that Social Media Promotion has a significant effect on purchasing decisions for Daviena cosmetic products, meaning that H3 is accepted. this research confirms that promotions carried out through social media can be a very effective tool in influencing purchasing decisions. Social media, as a channel that allows direct interaction between brands and consumers, provides space for Daviena to build more personalized and

authentic relationships with their audience. This allows the company to convey information about the product, its benefits and advantages in a more engaging and understandable way, which in turn drives consumer interest and purchase intent. Daviena needs to focus and allocate more resources to maximize its promotional strategy on social media, paying attention to factors that can increase the effectiveness of promotions. This includes choosing the right platform according to the target audience, creating relevant and engaging content, and using influencers or endorsements from users who have experienced the benefits of the product. This approach can be more convincing to potential consumers and help them make faster and more confident purchasing decisions. With the significant influence between social media promotion and purchase decisions, Daviena cosmetic products also need to regularly evaluate the success of their promotional campaigns to ensure their effectiveness.

Based on the results of this study, it shows that the relationship between Social Media Promotion and Purchasing Decisions with Brand Image as an Intervening Variable has an insignificant effect, which means that H4 is rejected. This shows that even though consumers are exposed to promotions on social media, the brand image factor is not strong enough to strengthen consumer decisions in purchasing Daviena cosmetic products. It could be that consumers prioritize other factors, such as product quality, price, or direct recommendations from friends or family, rather than relying solely on the brand image built on social media. One of the main causes of the decline in Daviena's brand image, which resulted in brand image not being able to mediate social media promotions on purchasing decisions, is the controversy related to product content claims. A doctor on TikTok, known as “Doctor Detective,” conducted laboratory tests on Daviena's HB Dosting product and found that the niacinamide content in the product was not detected in significant amounts. This contradicts Daviena's claim that the product can brighten the skin and treat hyperpigmentation. Daviena's owner, Melvina Husyanti, disputed the test results and sent the product to the factory for retesting, which showed different results. The difference in test results caused confusion among consumers and decreased trust in the Daviena brand. Although promotion through social media has become one of the dominant marketing strategies, it turns out that not all types of promotion are able to significantly influence consumer purchasing decisions. This indicates that promotions on social media, whether in the form of advertisements, influencer marketing, or other content, may not be effective enough to build a strong perception of the brand image and ultimately increase purchasing decisions. Cosmetics consumers' purchasing decisions are strongly influenced by various factors, not just social media promotion or brand image. For example, factors such as product diversity, competitive pricing, product effectiveness, as well as other direct user experiences can play a greater role in determining consumer choice. This indicates that Daviena cosmetics needs to pay attention to other more in-depth factors in building emotional relationships with consumers, apart from relying solely on social media. This research is not in line with previous research researched by Monica & Bahrun (2020) proving that social media promotion variables have a positive and significant effect on purchasing decisions. As well as research by Fatmaningrum et al, (2020) resulted in brand image variables having a positive and significant effect on purchasing decisions.

Based on the results of research and discussion related to the influence of Social Media Promotion on Purchasing Decisions on Daviena Cosmetic Products with Brand Image as an Intervening Variable, it can be concluded:

Social Media Promotion has a positive and significant effect on Purchasing Decisions for Daviena cosmetic products for FEB Unisma students. If Daviena cosmetic products often involve relatable content and direct interaction, this can create an emotional connection that increases trust and triggers impulsive buying decisions.

Brand Image does not have a positive and significant effect on purchasing decisions for Daviena cosmetic products for Unisma FEB students. Daviena's brand image was negatively affected by issues of product authenticity or effectiveness. This reduces trust in the brand, although some consumers still buy because of attractive promotions or influencer recommendations, not because of the brand image.

Social Media Promotion has a significant effect on purchasing decisions for Daviena cosmetic products for FEB Unisma students. If Daviena cosmetic products can utilize social media to market products, consumers will feel closer and trust because they see the faces and voices of people who provide testimonials directly. This creates a strong emotional connection and builds trust instantly.

Brand Image is unable to mediate the effect of Social Media Promotion on Purchasing Decisions for Daviena cosmetic products for Unisma FEB students. Daviena cosmetic products use social media promotions such as live TikTok, limited discounts, and influencer testimonials that directly influence purchasing decisions without the need for a strong brand image. This means: Consumers buy because they are interested in promotional content (price, testimonials, instant results), not because the Daviena brand already has a solid image. Although brand image exists, it is not the main intermediary factor in the consumer's buying decision process.

Based on the above conclusions, this researcher tries to provide the following suggestions:

For Daviena cosmetic products To increase consumer decisions to buy Daviena cosmetic products, the company must concentrate on strengthening its social media promotion strategy. It is very important for Daviena to build a strong brand image that can build customer loyalty in the long term, even though this does not directly affect current purchasing decisions. And Daviena should utilize social media more to increase visibility and engagement with customers while maintaining a positive brand image to build strong customer relationships.

Future researchers are expected to consider variables such as perceived value, trust, or emotional connection that are more relevant to consumer purchasing decisions. In addition, researchers are also advised to further explore the dimensions of brand image that can influence consumer perceptions, as well as conduct research with a wider and more diverse sample to ensure consistency of research results across various demographics. Research on the influence of the timing and frequency of social media promotions can also provide deeper insight into the dynamics of promotions in influencing purchasing decisions.

ANALYSIS OF THE INFLUENCE OF CAPITAL ADEQUACY RATIO, NON PERFORMING FINANCING, FINANCING TO DEPOSIT RATIO, ZAKAT PERFORMANCE RATIO ON RETURN ON ASSETS OF ISLAMIC COMMERCIAL BANKS IN INDONESIA (2021-2023)

Muhammad Alfayad, Harun Alrasyid, Abdullah Syakur Novianto

Faculty of Economic and Business, Universitas Islam Malang
E-mail: 22101083052@unisma.ac.id

Abstract

The banking sector is directly related to various institutions involved in corporate activities and society as a whole, therefore it has a very strategic position in promoting economic growth. As part of the Indonesian banking system, Islamic Banks manage their business based on Sharia rules and offer a variety of Sharia banking products and services. The purpose of this study is to analyze the effect of capital adequacy ratio (CAR), non-performing loans (NPF), funding ratio (FDR) and zakat performance ratio (ZPR) on return on assets (ROA) of Islamic banking in Indonesia from 2021 to 2023. The methodology used is quantitative causality through panel data regression analysis techniques based on quarterly data of Islamic commercial banks. The results show that CAR has a positive and significant effect on ROA while NPF and FDR have no significant effect. Meanwhile, ZPR has a negative and significant effect on the return on assets of Islamic commercial banks in Indonesia (2021-2023).

Keywords: *CAR, NPF, FDR, ZPR, ROA*

1. INTRODUCTION

Sharia-based banking in Indonesia has grown rapidly in the last decade, both in terms of structure and regulation (Bonita & Anggreyani, 2024) . Since its introduction in 1992, this growth has been reflected in the increasing number of sharia banks, the variety of products offered, and public awareness of the importance of financial services in accordance with sharia principles. According to Tuzzuhro et al., (2023) , efforts to increase public understanding of sharia banking have also driven demand for sharia financial products and services.

Banking financial performance is a crucial aspect for stakeholders (Susilowati & Tiningrum, 2019) . Given that there are also authorized parties, accurate and transparent bank performance assessments are essential to maintain public trust, comply with regulations, and support strategic decisions. One of the ways to measure financial performance is to analyze profitability, with the main indicator being Return on Asset (ROA), which reflects the bank's ability to make a profit from its total assets. Financial ratio analysis, including ROA, serves to assess the stability, condition, performance, and risk of the bank as a whole (Hasibuan et al., 2023) .

ROA Islamic Commercial Banks in Indonesia increased from 1.55% (2021) to 2.00% (2022), then decreased to 1.88% (2023) due to efficient risk management, operational improvements, and optimal portfolio diversification strategies (Kuncoro & Anwar, 2021) . Meanwhile, ROA at Conventional Commercial Banks continues to show a consistent increase, from 1.84 in 2021 to 2.43 in 2022, and reaching 2.74 in 2023. This comparison proves that,

although Islamic Commercial Banks increased in 2022, the trend did not continue, while Conventional Commercial Banks showed a stable increase in profitability every year (Anggadini et al., 2022) .

Capital Adequacy Ratio (CAR) is a key indicator that assesses the adequacy of bank assets and its financial condition (Kuncoro & Anwar, 2021) . High CAR tends to increase ROA, because CAR reflects the bank's efficiency in generating profits and its ability to take higher investment risks. Conversely, low CAR tends to make banks more cautious, which can reduce profit potential (Wibisono & Wahyuni, 2017) . According to BI, CAR is optimal if it is above 8%, reflecting the health of the bank based on ATMR (Ibrahim, 2019). Data from 2021-2023 shows that CAR increased by 0.57% (2021-2022), then decreased by 0.87% (2022-2023).

Non Performing Financing (NPF) is a ratio that functions to describe loans that have not been paid by debtors according to the agreed agreement (Wibisono & Wahyuni, 2017) . It can be seen that the decline in non-performing loans has improved in Islamic Commercial Banks, from 2.59% in 2021 to 2.10% in 2023. The consistent decline in NPF reflects the increasing ability of Islamic banks to manage credit risk and asset quality, in line with the study of Izzah et al. (2019) which states that the lower the NPF, the higher the ROA and profitability. This trend indicates the implementation of better risk management and prudent financing policies.

Financing to Deposit Ratio (FDR) is an indicator of cash flow that plays an important role in the banking sector, including in Islamic banking. FDR functions as a measure of a bank's ability to fund customer withdrawals and utilize these funds as a source of liquidity (Muchtar & Setiawan, 2021) . The FDR trend for Islamic Commercial Banks in Indonesia shows an increase from 70.12% in 2021 to 79.06% in 2023, approaching the safe limit but still below the tolerance threshold.

Zakat Performance Ratio (ZPR) is an indicator that assesses the level of effectiveness of Islamic banking institutions in carrying out their responsibilities (Iman & Umiyati, 2022) . ZPR also shows the commitment of Islamic banks to their social responsibility. Zakat is considered a moral obligation that can improve the reputation and trust of customers, potentially having a positive impact on bank profitability. Several studies, such as those conducted by Iman & Umiyati, (2022) and (Aeny et al., 2023) , explain that ZPR significantly increases ROA, supporting the argument that social responsibility through zakat can contribute to the profitability of Islamic banks.

Based on previous findings, it is important to review the variability that impacts Return on Assets (ROA) and limitations in research related to Zakat Performance Ratio (ZPR). Considering that not all Islamic Commercial Banks publish zakat data, this study applies panel data with purposive sampling technique to select only banks that consistently provide zakat data. This approach allows for in-depth exploration of differences between banks as well as dynamic aspects from 2021 to 2023.

2. LITERATURE REVIEW

Stakeholder Theory

According to Freeman, (1984), the concept of stakeholders includes all individuals or groups related to the achievement of a company's targets. They are not only affected by

decisions made by the company, but also have the ability to influence the decision-making process (Freeman & Phillips, 2002) .

Return On Assets

Return on Assets is an instrument used to determine how much an institution or bank can generate net profit from all their assets (Sholahudin, (2013) .

Capital Adequacy Ratio

Capital Adequacy Ratio is a percentage value that analyzes the level of financial institution's ability to prepare funds based on its capital to support its business expansion. In addition, this value also reflects the bank's capacity to overcome potential risk of loss arising from its operational activities (Muhammad, (2011) .

Non Performing Financing

Non Performing Financing is a situation where the proportion of credit experiencing payment problems is greater than the total funding distributed by the bank (Sugiono, 2009) .

Financing to Deposit Ratio

The Financing to Deposit Ratio functions to measure how easily banks can provide credit to clients with financial resources obtained from third parties (Bonita & Anggreyani, 2024) .

Zakat Performance Ratio

Zakat Performance Ratio is an important indicator in assessing the effectiveness of zakat and the financial performance of Islamic banks and provides information on how well banks distribute zakat from their net assets (Hatta et al., 2024)

Based on a theoretical review of the study findings logically, the hypothesis can be formulated as follows:

H1 : Capital Adequacy Ratio, Non Performing Financing, Financing to Deposit Ratio, and Zakat Performance Ratio have a joint effect on Islamic Commercial Banks 2021-2023

H2 : Capital Adequacy Ratio influences Return on Assets (ROA) in Islamic Commercial Banks 2021-2023

H3 : Non Performing Financing has an effect on Return on Assets (ROA) at Islamic Commercial Banks 2021-2023

H4 : Financing to Deposit Ratio has an effect on Return on Assets (ROA) in Islamic Commercial Banks 2021-2023

H5: Zakat Performance Ratio has an effect on Return on Assets (ROA) in Islamic Commercial Banks 2021-2023

3. METHODOLOGY

This study uses a quantitative method that emphasizes causal relationships, with the aim of analyzing the relationship between independent and dependent variables. This study

utilizes secondary data in panel format, which means that the information is collected indirectly from existing sources or documents. (Sugiyono, 2017) . According to Sugiyono (2020), Panel Data is a collection of cross-section and time-series data that allows further analysis of the variables studied. This study focuses on Islamic Commercial Banks (BUS), with data collection methods sourced from the official OJK website. The research population includes Islamic Commercial Banks that have been validated by OJK with a period spanning 2021 to 2023. This study conducted sampling based on certain and specific considerations that were relevant to the research objectives. Data collection was carried out through documentation methods to collect data from several official and trusted sources (Novianto, 2021) .

4. RESULTS AND DISCUSSION

Selecting a Regression Estimation Method for Panel Data

Common Effect Model

First, the common effect model or (CEM) is used. The results of this model analysis are as follows:

Table 1. Common Effect Model (CEM)

Variables	Coefficient	Std. Error	t-Statistic	Prob.
C	-6.496664	3.257648	-1.994281	0.0511
LOG(X1)	-0.793240	0.324831	-2.442006	0.0178
LOG(X2)	-0.058754	0.117577	-0.499704	0.6193
LOG(X3)	2.037704	0.702676	2.899918	0.0054
LOG(X4)	-0.419419	0.096975	-4.325033	0.0001

Source: Eviews Output 13, 2025

Fixed Effect Model

In the next step, the data is processed using the Fixed Effect Model (FEM) methodology to compare it with the general effect model (CEM) strategy. The results of the fixed effect (FEM) analysis are as follows:

Table 2. Fixed Effect Model (FEM)

Variables	Coefficient	Std. Error	t-Statistic	Prob.
C	-1.722681	1.575208	-1.093621	0.2793
LOG(CAR)	0.380737	0.219008	1.738457	0.0882
LOG(NPF)	-0.094974	0.087404	-1.086606	0.2823
LOG(FDR)	-0.036195	0.376411	-0.096159	0.9238

LOG(ZPR)	-0.403619	0.104582	-3.859369	0.0003
Effects Specification				

Source: Eviews Output 13, 2025

Chow Test

The Chow test is implemented in order to validate the more effective type of common effect (CEM) or fixed effect (FEM):

Table 3. Chow Test Results

Redundant Fixed Effects Tests

Equation: Untitled

Cross-section fixed effects test

Effects Test	Statistics	df	Prob.
Cross-section F	77.002890	(4.51)	0.0000
Cross-section Chi-square	117.091737	4	0.0000

Source: Eviews Output 13, 2025

The significance value of chi-square and F is 0.0000 (below 5%), and F-count 77.002890 is higher than F-table 2.539688635. The results conclude that the fixed effect model is the best for panel data regression.

Random Effect Model

The approach using the Random Effect Model (REM) is carried out as a type of comparison with the Fixed Effect Model (FEM):

Table 4. Random Effect Model (REM)

Variables	Coefficient	Std. Error	t-Statistic	Prob.
C	-6.496664	1.275062	-5.095176	0.0000
LOG(CAR)	-0.793240	0.127141	-6.239065	0.0000
LOG(NPF)	-0.058754	0.046020	-1.276691	0.2071
LOG(FDR)	2.037704	0.275032	7.408984	0.0000
LOG(ZPR)	-0.419419	0.037956	-11.05000	0.0000

Source: Eviews Output 13, 2025

Hausman test

This test is adopted in order to choose which type of regression is relevant between the random model (REM) and the fixed model (FEM):

Table 5. Hausman Test Results

Correlated Random Effects - Hausman Test

Equation: Untitled

Cross-section random effects test

Test Summary	Chi-Sq. Statistic	Chi-Sq. df	Prob.
Random cross section	308.011560	4	0.0000

Source: Eviews Output 13, 2025

output shows the random cross-section significance figure with a value of (0.0000 < 0.05). The fixed effect type is the right estimation model for panel data regression.

Panel Data Regression Analysis

Fixed Effects Model was selected as the most appropriate regression based on CEM, FEM, and REM analysis using E-Views:

Table 6. Fixed Effect Model

Variables	Coefficient	Std. Error	t-Statistic	Prob.
C	-1.722681	1.575208	-1.093621	0.2793
LOG(CAR)	0.380737	0.219008	1.738457	0.0882
LOG(NPF)	-0.094974	0.087404	-1.086606	0.2823
LOG(FDR)	-0.036195	0.376411	-0.096159	0.9238
LOG(ZPR)	-0.403619	0.104582	-3.859369	0.0003

Effects Specification

Cross-section fixed (dummy variables)

R-squared	0.935230	Mean dependent variable	-0.211258

Adjusted R-squared	0.925070SD dependent var	1.535735
SE of regression	0.420382Akaike information criterion	1.242174
Sum squared residual	9.012765Black criterion	1.556326
Log likelihood	-28.26523Hannan-Quinn critter.	1.365056
F-statistic	92.05036Durbin-Watson stat	1.111184
Prob(F-statistic)	0.000000	

Source: Eviews Output 13, 2025

The above equation can be interpreted below:

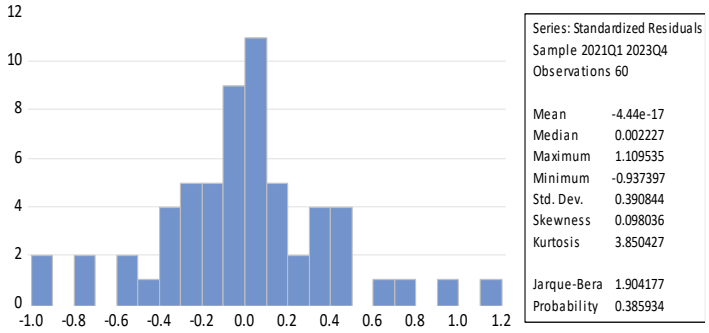
(ROA)= -1.72 + 0.38(CAR) - 0.09(NPF) - 0.04(FDR) - 0.40 (ZPR) + εit

1. Based on the results of the equation, it can be stated that the constant for ROA is -1.72, which states that without the influence of the independent variables (CAR, NPF, FDR, ZPR), ROA will be -1.72, which means that bank profitability is not achieved.
2. The regression coefficient for the Capital Adequacy Ratio (X1) is 0.38, which means that a 1% increase in CAR will increase ROA by 38%.
3. The regression coefficient for Non Performing Financing (X2) is -0.09, which means that a 1% increase in NPF will decrease ROA by 9%.
4. The regression coefficient for Financing To Deposit Ratio (X3) is -0.04, which indicates that every 1% increase in FDR will decrease ROA by 4%.
5. The regression coefficient for Zakat Performance Ratio (X4) is -0.40, which means that if it increases by 1%, ROA will decrease by 40%.

Normality Test Results

This study uses the Jarque-Bera normality test to examine the residual distribution in panel regression, where the regression model is considered normal if the probability value is above 0.05.

Table 7. Normality Test Results



Source: Eviews Output 13, 2025

It can be seen from the results of the Jarque-Bera normality test that has been carried out that there are symptoms of data not being normally distributed. So the data is transformed into log data. And based on the results of the normality test that has been transformed with log data as shown in the image above, it states that the probability level is 0.385934> 0.05, so the development of the log data transformation of the regression model is normal.

Classical Assumption Test Results
Multicollinearity Test

Table 8. Multicollinearity Test Results

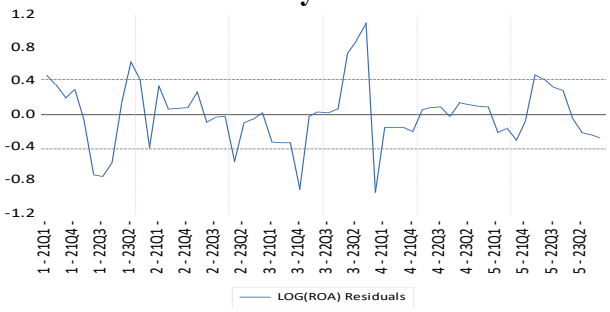
	LOG(CAR)	LOG(NPF)	LOG(FDR)	LOG(ZPR)
LOG(CAR)	1,000,000	0.125043	0.048204	-0.321854
LOG(NPF)	0.125043	1,000,000	-0.100035	0.256046
LOG(FDR)	0.048204	-0.100035	1,000,000	-0.535232
LOG(ZPR)	-0.321854	0.256046	-0.535232	1,000,000

Source: Eviews Output 13, 2025

It can be stated that there is no multicollinearity problem because all data values are less than 0.80 (<0.80) (Napitupulu et al., 2021: 141) .

Heteroscedasticity test

Table 9.
Heteroscedasticity Test Results



Source: Eviews Output 13, 2025

The residual values seen in the residual graph do not exceed the limits of 500 and -500, indicating that the residual variance is constant. Thus, no symptoms of heteroscedasticity were found or test results indicating the presence of this problem (Napitupulu et al, 2021) .

Autocorrelation Test

In autocorrelation testing, researchers apply the Durbin-Watson (DW) test to identify the presence of autocorrelation in a model.

Table 10. Autocorrelation Test Results

R-squared	0.935230Mean dependent variable	-0.211258
Adjusted R-squared	0.925070SD dependent var	1.535735
SE of regression	0.420382Akaike information criterion	1.242174
Sum squared residual	9.012765Black criterion	1.556326
Log likelihood	-28.26523Hannan-Quinn critter.	1.365056
F-statistic	92.05036Durbin-Watson stat	1.111184
Prob(F-statistic)	0.000000	

Source: Eviews Output 13, 2025

When viewed, the results of the autocorrelation test (DW) found the DW value to be 1.111184. Referring to the decision-making criteria according to Meiryani, (2021) , if the DW value is in the middle of -2 to +2, it can be stated that there is no autocorrelation in the model being tested.

Hypothesis Testing

F Test

Table 11. F Test Results

R-squared	0.935230
Adjusted R-squared	0.925070
SE of regression	0.420382
Sum squared residual	9.012765
Log likelihood	-28.26523
F-statistic	92.05036
Prob(F-statistic)	0.000000

Source: Eviews Output 13, 2025

Referring to the table, probability (F-statistic) 0.000000 < 0.05, this result states that the CAR, NPF, FDR, and ZPR elements together can significantly influence ROA.

Coefficient of Determination (R2)

Coefficient of Determination (R2) is a method with the function of assessing how well the effect on the dependent variable can be explained by the independent variable.

Table 12. F Test Results

R-squared	0.935230
Adjusted R-squared	0.925070
SE of regression	0.420382
Sum squared residual	9.012765
Log likelihood	-28.26523
F-statistic	92.05036
Prob(F-statistic)	0.000000

Source: Eviews Output 13, 2025

According to the results of the test (R2) with Adjusted R2 of 0.925070, it shows that the value of 92.50% of the ROA variable can be influenced by CAR, NPF, FDR, and ZPR, while 7.50% is given by other aspects that were not studied.

Result of t-Test (Partial Test)

To analyze the partial impact of each independent variable, such as CAR, NPF, FDR, and ZPR, on ROA individually.

Table 13. t-Test Results

Variables	Coefficient	Std. Error	t-Statistic	Prob.
C	-1.722681	1.575208	-1.093621	.2793
LOG(CAR)	0.380737	0.219008	1.738457	0.0882 *
LOG(NPF)	-0.094974	0.087404	-1.086606	0.2823
LOG(FDR)	-0.036195	0.376411	-0.096159	0.9238
LOG(ZPR)	-0.403619	0.104582	-3.859369	0.0003 **

Source: Eviews Output 13, 2025

According to Table 14, it can be interpreted:

CAR : Has a significant positive effect on ROA (T value = 1.738457; Significance 0.0882* < 0.010).

NPF : No Effect on ROA (T Value = -1.086606; Significance 0.2823 > 0.05).

FDR : No Effect on ROA (T Value = -0.096159; Significance 0.9238> 0.05).

ZPR : Negative Influence on ROA (T Value = -3.859369; Significance 0.0003** > 0.05)

The Influence of Capital Adequacy Ratio (CAR), Non Performing Financing (NPF), Financing to Deposit Ratio (FDR), Zakat Performance Ratio (ZPR) on Return on Assets (ROA) of Islamic Commercial Banks

The first hypothesis (H1) can be stated that CAR, NPF, FDR, and ZPR have a substantial impact on the ROA of Islamic Commercial Banks in 2021-2023. The findings of the F test produce a significance value with a value of 0.000 which is <0.05, which indicates a significant effect of these variables on ROA simultaneously. This finding is in line with existing studies such as the studies of Raharjo et al., (2020), Moorcy et al., (2020) , Iman & Umiyati, (2022) , and Hatta et al., (2024) which prove that the Capital Adequacy Ratio (CAR), Non Performing Financing (NPF), Financing to Deposit Ratio (FDR), and Zakat Performance Ratio (ZPR) have an effect on the ROA of Islamic Commercial Banks (2021-2023).

The Influence of Capital Adequacy Ratio on Return on Assets (ROA) of Islamic Commercial Banks

The findings reveal that the t-statistic for the CAR variable is 1.738457, with a probability of 0.0882, which is less than 0.10. This value indicates that CAR has a positive and substantial effect on ROA at a significance level of 0.10. Therefore, H2 is accepted, which states that the capital adequacy ratio has a good and quite high impact on the level of investment returns of Indonesian Islamic commercial banks in 2021-2023. CAR assesses the adequacy of a bank's capital to support and mitigate risks which in turn can affect financial performance. A higher CAR figure indicates a stronger bank financial performance.

These results are reinforced by research conducted by Moorcy et al., (2020) & Tami & Dewi, (2022) which revealed that the Capital Adequacy Ratio has a positive and significant impact on Return On Assets .

The Influence of Non Performing Financing (NPF) on Return on Assets (ROA) of Islamic Commercial Banks

According to the findings of this study, the NPF variable has a t-statistic value of -1.086606 and a probability of 0.2823 > 0.05. With this, it is proven that NPF has no impact on ROA. Therefore, H3 is rejected which assesses that Return on Assets at Islamic Commercial Banks in Indonesia during the 2021-2023 period is not influenced by Non-Performing Financing. This conclusion reveals that the financial performance of Islamic institutions is more significantly influenced by other variables. Although NPF is an important indicator of problematic financing, NPF is not the only factor that determines the success of ROA. Adhianto (2022) stated that Islamic banks can continue to implement problematic financing even though its prevalence is increasing. The results of this study are reinforced by research conducted by Raharjo et al. (2020), which shows that Return on Assets is not affected by Problematic Financing.

However, this is contrary to previous studies conducted by Raharjo et al., (2020) which prove that the ratio of non-performing financing does not affect Return On Assets . However, this is contrary to previous studies conducted by Moorcy et al., (2020) , and Hasanah & Riyadi, (2021) which state that Non -Performing Financing has an effect on ROA.

The Influence of Financing to Deposit Ratio on Return on Assets (ROA) of Islamic Commercial Banks

The findings of this study show that the FDR variable exceeds the threshold of 0.05 with a t-statistic of -0.096159 and a probability of 0.9238. Therefore, it can be said that the FDR variable does not have a substantial effect on Return on Assets (ROA). As a result, H4 is rejected, which concludes that the Financing to Deposit Ratio has no impact on ROA at Islamic Banks in Indonesia during the 2021-2023 period. The impact of this conclusion is that the profitability of Islamic banks does not necessarily increase with an increase in the FDR ratio, indicating that there are other factors that can have a more dominant impact on influencing financial performance.

The study conducted by Hasanah & Riyadi (2021) supports the findings of this study, showing that the Financing to Deposit Ratio has no effect on Return on Assets. However, this is in contrast to the findings of other studies conducted by Moorcy et al. (2020), Iman & Umiyati (2022), and Kharazi (2022) which revealed that the Financing to Deposit Ratio has an effect on ROA.

The Influence of Zakat Performance Ratio on Return on Assets (ROA) of Islamic Commercial Banks

The research findings state that the ZPR variable with a t-statistic of -3.859369 and a probability of 0.0003 is less than 0.05, so that ZPR plays a significant role in ROA. Thus, H5 is accepted, which indicates that Zakat Performance Ratio has a negative impact on ROA. Islamic Commercial Banks in Indonesia in 2021-2023. ZPR shows bank compliance with sharia principles and social duties, although it has the potential to reduce ROA, the importance of zakat as a mechanism for wealth redistribution is very important. (Hidayah et al., 2023)

Zakat has a significant role in helping the less fortunate and encouraging social development (Aroof et al., 2023) . Although zakat allocation can reduce net profit, its beneficial impact on society and the economy needs to be considered (Wardiwiyono et al., 2021) . In addition, effective zakat administration can improve public reputation and trust, thereby facilitating the sustainable growth of Islamic institutions (Alrasyid et al., 2021) . Zakat not only includes financial benefits, but also social responsibility and compliance with sharia norms (Arisandi, 2021).

The findings of this study are supported by Nasution et al. (2018) , who claim that the zakat performance ratio has a negative effect on Return on Assets.

5. CONCLUSION

Referring to the results of the studies that have been conducted, the research objectives can be formulated as follows:

1. Capital Adequacy Ratio, Non Performing Financing, Financing to Deposit Ratio, and Zakat Performance Ratio together have a significant effect on the Return on Assets of Islamic Commercial Banks in Indonesia (2021-2023).
2. Capital Adequacy Ratio has a significant positive effect on the Return on Assets of Islamic Commercial Banks in 2020-2023.
3. Non Performing Financing has no effect on the Return on Assets (ROA) of Islamic Commercial Banks in Indonesia (2021-2023).
4. Financing to Deposit Ratio has no effect on Return on Assets (ROA) of Islamic Commercial Banks in Indonesia (2021-2023).
5. Zakat Performance Ratio has a negative and significant effect on the Return on Assets of Islamic Commercial Banks in Indonesia (2021-2023).

THE EFFECT OF BI RATE, CAPITAL ADEQUACY RATIO AND OPERATING EXPENSES OPERATING INCOME ON THE PROFITABILITY OF ISLAMIC COMMERCIAL BANKS IN 2020-2023

Nabila Syifa Azzahra, Nur Diana, Dewi Diah Fakhriyyah

Faculty of Economic and Business, Universitas Islam Malang
E-mail: 22101083028@unisma.ac.id

Abstract

The banking sector plays an important role in supporting economic growth, acting as a mediator between parties with excess funds and parties in need of funds. Islamic banks, as one type of banking in Indonesia, operate based on sharia principles that avoid usury and replace it with a profit-sharing system. This study aims to determine the BI Rate, Capital Adequacy Ratio, and BOPO on the Profitability of Islamic Commercial Banks in the 2020-2023 period. Through quantitative methods, this study will answer the influence between variables, both partially. This study offers a new perspective by combining the latest data for the 2020-2023 period to comprehensively evaluate the financial performance of Islamic Commercial Banks. The results of this study found that partially, the BI Rate and BOPO did not have a significant effect on ROA. Since ROA is not affected by BI Rate, Islamic banks need to focus on diversifying financial products that are not too dependent on market interest rates, such as financing based on Islamic contracts (mudharabah, musyarakah, and others) and BOPO does not have a significant effect on ROA indicating that operational efficiency (BOPO) alone is not enough to increase profitability. While CAR shows a significant positive effect on ROA. Thus, high CAR, banks have the capacity to face credit, operational, and market risks better. This can improve financial stability, customer confidence, and long-term profitability.

Keywords: *BI Rate, CAR, BOPO, Profitability, Sharia Bank*

1. INTRODUCTION

The banking sector is an integral part of the development of every country in this era of rapid technological advancement, so it is impossible to isolate it from other financial sectors. The financial sector is very important for every field that drives rapid economic expansion. Banks must be able to continue to operate in the financial sector in order to continue to gain public trust. One of the many criteria used to evaluate the financial success of a bank is the bank's financial statements. (Meliana et al., 2024:174).

One of the parameters of Islamic banks to be able to increase public trust is through positive bank performance (Murtadha & Kornitasari, 2024:127). This is the perception of the general public regarding the bank's ability to carry out banking operations effectively, which can increase public trust in the use of financial services in the banking sector (Putera, 2020:134). Thus, public trust in using financial services is based on bank performance. The positive and negative performance of an Islamic bank can be indicated by how much profit or gain is obtained from its operational activities. One of the existing parameters is the profitability ratio to measure the company's financial performance. Islamic banks in Indonesia compete with each other to maximize profits, to achieve the highest possible profit margin

along with improving financial performance in the Islamic banking sector with increasing profitability.

Therefore, when assessing a bank's financial performance, Bank Indonesia (BI) prioritizes Return on Assets (ROA) over Return on Equity (ROE). Bank Indonesia pays more attention to ROA than ROE because Bank Indonesia analyzes bank profitability based on the assets used to obtain funds (Dendawijaya, 2005:29). ROA is more relevant than ROE in determining bank profitability because ROA is based on assets that are partly funded by public deposits (Elfadhli, 2022:25).

Mustabsyirah et al. (2024:61) stated that in general, the financial performance of Islamic banks shows better results compared to conventional banks in terms of liquidity. However, there are several ratios that show lower numbers in Islamic banks, such as the capital ratio, namely the Capital Adequacy Ratio (CAR) and the profitability ratio, namely ROA. These results indicate that Islamic banks need to improve their performance in terms of capital and profitability in order to compete effectively with conventional banks (Tang et al., 2024:43).

Zareta et al. (2024:352) shows that the analysis of financial ratios showed substantial differences between conventional and Islamic banks, especially in the ROA and ROE ratios, where conventional banks performed better. In addition, there were significant differences in the CAR and Operating Expenses to Operating Income (BOPO) ratios, where conventional banks had a higher CAR ratio and a lower BOPO ratio. However, this shows that the performance of conventional banks is better than Islamic banks in certain ratios, such as ROA, ROE, and BOPO. This study is in line with Eka Rimba (2022:72) the results showing differences in financial performance between conventional commercial banks and Islamic commercial banks, as measured by the ROA, ROE, Net Interest Margin / Net Operating Margin (NIM/NOM), BOPO and Non-Performing Loan / Non-Performing Financing (NPL/NPF) ratios. Overall, the financial performance of conventional commercial banks is superior to that of Islamic commercial banks. Thus, to improve competitiveness and performance, Islamic banks need to make improvements, especially in managing operational costs and improving asset quality. These steps are very important to increase the profitability and competitiveness of Islamic banks in the future.

Thus, this study aims to conduct a comprehensive analysis of the financial performance of Islamic banks in comparison with conventional banks, which focuses on measuring profitability using ROA as the main indicator. Considering the results of the study that have been presented above, previous performance reports indicate that the profitability of Islamic banks is generally lower than that of conventional banks, this study explores the influence of internal factors, namely and external factors that are the main determinants in the financial performance of Islamic banks. In the internal aspect, this study considers CAR and BOPO. Meanwhile, the external factor uses the BI Rate variable. Therefore, this study is expected to produce empirical insights that describe the comparative performance of Islamic banks.

External and internal factors are factors that influence profitability on banking performance. Herawati & Surya (2023:164)said that internal factors are factors related to the company, so they can be controlled by the company. Meanwhile, external factors are factors that refer to the environment outside the company, so they cannot be controlled by the company. Internal factors that will be discussed in this study include CAR and BOPO, while

external factors that will be studied are the BI Rate to measure the influence of external and internal factors on BUS profitability.

According to BI, BI Rate is a reference interest rate policy issued every month to represent the monetary policy adopted by BI since 1970. Research by Hasyim et al. (2023:179), Himma & Jaya (2024:24)and Sasmita & Anindyntha (2024:9)conducted the same research on BI Rate which resulted in BI Rate having a positive and significant effect on the profitability of Islamic banking. This is in contrast to the results of research by Anindya et al. (2022:134)and Syah (2018:133)which resulted in BI Rate having a significant negative effect on the profitability of Islamic Commercial Banks.

Based on the summary above, it is clear that the findings of the five studies are contradictory or inconsistent. The novelty of this study is combining external factors, namely the BI Rate and internal factors, namely CAR and BOPO to measure the profitability of Islamic Commercial Banks and using the most recent and latest data, namely 2020-2023.

2. LITERATURE REVIEW

Agency Theory

Agency theory, as explained Jensen & Meckling (1976), refers to the contractual relationship between two parties, namely the principal (shareholder) and the agent (manager). In this context, the agent is responsible for carrying out tasks that have been delegated by the principal, with the aim of acting in accordance with the interests of the principal , especially in decision making.

Profitability

According to Kasmir (2018)the profitability ratio is a ratio that assesses the company's capacity to create profit. The profitability ratio is used to assess the company's ability to create profit. This ratio also determines the success of the company's management. This is indicated by profit from sales and investment income. Overall, the use of this ratio shows the company's efficiency.

BI Rate

According to Rompas (2021:206)BI Rate is the amount of rupiah paid in return for the use of previous funds. When there is a change in interest rates, this reflects a change in the demand for money.

CAR

Capital Adequacy Ratio (CAR) is a measure that relates the amount of capital held by a bank to Risk-Weighted Assets. CAR is an important indicator in assessing the adequacy of a bank's capital. This capital adequacy is very crucial for banks to support business growth and to accommodate potential risks of losses that may occur (Pandia, 2012:31).

BOPO

BOPO is an efficiency ratio, which is used to assess the ability of bank management

to control operational costs against operational income. (Pandia, 2012:72).

Research Hypothesis

Based on a theoretical review of the results of the empirical study, the hypothesis that can be formulated is as follows:

H1 : BI Rate has a significant effect on the Profitability of Islamic Commercial Banks in 2020-2023.

H2 : CAR has a significant impact on the Profitability of Islamic Commercial Banks in 2020-2023.

H3 : BOPO has a significant effect on the Profitability of Islamic Commercial Banks in 2020-2023.

3. METHODOLOGY

In the context of this research, the characteristics it has indicate that this is a correlational study. In general, the term correlation refers to the existence of a relationship between two or more variables. However, the understanding of correlation can be expanded further. Correlational research is a method of quantitative data analysis in which two or more variables are considered correlated if one variable changes consistently followed by changes in the other variable, either in the same direction (positive correlation) or in the opposite direction (negative correlation).

This study is a quantitative method and focuses on Islamic Commercial Banks (BUS), with data collection conducted through the official OJK (Novianto et al, 2023). The time span of this study was from November 2024 to January 2025. The population studied included Islamic Commercial Banks registered with the OJK during the period 2020 to 2023. The data collection method used in this study was documentation, where data was collected from various official and trusted sites. The data collected included the BI Rate, Capital Adequacy Ratio (CAR), and data on the ratio of Operating Costs to Operating Income (BOPO).

4. RESULTS AND DISCUSSION

Multicollinearity Test

Multicollinearity tests were conducted to analyze tolerance and variance inflation factor (VIF) values.

Table 1. Multicollinearity Test Results
Coefficients [a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	3,124	1,210		2,583	,013		
	BI Rate	-,039	,038	-,147	-1,043	,303	,546	1,832
	CAR	,053	,018	,400	2,902	,006	,571	1,751

	BOPO	-,029	,010	-,482	-2,825	,007	,373	2,685
a. Dependent Variable: ROA								

Data source: SPSS Output Results 27, 2024

Based on the information from table 4, it can be concluded that there is no multicollinearity between each independent variable, because the tolerance value is above 0.01 and the VIF value is less than 10.

Autocorrelation Test

In autocorrelation testing, researchers apply the Durbin-Watson test . The Durbin-Watson (DW) test is used to test for autocorrelation in the residuals of a linear regression model.

Table 2. Durbin-Watson Test Results
Model Summary [b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	,569 [a]	,324	,309	,14541802	1,854

a. Predictors: (Constant), LAG_RES

b. Dependent Variable: Unstandardized Residual

Data source: SPSS Output Results 27, 2024

Based on the model analysis presented in table 5 above, it can be seen that the Durbin-Watson value shows a value of dU < DW < 4 – dU (1.6692 < 1.854 < 2.3308), so it can be concluded that there is no autocorrelation.

Heteroscedasticity Test

The heteroscedasticity test aims to determine whether there is inequality in residual variance between observations. In this study, the test used is the Park Test.

Table 3. Heteroscedasticity Test Results
Coefficients [a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-12,337	9,473		-1,302	,200
	LAG_X1	-,251	,787	-,052	-,319	,751
	LAG_X2	-,327	,371	-,151	-,881	,383
	LAG_X3	,295	,175	,316	1,687	,099

a. Dependent Variable: LN_RES

Data source: SPSS Output Results 27, 2024

Based on table 6, the results of the heteroscedasticity test show that the significance value for each variable is greater than α > 0.05. The significance value for the BI Rate is recorded at 0.751, for CAR at 0.383, and for BOPO at 0.099. Thus, it can be concluded that the regression equation model does not experience heteroscedasticity problems.

Results of Multiple Linear Regression Analysis

The purpose of this test is to identify the influence of independent variables (BI Rate, CAR and BOPO) on the dependent variable (ROA), both individually and as a whole.

Table 4. Results of Multiple Linear Regression Analysis
Coefficients [a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	,519	,645		,805	,425
	LAG_X1	,011	,054	,034	,208	,836
	LAG_X2	,051	,025	,348	2,014	,050
	LAG_X3	-,007	,012	-,111	-,586	,561

a. Dependent Variable: LAG_Y

Data source: SPSS Output Results 27, 2024

ROA = α + β1X1+ β2X2+ β3X3 + ε

ROA = ROA = 0.519 + 0.011 X1 + 0.051 X2 – 0.007 X3 + ε

Sig 0.0836 0.050 0.561

Model Test Results

Model testing is an estimation process that determines whether the independent variables in a regression model have a significant effect on the dependent variable.

Table 5. Model Test Results
ANOVA [a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	,206	3	,069	3,446	,025 [b]

	Residual	,857	43	,020		
	Total	1,063	46			

a. Dependent Variable: LAG_Y

b. Predictors: (Constant), LAG_X3, LAG_X1, LAG_X2

Data source: SPSS Output Results 27, 2024

Based on table 8, it can be concluded that the F value is 3.446 with a significance value of 0.025, which is smaller than 0.05. Because the significance value is below α <0.05, it can be concluded that testing this model has a significant effect on ROA.

Results of the Determination Coefficient (R2)

The coefficient of determination (R Square) is an estimation method used to measure how much variation in the dependent variable can be explained by the independent variables.

Table 6. Results of the Determination Coefficient Test (R2)
Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,440 [a]	,194	,138	,14119

a. Predictors: (Constant), LAG_X3, LAG_X1, LAG_X2

Data source: SPSS Output Results 27, 2024

Based on table 9, the R Square value is recorded at 0.194. This figure shows that 19.4% of the ROA variable is influenced by the BI Rate, CAR and BOPO variables. Meanwhile, the rest is influenced by other variables outside the analyzed model.

t-Test Results

The t-test is used to analyze the influence of each independent variable, namely BI Rate, Capital Adequacy Ratio (CAR), and Operating Expenses Operating Income (BOPO), on Return on Assets (ROA) partially.

Table 7. t-Test Results
Coefficients [a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	,519	,645		,805	,425
	LAG_X1	,011	,054	,034	,208	,836
	LAG_X2	,051	,025	,348	2,014	,050

LAG_X3	-,007	,012	-,111	-,586	,561

a. Dependent Variable: LAG_Y

Data source: SPSS Output Results, 2024

Based on Table 10 it can be concluded:

BI Rate : Does not have a significant effect on ROA (t value = 0.208; significance 0.836 > 0.05).

CAR : Has a significant positive effect on ROA (t value = 2.014; significance 0.050 = 0.05).

BOPO : No significant effect on ROA (t value = -0.586; significance 0.561 > 0.05).

The Influence of BI Rate, Capital Adequacy Ratio (CAR) and Operating Expenses Operating Income (BOPO) on Return on Assets (ROA) of Islamic Commercial Banks in 2020-2023

The first hypothesis (H1) in this study states that BI Rate, CAR and BOPO have a significant effect on ROA of Islamic Commercial Banks during 2020 to 2023. This study shows a significance value of the F test of 0.025, which is smaller than 0.05, which indicates that BI Rate, CAR and BOPO have a significant effect on ROA simultaneously. The results of this study are in line with research by Sholichatunnisa & Mariana (2022), which states that BI Rate, CAR and BOPO simultaneously have a significant effect on the ROA of Islamic Commercial Banks. ROA functions as an indicator to assess the ability of Islamic banks to generate overall profits. A higher ROA value indicates that the Islamic bank is able to obtain a higher level of profit (Yuliana & Listari, 2021).

The Influence of BI Rate on Return on Assets (ROA) of Islamic Commercial Banks in 2020-2023

The results of the study show that the BI Rate variable has a significance value of 0.836, which is greater than 0.05, it can be concluded that the BI Rate has no effect on Return on Assets (ROA) and indicates that any increase in the BI Rate does not contribute to an increase in Return on Assets (ROA). These results indicate that H1 is rejected and H0 is accepted. accepted, which states that the BI Rate variable has no effect on ROA. This study is supported by research Imaduddin & Nursito (2023)stating that although the BI Rate fluctuates, either an increase or a decrease, the performance of Return on Assets (ROA) does not show significant changes due to the movement of the BI Rate . One reason that can explain this condition is that Islamic bank customers tend to be loyal and have principles that are oriented towards profit and falah (happiness in the world and the hereafter). Therefore, even though the BI Rate increases, customers are not interested in moving their funds because they already have a strong commitment to sharia principles. This result is reinforced by research Istan & Fahlevi (2020)and Muhammad Irsyad et al. (2024)which shows that the BI Rate has no effect on BUS ROA.

The Influence of Capital Adequacy Ratio (CAR) on Return on Assets (ROA) of Islamic Commercial Banks in 2020-2023

The results of the study show that the CAR variable has a significance value of 0.050, which is equivalent to 0.05, it can be concluded that CAR has a significant positive effect on ROA and every one unit increase in the CAR ratio can contribute to an increase in ROA. This shows that H2 is accepted and H0 is rejected. rejected, which states that the CAR variable has a significant positive effect on ROA. This study is in line with Salsabila et al. (2023)the one that shows that a high CAR ratio will cause an increase in the ROA ratio. The greater the CAR value, the higher the profit obtained by the bank. This shows a relationship between the level of capital adequacy and the rate of return on assets, which in turn can generate the expected profit. The results of this study are also supported by Nura et al. (2023)and Putra (2020)which states that the CAR variable has a significant positive effect on the ROA of Islamic Commercial Banks.

The Influence of Operating Expenses on Operating Income (BOPO) on Return on Assets (ROA) of Islamic Commercial Banks in 2020-2023

The results of the study show that the BOPO variable has a significance value of 0.561, which is greater than 0.05, it can be concluded that BOPO has no effect on ROA and shows that every one unit increase in the BOPO ratio does not contribute to an increase in ROA. This shows that H3 is rejected and H0 is accepted, which states that the BOPO variable has no significant effect on ROA. In this research period, namely 2020-2023, which includes the COVID-19 pandemic, the results show that BOPO has no effect on ROA. The pandemic has created uncertain economic conditions, where the banking sector faces great pressure in maintaining operations (Siska et al., 2021). BOPO does not always have a significant effect on ROA because both measure different aspects of performance and are not always directly related. BOPO emphasizes more on operational efficiency, while ROA is a profitability indicator that measures the extent to which a bank is able to optimize assets to generate net income (Budiansyah, 2023). In practice, a bank can have a low BOPO (efficient) but still generate low ROA if the bank's assets are not productive or do not generate sufficient income, such as in the case of high Non-Performing Loans (NPL) (Ahmad & Puspitasari, 2020). Thus, it cannot be concluded that BOPO always has a significant effect on ROA, because both measure different aspects of performance and are influenced by various other factors in the banking industry.(Ramadhan & Amalia, 2023). Antika et al. (2024)explains that BOPO is an important measure in assessing the operational efficiency of a bank . According to Kasmir (2019)Banks that record large profits are not always considered efficient, because the operational efficiency of banks is measured through the BOPO ratio. High BOPO indicates that most of the bank's income is used to cover its operational costs. As a result, even though the bank is able to generate significant profits, its operational performance is not necessarily optimal or efficient. Hery (2015)explains that in the banking world, the efficiency ratio has a strong relationship with BOPO, which is the main indicator for measuring the operational efficiency of a bank. The smaller the BOPO value, the better the bank's ability to manage its resources. However, operational efficiency is not always directly proportional to the level of profitability. The results of this study are supported by Qhotimah et al. (2023)and Gunawan et al. (2020)which explain the results that BOPO has no effect on Return on Assets (ROA).

5. CONCLUSION

The objectives of the research from the results of the research that has been carried out, can be concluded as follows:

1. BI Rate has no significant effect on Return on Assets (ROA) of Islamic Commercial Banks in 2020-2023.
2. Capital Adequacy Ratio (CAR) has a significant positive effect on Return on Assets (ROA) of Islamic Commercial Banks in 2020-2023.
3. Operating Expenses Operating Income (BOPO) does not have a significant effect on the Return on Assets (ROA) of Islamic Commercial Banks in 2020-2023.

Abstract

This study aims to determine the effect of the implementation of the e-registration and e-filing systems on individual taxpayer compliance in Randuagung village, Singosari, Malang. with internet understanding as a moderating variable. A total of 100 respondents were selected as the research sample using the Slovin formula, but only 99 questionnaires were eligible for processing. The sampling technique employed in this study was purposive sampling. This study is categorized as quantitative research, with data collected through a survey method by distributing questionnaires. The data analysis technique used in this study is Moderated Regression Analysis (MRA). The results indicate that the implementation of the e-registration system has a negative effect on taxpayer compliance. The implementation of the e-filing system has a positive effect on taxpayer compliance. Internet understanding can moderate the effect of the implementation of the e-registration and e-filing systems on taxpayer compliance.

***Keywords**: E-registration, e-filing, internet understanding, taxpayer compliance.*

1. INTRODUCTION

Taxes are one of the main sources of state revenue, with about two-thirds of state revenue coming from taxes. Among the various types of taxes in Indonesia, income tax has the largest contribution in increasing tax revenue which continues to increase every year (Ozbalkan et al., 2004). The ratio of total tax revenue to Gross Domestic Product (GDP) or tax ratio in Indonesia tends to increase, except for 2020 which has decreased due to Covid-19. In 2023 the tax ratio experienced a slight decrease of 0.7% from 2022. As for the tax ratio as of the end of October 2024, Minister of Finance Sri Mulyani said it had reached 10.02%. Based on the following graph, the tax ratio level is still relatively low when compared to the tax ratio in 2023 which reached 10.31%. However, the target is still in line with the government's target this year which is in the range of 9.92% to 10.2% (Kompas.com, 2024). This shows that there is still an opportunity to increase the tax ratio in Indonesia.

Tax according to KUP Law No. 28 of 2007 Article 1 paragraph 1 is a mandatory contribution imposed by the government on each individual or entity that is compelling in nature by providing indirect rewards. This contribution is used for state functions aimed at improving the welfare and prosperity of the people. Over time, taxes have undergone various changes and adjustments to keep up with economic and social dynamics. The form of these changes and adjustments is tax digitalization, which brings various innovations in the tax administration system. Tax digitalization has brought various significant benefits to the tax

system in Indonesia. One of the main benefits is the increased efficiency of tax administration. In addition, digitization also increases transparency and accountability, thereby reducing the potential for fraud and tax evasion. With information technology, tax authorities can conduct more effective monitoring of taxpayer compliance. With this, it is expected that the queue of taxpayers coming to the Tax Office can be minimized.

Taxpayer compliance is defined as the actions of a taxpayer who fulfills all his tax obligations and utilizes all his rights in accordance with applicable tax regulations (Ersania & Merkusiwati, 2018). Internal and external factors affect taxpayer compliance. Internal factors come from the taxpayer himself and are related to individual characteristics that trigger him to carry out his tax obligations. Meanwhile, factors that come from outside the taxpayer, such as conditions and the surrounding environment, are called external factors (Jotopurnomo & Mangoting, 2013).

The implementation of e-registration and e-filing systems is an important factor in improving taxpayer compliance in the digital era. E-filing enables online tax return reporting through the DGT portal, while e-registration facilitates the registration of taxpayers and the confirmation of taxable entrepreneurs digitally. E-registration and e-filing were developed by DGT with the hope of making it easier for taxpayers to fulfill their tax obligations, particularly to register and report their taxes. This system is private without going through other parties and can be accessed free of charge (Pradnyana & Prena, 2019).

Urban communities benefit from Information and Communication Technology (ICT) infrastructure development earlier than rural communities, which has triggered the digital divide (Subiakto, 2013). Initially, the digital divide was only related to access to technology (first-tier divide), but then evolved into a gap in the ability to use it (second-tier). Furthermore, a new gap emerged related to the perception of the need to continue using digital technology (Putri, 2023). Therefore, internet understanding also plays a role in increasing taxpayer compliance. This factor functions as a moderating variable that can strengthen or weaken the effect of tax digitalization. A good understanding of the internet allows taxpayers to access and utilize tax features optimally, keep abreast of regulatory developments, and increase efficiency in implementing tax obligations, which ultimately encourages overall tax compliance.

2. LITERATURE REVIEW

Technology Acceptance Model (TAM)

TAM is a concept used to describe and predict the extent to which users accept technology. This model was first introduced by Fred Davis in 1986 and is the result of the development of the Theory of Reasoned Action (TRA). This model is commonly used to analyze factors that influence whether or not an information system is accepted.

According to Davis 1986 in (Gupta et.al, 2015) technology acceptance model states that technology acceptance depends on two main factors, namely Perceived Ease of Use (PEoU), namely how much effort users think is needed to operate a new information system and

Perceived Usefulness (PU), namely users' beliefs that using a new system will improve their task performance.

Compliance Theory

Compliance theory, introduced by Stanley Miligram in 1963, is a theoretical concept that aims to understand why and how individuals or groups comply with certain rules, laws, or policies.

In sociological studies, there are two main approaches used to understand compliance with the law, namely the instrumental perspective and the normative perspective. The instrumental perspective assumes that individuals are driven by self-interest and will adjust their behavior based on changes relevant to those interests. In contrast, the normative perspective focuses on moral values that transcend personal interests (Marlinah, 2018).

Taxpayer Compliance

In general, taxpayer compliance is an action that shows awareness and obedience to tax payment and reporting obligations (Agun et.al, 2022). There are two types of tax compliance, namely formal compliance, where taxpayers fulfill obligations according to formal rules in tax regulations, and material compliance, where taxpayers comply with the substance stipulated in the tax law (Pratama et al., 2020).

According to the Minister of Finance Regulation Number 192/PMK.03/2007, the criteria for taxpayers who are said to be obedient taxpayers if they submit tax returns on time, do not have tax arrears for all types of taxes, except for arrears that have received permission to be paid in installments or postponed payment, financial reports audited by a Public Accountant or government financial supervision institution with an unqualified opinion for three consecutive years and have never been convicted of a tax crime based on a court decision that has permanent legal force in the last five years.

E-registration

Based on Directorate General of Taxes Regulation Number Per-20/PJ/2013 e-registration is a facility for taxpayer registration or business reporting to be recognized as a Taxable Entrepreneur (PKP), changes in taxpayer or PKP data, taxpayer transfer, NPWP removal, and revocation of PKP confirmation that can be accessed via the internet that is directly connected online with the Directorate General of Taxes.

E-registration serves to assist the tax administration process efficiently without the need to visit the tax office directly. The system also supports data accuracy, and accelerates the registration and data change process. The implementation of e-registration is expected to support more inclusive tax digitalization efforts and improve tax compliance among taxpayers.

E-filing

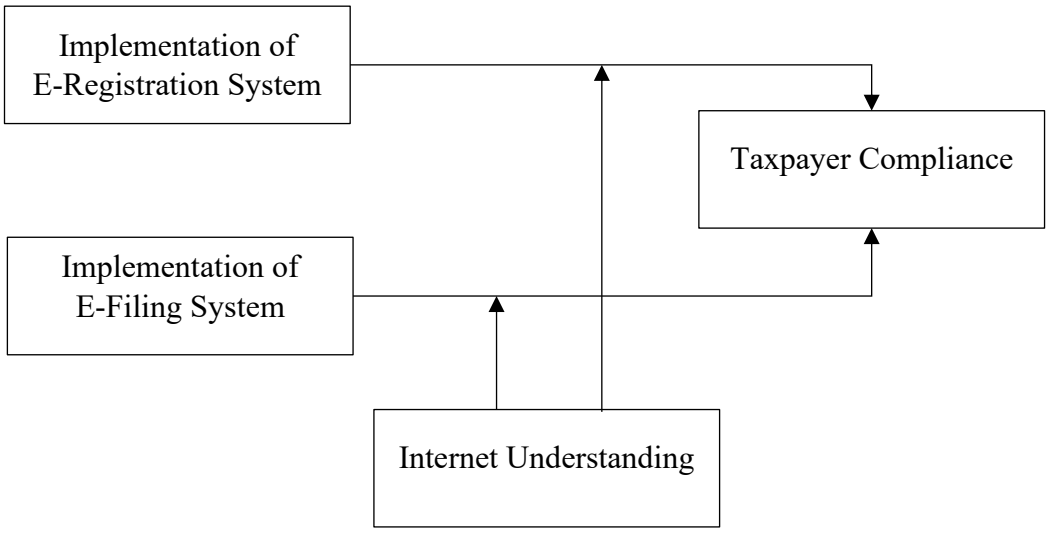
E-filing is an online tax reporting system that allows taxpayers to report their taxes via the internet without being limited by place and time.

Based on Directorate General of Taxes Regulation Number Per-01/PJ/2014, e-filing is defined as a means used to submit annual tax returns electronically which is done online and real-time via the internet. This process can be done through the official website service of the Directorate General of Taxes (DGT) or through an application service provider (ASP).

Internet Understanding

The internet is a form of modern information that is a communication medium that is widely used throughout the world, through interconnection between computer networks connected through internet access providers (Rachmawati et.al, 2022).

According to the KBBI, understanding comes from the word paham, which means clever or understanding something well. Based on this explanation, internet understanding is the ability to really understand and comprehend how the internet works and uses.



3. RESEARCH METHODS

This research is quantitative research with survey data collection techniques through distributing questionnaires. According to Sugiyono (2013) quantitative methods, which are based on the philosophy of positivism, are known as traditional methods because they fulfill scientific rules such as objectivity, measurable, and systematic.

In this study, the data source used is using primary data. This data is obtained directly by researchers during the research process in the field (Syafnidawaty, 2020). Primary data in this study were obtained by distributing questionnaires directly to people who have worked and have livelihoods as employees and self-employed in Randuagung Village, Singosari.

4. RESEARCH RESULTS AND DISCUSSION

Research Result

Overview

This research was conducted in Randuagung Village, Singosari Subdistrict. Respondents in the study were Randuagung villagers who had worked and had livelihoods as employees and self-employed. The population of respondents was 4,173 people, and by calculating using the Slovin formula, a research sample of 100 respondents was obtained. Data was obtained by distributing questionnaires directly to respondents. The questionnaire that can be processed is only 99 respondents.

Table 1. Questionnaire Distribution

No.	Describption	Total	Percentage
1	Questionnaires distribted	100	100%
2	Questionnaires not returned	(0)	0%
3	Incomplate questionnaiere filling	(1)	(1%)
3	Questionnaires that can be processed	99	99%

Source: primary data processed, 2025

Based on the data obtained, the largest number of respondents who filled out the questionnaire were male respondents, namely 69 or 69.70% and the remaining 30 or 30.30% were female respondents. Based on the age of the respondents who filled out the questionnaire, most of them were 31-40 years old, namely 36 people or 36.37%. While the age of 20-30 years as many as 32. people or 32.32%, aged 41-50 years as many as 18 people or 18.18%, aged 51-60 years. 11 people or 11.11%, and age> 60 years as many as 2 people or 2.02%.

Validity Test

The validity of the instrument in this study was assessed by comparing the calculated r value with the r table value. Terms are said to be valid an instrument if the value of r count table. In this study r table df (99-2)=0.197. The validity test results can be seen in the following table:

Table 2. Validity Test

Variables	R count	R table	Descriptions
Implementation of e-registration system	0,896	0, 197	Valid
Implementation of e-filing system	0,758	0, 197	Valid
Taxpayer Compliance	0,869	0, 197	Valid
Internet Understanding	0,769	0, 197	Valid

Source: primary data processed, 2025

Based on table 2, it can be seen that the results of the validity test of the variable Implementation of e-registration system (X1), the Implementation of e-filing system (X2), taxpayer compliance (Y) and internet understanding (Z) state that the value of r count r table, it can be concluded that the data in the study is declared valid.

Reliability Test

In this study, the reliability test used the Cronbach's Alpha analysis technique. The Cronbach's Alpha value is acceptable or said to be reliable if the value is 0.60. The results of the Reliability test can be seen in the following table:

Table 3. Reability Test

Variables	*Cronbach's Alpha*	Reliability Criteria	Description
Implementation of e-registration system	0,835	> 0,60	Reliabel
Implementation of e-filing system	0,911	> 0,60	Reliabel
Taxpayer Compliance	0,863	> 0,60	Reliabel
Internet Understanding	0,842	> 0,60	Reliablel

Source: primary data processed, 2025

Based on table 3, it can be seen that the results of the Reliability test of the variable Implementation of e-registration system (X1), the Implementation of e-filing system (X2), taxpayer compliance (Y) and internet understanding (Z) state that the Cronbach's Alpha value 0.60, it can be concluded that the data in this study are declared reliable.

Normality Test

The normality test in this study can be said to be normally distributed if the significance value is 0.05. This research test uses the Kolmogorov Smirnov statistical test. The test results can be seen in the following table;

Table 4. Normality Test

One-Sample Kolmogorov-Smirnov Test					
		Implementation of e-registration system	Implementation of e-filing system	Taxpayer Compliance	Internet Understanding
N		99	99	99	99
Normal Parameters[a,b]	Mean	16.84	62.84	21.19	24.30
	Std. Deviation	2.113	6.022	2.506	2.690
Most Extreme Differences	Absolute	.077	.109	.156	.112
	Positive	.077	.109	.147	.112
	Negative	-.063	-.062	-.156	-.062
Test Statistic		.077	.109	.156	.112
Asymp. Sig. (2-tailed)[c]		.165	.057	.064	.072

Source: primary data processed, 2025

Based on the test results in table 4, it shows that the asymp.sig (2-tailed) value of the variable e-registration system implementation (X1), e-filing system implementation (X2),

taxpayer compliance (Y) and internet understanding (2.) is greater than 0.05, so it can be concluded that the data in this study is normally distributed.

Multikolinierity Test

In this study, to detect the presence of multicollinearity, the correlation matrix analysis of the independent variables was evaluated through the Variance Influation Factor (VIF). VIF value <10 or tolerance value> 0.10 then it can be stated that there is no multicollinearity. The multicollinearity test results can be seen in the following table:

Table 5. Multikolinearity Test

Coefficients[a]								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	9.070	1.495		6.066	.000		
	Implementation of e-registration system	-.848	.067	-.715	-12.707	.000	.722	1.385
	Implementation of e-filing system	.426	.025	.937	17.376	.000	.657	1.521
	Internet Understanding	-.016	.047	.102	-.346	.730	.892	1.120
a. Dependent Variable: Taxpayer Compliance								

Source: primary data processed, 2025

Based on the multicollinearity test results in table 5, it can be seen that the variables of the Implementation of e-registration system (X1), the Implementation of e-filing system (X2), understanding the internet (Z) show a VIF value of less than 10 and a tolerance value of more than 0.10, so it can be concluded that in this study there is no multicollinearity.

Heteroskedasticity Test

The heteroscedasticity test is carried out by statistical testing using the Glejser test. The results of the heteroscedasticity test can be seen in the following table:

Table 6. Heteroskedasticity Test

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1.940	.854		2.271	.025
	Implementation of e-registration system	.027	.038	.083	.698	.487
	Implementation of e-filing system	-.010	.014	-.091	-.728	.468

	Internet Understanding	-.033	.027	-.131	-1.222	.225
a. Dependent Variable: ABS_RES						

Source: primary data processed, 2025

Based on the test results in table 6, it can be seen that the variables of Implementation of e-registration system (X1), Implementation of e-filing system (X2) and understanding the internet (2) have a Sig, value greater than 0.05, it can be concluded that this study does not occur heteroscedasticit.

Multiple Linear Analysis Test

Multiple regression is a test conducted to determine the effect of the independent variable on the dependent variable. In this test, regression equation 1 is obtained as follows:

$$Y = \alpha + \beta_1 X_1 + \beta_2 X_2 + e \ldots\ldots\ldots (1)$$

Description:

Y = Taxpayer compliance

a = Constant coefficient

β = Regression coefficient

X_1 = Implementation of e-registration system

X_2 = Implementation of e-filing system

e = Error, nuisance variable

The results of multiple linear tests can be seen in the following table:

Table 7. Equation 1: Multiple Linear Regression

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	8.817	1.298		6.794	.000
	Implementation of e-registration system	-.847	.066	-.714	-12.763	.000
	Implementation of e-filing system	.424	.023	1.019	18.203	.000
a. Dependent Variable: Taxpayer Compliance						

Source: primary data processed, 2025

The equation can be described as follows:

1. The coefficient value of the Implementation of e-registration system (X1) of -0.847 indicates that any increase in the Implementation of e-registration system (XI) will reduce taxpayer compliance.

2. The coefficient value of the Implementation of e-filing system (X2) of 0.424 indicates that each increase in the Implementation of e-filing system (X2) will increase taxpayer compliance by 0.424.
3. The calculated F value is 172.714 and a significant value of 0.000. It can be concluded that the significant value of 0.000 <0.05, which means that there is a simultaneous influence between the variables of the Implementation of e-registration system (XI) and the Implementation of e-filing system (X2) on the taxpayer compliance variable (Y).
4. The Adjusted R square value is 0.778 or 77.8%. This value is close to 1, which means that the variable Implementation of e-registration system (X1) and the Implementation of e-filing system (X2) are able to explain the variation in the taxpayer compliance variable (Y) by 77.8% and the remaining 22.2% is explained by other predictors not examined.
5. The t test value of the e-registration system application variable (X1) is -12.763 and a significant value of 0.000 <0.05, then H1 is accepted, meaning that the Implementation of e-registration system (X1) affects the taxpayer compliance variable (Y) with a negative coefficient direction. The t test value of the e-filing system application variable (X2) is 18.203 and a significant value of 0.000 <0.05, then H2 is accepted, meaning that the Implementation of e-registration system (X1) affects the taxpayer compliance variable (Y) with a positive coefficient direction.

Moderated Regression Analysis Test (MRA)

This regression analysis is used to see whether the moderating variable can moderate or not moderate the effect of the independent variable on the dependent variable. In this test, the regression equation 2 is obtained as follows:

$$Y = \alpha + \beta_1 X_1 + \beta_2 X_2 + \beta_3 Z + \beta_4 X_1 * Z + \beta_5 X_2 * Z + e \ldots\ldots\ldots (2)$$

Description:

Y = Taxpayer compliance

a = Constant coefficient

β = Regression coefficient

X_1 = Implementation of e-registration system

X_2 = Implementation of e-filing system

Z = Internet Understanding

e = Error, nuisance variable

The results of the moderated regression analysis test can be seen in the following table:

Table 8. Equation 2: MRA

Coefficients[a]				
Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.

		B	Std. Error	Beta

	Implementation of e-registration system	-1.959	.221	-1.652	-8.851	.000
	Implementation of e-filing system	.199	.085	.479	2.343	.021
	Internet Understanding	-1.452	.103	-1.559	-14.129	.000
	Penerapan sistem e-registration*Internet Understanding	.053	.009	1.483	5.621	.000
	Penerapan sistem efiling*Internet Understanding	.009	.004	.911	2.513	.014
a. Dependent Variable: Taxpayer Compliance						

Source: primary data processed, 2025

The equation can be described as follows:

1. The constant value (a) of 41.684 indicates that without the application of the e-registration and e-filing system, the value of taxpayer compliance is 41.684.
2. The coefficient value of the Implementation of e-registration system (X1) of -1.959 indicates that any increase in the Implementation of e-registration system (X1) will reduce taxpayer compliance.
3. The coefficient value of the Implementation of e-filing system (X2) of 0.199 indicates that each increase in the value of the Implementation of e-filing system (X2) will increase taxpayer compliance by 0.199.
4. The coefficient value of the interaction of the Implementation of e-registration system (X1) with internet understanding (Z) of 0.053 indicates that each increase in the Implementation of e-registration system (X1) with internet understanding (Z) will increase taxpayer compliance by 0.053.
5. The coefficient value of the interaction of the Implementation of e-filing system (X2) with internet understanding (Z) of 0.009 indicates that every increase in the Implementation of e-filing system (X2) with internet understanding (Z) will increase taxpayer compliance by 0.009.
6. The calculated F value is 443.780 and a significant value of 0.000. It can be concluded that the significant value of 0.000 <0.05, which means that there is a simultaneous influence between the variables of the Implementation of e-registration system (X1), the Implementation of e-filing system (X2), the Implementation of e-registration system (X1) internet understanding (Z), the Implementation of e-filing system (X2) internet understanding (Z) on the taxpayer compliance variable (Y).
7. The Adjusted R square value is 0.958 or 95.8%. This value is close to 1, which means that the variables of the Implementation of e-registration system (X1), the Implementation of e-filing system (X2), the Implementation of e-registration system (X1) internet understanding (2), the Implementation of e-filing system (X2) internet understanding (Z) are able to explain variations in the taxpayer compliance variable (Y) by 95.8% and the remaining 4.2% is explained by other predictors not examined.

8. The t test value of the e-registration system application variable (XI) is -8.851 and a significant value of 0.000 0.05, then **H1 is accepted**, meaning that the Implementation of e-registration system (X1) has an effect on the taxpayer compliance variable (Y) with a negative coefficient direction. The t-test value of the e-filing system application variable (X2) is 2.343 and a significant value of 0.000 0.05, then **H2 is accepted**, meaning that the Implementation of e-registration system (XI) affects the taxpayer compliance variable (Y) with a positive coefficient direction. The t test value of the variable Implementation of e-registration system (X1)* internet understanding (Z) is 5.621 with a significant value of 0.000 0.05, then **H3 is accepted**, meaning that internet understanding (Z) can moderate the relationship between the Implementation of e-registration system (X1) on taxpayer compliance (Y). The t test value of the variable e-filing system application (X2) internet understanding (Z) is 2.513 with a significant value of 0.014 0.05, then **H4 is accepted**, meaning that internet understanding (Z) can moderate the relationship between the Implementation of e-filing system (X2) on taxpayer compliance (Y).

Discussion

1. The effect of implementing an e-registration system on taxpayer compliance

Based on the test results, the variable Implementation of e-registration system (X1) has a t-count of -8.851 and a significant value of 0.000 smaller than 0.05, so HO is rejected and HI is accepted, meaning that the variable Implementation of e-registration system affects the taxpayer compliance variable (Y) with a negative coefficient direction. Thus the first hypothesis (H1) is accepted.

Based on the Technology Acceptance Model (TAM) theory and compliance theory, the effect of the implementation of the e-registration system on taxpayer compliance with a negative coefficient direction can be explained because the taxpayer factor feels that the e-registration system is not easy (Perseived Ease of Use-PEoP) and does not see any direct benefits from the system (Perseived Usefulness-PU), this can be caused by the lack of efficiency of the system and a system that is difficult to access. Another factor based on a normative perspective on compliance theory, namely the lack of taxpayer trust in the e-registration system and the legitimacy of tax authorities which can make taxpayers reluctant to comply with the rules and reduce taxpayer compliance.

The results of this study are in line with research by Rohmadani (2021) and Tomy & Fatchan. (2025) and inversely proportional to the research of Hasan et.al (2018) and Safitri et.al (2021), which state that the Implementation of e-registration system has a positive effect on taxpayer compliance.

2. The effect of implementing an e-filing system on taxpayer compliance

Based on the test results, the variable Implementation of e-filing system (X2) has a t count of 2.343 and a significant value of 0.021 smaller than 0.05, so HO is rejected and H2 is accepted, meaning that the variable Implementation of e-registration system has an effect on the taxpayer compliance variable (Y) with a positive coefficient direction. Thus the second hypothesis (H2) is accepted.

The effect of the e-filing system implementation variable on taxpayer compliance with a positive coefficient direction can be explained by the Technology Acceptance Model (TAM) theory and compliance theory. Based on this theory, taxpayer compliance through the e-filing

system can be explained by the convenience factor (Perseived Ease of Use-PEoP) and consider the practical benefits obtained (Perseived Usefulness-PU), meaning that people feel that the existence of e-filing makes it easier for them to carry out tax obligations, such as tax calculations being faster and more accurate. Another factor is based on a normative perspective in compliance theory, namely a sense of trust in the system and the legitimacy of the tax authority which can encourage taxpayers to comply with the rules and can increase taxpayer compliance.

The results of this study are in line with research by Hasan et al (2018), Pratama et al (2020) and Novimilldwiningrum & Hidayat (2022) and inversely proportional to Syuhada's research (2023), which states that the Implementation of e-registration system has no effect on taxpayer compliance.

3. The effect of implementing an e-registration system on taxpayer compliance moderated by internet understanding

Based on the test results, the interaction variable of the Implementation of e-registration system (X1) internet understanding (Z) has a t-test value of 5.621 and a significant value of 0.000 smaller than 0.05, so HO is accepted and H3 is rejected, meaning that the internet understanding variable can moderate the variable Implementation of e-registration system on the taxpayer compliance variable.(Y). Thus the third hypothesis (H3) is accepted. This moderation interaction is strengthens and changes the direction of the relationship between the Implementation of e-registration system on taxpayer compliance, this is because the t-test value of the e-registration system application variable was initially negative, amounting to -8.851.

Based on the Technology Acceptance Model (TAM) theory and compliance theory, the moderation of the internet understanding variable in the relationship between the effect of Implementation of e-registration system on taxpayer compliance can be explained because with a good understanding of the internet, taxpayers feel that the e-registration system is easy to operate (Perseived Ease of Use-PEoP) and helps speed up their performance (Perseived Usefulness-PU). Other factors based on the normative perspective in compliance theory, the existence of a sense of trust in the e-registration system and the legitimacy of tax authorities can also affect taxpayer compliance.

The results of this study are in line with research by Lestari (2024) and inversely proportional to the results of research by Rohmadani (2021) and Amiliasari & Setiawan (2021) which state that internet understanding cannot moderate the Implementation of e-registration system to taxpayer compliance

4. The effect of implementing an e-filing system on taxpayer compliance moderated by internet understanding

Based on the test results, the interaction variable of the Implementation of e-filing system (X2)" internet understanding (Z) has a test t value of 2.513 and a significant value of 0.014 smaller than 0.05, so H0 is rejected and H4 is accepted, meaning that the internet understanding variable can moderate the variable Implementation of e-registration system on the taxpayer compliance variable (Y). Thus the fourth hypothesis (H4) is accepted. This moderation interaction strengthens the relationship between the Implementation of e-registration system and taxpayer compliance, this is because the t-test value of the e-filing system application variable is initially positive, which is 2.343.

Based on the Technology Acceptance Model (TAM) theory and compliance theory, the moderation of the internet understanding variable in the relationship between the effect of e-filing system implementation on taxpayer compliance can be explained because with a good understanding of the internet, taxpayers feel that the e-filing system is easy to operate (Perseived Ease of Use-PEoP) and helps speed up their performance (Perseived Usefulness-PU). Other factors based on the normative perspective in compliance theory, a lack of trust in the e-filing system and the legitimacy of the tax authority can also affect taxpayer compliance.

The results of this study are in line with research by Lestari (2024) and inversely proportional to the results of research by Rohmadani (2021) and Amiliasari & Setiawan (2021) which state that internet understanding cannot moderate the Implementation of e-registration system to taxpayer compliance

5. CONCLUSIONS AND SUGGESTIONS

Conclusions

Based on the test results that have been carried out, the following conclusions can be drawn:

1. The variable Implementation of e-registration system (X1) affects taxpayer compliance (Y) with a negative coefficient direction.
2. The variable Implementation of e-filing system (X2) affects taxpayer compliance (Y) with a positive coefficient direction.
3. Understanding the internet (Z) moderates the effect of Implementation of e-registration system. (X1) on taxpayer compliance (Y).
4. Understanding the internet (2) moderates the effect of Implementation of e-filing system (X2) on taxpayer compliance (Y).

Limitations

The limitations of this study are as follows:

1. In this study using the Slovin formula with a tolerable error rate of 10 percent, so it is only limited to 100 respondents and only on individual taxpayers in Randuagung Village.

2. This study only examines the effect of Implementation of e-registration system and implementing e-filing.

3. The moderating variable used in this study only uses internet understanding.

Sugestions

Based on the limitations that have been described, the researcher provides the following suggestions:

1. This study uses the Slovin formula with an error tolerance level of 10%, so the number of respondents is limited to 100 people. Further research is recommended to use a larger number of respondents in order to obtain more accurate and representative results. This research also only focuses on individual taxpayers in Randuagung Village Future research can expand the coverage area or consider corporate taxpayers to obtain more comprehensive results.

2. This study only examines the effect of implementing the e-registration and e-filing systems on taxpayer compliance. It is recommended for future research to add other relevant variables, such as the application of the e-billing system (Safitri et al., 2021), tax transparency (Rohmadani, 2021), taxpayer awareness, tax sanctions (Syuhada, 2023), tax knowledge (Lestari, 2024) and risk preferences (Tomy & Fatchan, 2025).

3. The moderating variable in this study only uses internet understanding. Therefore, further research can consider other moderating variables, such as tax understanding and taxpayer risk preferences (Novimilldwiningrum & Hidayat, 2022) to see the extent to which these factors can strengthen or weaken the relationship between variables.

ANALYSIS OF THE PHYSICAL WORK ENVIRONMENT AND COMPETENCE ON EMPLOYEE PERFORMANCE IN THE MOTORCYCLE INSTRUCTOR SECTION OF THE CIANJUR PRIMA WORK TRAINING INSTITUTE

Aliva Desviana[1], Khaerul Rizal Abdurahman[2]

[1]Faculty of Economics and Business, General Achmad Yani University

Abstract

Every company must be able to face various local challenges arising from intense competition and economic uncertainty. Therefore, strength is needed to confront these challenges, and the strength of any organization lies in its human resources. If human resources are adequately attended to by valuing their talents, developing their skills, and using them appropriately, it can be assured that the organization will become dynamic and grow rapidly. Thus, it is very important to prepare strong and competent human resources, one way to achieve this is through training programs held at training centers. The purpose of this research is to analyze employee performance based on the physical work environment and competencies in the motorcycle instructor section of the Prima Cianjur Vocational Training Institute. The research method used in this study is qualitative, with data collection methods including interviews, observations, and documentation. The data validity test used in this study is through triangulation. The results of the research using the triangulation process show that, based on the informants' responses, the physical work environment and competencies in the company fall into the inadequate category, and employee performance falls into the category that needs attention. This indicates that the physical work environment and competencies have a significant impact on employee performance in the motorcycle instructor section. This means that the more supportive the work facilities are, along with adequate competencies, the better the performance will be.

Keywords:

1. Introduction

Unemployment is one of the crucial problems faced by the Indonesian nation. Based on data from the Central Statistics Agency (BPS) until February 2024, the open unemployment rate in February 2024 was 4.82%. The Open Unemployment Rate (TPT) is an indicator that can be used to measure the level of labor supply that is not used or not absorbed by the labor market. The TPT from the National Labor Force Survey in February 2024 was 4.82%, this means that out of 100 people in the workforce, there are around 5 unemployed people. Based on information obtained from the Central Statistics Agency (BPS) regarding Indonesia's TPT based on the highest level of education completed is as follows:

Table 33. Indonesia's Open Unemployment Rate (TPT) According to Highest Level of Education Completed, February 2022-2024

NO	HIGHEST EDUCATION ATTENDED	FEBRUARY 2022 (%)	FEBRUARY 2023 (%)	FEBRUARY 2024 (%)
1	≤ ELEMENTARY SCHOOL	3.09	3.02	2.38
2	JUNIOR HIGH SCHOOL	5.61	5.41	4.28

3	SENIOR HIGH SCHOOL	8.35	7.69	6.73
4	VOCATIONAL HIGHSCHOOL	10.38	9.60	8.62

Source: www.bps.go.id

Although national data shows a decline in unemployment rates, a different situation occurs in a district or city. In the city, according to the Central Statistics Agency (BPS), until 2023, there were 107,219 unemployed workers. To overcome this problem, the Manpower and Transmigration Office in the city took the initiative to hold skills courses to reduce the increasing unemployment rate. Through the Productivity Training and Transmigration Institutional sector, the local government is trying to provide training that can create job opportunities. The requirements for entering the workforce are getting stricter, so relying on school diplomas is no longer sufficient. To support the community in facing the increasingly competitive world of work, the Manpower and Transmigration Office is trying to provide various training facilities such as sewing, automotive, mechanical, make-up, and culinary.

One sector that has the potential to absorb labor is the automotive industry which continues to grow in Indonesia. Rapid growth in motorcycle production and technological innovation create many job opportunities that require special skills. Therefore, appropriate education and training must be provided to prospective workers so that they are ready to face challenges in the world of work. The implementation of training to improve these competencies, there are facilities that can be utilized by the community to improve their knowledge and skills, namely through job training institutions. According to the Regulation of the Minister of Manpower Number 17 of 2016 in Article 1 Paragraph 7, it states that Job Training Institutions are government agencies, legal entities, or individuals who meet the requirements to organize job training.

There are institutions that often hold training for the community and students who want to improve their knowledge and skills. In addition to students, there are also human resources who act as instructors to guide the implementation of the training. The main task of the instructor is to transfer knowledge and practical skills to others through effective learning methods. It can be concluded that instructors have an important role in facilitating training participants to get jobs more easily. Therefore, the institution pays close attention to the performance of each instructor who works to achieve the company's goals. Good performance from human resources contributes to the achievement of the company's overall goals. Well-performing human resources can create a productive environment.

Employee performance is the work results in terms of quality and quantity achieved by an employee in carrying out his duties in accordance with the responsibilities given to him. **(Mangkunegara, 2011).**Therefore, by creating good employee performance, it will produce work results above the standards expected by the company.

Table 34. Employee Performance Data for Motorcycle Instructor Section of Prima Cianjur Work Training Institute

Employee Name	Performance
Instructor 1	80%
Instructor 2	82%
Instructor 3	75%
