The company sets a target for each employee's performance achievement of above 85%, but this does not match the actual situation. Judging from the data above, there is only one employee whose performance is in accordance with the target. This data not only provides an overview of individual effectiveness, but also functions as an evaluation tool to assess employee performance as a whole. With this analysis, management can identify areas that need to be improved and formulate focused development strategies to improve employee performance. According to the head of the training institution, the decline in employee performance was caused by a lack of competence, especially in the mechanical section. In addition to competence, there is a lack of support for the physical work environment at the training institution, so that employees experience discomfort when doing their work.

In achieving good employee performance, companies need to pay attention to several factors that affect employee performance, such as the physical work environment and competence. A comfortable and safe physical work environment can improve employee performance. This is in line with the statement put forward by **(Rastana & Mahayasa, 2021)** states that the work environment is a measuring tool that will affect employee performance if the work environment in the agency is comfortable then employee performance will increase. This is supported by research from **(Wangi et al., 2020)** which states that the physical work environment has a positive effect on employee performance. In addition to physical work environment factors, competence also plays an important role in employee performance. According to **Rivai, (2015)** defines that competence is a person's ability that can be observed such as including knowledge, skills and attitudes in completing a job or task according to the specified abilities. In this case, competence with the basic word, namely competent which means capable, able, skilled. Competence refers to the traits / characteristics that enable him to succeed in his work.

Table 35. Employee Certificate Data for Motorcycle Instrutor Section of Cianjur Prima Work Training Institute

			• Methodology Instructor (BNSP)

Source: Prima Cianjur Job Training Institute

Of the four instructors who have National Professional Certification Agency (BNSP) certificates, some of them have not achieved every given work target. This shows the need for more attention to developing employee skills. Therefore, it is important to ensure that all instructors achieve the set level of competency in order to succeed in their jobs. Based on the description that has been presented, the phenomena and facts in the field regarding the performance issues of motorcycle instructor employees at the training institution are caused by the physical work environment and competence.

2. Literature review

2.1 Work environment

In carrying out company activities, the work environment is all conditions that are around the workers, so that both directly and indirectly can affect them in carrying out the tasks assigned. A good and pleasant environment will be able to generate enthusiasm and passion for work, and vice versa if the unpleasant work environment will be able to reduce enthusiasm and passion for work.

In general, the work environment is divided into two, namely the work environment physical work and non-physical work environment (Serdamayati: 2009). The physical work environment is all physical existence, which is found around the employee's workplace, which can influence the employee directly. directly or indirectly. The physical work environment is either direct or indirect. directly related to employees, but there are also those who are related with an intermediary or general environment, which can also be called the general environment work that affects human conditions, such as temperature, humidity, and air circulation. Meanwhile, a non-physical work environment is a condition that occurs and is related to work relationships, both relationships with superiors, fellow co-workers, as well as subordinates. The company should be able to provide conducive working conditions and support cooperation between employees. work in it both at the top and bottom levels, with an atmosphere family, good communication, and also self-control. Good.

According to **(Atmaja & Maryatni, 2019),** There are several factors that influence the physical work environment, namely: (1) Lighting/light in the workplace, (2) Air temperature in the workplace, (3) Humidity in the workplace, (4) Air circulation in the workplace, (5) Noise in the workplace, (6) Mechanical vibrations in the workplace, (7) Smells in the workplace, (8) Color scheme in the workplace, (9) Decoration in the workplace, (10) Music in the workplace, and finally (10) Safety in the workplace.

2.2 Competence

According to **Miftahul et al (2017)**, competence is a characteristic that underlies a person in relation to the effectiveness of individual performance in their work or the basic characteristics of an individual that have a causal relationship with the criteria used as a reference, effective or performing excellently or superiorly in the workplace or in certain situations.Based on the opinions of experts, it can be concluded that competence is the ability that involves knowledge, skills, and performance needed to carry out tasks in the workplace. This competence must be measurable and observable, and in accordance with the established performance standards. Thus, competence includes not only technical aspects, but also aspects of attitudes that support good job implementation.

Thus, competence includes not only technical aspects, but also attitudinal aspects that support good job execution. According to **(Sutrisno, 2014:135)** Several aspects contained in the concept of competency indicators, including:

a. Knowledge, namely a person's awareness in the cognitive field.
b. Understanding, namely the cognitive and affective depth possessed by an individual.
c. Ability (skill) is something that an individual has to carry out the tasks or work assigned to him.
d. Attitude, namely feelings (happy or unhappy, like or dislike) or reactions to stimuli that come from outside.
e. Interest is a person's tendency to carry out an action.

2.3 Employee performance

According to **Mangkunegara (2011:67)**Employee performance is the work results in terms of quality and quantity achieved by an employee in carrying out his duties in accordance with the responsibilities given to him.

The performance must be in accordance with the authority held and aims to achieve the organization's goals in a legal and ethical manner. According to Mangkunegara (2012:67), there are several indicators used by a company in determining an employee's performance, namely as follows:

a. Quality of Work, refers to the extent to which an employee carries out the tasks that are supposed to be done in the company. This includes such things as accuracy, precision, and skill in the job.
b. Work Quantity, refers to the length of time an employee works in a day. This aspect can be measured from the work speed of each employee and the results achieved.
c. Task Execution, how far employees are able to carry out their work with accuracy or without errors.
d. Responsibility is an employee's awareness of their obligation to carry out the work assigned by the company.
e. Initiative, the ability from within to solve problems and do work without waiting for orders from superiors.

3. Methodology

The method used in this study is a method with a qualitative approach because this study aims to present data in accordance with the reality in the analysis of the physical work environment and the competence and performance of motorcycle instructor employees at the Prima Cianjur Job Training Institute. The type of research used in this study is descriptive research. This descriptive research is a research method that attempts to describe and interpret objects according to what they are. The informants taken from this study were motorcycle instructor employees at the Prima Cianjur Job Training Institute. The primary data used by the researcher were the results of interviews with 1 direct superior of the Prima Cianjur Job Training Institute and 4 instructors with the criteria of having a certificate from the National Professional Certification Agency (BNSP), and also secondary data used by the researcher were employee performance data and certificate data owned by the instructor.

3.1 Theoretical framework

In achieving good employee performance, companies need to pay attention to various factors that can affect employee productivity and work effectiveness such as the physical work environment and competence. A comfortable, safe, and supportive work environment for each

job will play a major role in improving employee performance. This is in line with the statement in **(Rastana & Mahayasa, 2021)** states that the work environment is a measuring tool that will affect employee performance if the work environment in the agency is good. This is supported by research from **(Wangi et al., 2020)** which states that the physical work environment has a positive effect on employee performance. In addition to physical work environment factors, competence is also one of the factors that will affect employee performance.

Competence refers to the traits/characteristics of a person that enable him/her to succeed in his/her job. This is supported by research **(Fathiyah, Masnun, & Syekh, 2022)** showing that there is a positive influence from both competency variables on employee performance. In other words, the higher the level of competency of an employee, the higher the level of employee performance in an organization.

3.2 Conceptual framework

According to **(Sugiyono, 2018:26)** states that "A research variable is an attribute or characteristic or value of a person, object or activity that has certain variations that are determined by the author to be studied and then conclusions drawn."

In this study, there are three variables, namely physical work environment variables, competence, and employee performance. These variables will be developed into variable concepts, subvariables, and measurement scales, which will be the basis or guidelines in interviews conducted by the author to data sources or informants in this study. The following is a table of variable operationalization.

Table 36. Variable Operationalization

VARIABLES	VARIABLE CONCEPT	SUB VARIABLE
Physical Work Environment (X1)	Physical conditions that exist around the workplace that can affect employees either directly or indirectly.	Lighting/light in the workplace
		Comfort
		Odors in the workplace
		Color scheme in the workplace
		Decoration in the workplace
Competence (X2)	A person's observable abilities include knowledge, skills and attitudes in completing a job or task according to the specified performance.	knowledge
		Understanding
		Ability (skill)
		Attitude
		Interest (interesting)

Employee Performance (Y)	The work results in terms of quality and quantity achieved by an employee in carrying out his duties in accordance with the responsibilities given to him.	Quality of Work
		Quantity of Work
		Execution of Tasks
		Responsibility
		Initiative

3.3 Instrumentation

According to **Firdaus & Zamzam (2018:106)**: "Triangulation is an effort to check the accuracy of data or information obtained by the author from various different points of view by reducing bias that occurs during data collection and analysis."

Some data triangulation techniques according to **Denzin & Lincoln (1998:141)** includes source triangulation, technical triangulation, and theoretical triangulation. Source triangulation tests the credibility of data by comparing information from various sources. Technical triangulation examines data from the same source using different methods. While theoretical triangulation compares the information obtained with relevant theories.

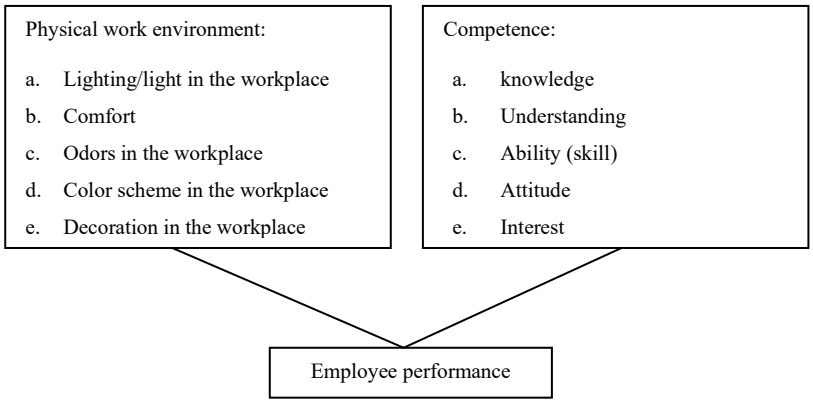

Figure 7. Paradigm of Physical Work Environment Analysus and Competence on Employee Performance in the Motorcycle Instructor Section of the Cianjur Prima Work Training Institute

4. Results and discussions

4.1 Physical Work Environment

Table 37. Results of Observation on Physical Work Environment Variables

NO	SUB VARIABLE	INFORMANT
1	Lighting/light in the workplace	4 informants
2	Comfort	4 informants
3	Odors in the workplace	4 informants
4	Color scheme in the workplace	4 informants
5	Decoration in the workplace	4 informants

Based on the results of the researcher's observations, it was found that the lighting or light in the practice/work room was inadequate due to the lack of lights in one room so that the informant was less able to see every detail of the practice media used.

Based on the results of the researcher's observations, it was found that the practice room used was not large enough to carry out the training program with 40 students and also the equipment used for practice still needed to be repaired or upgraded.

Based on the results of the researcher's observations, it was found that the smells of fuel and oil from the practice media can disrupt the concentration and focus of the instructors, because the smell is so pungent that it causes headaches.

Based on the results of the researcher's observations, it was found that the colors in each room seemed monotonous and could not improve the mood when doing work. A workspace dominated by neutral or monotonous colors can create a boring and less inspiring atmosphere, which in turn can reduce work enthusiasm and creativity. The researchers also observed that an unsupportive environment can hinder collaboration and social interaction between employees, which are important for building good working relationships and improving teamwork.

Based on the results of the researcher's observations, it was found that the storage of equipment and spare parts was not neatly arranged and was not in its place. This condition can have a negative impact on various operational aspects. Untidiness in the storage of equipment and spare parts can make it difficult for employees to find the necessary tools when needed, which in turn can slow down the work process. In addition, irregular storage can also increase the risk of work accidents. Equipment that is not stored properly can cause the danger of tripping or falling, which can endanger employee safety.

4.2 Competence

Table 38. Results of Observations on Competency Variables

NO	SUB VARIABLE	INFORMANT
1	Knowledge	4 informants
2	Understanding	4 informants
3	Skill	4 informants
4	Attitude	4 informants
5	Interest	4 informants

Knowledge gained from work experience covers various aspects, such as problem solving, decision making, and implementing the right strategy in different situations. Informants who have been involved in a particular field for a long time tend to have broader and deeper insights. Thus, the knowledge possessed by informants is not only based on formal education, but also an accumulation of every practical experience gained over the years.

By adjusting the work environment to be more conducive, and trying to create an atmosphere that supports collaboration and interaction with students. In a dynamic and often stressful work environment, employees who are unable to manage stress well will pose a risk of decreased performance and will also be a challenge that is often faced in managing work conditions.

Based on the results of the interview, the researcher obtained a statement that the abilities that must be possessed as an instructor must be closely related to education and expertise in the automotive field. Although the instructors have adequate knowledge and experience, there are indications that their performance may decline. With several possibilities such as lack of

updates in knowledge and skills in the automotive world and lack of resources provided by the company. The instructors also choose to work collaboratively to lighten the workload so that the work process is more effective. In addition, the instructors accept feedback openly and try to improve themselves from the feedback given.

Based on the interview results, researchers obtained statements that the attitudes given to changes in work were different, some considered it a challenge because it would create additional pressure and raise concerns about the abilities possessed for the new situation. Therefore, it will affect individual performance.

Based on the interview results, researchers obtained statements that their interest in this job was because they enjoyed the activity of exchanging experiences and insights. This shows that the instructors' awareness to share experiences not only enriches individual knowledge, but will also create a collaborative environment that supports mutual growth. In addition, there are also instructors who experience changes in interest in working which may be caused by boredom or dissatisfaction with the work environment.

4.3 Employee performance

Table 39. Results of Observations on Employee Performance Variables

NO	SUB VARIABLE	INFORMANT
1	Quality of Work	1 informant
2	Quantity of Work	1 informant
3	Implementation of Task	1 informant
4	Responsibility	1 informant
5	Initiative	1 informant

The criteria given by informants to their employees are in the form of target achievement where instructors successfully train many students and achieve high graduation rates. Punctuality is also very important where instructors are present on time and start training sessions according to the schedule that has been set. Discipline reflects where instructors comply with the rules and ensure safety before training is carried out. Finally, the appreciation given is like praise or awards for good performance.

In assessing the quantity of work, the informant employees monitored the number of students who successfully completed training by each instructor in a certain period, and also analyzed the completeness and regularity of the training plan prepared, which reflects the instructor's ability to organize the workload. Although focusing on the quantity aspect, direct observation of the implementation of training is still needed to ensure that the quantity achieved does not sacrifice quality.

In assessing the implementation of employee tasks, informants conduct periodic evaluations to monitor employee progress in carrying out tasks. This evaluation not only serves as an assessment tool, but also as an opportunity to provide constructive feedback and set clear development goals. In this way, informants strive to create an environment that supports continuous growth and improvement, where employees feel motivated to improve their performance.

In assessing employee responsibility, informants analyze the relationship between employee engagement and responsibility in completing tasks. Superiors need to use a systematic approach that includes analysis of emotional engagement, internal communication effectiveness, and work environment conditions. By identifying factors that influence these two aspects, superiors can design appropriate interventions. Periodic evaluation is also

important to ensure that the strategies implemented remain effective in improving employee performance. Increased engagement is expected to contribute to the overall responsibility and performance of the organization.

In assessing employee initiatives, informants need to pay more attention to other employees with a more balanced approach between individual development and team collaboration, informants can identify employees who are not only able to work independently, but also who can contribute to achieving common goals through cooperation. This approach encourages the development of interpersonal and communication skills among employees, which are very important in a dynamic work environment.

4.4 Impact of Physical Work Environment on Employee Performance

The physical work environment is very important for an organization to pay attention to. A safe and pleasant physical work environment can affect the comfort of employees at work. A comfortable environment for employees creates a supportive atmosphere in completing tasks, which in turn can improve overall working conditions and help reduce boredom and fatigue. Comfortable working conditions will trigger increased worker productivity, while poor environmental conditions can reduce employee productivity **(Febriani & Indrawati, 2013)**. The physical condition of the work environment can play a role in making employees work more effectively **(Agastia, 2014)**. The importance of improving the physical work environment is because each worker has different needs, including different movement space, light intensity, air ventilation, sense of security, and cleanliness. Improving these conditions in the work environment is expected to positively affect employee performance **(Hasan et al., 2017).** The physical work environment plays a role in increasing work enthusiasm and passion, making it safe and comfortable, and can also make it easier for employees to complete their work. **(Suwardi.LK, Limgiani, Klemens Mere, 2023)**

4.5 Impact of Competence on Employee Performance

Based on the results of interviews conducted with 4 employees in the motorcycle instructor section, it was found that the competencies possessed by these employees were obtained from work experience that can improve employees' abilities in completing each task more effectively, in addition, good stress management skills will help employees maintain focus and maintain optimal performance. A positive attitude towards change also contributes to employees' ability to adapt, so that all of these factors contribute to improving employee performance.

5. Conclusion

Based on research on the analysis of the physical work environment and competence on employee performance. The results showed that the physical work environment has a greater impact on employee performance compared to competence. The conclusions of the sub-variables studied in this study include the following:

a. The results of this study indicate that the physical work environment affects the performance of motorcycle instructor employees. Therefore, training institutions are advised to improve several aspects to increase employee productivity. First, increasing lighting in the practice room is needed so that employees can work comfortably. Second, expanding the practice room will provide comfort during training and increase the effectiveness of work equipment. Third, adding larger air vents is important to facilitate circulation and reduce fuel odor. Fourth, changing the color scheme of the practice room to be brighter can help avoid boredom. Finally, improving the decoration

in the equipment storage area will make it easier for employees to find the equipment they need.

b. The results of this study state that competence has an impact on the performance of motorcycle instructor employees. The difference in work experience of each employee is one of the factors that affects the competence of each instructor. Where there are still some instructors who feel they cannot work collaboratively so that it can hinder the achievement of the organization. In addition, there are also some employees who feel they cannot receive feedback well, and also have changes in interest in the work they do.
c. The level of employee performance based on information from direct superiors shows that there are several motorcycle instructor employees who are still below the company's target. This is based on the inadequacy of the physical work environment in the company and the competence based on the work experience of the motorcycle instructor employees.
d. The results of this study show that the physical work environment and competencies in the company are in the poor category, so that employee performance in the company is in the category that needs attention.

THE EFFECT OF CARBON EMISSION DISCLOSURE, GREEN INNOVATION AND INTELLECTUAL CAPITAL ON FIRM VALUE

[1]Salsabila Aulia Putri, [2]Nunung Aini Rahmah

Accounting Department Jenderal Achmad Yani University
[1]Email: salsabilaap84@gmail.com
[2]Email: nunung.aini@lecture.unjani.ac.id

Abstract

In energy companies listed on the Indonesia Stock Exchange, the period 2019-2023 experienced a decrease in company value. This study aims to test partial and simultaneous results on firm value, as in this study, as many as 83 companies using Carbon Emission Disclosure, Green Innovation, and Intellectual Capital variables, while for the dependent variable, Firm Value. This research uses a descriptive approach, with quantitative data types from secondary data sources. The data analysis technique used in this research is literature study and documentation study, and the sample population used in Non-Probability Sampling using Purposive Sampling technique and produces a sample of 16 companies. The findings of this study are partially and simultaneously Carbon Emission Disclosure has a significant positive effect on Firm Value, Green Innovation has a significant negative effect on Firm Value, and Intellectual Capital has no significant effect on Firm Value.

Keywords**:** *Carbon Emission Disclosure, Green Innovation, Intellectual Capital and Firm Value.*

1. Introduction

One of the company's objectives in carrying out its business activities is to make a profit and provide welfare for shareholders. In this era of the Industrial Revolution 4.0, the good or bad assessment of a company can be seen from the value of the company. This company value is based on the total value of the company's shares, therefore, it is one indicator of the company's success (Trisakti et al., 2024). Various aspects can be a benchmark for assessing the value of the company, for example, the company's stock market price which illustrates the value of investors from all aspects for each existing equity (Hardiyansah et al., 2021).

As for the phenomenon of the decline in the value of energy sector companies showing in 2023, reported by the news https://www.cnbcindonesia.com Composite Stock Price Index (JCI) at the close of session 1 dropped 0.54%. JCI corrected even though global market sentiment tends to be positive, especially from the United States (US). From the US, positive sentiment came from inflation, which returned to a slope. Based on records from the Indonesia Stock Exchange (IDX) via Refinitiv, most sectors weakened. The energy sector was the weakest, down 1.65%. One piece of bad news came from the price of coal, which has weakened three days in a row with a 5% decline. The decline in coal prices could weigh on the shares of coal issuers such as PT Bukit Asam (PTBA), PT Bayan Resources (BYAN) to PT Adaro Energy Indonesia (ADRO).

The following is company value data on energy companies listed on the Indonesia Stock Exchange:

Table 1 Tobins'Q Energy Company

Year	Company Code			
	BUMI	**ABMM**	**ADRO**	**PTBA**
2019	0.946	1.068	0.923	0.427
2020	1.063	0.985	0.891	0.389
2021	0.930	0.920	1.078	1.184
2022	1.218	0.979	1.122	0.422
2023	0.811	0.930	0.765	0.491

Based on Table 1 above, which illustrates the condition of the decline in company value, how many energy companies tend to fluctuate. Among them at PT Bumi Recosurces (BUMI) in 2019-2020 indicated an increase in company value, in 2020-2021 indicated an increase in company value, in 2021-2022 experienced a decrease in company value, and in 2022-202n experienced a decrease in company value. PT ABM Investama Tbk (ABMM) indicated a decrease in company value in 2020 and 2023. Likewise, PT. Adaro Energy (ADRO) and PT.Bukit Asam (PTBA) which experienced a decrease in company value for five consecutive years with Tobins'Q value increasing at PT. ADRO in 2021-2022 and PTBA in 2021.

If a tobins'Q value illustrates that the company can be said to be successful in creating company value and the position of the shares is in an overvalued position if the Q value is high Q > 1, then the company's shares are considered overvalued and the company has the potential to generate a greater rate of return than the cost of assets issued. Conversely, if the Tobins'Q of a company is low if Q < 1, then the company's shares are considered undervalued and its bad value is higher than its market value.

Based on the above, a high market value may indicate high growth expectations, which may encourage the business to invest in capacity building or innovation. Consequently a high Q ratio may indicate that the business has room for expansion and is profitable (Hardiyansah et al., 2021).

2. Literature review

Legitimacy Theory

Legitimacy theory was first proposed by Dowling & Pfeffer, (1975) explains that legitimacy theory is a theory that focuses on how organizations seek to obtain and maintain social legitimacy. In this context, legitimacy refers to the acceptance and recognition of an organization by society or a wider group. Concerning voluntary disclosure, there are two main reasons why this might apply. First, legitimacy theory provides a complementary perspective to stakeholder and legitimacy theories on voluntary disclosure. (Ananda & Salma, 2024)

Signaling Theory

Signaling theory was first proposed by Michael Spence (1973), who states that the sender (owner of information) provides a signal or signal in the form of information that signal theory is information that reflects the condition of a company that is beneficial to the recipient (investor). Therefore, it conveys signals or signals that contain information about the state of the company that is useful for the decision-making of shareholders (the receiving party) (Kusumaningrum & Astuti, 2024).

Carbon Emission Disclosure

Carbon Emission Disclosure (CED) is environmental reporting on the quality and quantity of a company's carbon emissions, both past and future (Dian Rahmawati Putri & Murtanto, 2023). Carbon emission itself is the event of increasing atmospheric carbon, and greenhouse gas emissions as one of the drivers of climate change. Through carbon emission disclosure, companies are expected to be able to prevent and reduce carbon emissions, and stakeholders such as the government and society can monitor. However, carbon emission disclosure is voluntary disclosure for companies in Indonesia so not all companies report it. The Carbon Disclosure Project (CDP) query method can be used to calculate the carbon emissions disclosure index. (Dian Rahmawati Putri & Murtanto, 2023).

$$\frac{Number\ Of\ Items\ Disclosed}{Number\ Od\ Disclosure\ Items}\ x\ 100\%$$

Green Innovation

Green innovation is one of the environmental approaches in integrating its environmental elements in the company's operations from production to distribution (Fanda & Dwijayanti, 2024). This includes developing new methods that are more environmentally friendly, such as more efficient use of resources, reduced use of hazardous materials, and preventing pollution and other negative effects on the environment (Damas et al., 2021). Green innovation focuses on competitive advantage by reducing environmental impact, the company's response to today's growing social and environmental problems is the development of green innovation. Green innovation can be understood as innovation related to environmentally friendly processes or products (Handoko *et al*., 2024). According to (Fanda & Dwijayanti, 2024) the formula for measuring green innovation variables using CSR Environmental Costs with the formulation formulated as follows:

$$BL = \frac{\text{CSR Activity Cost}}{\text{Net Profit Before Tax}}$$

Intellectual Capital

Intellectual Capital is wealth and competitive advantage through the use of intangible assets known as intellectual capital which serves to drive company value (Alveno Prakoo Nugroho et al., 2023). Intellectual Capital is the three main elements of the organization (human capital, structural capital, value added capital) related to knowledge and technology that can provide more value to the company how much the organization's competitive advantage (Wulandari & Purbawati, 2021). Intellectual Capital in the company allows the company to use its resources more efficiently and economically. Companies can also optimize their assets better which allows them to produce products that excel in competition and are expected to, this research will be measured using the VAICTM (Value Added Intellectual Capital Coefficient) method created by Pulic (1998), consisting of a combination of three

components namely Value Added Capital Employed (VACA), Value Added Human Capital (VAHU), and Structural Capital Value Added (STVA) (Wulandari & Purbawati, 2021).

$$VAIC^{TM} = VACA + VAHU + STVA$$

Diformulasikan :

VA = OUT-IN

VACA = VA/CE

VAHU = VA/HC

STVA = SC/VA

$VAIC^{TM}$ = VACA + VAHU + STVA

Keterangan:

VA : *Value Added*

VACA : *Value Added of Capital Employed*

VAHU : *Value Added Human Capital*

STVA : *Structutal Capital Value Added*

$VAIC^{TM}$: *Value Added Intellectual Capital Coefficient*

OUT : *Output*

IN : *Input*

CE : *Capital Employed*

HC : *Human Capital*

SC : *Structural Capital*

Firm Value

According to (Mardiana et al., 2023) Firm value is the market value of a company's debt and equity. Firm value is the view of investors or the market of a company which is often reflected in its share price. Measuring the value of the company through the stock price will also affect shareholders' confidence in the company's business potential and performance, both now and in the future. Therefore, the company must maintain or increase the stability of its share price (Al-amin & Herawaty, 2024). formula to measure the company value variable using the Tobin's Q scale (Mardiana et al., 2023).

$$\frac{\text{MVS} + \text{D}}{\text{TA}}$$

Keterangan:

Tobin’s Q : Firm Value

Mvs : Market value of shares (closing share price x total shares outstanding at the end of the year)

Debt : Total Liabilities

TA : Total Assets

3. Research Method

This research was conducted at Energy Companies listed on the Indonesia Stock Exchange (IDX) for the 2019-2023 period. This research is a quantitative study with secondary data obtained from www.idx.co.id and the company's website. The sample was taken using purposive sampling method with a sample of 16 companies during the 5-year observation period. The data analysis used in this study used IBM SPSS 27 for windows statistical software, with the classical assumption test used, namely normality test, multicollinearity test, heteroscedasticity test and autocorrelation test, then multiple linear regression, correlation coefficient, coefficient of determination and finally hypothesis testing, namely partial test (t test) and simultaneous test (f test).

4. Results and Discussion

Normality Test

Normality tests are performed to determine and test whether the residual values are distributed normally or not using the Kolmogorov-Smirnov statistical test with decisionmaking when the significant values have values above 0.05 then the stated data have been distributed normal and vice versa. The results of the normality test are as follows:

Table 2

Results of Kolmogrov Smrinov's Normality Test Before Outlier

One-Sample Kolmogorov-Smirnov Test

			Unstandardized Residual
N			80
Normal Parameters[a,b]	Mean		.0000000
	Std. Deviation		.17826410
Most Extreme Differences	Absolute		.325
	Positive		.325
	Negative		-.237
Test Statistic			.325
Asymp. Sig. (2-tailed)[c]			<,001
Monte Carlo Sig. (2-tailed)[d]	Sig.		.000
	99% Confidence Interval	Lower Bound	.000
		Upper Bound	.000

a. Test distribution is Normal.

b. Calculated from data.

c. Lilliefors Significance Correction.

d. Lilliefors' method based on 10000 Monte Carlo samples with starting seed 2000000.

Source : Data processing results using SPSS

Based on table 2 above, shows the results of the Kolmogorov-Smirnov test which is seen from the Asymp.Sig (2-tailed) results resulting in a value of 000. This figure is smaller than $\alpha = 0.05$, which means that the residual data is not normally distributed. So, it is necessary to repair or treat the data by eliminating extreme data (outliers).

Table 3

Results of Kolmogrov Smrinov's Normality Test After Outlier

One-Sample Kolmogorov-Smirnov Test

			Unstandardized Residual
N			80
Normal Parameters[a,b]	Mean		.0000000
	Std. Deviation		.17826410
Most Extreme Differences	Absolute		.325
	Positive		.325
	Negative		-.237
Test Statistic			.325
Asymp. Sig. (2-tailed)[c]			<,001
Monte Carlo Sig. (2-tailed)[d]	Sig.		.000
	99% Confidence Interval	Lower Bound	.000
		Upper Bound	.000

a. Test distribution is Normal.

b. Calculated from data.

c. Lilliefors Significance Correction.

d. Lilliefors' method based on 10000 Monte Carlo samples with starting seed 2000000.

Source : Data processing results using SPSS

Based on table 4.7 above, it shows that the Kolmogorov-Smirnov test results seen from the Asymp. Sig. (2-tailed) has a value of 200 or this value is greater than α = 0.05. so that the residual data in this study is normally distributed.

Multicollinearity Test

The next classic assumption test is the multicollinearity test. This test aims to test whether the regression model found a correlation between independent variables (independent). A good regression model is a regression model in which there is no correlation between independent variables. To determine the presence or absence of multicollinearity in the regression model, it can be done by assessing the amount of VIF (Variance Inflation Factor) and tolerance value. If the tolerance value> 0.10 or VIF value < 10 then there is no multicollinearity and if the tolerance value < 0.10 or VIF value> 10 then there is multicollinearity in the regression model. The multicollinearity test results in this study are as follows:

Table 4

Multicollinearity Test Results

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	.652	.047		13.830	<,001		
	Carbon Emission Disclosure	.012	.001	.875	18.386	<,001	.972	1.029
	Green Innovation	-1.602E-6	.000	-.139	-2.966	.004	.997	1.003
	Intellectual Capital	.005	.002	.094	1.974	.052	.975	1.025

a. Dependent Variable: Nilai Perusahaan

Source : Data processing results using SPSS

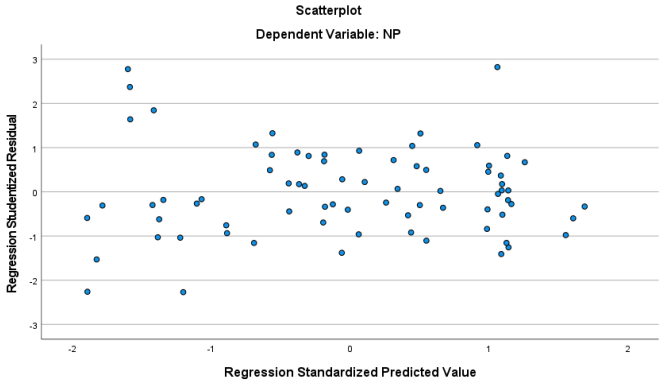
Based on table 4 above, it is known that the toletance value on the Carbon Emission Disclosure variable is 0.972, Green Innovation is 0.997, and Intellectual Capital is 0.975. Then the results of the Tolerance value show> 0.1. In addition, the Variance Inflation Factor (VIF) value on the carbon emission disclosure variable is 1,029, the green innovation variable is 1,003, and the intellectual capital variable is 1,025, so that overall it shows that VIF < 10 from each of these variables. It can be concluded that carbon emission disclosure, green innovation, and intellectual capital in this study do not have multicollinearity.

Heteroscedasticiy Test

The third test of classical assumptions is the heteroscedasticity test. The heteroscedasticity test is that the explanatory variables in the regression equation have error variances that are not constant and cause the estimator to be inefficient. In this test, it can be observed by looking at the results of the scatterlot test if the points on the scatterlot graph spread above and below the number 0, then it shows that there is no heteroscedasticity. The following are the results of the heteroscedasticity test using IBM SPSS 27 can be seen as follows:

Figure 1

Heteroscedasticity Test Results



Source : Data processing results using SPSS

Autocorrelation Test

The autocorrelation test is the last step test carried out which aims to test confounding errors in period t with confounding errors in period t-1 that arise due to consecutive observations to find whether there is autocorrelation or not which is carried out by means of the Durbin-Watson test (WD-test) using IBM SPSS 27 software.

Table 5

Autocorrelation Test Results

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.913[a]	.833	.826	.18175	1.833

a. Predictors: (Constant), Intellectual Capital, Green Innovation, Carbon Emission Disclosure

b. Dependent Variable: Nilai Perusahaan

Source : Data processing results using SPSS

Based on table 4.8 above shows the results of the autocorrelation test of 1,833 (DW), the value is compared with the Durbin-Watson table with a significance of 5%. The total data in this study were 82 (n) and a total of 3 (k) independent variables. so that the fair limit value or lower board (dL) is 1,560 and the limit value or upper lowe board (dU) is 1,715. Then the Durbin-Watson value is obtained which is explained as follows:

= dU < d < 4 - dU

= 1,715 < 1,833 < (4 - 1,715)

= 1,715 < 1,124 < 2,285

The above calculation concludes that this study can reject (H0) which states that there is no positive and negative autocorrelation between all independent variables, so there are no symptoms of autocorrelation.

Multiple Linear Regression Analysis

This study uses multiple linear regression tests which aim to test the independent variables, namely carbon emission disclosure, green innovation, and intellectual capital on the dependent variable, namely firm value. The data processing used to analyze this uses IBM SPSS 27 software, the following are the results of the processed data:

Table 6

Multiple Linear Regression Test Results

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients			Collinearity Statistics	
		B	Std. Error	Beta	t	Sig.	Tolerance	VIF
1	(Constant)	.652	.047		13.830	<,001		
	Carbon Emission Disclosure	.012	.001	.875	18.386	<,001	.972	1.029
	Green Innovation	-1.602E-6	.000	-.139	-2.966	.004	.997	1.003
	Intellectual Capital	.005	.002	.094	1.974	.052	.975	1.025

a. Dependent Variable: Nilai Perusahaan

Source : Data processing results using SPSS

Based on table 6 above, it can be concluded that the multiple linear regression equation in this study is as follows:

Y = 0.652 + 0.012X1 +-1.602X2 + 0.005X3

1. The constant value of 0.652 which indicates that the value of Carbon Emission Disclosure (X1), Green Innovation (X2), and Firm Value (X3) is 0, then the value of Firm Value (Y) is 0.652.

2. The regression coefficient value of Carbon Emission Disclosure (X1) is 0.012 which shows that the Carbon Emission Disclosure (X1) variable has a positive influence on Firm Value (Y). If Carbon Emission Disclosure (X1) increases by 1%, it will be followed by an increase in Firm Value (Y) of 0.012.

3. The Green Innovation (X2) regression coefficient value of -1.602 which shows the Green Innovation (X2) variable has a positive influence on Firm Value (Y). If Green Innovation (X2) increases by 1%, it will be followed by an increase in Company Value (Y) of -1.602.

4. The Intellectual Capital (X3) regression coefficient value is 0.005 which indicates the Intellectual Capital (X3) variable has a negative effect on Firm Value (Y). If Intellectual Capital (X3) increases by 1%, it will be followed by a decrease in Company Value (Y) of 0.005.

Correlation Coefficient Analysis

Correlation analysis is used to find out how close the relationship between two independent variables is together (simultaneous) and one dependent variable. The correlation number ranges from -1 to 1. The closer to the number 1, the higher the relationship between the independent variables together and the dependent variables. Positive and negative values indicate the direction of the relationship, if the value is positive then the relationship is unidirectional and vice versa if the value is negative then the relationship is not unidirectional. The following are the results of the correlation test as follows:

Table 7

Results of Correlation Coefficient Analysis Test

Correlations

		Carbon Emission Disclosure	Green Innovation	Intellectual Capital	Nilai Perusahaan
Carbon Emission Disclosure	Pearson Correlation	1	-.056	.147	.141
	Sig. (2-tailed)		.621	.192	.212
	N	80	80	80	80
Green Innovation	Pearson Correlation	-.056	1	-.004	-.029
	Sig. (2-tailed)	.621		.972	.799
	N	80	80	80	80
Intellectual Capital	Pearson Correlation	.147	-.004	1	.047
	Sig. (2-tailed)	.192	.972		.676
	N	80	80	80	80
Nilai Perusahaan	Pearson Correlation	.141	-.029	.047	1
	Sig. (2-tailed)	.212	.799	.676	
	N	80	80	80	80

Source : Data processing results using SPSS

It is known that the relationship between the Carbon Emission Disclosure variable and Firm Value has a very low relationship, the correlation coefficient value produces a negative number, which means that any increase in Carbon Emission Disclosure will be accompanied by a decrease in Firm Value. Furthermore, the relationship between the Green Innovation variable and the Company Value variable has a very low relationship, the correlation coefficient value shows a negative number. This shows that any increase in Green Innovation will be accompanied by a decrease in Company Value. Furthermore, the relationship between the Green Innovation variable and the Company Value variable has a very low relationship, the correlation coefficient value shows a negative number. This shows that any increase in Green Innovation will be accompanied by a decrease in Company Value.

Determination Coefficient Analysis

The coefficient of determination test is used to assess the extent to which the independent variable affects the dependent variable as a whole, the measurement refers to the Adjusted R Square value resulting from multiple linear regression analysis. The following are the results of the coefficient of determination test which can be seen in the following table:

Table 8

Results of Determination Coefficient Analysis Test

Correlations

		Carbon Emission Disclosure	Green Innovation	Intellectual Capital	Nilai Perusahaan
Carbon Emission Disclosure	Pearson Correlation	1	-.056	.147	.141
	Sig. (2-tailed)		.621	.192	.212
	N	80	80	80	80
Green Innovation	Pearson Correlation	-.056	1	-.004	-.029
	Sig. (2-tailed)	.621		.972	.799
	N	80	80	80	80
Intellectual Capital	Pearson Correlation	.147	-.004	1	.047
	Sig. (2-tailed)	.192	.972		.676
	N	80	80	80	80
Nilai Perusahaan	Pearson Correlation	.141	-.029	.047	1
	Sig. (2-tailed)	.212	.799	.676	
	N	80	80	80	80

Source : Data processing results using SPSS

Kd = R^2 x 100%

= $(0, 913)^2$ x 100%

= 83,3%

Based on table 8 and the calculation of Kd, it can be seen that the coefficient of determination is 83.3%, this value concludes that 83.3% of Firm Value is influenced by the independent variables in this study, namely Carbon Emission Disclosure, Green Innovation, and Intellectual Capital. Meanwhile, the remaining 16.7% is influenced by other factors or variables outside of the study.

Drawing Conclusions

Drawing conclusions The conclusion is drawn to find out whether the hypothesis presented is accepted or not, by testing the hypothesis, namely partial test (t-test) and simultaneous test (f-test).

Partial Test (t-Test)

Partial tests or t tests are carried out to draw conclusions about whether the proposed hypothesis is accepted or rejected. The t test illustrates the extent to which the influence of each independent variable can explain the dependent variable. The t test is done by comparing Thitung with Ttabel. H0 is rejected and Ha is accepted if Thitung> Ttabel or - Thitung < Ttabel and a significant level <0.05, this indicates that the independent variable has a partial and significant effect on the dependent variable. Conversely, if Ha is rejected and H0 if Thitung < Ttabel or - Thitung > - Ttabel and a significant level> 0.05, this indicates that the independent variable partially has no effect on the dependent variable. The following are the partial test results (t test) as follows:

Table 9

Partial Test Results (t- Test)

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	.652	.047		13.830	<,001
	Carbon Emission Disclosure	.012	.001	.875	18.386	<,001
	Green Innovation	-1.602E-6	.000	-.139	-2.966	.004
	Intellectual Capital	.005	.002	.094	1.974	.052

a. Dependent Variable: Nilai Perusahaan

Source : Data processing results using SPSS

Carbon Emission Disclosure shows a Thitung result of 18.386 and a Ttable value of 1.991, which means that H0 is rejected and Ha is accepted. With a significance result of 0.000 <0.05, it can be concluded that the Carbon Emission Disclosure variable has a positive and significant effect on Firm Value. Green Innovation shows the Thitung result of -2.966 and the Ttabel value of -1.991 which means that -Thitung> -Ttabel, it shows that H0 is rejected and H1 is accepted. So that the significance result is 0.004 <0.05, it can be concluded that the Green Innovation variable has a negative and significant effect on firm value. Intellectual Capital shows the results of the Thitung value of 1.974 and the Ttabel value of 1.9971 which means that Thitung < Ttabel, it shows that H0 is accepted and H1 is rejected. So that the significance result is 0.052> 0.05, it can be concluded that the intellectual capital variable has no positive and insignificant effect on firm value.

Simultaneous Test (F- Test)

The Statistical Test F was carried out to find out whether independent variables together could affect the dependent variables. The decision making is that if the significance value < 0.05 and the value of fCalculate > FTable, it can be declared H0 rejected and Ha accepted. The following are the results of the F test.

Table 10

Simultaneous Test Results (f- Test)

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	.652	.047		13.830	<,001
	Carbon Emission Disclosure	.012	.001	.875	18.386	<,001
	Green Innovation	-1.602E-6	.000	-.139	-2.966	.004
	Intellectual Capital	.005	.002	.094	1.974	.052

a. Dependent Variable: Nilai Perusahaan

Source : Data processing results using SPSS

The F statistical test in table 4.14 above shows the results of simultaneous hypothesis testing (f test), it can be seen that the Fcount value is 126.183. So it can be concluded that Ftable> Fcount, namely 126.183 < 2.72. The f test results also show a significance level of <0.000, so that the value is smaller than 0.05, namely (0.000> 0.05). Therefore, it can be concluded that simultaneously the Carbon Emission Disclosure, Green Innovation, and Intellectual Capital variables have a significant effect on Firm Value in energy companies listed on the Indonesia Stock Exchange (IDX) in 2019-2023.

The Effect of Carbon Emission Disclosure on Firm Value

The results of this study indicate that Carbon Emission Disclosure has a positive and significant effect on Firm Value. This is indicated by the value of the Carbon Emission

Disclosure variable 18.386> 1.991 or the value of Thitung> Ttabel with a significance of 0.000 <0.05, then H0 is rejected and Ha is accepted, which means that there is a significant positive effect between Carbon Emission Disclosure on Firm Value. This shows that any increase in Carbon Emission Disclosure reduces the reputational risk of compliance with environmental regulations, which has a positive impact on firm value.

The Effect of Green Innovation on Firm Value

The results of this study indicate that Green Innovation has a negative and significant effect on firm value, this is because the value of the Green Innovation variable is -2.966 and the Ttable value is -1.991 which means that -Thitung> -Ttabel, it shows that H0 is rejected and H1 is accepted. So that the significance result is 0.004 <0.05, it can be concluded that the Green Innovation variable has a negative and significant effect on firm value.

The Effect of Intellectual Capital on Firm Value

The results of this study indicate that Intellectual Capital has no negative and insignificant effect on Firm Value, this is because the value of the Intellectual Capital variable is 1.974 < 1.991 or Thitung < Ttabel with a significance of 0.052> 0.05, so H0 is rejected and H1 is accepted, which means that there is no negative and insignificant effect between Intellectual Capital on Firm Value.

5. Conclusion and Suggestion

Conclusion

Based on the results of data analysis through hypothesis testing that has been carried out by research entitled The Effect of Carbon Emission Disclosure, Green Innovation, and Intellectual Capital on Firm Value in Energy Companies Listed on the Indonesia Stock Exchange (IDX) for the 2019-2023 Period, it can be concluded that this research is as follows:

1. Carbon Emission Disclosure partially has a significant positive effect on Firm Value.

2. Green Innovation partially has a significant negative effect on Company Value.

3. Intellectual Capital partially has no effect and is not significant to the Company's Value.

Suggestion

This study is expected to provide an overview of the effect of Carbon Emission Disclosure, Green Innovation funds Intellectual Capital on Company Value in Energy Companies Listed on the Indonesia Stock Exchange for the 2019-2022 Period. Based on several research limitations, the researcher intends to provide suggestions for future researchers, namely as follows: a). It is expected to increase the observation period and expand the sample population so that the research results are more accurate for future research. b). It is expected to use moderating variables in order to analyze the factors that influence the independent variable on the dependent variable. c). It is expected to add variables that can strengthen the influence of the independent variable on the dependent variable. d). It is hoped that it can expand the sector under study so that the range of information generated is more.

Acknowledgments

This research would not have happened without the support of my parents and my own hard work. I would like to thank my parents and myself, for being able to fight hard so far and continue to try until finally being able to complete this research

ANALYSIS OF THE USE OF ARTIFICIAL INTELLIGENCE (AI) ON PRODUCTION EFFECTIVENESS AND EMPLOYEE PERFORMANCE

Sapto Ari Prabowo[1]

[1]Master of Management, Faculty of Economics and Business, Jenderal Achmad Yani University, Cimahi, Indonesia
iwosky_11@yahoo.com[1]

Abstract

The development of artificial intelligence (AI) technology has driven digital transformation across various sectors, including human resource management (HRM) and business operations. This study aims to analyse the impact of AI implementation on production effectiveness and employee performance through a systematic literature review of 12 previous studies. The research method employs a descriptive qualitative approach with content analysis of relevant literature sources. The findings indicate that AI significantly contributes to enhancing operational efficiency, such as automating routine tasks, reducing machine downtime (up to 25%), improving production defect detection (95%), and accelerating decision-making. Additionally, AI supports human resource performance evaluation and employee productivity, with work efficiency improvements ranging from 55% to 68.9% across various sectors. However, AI implementation also presents challenges, including psychological stress on employees (77% experienced stress) due to changes in work systems. The conclusion of this study emphasises that AI is a strategic tool for improving production effectiveness and employee performance, provided it is balanced with an adaptive management approach and adequate human resource training. Recommendations for further research include a more in-depth exploration of the impact of AI in various industrial contexts and the development of psychosocial risk mitigation strategies.

Keywords**:** *Artificial Intelligence (AI), Production Effectiveness, Employee Performance, Literature Review, Digital Transformation*

1. Introduction

The development of technology, particularly in the field of artificial intelligence (AI), has become one of the driving factors in digital transformation across various sectors, including human resource management (HRM). Currently, AI serves as a tool to enhance operational efficiency, improve production effectiveness, and boost employee performance.

AI has the ability to receive commands and visualise them. The emergence of AI in information technology offers numerous benefits. AI complements information technology, which consists of infrastructure, hardware, software, and automated services supported by technology, enabling companies to operate more effectively and efficiently (Siska et al, 2023).

In addition to the competence of human resources (HR), the presence of technology is considered capable of boosting production effectiveness and employee performance. This is because technology can help employees, particularly in improving their performance in the series of processes, policies, and procedures undertaken by the organisation to achieve its goals (Muzakir et al, 2023).

Through the application of Artificial Intelligence, companies can improve productivity, as AI makes employees' work easier, allowing them to quickly and efficiently complete the tasks assigned by the company (Raihan Saputra, 2023:91). AI can be implemented in a company by utilising various applications that can boost production effectiveness and

employee performance. This process is evident from the automation of routine tasks to the personalisation of work experiences, as well as the analysis and management of human resources by identifying the potential for collaboration that can be achieved. All these processes have a significant impact on enhancing production efficiency and optimising employee performance.

The positive assessment of AI's presence is reflected in its potential and capabilities. However, to align this perspective with reality on the ground, a thorough analysis is needed to ensure that AI's presence can enhance production efficiency and employee performance. In the modern era, the use of AI in companies has become commonplace and is already implemented by many companies and organisations.

Based on the above explanation, the problems addressed in this paper are as follows: 1. How can artificial intelligence (AI) be applied to improve production efficiency and employee performance?; 2. How does AI solve problems related to production efficiency and employee performance?; 3. What are the positive impacts of applying AI to production efficiency and employee performance?

2. Literature review

2.1 Artificial Intelligence (AI)

Artificial Intelligence can be defined as artificial intelligence, which in the process means creating or preparing machines such as computers to have intelligence based on human behaviour. Artificial Intelligence basically aims to make computers carry out commands that can be performed by humans. One part of artificial intelligence is expert systems (Turban, 1995, p. 422).

According to John McCarthy, artificial intelligence (AI) is the science and technique of creating intelligent machines, particularly in the creation of intelligent computer programs or applications. AI is a step towards creating computers, robots, or applications or programs that work intelligently, just like humans (McCarthy, 2007).

The purpose of creating AI itself is to: a. Create an expert system, i.e. a system that can perform intelligent behaviour, learn, demonstrate, explain, and advise users. b. Implement human intelligence into machines, creating a system that can understand, think, learn, and behave like humans. The fields that contribute to AI include Computer Science, Biology, Psychology, Linguistics, Mathematics, and Engineering. One of the major steps in creating computers related to artificial intelligence is thinking logically, learning, and solving problems. The techniques used by AI to solve problems involve organising information and knowledge so that it can be easily accessed and understood by users, can be easily modified to correct errors, and can be useful in various situations, even though it is still not perfect or accurate.

AI has capabilities that can support three areas of business functions (Davenport & Ronanki, 2018). First, AI can improve business automation processes by adding cognitive capabilities to software. For example, organisations use AI to make automatic decisions such as loan processes at banks and automate business processes by providing cognitive capabilities in software. For example, organisations use AI to add automated decision-intensive tasks such as loan processing and supply chain management to understand customer purchasing behaviour. The National Aeronautics and Space Administration (NASA) states that the use of AI technology in HR processes allows them to complete 86% of HR tasks without human intervention (Davenport & Ronanki, 2018). This means that AI enables automation processes using software algorithms that can make and implement decisions without human intervention. The application of AI in eHRM is not only a tool for providing recommendations on the benefits each employee will receive but also a tool that can determine the benefits each employee will receive and automatically register them (Johnson et al., 2020).

Secondly, AI can provide input or options that will assist in the decision-making process. This AI capability uses algorithms and machine learning that are useful as translators of large amounts of data, searching for hidden patterns that were previously unknown to an organisation. By using AI, an organisation can predict the purchasing behaviour of its customers, prevent and identify fraud, and customise advertising. AI also functions as a diagnostic tool for patients in the medical field, for example, predicting cancer patients (Davenport & Ronanki, 2018).

Thirdly, the use of intelligent agents and chatbots. For example, many e-commerce vendors have implemented intelligent agents to help customers decide what to buy (Johnson et al., 2020). Meanwhile, chatbots can assist customers and employees. For example, SEBank uses chatbots to support employees who have questions related to IT (Davenport & Ronanki, 2018).

2.2 Effectiveness

Effectiveness can be defined as an effort made by a group of people or an organisation to achieve predetermined targets or objectives, so that the effort can be considered successful. According to Adibowo et al. (2014) in Mahmudi (2005:92), effectiveness is defined as follows: 'Effectiveness is the implementation of a series of tasks that have been set out in a plan, carried out in accordance with applicable guidelines and procedures so that the desired objectives can be achieved.' (Mahmudi, 2005:92).

Based on the above opinions, it can be understood that effectiveness is a strategy to achieve success that has been set by individuals, groups, or organisations in carrying out an activity that is expected to achieve objectives in accordance with applicable guidelines and procedures. In general, effectiveness is a state that indicates the level of success measured by quality, quantity, and time in accordance with what has been planned. In other words, the more plans that are achieved or have been successful, the more effective the activity is considered to be.

There are also those who explain that effectiveness is a level of success achieved by an individual or organisation in a certain way in accordance with the objectives to be achieved. In other words, the more plans that are successfully achieved, the more effective an activity is considered to be. Measuring the effectiveness of a programme is not a simple matter, because effectiveness can be assessed from various perspectives and depends on who is assessing and interpreting it. From an information system perspective, those who implement it and those who use it provide an understanding of how the input-process-output of the programme works

Measuring effectiveness according to S.P Siagian in his book Modern Management (1982:30-33) includes: 1. Clarity of the objectives to be achieved so that employees can achieve their goals and objectives in carrying out their duties; 2. Clarity of the strategy for achieving objectives; this strategy is the method used in the effort to achieve a goal; 3. The process of analysing and formulating policies related to the objectives to be achieved and the strategies to be used, meaning that policies must be able to bridge the gap between objectives and operational activities; 4. Thorough planning, which essentially involves deciding now what will be done in the future; 5. Proper programme formulation. If implementation lacks guidelines for action, it is because the plan has not been properly outlined in the implementation programme; 6. Productive work capacity with available facilities and infrastructure; 7. Effective and efficient implementation; if a programme is not implemented effectively and efficiently, the organisation will not achieve success in line with its objectives; 8. An educational monitoring and control system, given the imperfect nature of humans, effectiveness requires a monitoring and control system. (Siagian, 1982:30-33).

Based on the benchmarks according to S.P Siagian in his book Modern Management (1982:30-33) above, the effectiveness of a program is measured using eight indicators to assess whether the work is effective or not.

Furthermore, according to Budiani, measuring the effectiveness of a program can be done using the following variables: 1. Program Objective Achievement, which refers to the extent to which program participants achieve the objectives set for the program; 2. Program Socialisation, which refers to the ability of program organisers to socialise the program so that information about its implementation can be conveyed to the general public and program participants in particular; 3. Program Goal Achievement, which refers to the extent to which the results are in line with the program goals that have been set; 4. Program Monitoring: activities conducted after the program is implemented as a form of attention to program participants. (Budiani, 2007:53).

Based on the above explanation, the effectiveness of a program can be measured by program target achievement, program socialisation, program implementation, program goal achievement, and program monitoring.

2.3 Performance

Performance comes from the words job performance or actual performance (work performance or actual achievements made by someone). The definition of performance (work performance) is the quality and quantity of work achieved by an employee in carrying out their duties in accordance with the responsibilities assigned to them. Performance refers to employee achievements measured based on standards or criteria set by the company (Suryanto, 2020).

According to Mangkunegara (2017), employee performance is the quality and quantity of work achieved by an employee in performing their duties in accordance with the responsibilities entrusted to them. Furthermore, Pranata (2020) states that performance is the work results that can be displayed or the work performance of an employee, while Hasibuan (2018) states that performance is the work results that can be achieved by an individual or group of people in an organisation in accordance with their respective authorities and responsibilities in order to achieve the organisation's objectives legally, without violating the law and in accordance with morals and ethics.

Performance refers to the degree of achievement of the tasks that make up an employee's job. Performance is defined as the result of the work/activities of an individual or group within an organisation that is influenced by various factors to achieve the organisation's objectives within a certain period of time (Suryanto, 2020). Employee performance refers to an employee's ability to carry out all the tasks that are their responsibility. The objectives of an institution can only be achieved when the institution is supported by the work units within it.

Employee performance can be categorised into high, medium, or low performance levels, and can also be categorised as exceeding targets, meeting targets, or falling short of targets. Based on these considerations, performance is understood as the overall work performance of an employee (Mundakir & Zainuri, 2018).

3. Methodology

This study uses a qualitative descriptive analysis method with the aim of analysing the use of Artificial Intelligence (AI) on production effectiveness and employee performance. The data used for analysis is derived from previous literature reviews. By incorporating literature reviews, this study aims to present a comprehensive understanding of the contribution of AI to production effectiveness and employee performance. The qualitative descriptive approach is used to approach this phenomenon in a deep manner, facilitating the identification of patterns, trends, and implications that may arise from the integration of AI in production effectiveness

and employee performance. Qualitative analysis through literature review in this study refers to a systematic process of understanding and reorganising information from relevant literature sources. The qualitative approach focuses on a deep and interpretative understanding of concepts, phenomena, or theories, and this method is well-suited for exploring the complex aspects of the use of Artificial Intelligence (AI) on production effectiveness and employee performance.

In the context of a literature review, this study collects and evaluates previous works that have outlined various aspects of AI in various journal articles. Qualitative analysis involves identifying patterns, themes, and common findings that can be found in the literature. Additionally, this approach allows researchers to detail differences, controversies, or knowledge gaps that may exist in the literature.

By conducting qualitative analysis through a literature review, this study not only summarises information but also performs an in-depth interpretation of the findings. This includes understanding the context in which previous research was conducted, evaluating the methodologies used, and identifying the implications of the findings. Overall, qualitative analysis through a literature review provides a strong foundation for detailing the conceptual framework of the research and better understanding the use of AI in production effectiveness and employee performance.

4. Results and discussions

Journals are categorized by type to facilitate the search and analysis process. The following table shows the grouping of journals by source and year of publication:

Table 1. Classification of Journals Based on Source and Year of Publication

No	Research	Year	Total
1	Production Schedule Optimisation (Agra Nurtrihadi et al.)	2025	1
2	Efficiency & Innovation (Herbet Simangunsong et al.)	2025	1
3	AI in Manufacturing (API Tulungagung)	2025	1
4	USNI Repository (Sutrisno)	2024	1
5	SLR Human Resource Effectiveness (Kurniawan et al.)	2024	1
6	AI Competence (Anwar Tahir et al.)	2024	1
7	Jurnal Inobis (Rahmawati et al.)	2023	1
8	JPSN (Ardiansyah et al.)	2023	1
9	Makreju (Maulidina)	2023	1
10	Jurnal Jaras (Nurdin)	2023	1
11	Generative AI (Brynjolfsson et al.)	2023	1
12	GitHub Copilot Study	2023	1

Discussion of Results

RQ1: What is the Potential Application of Artificial Intelligence (AI) in Production Effectiveness and Employee Performance?

The following table shows the potential application of AI in Production Effectiveness and Employee Performance:

Table 2. Potential Application of AI in Production Effectiveness and Employee Performance

No	Research	Findings
1	Agra Nurtrihadi et al.	Production efficiency and flexibility improved with AI.
2	Herbet Simangunsong et al.	Machine downtime reduced by 25%, defect detection improved by 95%.
3	API Tulungagung	Productivity increased by 18%, ROI positive.
4	Sutrisno	AI accelerated business processes.
5	Kurniawan et al.	Focus on HR analytics and performance evaluation.
6	Anwar Tahir et al.	Productivity increased by 68.9%.
7	Rahmawati et al.	AI assisted HR and performance evaluation.
8	Ardiansyah et al.	AI accelerated work decisions.
9	Maulidina	Work processes are more efficient.
10	Nurdin	AI reduces manual errors in the back office.
11	Brynjolfsson et al.	Customer support productivity increases by 15%.
12	GitHub Copilot Study	Coding speed increases by 55%.

RQ2: How does AI solve problems related to production effectiveness and employee performance?

Table 3. AI Solutions for Solving Production Effectiveness and Performance Issues

No	Research	Solutions Provided
1	Agra Nurtrihadi et al.	Further research is needed to measure the impact of AI on employee performance, such as job satisfaction or stress levels.
2	Herbet Simangunsong et al.	Further research is needed to measure the impact of AI on employee performance, such as job satisfaction or stress levels.
3	API Tulungagung	Evaluate the impact of AI on job structures, such as whether there is a reduction in human resources or changes in job descriptions.
4	Sutrisno	More detailed research on the impact of AI on employee productivity, not just the organization, is needed.
5	Kurniawan et al.	Integrate AI into HR training to improve competency in the manufacturing sector.
No	**Research**	**Solutions Provided**
6	Anwar Tahir et al.	Pilot a similar model in the manufacturing sector to see the impact of AI on the production line.

7	Rahmawati et al.	Develop AI for performance analysis of production operators in manufacturing.
8	Ardiansyah et al.	Apply AI in predictive maintenance to reduce machine downtime.
9	Maulidina	Pilot on the production line to measure the acceleration of the manufacturing process.
10	Nurdin	Apply AI in production quality control.
11	Brynjolfsson et al.	Adapt generative AI for technical documentation or machine troubleshooting.
12	GitHub Copilot Study	Use AI for CNC machine programming or product design automation.

RQ3: What are the positive impacts of AI implementation on production effectiveness and employee performance?

Table 4. Positive Impact of AI Implementation on Production Effectiveness and Employee Performance

No	Research	The Positive Impact of AI
1	Agra Nurtrihadi et al.	AI increases production efficiency and flexibility.
2	Herbet Simangunsong et al.	Machine downtime reduced by 25%, defect detection increased by >95%.
3	API Tulungagung	Productivity increased by 18% with positive ROI.
4	Sutrisno	AI accelerates business processes and improves organizational performance.
5	Kurniawan et al.	AI helps HR analytics and employee performance evaluation.
6	Anwar Tahir et al.	Productivity increased by 68.9% in the retail sector.
7	Rahmawati et al.	AI helps HR performance evaluation.
8	Ardiansyah et al.	AI accelerates decision making.
9	Maulidina	AI improves general work efficiency.
10	Nurdin	AI reduces manual errors and improves accuracy.
11	Brynjolfsson et al.	Customer support productivity increased by 15%.
12	GitHub Copilot Study	Developers work 55% faster.

The following is a summary table of previous research from existing sources related to the use of Artificial Intelligence (AI):

Table 5. Previous Research

No	Research & Year	Focus & Method	Key Results	Equations	Differences
1	Optimisation of Production Schedules (Agra Nurtrihadi et al., 2025)	Qualitative – manufacturing	Increased efficiency and flexibility	Production effectiveness via AI	Do not measure employee performance
2	Efficiency & Innovation (Herbet Simangunsong et al., 2025)	Qualitative	Downtime -25%, defect detection +95%	Focus on AI production & innovation	No direct assessment of human resources yet
3	AI in Manufacturing (API Tulungagung, 2025)	Mixed method	Productivity +18%, positive ROI	Production efficiency & AI	Do not measure individual performance
4	USNI Repository (Sutrisno, 2024)	Study of the impact of AI in the digital age	AI accelerates business processes	The effect of AI on performance	Do not measure production output
5	SLR Human Resource Effectiveness (Kurniawan et al., 2024)	Systematic literature	AI assists HR and evaluation	Performance & HR analytics	Not specific to production
6	AI Competence (Anwar Tahir et al., 2024)	Quantitative (99 respondents)	Productivity increased by 68.9%	Focus on AI & productivity	Retail context, not manufacturing
7	Inobis Journal (Rahmawati et al., 2023)	Quantitative	AI assists HR and evaluation	Focus on human resource performance	No discussion of direct production
8	JPSN (Ardiansyah et al. 2023)	AI studies & work	AI speeds up work decisions	Work effectiveness increases	Not specific to production
9	Makreju (Maulidina, 2023)	Quantitative	Work efficiency improves	Faster work process	Not in the production sector
10	Jaras Journal (Nurdin, 2023)	Digital transformation study	Reduction of manual errors	AI improves work accuracy	Focus back office
11	Generative AI (Brynjolfsson et al., 2023)	Experiment	Productivity +15%	The effect of AI on productivity	Focus Customer support
12	GitHub Copilot Study (2023)	Coding experiment	Task completed 55% faster	AI efficiency is very high	Focus software developer

Research by Agra Nurtrihadi et al. (2025) investigated the optimisation of production schedules in the manufacturing sector using a qualitative approach, with the results showing that the application of AI can improve efficiency and flexibility in the production process. The

main focus was on improving operational effectiveness, but this study did not measure the direct impact on employee performance.

According to Herbet Simangunsong et al. (2025), a qualitative study was conducted on the application of AI in improving production process efficiency and innovation. The results showed that machine downtime was reduced by up to 25% and product defect detection increased by more than 95%. This study demonstrated a significant impact on production efficiency, although it did not directly address the impact of AI on human resources.

Furthermore, according to API Tulungagung (2025), a mixed method was used in the research to assess the application of AI in the manufacturing sector. This study found an 18% increase in productivity and a positive Return on Investment (ROI). The main focus was on production efficiency through the use of AI, without specifically discussing its impact on individual performance.

According to Sutrisno in the USNI Repository (2024), which discusses the impact of AI on accelerating business processes in the digital era. This study emphasises how AI contributes to improving organisational performance, although it does not directly measure production output.

Then, according to Kurniawan et al. (2024), a systematic literature review was conducted on the effectiveness of using AI to support human resource management. The main findings stated that AI is useful in the HR analytics process and employee performance evaluation. The focus is more on human resource optimisation than production efficiency.

According to Anwar Tahir et al. (2024), the study used a quantitative method involving 99 respondents to assess AI's competencies in the workplace. The study found that AI can increase productivity by 68.9%. However, this study was conducted in the retail sector, not manufacturing.

In a study conducted by Rahmawati et al. in the Inobis Journal (2023), which presented quantitative research on the use of AI in supporting Human Resource (HR) functions, including performance evaluation and assessment. This study highlighted the role of AI in improving human resource performance, although it did not discuss its application in the production process.

Then, according to Ardiansyah et al. in the JPSN Journal (2023), a study was conducted on the influence of AI on work effectiveness. The results showed that AI can accelerate the decision-making process in the workplace, thereby increasing overall effectiveness. However, this study did not specifically focus on the production sector.

Meanwhile, according to Maulidina in the Makreju Journal (2023), a quantitative study was conducted which showed that the application of AI can improve work efficiency in general. In this case, AI can help speed up work processes, but this study was not conducted in the context of the manufacturing sector.

There are similarities between the research conducted by Maulidina and Nurdin in the Jaras Journal (2023), which examines digital transformation with a focus on the use of AI in the back-office work environment. This study found that AI was able to reduce manual errors and improve job accuracy, but was not directly related to the production process.

Highlighting the field of customer service, according to Brynjolfsson et al. (2023), which conducted experiments on the use of generative AI in the field of customer support. The results show a 15% increase in productivity, which proves that AI can speed up task completion and increase output. The focus of this research is more on customer service.

On the other hand, according to the GitHub Copilot Study (2023), it shows how AI can support the work of software developers, so that in this experiment the developers completed programming tasks 55% faster with the help of AI. This study is proof of high work efficiency through AI, especially in the context of software development.

The results show that the application of Artificial Intelligence (AI) has great potential in improving operational efficiency, both through process automation, reducing work time, increasing accuracy, and making faster decisions. However, there are also negative psychological impacts such as work stress that need attention. This research makes an important contribution to understanding the future direction of AI development in business operational practices.

From the results of a systematic literature review of 13 studies, it can be concluded that Artificial Intelligence (AI) makes a clear positive contribution to the efficiency of the production process, work acceleration, and increased accuracy in business decision making. However, the implementation of AI also poses challenges, especially in the form of psychological pressure on the workforce due to significant changes in work processes. Therefore, the implementation of AI in business must be balanced with an adaptive managerial approach to maintain sustainable productivity and human resource welfare.

5. Conclusion

Based on the results of the literature review of 12 analyzed studies, it can be concluded that Artificial Intelligence (AI) has a significant contribution to improving production efficiency and employee performance. The application of AI in the context of business operations is proven to automate routine tasks, speed up work processes, improve decision-making accuracy, and support more strategic human resource management. Findings show that AI has a positive impact in various sectors, ranging from manufacturing, education, public services, to smart city management. AI not only acts as a technical tool, but also as an agent of organizational transformation towards more optimal performance.

However, the integration of AI in the workplace also poses challenges, especially related to HR adaptation and potential psychological burdens such as stress due to changes in the work system. Therefore, the implementation of AI needs to be accompanied by an inclusive managerial strategy, strengthening the digital capacity of HR, and policies that ensure employee welfare.

Considering the benefits and risks, it can be concluded that AI is a strategic tool that, if applied wisely, can sustainably improve production effectiveness and employee performance. Further research is still needed to examine the dynamics of AI implementation contextually across different types of industries and organizational levels

THE EFFECT OF WORK STRESS, PHYSICAL WORK ENVIRONMENT, AND ORGANIZATIONAL CITIZENSHIP BEHAVIOR (OCB) ON WORK PERFORMANCE IN THE PRODUCTION DEPARTMENT OF PT. GENTA TRIKARYA SUMEDANG

Shintia Maharani[1], RM Juddy Prabowo[2]

Faculty of Economics and Business, General Achmad Yani University
shintiamaharani_21p042@mn.unjani.ac.id [1], yudi.prabowo@lecture.unjani.ac.id [2]

Abstract

This study aims to analyze the effect of work stress, physical work environment, and Organizational Citizenship Behavior (OCB) on the performance of production employees at PT. Genta Trikarya Sumedang. This study uses a quantitative approach with 41 respondents from the production department, while the performance assessment is carried out by one direct superior. Data collection was carried out using a questionnaire consisting of four variables. Data were analyzed using multiple linear regression. The results of the data processing simulation showed that work stress had no effect on employee performance β = -0.008, the physical work environment had a significant positive effect on performance β = 0.344, and OCB also had a significant positive effect on employee performance β = 0.358. Simultaneously, the three independent variables had a significant effect on employee performance with a calculated F value of 29.278 and a coefficient of determination (R^2) of 0.709, which indicated that 70.9% of the variation in performance could be explained by the three variables. The conclusion of this study is that work stress in this context does not directly reduce or increase their performance significantly. However, it still needs to be managed so that it does not develop into chronic stress and damage productivity in the long term, while a decent physical work environment and high OCB behavior can improve performance. Therefore, companies are advised to improve the physical conditions of the work environment and encourage a work culture that supports OCB, while managing workloads to reduce employee stress.

Keywords: *Job Stress, Physical Work Environment, Organizational Citizenship Behavior (OCB), Employee Performance.*

1. Introduction

In the era of globalization and increasingly fierce competition, the success of a company is highly dependent on the quality of its human resources, especially in terms of employee productivity and performance. Employee performance plays an important role in achieving the company's strategic and operational goals, including achieving production targets, improving product quality, and ensuring customer satisfaction. However, employee performance is often influenced by various factors, both internal and external. With very rapid technological changes, of course, it brings changes in human life, so these changes result in high demands on each individual in improving their performance, with the development of technology and knowledge, employees must be able to change their work patterns and systems with various demands applied in the current era. Performance is the result achieved by a person in carrying out PT. Genta Trikarya, as one of the companies engaged in the musical instrument industry, especially guitars with ukuleles which routinely markets its products to England, Germany and the Netherlands **(beacukai.go.id)** . According to **Nur & Marlina (2022)** stated that employee performance is part of the actions or behaviors that are in accordance with the work that has been given by the company, with the current changes of course the company is experiencing

development, with changes in the company. As a result of declining employee performance, of course, there are many factors that can be the basis of performance problems. According to **Amanda, Suherman, & Hidayaty (2022)** , work stress affects employee performance, so work stress is one of the factors that can affect employee performance. In addition to work stress that affects employee performance, the physical work environment is also a factor that causes less than optimal employee performance. According to **Rastana, S. Made & Premayani (2021)** , the physical work environment affects performance. The physical work environment affects employee performance **Rastana, Mahayasa, & Premayani (2021).** In addition to the physical work environment which is a problem for performance, *Organizational Citizenship Behavior* (OCB) one of the factors causing declining employee performance. Based on research conducted by **Sartika (2022),** it was stated that *Organizational Citizenship Behavior* (OCB) affect employee performance. *Organizational Citizenship Behavior (OCB)* or organizational citizenship behavior can also affect employee performance because employee behavior can support the implementation of tasks carried out.

Thus, based on the facts obtained from the company PT. Genta Trikarya Sumedang, it can be assumed that employee performance is influenced by work stress, physical work environment, and *Organizational Citizenship Behavior* (OCB), so that the problem that underlies this study takes the title **" The Effect of Work Stress, Physical Work Environment, and *Organizational Citizenship Behavior (OCB)* on the Performance of Production Employees at PT. Genta Trikarya Sumedang ".** The identification of problems from this study, as follows:

1. How is the level of work stress of Production Department employees at PT. Genta Trikarya Sumedang.
2. How do respondents respond to the physical working environment conditions of the Production Department of PT. Genta Trikarya Sumedang.
3. How do respondents respond to *Organizational Citizenship Behavior* (OCB)? Production Department employees at PT. Genta Trikarya Sumedang.
4. How is the performance of Production Department employees based on the perception of their direct superiors at PT. Genta Trikarya Sumedang.
5. How do work stress, physical work environment, and *Organizational Citizenship Behavior* (OCB) affect the performance of Production Department employees both partially and simultaneously at PT. Genta Trikarya Sumedang.

2. Literature Review

2.1 Job Stress

Job stress is a condition that affects a person's emotions, thought processes, and condition. People who experience stress become *nervous* and feel chronic anxiety **(Hasibuan, 2013)**

- ***Sources of Work Stress in the Work Environment***

According to **Suwanto & Priansa (2018),** the sources of work stress in the work environment are as follows:

1. Stress that originates from the individual level

Stress that originates from the individual level is stress that is related to tasks that must be completed quickly and to the relationship between a person's position in their workplace.

2. Stress originating from groups and organizations

Stress from groups and organizations refers to the emotional and psychological pressure experienced by individuals as a result of the interactions or dynamics that occur within the work group or organization to which they belong.

2.2 Physical Work Environment

The physical work environment is a condition that exists in the workplace, so it will affect employees either directly or indirectly (**Sedarmayanti, 2017).**

- ***Factors Affecting the Physical Work Environment***

According to **Sedarmayanti (2018),** the factors that influence the physical work environment are as follows:

1. Adequate lighting/light

Lighting is very important in a room, especially in the workplace, therefore good lighting can affect employee performance.

2. Temperature

Each part of the human body has a different temperature, the human body will try to maintain a normal state, with a perfect body system it will adapt to changes that occur outside the body.

3. Humidity

This humidity is related to or can be influenced by air temperature, as well as together with temperature, humidity, speed of moving air and heat radiation from the air.

4. Air circulation

Air circulation is the main source for employees to breathe fresh air, with good circulation, there will be many plants in the workplace to produce more oxygen.

2.3 Organizational Citizenship Behavior (OCB)

Organizational Citizenship Behavior (OCB) is behavior that is voluntary, not through a formal reward system, and can increase the effectiveness of organizational functions (**Kaswan, 2016).**

- ***Dimensions in Organizational Citizenship Behavior (OCB)***

According to **Lestari & Ghaby (2018)** there are 5 dimensions in *Organizational Citizenship Behavior* (OCB), namely:

1. *Altruism*

An attitude or behavior that is oriented towards caring for others without expecting rewards or personal gain and without coercion (voluntary).

2. *Conscientiousness*

The attitude shown can exceed the requirements set by the company, such as arriving at the factory early and making good use of working time.

3. *Sportsmanship*

A positive attitude towards work and the organization even when facing less than ideal situations, and having positive behavior towards the organization by tolerating or not complaining about less than ideal conditions in the organization.

4. *Courtesy*

Proactive action to avoid conflict in the work environment, so you have to maintain good relationships with coworkers to prevent conflict from occurring in order to avoid interpersonal problems.

5. *Civic Virtue*

Active participation in organizational life that reflects responsible participation and participation in the sustainability of the organization.

2.4.Employee performance

Performance is the result of work and attitude while working which has been achieved by completing the tasks and responsibilities given in a certain period (**Kasmir, 2016)**

- ***Dimensions That Influence Employee Performance Levels in a Company***

According to **Kasmir (2016),** there are dimensions that can influence the level of employee performance in a company:

1. Quality

Quality is a process with a level in completing a task of an activity that approaches the point of perfection or conformity with established regulations.

2. Quantity

The quantity of work produced by an individual or group as a requirement that becomes the standard of work.

3. Time

Time is a type of work that is given a time limit to complete the work, which has a minimum and maximum limit in a given job.

4. Cooperation between employees

The work that is done is not always done alone, there must be cooperation where performance is often linked to cooperation between employees and between leaders.

5. Supervision

Supervision is monitoring carried out by employees which is carried out by superiors to their employees.

3. Research Methods

This study uses a quantitative approach, documentation data collection techniques, questionnaires, interviews, and descriptive and associative studies to achieve research objectives that lead to the quality of employee performance in the Production Department. The number of population units is 41 employees in the production department of PT. Genta Trikarya Sumedang and all of them are used as respondents (census), with the characteristics of respondents who have worked at PT. Genta Trikarya Sumedang for at least one year. In this study, the measuring instrument testing technique uses validity and reliability tests.

3.1 Theoretical Framework

According to **Robbins and Judge (2015),** work stress is a dynamic condition in which individuals are confronted with opportunities, demands, or resources related to their desires and where the outcome is perceived as important and uncertain. The physical work environment is everything that is around the work and can directly affect a person in their work, including lighting, control, noise in the workplace, and security arrangements in the workplace **Sukanto and Indryo (2018).** According to **Robbins & Timothy (2016)** *Organizational Citizenship Behavior* (OCB) is *a discretionary* that is not part of the employee's formal job requirements, but which promotes the effective functioning of the organization. According to **Marzuki, Nasir, and Idris (2020)** Performance or what is often referred to as work achievement is a quality and quantity produced by an individual in a particular activity and according to the applicable measures for the work concerned and determined by the organization which is set as a target in a period.

3.2 Conceptual Framework

Based on research conducted by **Ariansy & Kurnia (2022)** , it was stated that work stress has a negative effect on employee performance, while according to **Rastana, Mahayasa, & N. Wayan (2021)** it shows that the physical work environment has a positive effect on

employee performance, as well as previous research conducted by **Anggraini & Rakhmalina (2023)** shows that *Organizational Citizenship Behavior* (OCB) has an effect on employee performance. For more details regarding work stress, physical work environment and *Organizational Citizenship Behavior* (OCB) on employee performance that have been described above, the framework of thought (Instrumentation) is manifested using a research paradigm as shown in Figure 1.

3.3 Instrumentation

This study contains 31 statement items contained in the questionnaire that will be tested using the reliability and validity test shown in Table 1. In this validity and reliability test, statements will be tested one by one stating valid and reliable, if the statement is valid, it means the value is less than 0.05 (sig <0.05), if the reliability test value of Cronbach's Alpha should be greater than 0.6 (Cronbach's Alpha> 0.6) then the statement is declared reliable. The results of the validity test in each statement of all variable instruments X1, X2, X3 and Y are declared valid because the $_{\text{calculated R value}} > R_{\text{table}}$ (0.312) The results of the reliability test can be seen in table 1.

Table 1.
Reliability Test Results

Variables	Alpha Cronbach	R_{table}	Information
X1	0.679	0.312	Reliable
X2	0.960	0.312	Reliable
X3	0.768	0.312	Reliable
Y	0.845	0.312	Reliable

Source: Data Processing Results, 2025

The following is the research paradigm of the Influence of Work Stress, Physical Work Environment, and *Organizational Citizenship Behavior* (OCB) on the Performance of Employees in the Production Division of PT. Genta Trikarya Sumedang:

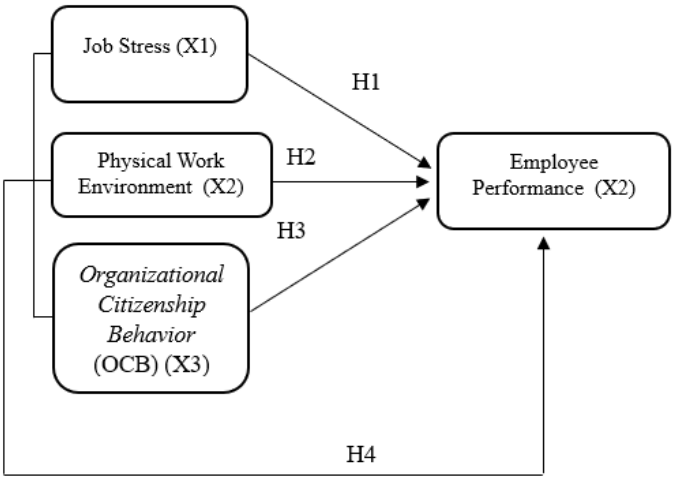

Figure 1. Research Paradigm of the Influence of Work Stress, Physical Work Environment, and *Organizational Citizenship Behavior* (OCB) on the Performance of Production Employees at PT. Genta Trikarya Sumedang

Based on the paradigm above, the research hypothesis that is used as the basis for the research conducted is:

H1: Work stress has a negative effect on the performance of employees in the Production Department of PT. Genta Trikarya Sumedang

H2: Physical work environment has a positive effect on the performance of employees in the Production Department of PT. Genta Trikarya Sumedang

H3: *Organizational Citizenship Behavior (OCB*) has a positive effect on the performance of employees in the Production Department of PT. Genta Trikarya Sumedang

H4: Job stress, physical work environment, and *Organizational Citizenship Behavior* (OCB) influence on the performance of employees in the Production Department of PT. Genta Trikarya Sumedang

4. Results and Discussion

The influence of work stress, physical work environment and *organizational Citizenship Behavior (OCB)* on employee performance partially and simultaneously and utilizing quantitative associative using multiple linear regression analysis test and determination coefficient.

In order for the use of multiple linear regression tests to pass , the requirements for using classical assumption tests are as follows:

a. Classical Assumption Test

To test the classical assumptions there are normality tests, multicollinearity tests, and heteroscedasticity tests:

1. Data Normality Test

The data normality test showed a significant value of 0.946 > 0.05 with the significance results meaning that the research data was declared to be normally distributed.

2. Multicollinearity Test

The multicollinearity test of the data shows that the *tolerance value* for variable X1 is 0.946>0.01, variable X2 is 0.576>0.01, and variable X3 is 0.553>0.01, while the VIF value for variable X1 is 1.058<10, variable X2 is 1.736<10, variable X3 is 1.810<10, which means that the data does not experience multicollinearity.

3. Heteroscedasticity Test

Heteroscedasticity test showing significant data worth variable X1 0.27>0.05 variable X2 0.940>0.05, and variable X3 0.175>0.05. Which means there is no heteroscedasticity symptom. To determine \the criteria for the influence of the results of the determination coefficient test, namely:

Table 3.
Criteria for the Influence of the Determination Coefficient

INTERVAL COEFFICIENT OF DETERMINATION	INFORMATION
<4.99%	Very Low Influence
5% -16.99%	Low But Sure Influence
17% -49.99%	Significant Influence
50% -80.99%	High or Strong Influence
>81%	Very High Influence

Source: Fitrianingsih and Budiansyah, (2019)

b. Statistical Hypothesis

1. Hypothesis of the influence of work stress variable (X1) on employee performance (Y) in the Production Department of PT. Genta Trikarya Sumedang

Ho: β 1≥0 (work stress does not affect the performance of employees in the Production Department of PT. Genta Trikarya Sumedang).

Ha: β 1<0 (work stress has a negative effect on the performance of employees in the Production Department of PT. Genta Trikarya Sumedang).

2. Hypothesis of the influence of physical work environment variables (X2) on employee performance (Y) in the Production Department of PT. Genta Trikarya Sumedang

Ho: β 1≤0 (physical work environment does not affect the performance of employees in the Production Department of PT. Genta Trikarya Sumedang).

Ha: β 1>0 (physical work environment has a positive effect on the performance of employees of the Production Department of PT. Genta Trikarya Sumedang).

3. Hypothesis of the influence of *the Organizational Citizenship Behavior (OCB) variable* (X3) on employee performance (Y) in the Production Department of PT. Genta Trikarya Sumedang.

Ho: β 1≤ 0 (*Organizational Citizenship Behavior* (OCB) has no effect on the performance of employees in the Production Department of PT. Genta Trikarya Sumedang).

Ha: β 1>0 (*Organizational Citizenship Behavior* (OCB)) has a positive effect on the performance of employees of the Production Department of PT. Genta Trikarya Sumedang).

4. Ho: $\beta 1$, $\beta 2$, $\beta 3$ = 0 (Work stress, physical work environment, and *Organizational Citizenship Behavior* (OCB) do not affect the performance of employees in the Production Department of PT. Genta Trikarya Sumedang).

Ho: $\beta 1$, $\beta 2$, $\beta 3 \neq 0$ (Work stress, physical work environment and *Organizational Citizenship Behavior* (OCB) have an effect on the performance of employees in the Production Department of PT. Genta Trikarya Sumedang).

c. Descriptive Analysis

1. Work Stress Level of Production Employees at PT. Genta Trikarya Sumedang.

By calculating the respondents regarding variable X1 (Work Stress) with five sub-variables and five statements, the total average result for respondents regarding variable X1 is:

Table 4
Total Average Respondents' Responses to Statements Regarding Work Stress Variables

SUB VARIABLE	TOTAL AVERAGE	CRITERIA
Opportunity to develop career.	3.65	Quite a Chance
Workload suitability.	3.70	Quite Appropriate
Member and group support	3.30	Lack of Support
The tendency of employees to work together.	3.50	Currently
Leader involvement.	3.58	Enough
TOTAL AVERAGE SCORE (3.65+3.70+3.30+3.50+3.58)/5 = 3.55		
CRITERIA = Medium		

Source: Questionnaire, Reprocessed, 2025

Based on table 4. There is a total average for the work stress variable (X1) of **3.55** and is classified as **moderate,** which means that the level of work stress in the company PT. Genta Trikarya Sumedang is moderate, which means that it does not have a high level of stress.

In table 4. The smallest value for the work stress variable (X1) is in the member and group support sub-variable.

2. Respondents' Responses to Physical Working Environment Conditions of the Production Section of PT. Genta Trikarya Sumedang

By calculating the respondents regarding variable X2 (Physical Work Environment) with 5 sub-variables and 12 statements, the total average results regarding respondents regarding variable X2 are:

Table 5
Total average of respondents' responses to statements regarding the fiscal work environment variables

SUB VARIABLE	TOTAL AVERAGE	CRITERIA
Adequate lighting/lighting	3.10	Underexposed
Air comfort (temperature, humidity, and air circulation).	3.13	Less comfortable
Noise	3.13	Noisy
Vibration	2.95	Quite disturbing
The aroma that arises	3.00	Less fragrant
Color scheme conformity	2.98	Less appropriate
Layout conformity.	3.00	Less appropriate
Security	2.95	Less secure
Cleanliness	3.58	Quite clean
TOTAL AVERAGE SCORE (3.10+3.13+3.13+2.95+3.00+2.98+3.00+2.95+3.58)/9= 3.00		
CRITERIA = Less		

Source: Questionnaire, Reprocessed, 2025

Based on table 5. There is a total average for the physical work environment variable (X2) of 3.00 and is classified as **lacking,** which means that the physical work environment at PT. Genta Trikarya Sumedang is not well-maintained, both in terms of place, cleanliness and security.

In table 5. The smallest value for the physical work environment variable (X2) is in the vibration and safety sub-variable.

3. Respondents' Responses to *Organizational Citizenship Behavior* (OCB) Production Employees at PT. Genta Trikarya Sumedang.

By calculating the respondents regarding variable X3 (*Organizational Citizenship Behavior (OCB)*) with 5 sub-variables and 8 statements, the total average results regarding respondents for variable X3 are as follows:

Table 6
Total Average Respondents' Responses to Statements Concerning *Organizational Citizenship Behavior* (OCB) Variables.

SUB VARIABLE	TOTAL AVERAGE	CRITERIA
Altruism.	3.53	Quite capable
Conscientiousness.	3.53	Quite capable
Sportsmanship.	3.63	Enough to do it

SUB VARIABLE	TOTAL AVERAGE	CRITERIA
Courtesy.	3.35	Less fortunate
Civic Virtue.	3.63	Quite capable
TOTAL AVERAGE SCORE (3.53+3.53+3.63+3.35+3.63)/5= 3.53		
CRITERIA = Sufficient		

Source: Questionnaire, Reprocessed, 2025

Based on table 6. There is a total average for the *Organizational Citizenship Behavior (OCB) variable* (X3) of 3.53 and is classified as **sufficient,** which means that *Organizational Citizenship Behavior (OCB*) in PT. Genta Trikarya Sumedang is sufficient regarding the voluntary attitude possessed by each employee.

In table 6. The smallest value for the *Organizational Citizenship Behavior (OCB) variable* (X3) is in the *Courtesy sub-variable.*

4. Respondents' Responses to the Performance of Production Employees Based on the Perception of Direct Superiors at PT. Genta Trikarya Sumedang.

By calculating the respondents regarding the Y variable (Performance) with 5 sub-variables and 6 statements, the total average results regarding the respondents for the Y variable are:

Table 7
Total Average Respondents' Responses to Statements Regarding Performance Variables

SUB VARIABLE	TOTAL AVERAGE	CRITERIA
Quality	3.60	Enough
Quantity	3.65	Enough
Time	3.43	Not on time
Cooperation between employees	2.60	Unable
Supervision	3.63	Quite capable
TOTAL AVERAGE SCORE (3.60+3.65+3.43+2.60+3.63)/5= 3.38		
CRITERIA = Sufficient		

Source: Questionnaire, Reprocessed, 2025

Based on table 7. There is a total average for the performance variable (Y) of 3.38 and is classified as **sufficient,** which means that the performance of production employees is quite good.

In table 7. The smallest value in Employee performance (Y) lies in the sub-variable of cooperation between employees.

d. Associative Analysis

1. The Influence of Job Stress, Physical Work Environment, and *Organizational Citizenship Behavior* (OCB) on the Performance of Production Employees Partially at PT. Genta Trikarya Sumedang.

Table 8.
Multiple Regression Test Results

Coefficients [a]						
Model		**Unstandardized Coefficients**		**Standardized Coefficients**	**t**	**Sig.**
		B	Std. Error	Beta		
1	(Constant)	1,222	.385		3,173	.033
	X1	-0.008	.007	.104	1,127	.267
	X2	0.344	.069	.587	4,957	.000
	X3	0.358	.139	.312	2,581	.014
a. Dependent Variable: Y						

Source: SPSS 26 output results, Reprocessed in 2025

In table 8. The results of the multiple regression test obtained, the results of the multiple regression equation are:

Y= 1.222 + 0.104 X1 + 0.587 X2 + 0 .312 X3

How much influence the work stress variable has on employee performance variables can be seen as follows:

a. *Beta coefficient* value for the work stress variable (X1) is 0.104, which means that there is a positive influence of 10.4% on the work stress variable (X1) on performance (Y) with the criteria of **low but definite influence.**
b. The Beta coefficient value *for the physical work environment* (X2) is 0.587, which means that there is a positive influence of 58.7% on the work stress variable (X1) on performance with a **high influence criterion.**
c. *Beta coefficient* value of *the Organizational Citizenship Behavior (OCB)* variable (X3) is 0.312, which means that there is a positive influence of 31.2% on the *Organizational Citizenship Behavior (OCB*) variable (X3) on performance (Y) with the criteria of **having a significant influence.**

To conduct simultaneous testing, it is necessary to know the df (*degree of freedom)* first in order to see the $t_{\text{table value.}}$

In this study, the df used is 42-3-1 =37, so the t_{table} used is 1.687, so the calculation results can be seen in the following table:

Table 9.
Partial Test Results

Variables	t_{count}	t_{table}	Sig	Prob	Beta	Information
X1	1,127	1,687	.267	0.05	-0.008	Not Significant
X2	4,957	1,687	.000	0.05	0.344	Significant
X3	2,581	1,687	.014	0.05	0.358	Significant

Source: SPSS 26 output results, Reprocessed in 2025

In table 9. With the work stress variable with a $_{\text{calculated T value}} > T_{\text{table}}$ 1.127 <1.687 with the magnitude of the influence of the work stress variable with a significant value of 0.267> 0.05, therefore H0 is accepted and Ha is rejected, which means that work stress does not affect the performance of the production department of PT. Genta Trikarya Sumedang but is significant.

Furthermore, the physical work environment variable with a $_{\text{calculated T value}} > T_{\text{table}}$ 4.957> 1.687 with a large influence of the work stress variable with a significant value of 0.000 <0.05,

therefore H0 is rejected and Ha is accepted, which means that the physical work environment has a positive effect on the performance of the production department of PT. Genta Trikarya Sumedang but is significant.

Furthermore, the *Organizational Citizenship Behavior (OCB*) variable with a calculated T value > T table 2.581> 1.687 with a large influence of the work stress variable with a significant value of 0.014 <0.05, therefore H0 is rejected and Ha is accepted, which means that *Organizational Citizenship Behavior (OCB*) has a positive effect on the performance of the production department of PT. Genta Trikarya Sumedang.

2. The Influence of Job Stress, Physical Work Environment, and *Organizational Citizenship Behavior* (OCB) on the Performance of Production Employees Both Simultaneously at PT. Genta Trikarya Sumedang.

In order to find out the variables X1 (work stress), X2 physical work environment and X3 (*Organizational Citizenship Behavior) (OCB),* there is a calculated F of 0.431.

And the F table value used is 42-3-1 = 37, then the F table is 2.84, so the calculation results can be seen in table 10. As follows:

Table 10.
Simultaneous Test Results

Variables	F count	F table	Sig.	Prob	Information
Job stress, physical work environment, and *organizational citizenship behavior (OCB)*	29,278	2.84	0,000	0.05	Significant

Source: SPSS 26 output results, Reprocessed in 2025

The results of the simultaneous test are in table 10. Showing the calculated F value > F table 29.278 > 2.84 with a significant value of 0.000 < 0.05, then H0 is rejected and Ha is accepted, which means that work stress, physical work environment and *Organizational Citizenship Behavior (OCB)* have a significant effect on the performance of employees in the production department of PT. Genta Trikarya Sumedang.

In measuring the extent to which the model's ability to explain the dependent variable, the independent variable becomes weaker, but if R *square* approaches 0 in influencing the relationship between the independent variable, but if R *square* approaches 1, then the stronger the independent variable with the dependent variable can be seen in the following table:

Table 11.
Determination of Variables

Model Summary				
Model	R	R Square	Adjusted R Square	Sig.
1	.842 [a]	0.709	0.685	0.2851
a. Predictors: (Constant), X3, X1, X2				

Source: SPSS 26 output results, Reprocessed in 2025

The results are in table 11. The variables of work stress, physical work environment, and *Organizational Citizenship Behavior (OCB)* on employee performance are shown by the determination coefficient value (R2) of 0.709 with a sig value of 0.2851.

So the test results can be influenced by the respondents' responses to the questionnaire that has been distributed.

5. Conclusion

This study aims to determine the effect of work stress, physical work environment, and Organizational Citizenship Behavior (OCB) on the performance of production employees at PT. Genta Trikarya Sumedang. Based on the results of data analysis, it was found that work stress did not have a significant partial effect on employee performance, while the physical work environment and OCB were proven to have a positive and significant effect on improving employee performance.

Simultaneously, the three independent variables. Job stress, physical work environment, and OCB have a significant effect on performance, with a coefficient of determination (R^2) of 70.9%, which means that most of the variation in employee performance can be explained by the three factors. The physical work environment has the greatest effect, followed by OCB.

Thus, companies need to focus more on improving the quality of the physical work environment, such as lighting, air circulation, security, and cleanliness, as well as encouraging positive and voluntary behavior (OCB) among employees. Although work stress has not been proven to have a statistically significant effect, stress management is still important so as not to reduce work enthusiasm and comfort indirectly.

Abstract

Economic growth is marked by the growth of industry in recent years. In line with the development of the industrial world, issues regarding environmental pollution such as global warming and carbon emissions have developed. The purpose of this study is to determine how eco-efficiency, carbon emission disclosure, and green innovation affect company value. The method used is quantitative, using secondary data. The sampling technique using purposive sampling obtained 85 data, data processing using SPSS version 25. This study shows that eco-efficiency and carbon emission disclosure do not affect company value, while green innovation has a positive and significant effect on company value, and simultaneously eco-efficiency, carbon emission disclosure, and green innovation affect company value. It can be concluded that eco-efficiency and carbon emission disclosure cannot reduce the environmental impact caused by the company's operational activities, but green innovation has proven to be successful in innovating or modifying reducing the impact of environmental damage which means that the company has complied in complying with the normal social norms that exist in society related to the environment.

Keywords*: Eco-Efficiency, Carbon Emission Disclosure, Green Innovation, Company Value*

1. Introduction

According to Dewi & Rahmianingsih (2020), the environment is one of the important topics in the discussion of the global economy today. The high expectations of society for companies to be more responsible for the environment. The development of the industrial world is also followed by the development of issues regarding environmental pollution such as global warming and carbon emissions. The issue of global warming is not only a topic that needs to be discussed in Indonesia, but also in various parts of the world related to its management (Rahmanita, 2020).

Exploration of natural gas and oil, coal mining, and electricity production are the main factors causing climate change. Therefore, the company's annual report must contain information regarding the utilization and programs of resources implemented to protect the environment. (Bahriansyah & Lestari Ginting, 2022).

The United Nations (UN) implements sustainable development to meet current needs without sacrificing the fulfillment of the needs of future generations, known as SDGs (Sustainable Development Goals). SDGs came into effect in 2015 and were given a period of 15 years to implement 17 goals with the achievement of 169 targets by 2030. Of the 17 goals, this study focused on goal 7, namely clean and affordable energy, and goal 13, addressing climate change (https://sdgs.un.org/goals).

The company's CSR obligations have been regulated in Law Number 40 of 2007 on Limited Liability Companies, in Article 74 states that: "companies carrying out business

activities in the field of and/or related to natural resources are required to carry out social and environmental responsibilities" (Sanarta, 2023).

One form of accountability for the environment is that companies report Corporate Social Responsibility (CSR) which is integrated with the disclosure of business actors' efforts to reduce Greenhouse Gas emissions. Carbon Emission Disclosure in Indonesia is still voluntary disclosure, the Government of the Republic of Indonesia also participates in creating social responsibility, for example by enacting Law No. 17 of 2004 which ratified the Kyoto Protocol as an effort to reduce Greenhouse Gas emissions. In addition, the government through the Ministry of Environment & Forestry issued a Decree of the Minister of Environment No. 127 of 2002 which became the legal basis for the Performance Rating Assessment Program (PROPER) to increase stakeholder commitment to environmental conservation efforts (Rahmanita, 2020).

Companies create waste and hurt the environment, requiring awareness that company activities are not only concerned with profits for the company itself but also paying attention to the surrounding environment (Dewi & Rahmianingsih, 2020)

Therefore, to reduce global greenhouse gas emissions, there are six greenhouse gases targeted for reduction in the Kyoto Protocol including carbon dioxide (CO_2), Methane (CH_4), Nitrogen Oxide (N_2O), Hydrofluorocarbons (HFCs), Fluorocarbons (PFCs) and Sulfur Hexafluoride Gas (SF_6) (Law of the Republic of Indonesia Number 17 of 2004) (Bahriansyah & Lestari Ginting, 2022).

Companies to develop their business must compete healthily with innovations that are linked to environmental conditions. The best innovation is to realize environmental friendliness in all its activities, which is commonly called green innovation (Dewi & Rahmianingsih, 2020).

Green innovation is an indicator of a company's performance in developing better environmental conditions through effective and efficient management mechanisms (Yuniarti et al., 2022). An innovation is an investment that requires a lot of money and time but can have a positive impact on the company in the long term. Concern for the environment will result in creating the latest innovations regarding environmentally friendly products and can help business actors achieve sustainable development, improve product quality, and make the surrounding resources more efficient (Dewi & Rahmianingsih, 2020).

In addition to green innovation, there is also eco-efficiency as a form of business actor responsibility in preventing environmental pollution. Eco-efficiency stimulates creativity and innovation in finding new ways (Dewi & Rahmianingsih, 2020).

This study focuses on the value of companies in the basic materials sector, the phenomenon that occurs is a decrease in stock value, namely PT Champion Pacific Indonesia experienced a decrease in stock prices in 2019 in the previous year from IDR 384 per share to IDR 340 per share and PT Kirana Megatara Tbk, experienced a decrease in price per share in 2022 from IDR 258 per share compared to the previous year, which was IDR 334 per share. At the company PT Fajar Surya Winesa (FASW) Tbk in 2019, it recorded a decrease in revenue of 16.8% YoY to IDR 8.27 trillion, from the previous IDR 9.94 trillion. Even FAWS's net profit fell deeper, namely 31.06% YoY to IDR 968.83 billion. In fact, in 2018, FASW posted a net profit of IDR 1.4 trillion. YoY, FASW shares fell 8.44% to IDR 7,050 per share (Rahmawati, 2020). Meanwhile, in 2022, FASW's net profit was recorded at IDR 119.92 billion or dropped 80.7% compared to 2021 which was IDR 617.42 billion. As a result, earnings per share fell to IDR 48.4 per share, while at the end of, 2021 it was at IDR 249.17.

In addition, FAWS's net sales were corrected by 8.4% to IDR 10.98 trillion, triggered by a 13.8% decline in sales to third parties to IDR 8.734 trillion. However, sales to related parties grew by 22.08% to IDR 2.178 trillion. Although the cost of goods sold could be reduced by 4.04% to IDR 9.898 trillion. But gross profit still fell 38.7% to IDR 991.96 billion.

Meanwhile, total liabilities decreased by 3.7% to IDR 7.866 trillion. On the other hand, equity eroded by 2.2% to IDR 5.011 trillion. Previously, the company had projected sales until the end of 2022 to reach IDR 11 trillion. This target is not much different from the realization of sales in 2021 which amounted to IDR 11.93 trillion (Nabhani, 2023)

2. Theoretical Basis

2.1 Eco-Efficiency

Eco-efficiency is a concept of environmental sustainability carried out by companies to reduce the environmental impact of the company's operational activities by minimizing the company's operational costs (Aviyanti & Isbanah, 2019)

The World Business Council for Sustainable Development WBCSD (2006:16) defines the key elements of eco-efficiency as follows:

1. Reengineering processes, companies can reengineer their processes to reduce resource consumption, reduce pollution, and avoid risks, while saving costs.
2. Revalorizing by-products, by collaborating with other companies. Many businesses have found creative ways to revalorize their by-products. Striving for zero waste or 100% product targets, they find that the so-called waste from their processes can have value to other companies.
3. Redesigning products, their influence is not only important for the functionality and price of the product. It also has a major effect on the environmental impact of the production, maintenance, and disposal of the product. Therefore, this suggests a third area for eco-efficiency opportunities: companies can become more eco-efficient by redesigning their products.
4. Rethinking markets, some innovative companies are not just redesigning products, they are finding new ways to meet customer needs. They are working with customers or other stakeholder groups to rethink their markets and completely reshape demand and supply. Too many customers' needs today are met in ways that are material and energy-intensive.

2.2 Carbon Emission

Carbon emission is the release of carbon into the atmosphere. Disclosure of carbon emissions is one example of environmental disclosure which is part of the additional report stated in the legislation (Rusmana & Purnaman, 2020). Carbon emission disclosure is a company's activity in recording, recognizing, disclosing, measuring, and presenting the extent of carbon emissions produced by the company (Damas et al., 2021).

Carbon emission disclosure is one example of environmental disclosure which is part of the additional report stated in the legislation (Rusmana & Purnaman, 2020). Carbon emission disclosure can be divided into voluntary disclosure and mandatory disclosure. Voluntary disclosure is disclosure that is not required by existing standards or regulations. Meanwhile, mandatory disclosure is disclosure based on existing standards or regulations (Arifah & Haryono, 2021).

Information regarding carbon emission disclosure can provide a signal for investors in making investment decisions if it has been published. Information that can be used as a signal for investors includes annual reports containing financial and non-financial information (Rahmanita, 2020). Disclosure of carbon emissions is included in environmental disclosure (Amaliya et al., 2019).

However, its voluntary nature means that not all companies in industries close to the environment disclose carbon emissions (Amaliya et al., 2019). Disclosure of carbon emissions

is included in environmental disclosure (Amaliya et al., 2019). Disclosure of carbon emissions based on the Global Reporting Initiative (GRI)-305 is as follows:

1. Disclosure of management approach (this section refers to GRI 103)
2. Disclosure 305-1 Direct GHG emissions (Scope 1)
3. Disclosure 305-2 Indirect GHG emissions (Scope 2)
4. Disclosure 305-3 Other indirect GHG emissions (Scope 3)
5. Disclosure 305-4 GHG emissions intensity
6. Disclosure 305-5 GHG emissions reductions
7. Disclosure 305-6 Ozone-depleting substances (ODS) emissions
8. Disclosure 305-7 Nitrogen Oxides (NOX), Sulfur Oxides (SOX), and other significant air emissions.

2.3 Green Innovation

Green Innovation is a new technique or modification, practice, system, and production process to reduce the impact of damage to the environment. Green Innovation encourages companies to convert waste production into viable products that can generate additional profits for the company. This variable aims to reduce the impact of environmental damage, which will cause (Agustia et al., 2019). implementing green innovation will be considered responsible for the environment and can utilize its resources efficiently, this will increase investor confidence and company value (Yuliandhari et al., 2023).

Green Innovation in this study refers to the research of Agustia et al., (2019). Several indicators will be used to determine whether the company has implemented green innovation. The results of this analysis will be quantified in the form of a ratio. The indicators that will be used are: (1). The production process uses new technology to reduce energy, water, and waste, (2). products use fewer substances that do not cause pollution or are hazardous (environmentally friendly materials), (3). using environmentally friendly product packaging (paper and plastic), and (4). components or materials in the production process can be recycled or reconditioned (Damas et al., 2021).

2.4 Company Value

Company value is an important aspect in assessing the performance conditions of environmental interests and economic interests (Agustia et al., 2019).

This study uses Tobin's Q ratio to measure company value. Tobin's Q is a ratio measuring tool that defines company value as a form of tangible and intangible asset value. Tobin's Q can also describe the effectiveness and efficiency of a company in utilizing all resources in the form of assets owned by the company (Dzahabiyya et al., 2020)

Tobin's Q can be calculated using the following formula:

$$\text{Tobin's Q} = \frac{\text{MVS} + \text{Total Liabilities}}{\text{Total Asset}}$$

MVS is the market value of all outstanding shares, where MVS is added to total liabilities and then divided by total assets. If Tobin's Q is less than 1, the stock is undervalued, but if Tobin's Q = 1, the stock is average, and if Tobin's Q is more than 1, it describes the stock as overvalued.

2.5 Previous Research Review

The previous research review referred to is a study of several research results related to: Eco-Efficiency, Carbon Emission disclosure, and Green Innovation on Company Value. The following are several studies related to the object of research conducted by the author, as follows:

The influence of eco-efficiency on company value, research conducted by (Atiningsih & Setiyono, 2023), (Dewi & Rahmianingsih, 2020), (Savitri & Abdullah, 2023), (Rais & Usman, 2020), (Kurnianta & Dianawati, 2020), and (Noor et al., 2022). The results of the eco-efficiency study affect company value. However, this is in contrast to the research conducted by (Yuliandhari et al., 2023), (Damas et al., 2021), and (Kumala & Bakar, 2021). The results show that eco-efficiency has a significant negative effect on company value.

The influence of carbon emission disclosure on company value, research conducted by (Zuhrufiyah & Anggraeni, 2019), (Rahmanita, 2020), (Rusmana & Purnaman, 2020), (Alfayerds & Setiawan, 2021), (Rahmianingsih & Malau, 2021), (Damas et al., 2021), (Bahriansyah & Lestari Ginting, 2022), (Sari & Budiasih, 2022), (Yuliandhari et al., 2023), and (Hardianti & Susi Dwi Mulyani, 2023) the results of the study explain that Carbon Emission Disclosure (CED) has been proven to affect company value. Except for research conducted by (Kurnia et al., 2020) entitled Carbon Emission Disclosure, Good Corporate Governance, Financial Performance, and Firm Value. The results of this study indicate that carbon emission disclosure does not affect company value.

The influence of green innovation on company value, research conducted by (Dewi & Rahmianingsih, 2020), (Damas et al., 2021), (Putri Fabiola & Khusnah, 2022), (Yuniarti et al., 2022), (Arini et al., 2023), and (Setyawan & Wijayanti, 2023) the results of the study stated that Green Innovation has a significant positive effect on Company Value. Except for research conducted by (Tonay & Murwaningsari, 2022), (Roza Mulyadi & Maulana, 2022), and (Ramadhan et al., 2023) the results of the study stated that Green Innovation has no positive effect on Firm Value.

3. Research Methodology and Hypothesis Determination

3.1 Research Method

Research Population

The population in this study were all basic materials companies listed on the Indonesia Stock Exchange (IDX) for 5 years, namely 2018-2022, consisting of 103 companies

Sampling Technique and Research Sample

The sampling technique used the non-probability sampling method with the following criteria:

Table 1. Sample Selection with Purposive Sampling

No.	Description	Total
1	Basic Materials Sector Companies listed on the Indonesia Stock Exchange (IDX) for the 2018-2022 period.	103
2.	Not publishing annual reports consecutively from the period 2018-2022.	(37)
3.	Does not include the use of raw materials, electricity, water, gas, and fuel consecutively from the period 2018-2022.	(19)
4	Not disclosing carbon emissions for 5 consecutive years, as seen from the annual report or sustainability report (disclosing at least one carbon emission disclosure item).	(28)
5	Does not include green innovation business activities for 5 consecutive years, seen from the annual report or sustainability report (minimum includes one green innovation indicator)	(2)

	Total research sample	17

Source: IDX (data processed 2024**)**

Samples that meet the criteria of 17 companies are as follows:

Table 2. List of Research Sample

No.	Code	Company Name
1.	ANTM	Antam Tambang Tbk
2.	CTBN	Citra Tubindo Tbk
3.	DPNS	Duta Pertiwi Nusantara Tbk
4.	FASW	Fajar Surya Winesa Tbk
5.	IGAR	Champion Pasific Indonesia Tbk
6.	INAI	Indai Alumunium Industry Tbk
7.	INRU	Toba Pulp Lestari Tbk
8.	INTP	Indocement Tunggal Prakasa Tbk
9.	IPOL	Indopoly Swakarsa Industry Tbk
10.	KMTR	Kirana Megatara Tbk
11.	LTLS	Lautan Luas Tbk
12.	NIKL	Pelat Timah Nusantara Tbk
13.	OKAS	Ancora Indonesia Resource Tbk
14.	SMBR	Semen Baturaja (Persero) TBK
15.	SMCB	Solusi Bangun Indonesia Tbk
16.	SMGR	Semen Indonesia (Persero) Tbk
17.	TKIM	Pabrik Kertas Tjiwi Kimia Tbk

Source: IDX (data processed 2024)

3.2. Variable Operationalization

Table 3. Variable Operationalization

Variable	Concept	Indicator	Scale
Independent (X_1) Eco-Efficiency	Eco-efficiency: is an environmental sustainability concept carried out by companies to reduce the environmental impact of company operational activities by minimizing company operational costs (Aviyanti & Isbanah, 2019)	WBCSD module published in 2006 Eco-efficiency = $\frac{\text{Net sales}}{\text{environmental cost}}$ Environmental cost: Raw materials, electricity, water, gas, and fuel. (Dewi & Rahmianingsih, 2020)	Ratio

Variable	Concept	Indicator	Scale
(X_2) Carbon Emission Disclosure	Carbon Emission Disclosure: is a company activity in recording, recognizing, disclosing, measuring, and presenting the extent of carbon emissions produced by the company (Damas et al., 2021)	Carbon Emission Disclosure = Carbon Emission Disclosed ----------X100% All carbon emission disclosures (Muhammad & Aryani, 2021)	Ratio
(X_3) Green Innovation	Green Innovation: are new or modified techniques, practices, systems, and production processes to reduce the impact of damage to the environment. (Agustia et al., 2019)	Green Innovation = $\frac{\text{Total Indicator Score}}{\text{Total of all indicator scores}}$ (Agustia et al., 2019)	Ratio
Dependent (Y) Company Value	Company value is an assessment given by investors for the success of the company and the company's performance which is reflected through the stock price in the market. The company value formed through the stock price indicator in the market will show the existence of good investment opportunities. (Hidayat & Khotimah, 2022)	$Tobin's\ Q = \frac{\text{MVE} + \text{DEBT}}{\text{TA}}$ MVE: Market value of equity (Closing stock price X number of shares outstanding at the end of the year) DEBT: Total debt of the company TA: Total Assets (Dzahabiyya et al., 2020)	Ratio

Table 4. Indicator Carbon Emission Disclosure

Category	Code	Item
Management Approach (GRI 103)	PM1	An explanation of why carbon emissions are a topic for companies.
	PM2	An explanation of how companies manage their carbon emissions.
	PM3	Statement of objectives for carbon emission management.
	PM4	Description of company policies or commitments related to carbon emissions.
	PM5	Evaluation of management approaches related to carbon emissions.

Category	Code	Item
Emission (GRI 305)	CD1	Total carbon emissions are presented in metric tons.
	CD2	Disclosure of sources of carbon emission factors.
	CD3	Disclosure of base year of calculation.
	CD4	Disclosure of standards, methodologies, assumptions, and/or calculation tools used.
	CD5	Emission carbon intensity ratio.
	CD6	Reducing carbon emissions.

Source: Global Reporting Initiative (GRI) 103 dan 305, (Muhammad & Aryani, 2021)

Table 5. Indicator Green Innovation

No.	Measurement Indicator
1.	The production process uses new technologies to reduce energy, water, and waste.
2.	Products use fewer non-polluting or hazardous substances (eco-friendly materials)
3.	Using environmentally friendly product packaging (e.g. paper and plastic)
4.	Components or materials in the production process can be recycled or reconditioned

Source: (Agustia et al., 2019)

3.3 Hypothesis Determination

1. Partially:

a. Eco-efficiency has a positive effect on company value.

$H0_1$: $\beta_1 \geq 0$ Eco-efficiency does not have a positive effect on Company Value.

Ha_1: $\beta_1 < 0$ Eco-efficiency has a positive effect on Company Value.

b. Carbon Emission Disclosure has a positive effect on company value

$H0_2$: $\beta_2 \geq 0$ Carbon Emission Disclosure does not have a positive effect on Company Value.

Ha_2: $\beta_2 < 0$ Carbon Emission Disclosure has a positive effect on Company Value.

c. Green Innovation has a positive effect on company value

$H0_3$: $\beta_3 \geq 0$ Green Innovation does not have a positive effect on Company Value.

Ha_3: $\beta_3 < 0$ Green Innovation has a positive effect on Company Value.

2. Simultaneously:

$H0_4$: $\beta_1 = \beta_2 = \beta_3 = 0$ Eco-efficiency, Carbon Emission Disclosure, and Green Innovation do not have a simultaneous effect on Firm Value.

Ha_4: $\beta_1 \neq \beta_2 \neq \beta_3 \neq 0$ Eco-efficiency, Carbon Emission Disclosure, and Green Innovation have a simultaneous effect on Firm Value.

3.4 Data Processing Test

1. Description of Data
2. Classical Assumption Tests include: (a) data normality test, (b) multicollinearity test, (c) heteroscedasticity test, and (d) autocorrelation test.
3. Multiple regression analysis

The formula for multiple regression according to Sugiyono (2022, p. 188) is as follows:

$$\mathbf{Y=a+ b_1 X_1+ b_2 X_2+ b_3 X_3+Ɛ}$$

Description:

Y = Company Value

a = Constant, if variable X is zero

X_1 = Eco-efficiency

X_2 = Carbon Emission Disclosure
X_3 = Green Innovation
$b_1b_2b_3$ = Multiple regression coefficients between each variable
Ɛ = Standard error
4. Correlation Coefficient Analysis
5. Determination Coefficient Analysis
6. Partial Hypothesis Test (t-statistic test)
7. Simultaneous Hypothesis Test (f test). Data processing using SPSS 25 tools.

4. Discussion

4.1 Data Description

1. Eco-Efficiency in basic materials companies listed on the Indonesia Stock Exchange in 2018-2022.

The following is the calculation results of the eco-efficiency variable from 2018-2022

Table 6. Eco-Efficiency in basic materials sector companies listed on the IDX 2018 - 2022

No	Issuer Code	Eco Efficiency					Average 5 Years
		2018	2019	2020	2021	2022	
1	ANTM	10,3	11,06	11,94	13,87	9,81	11,40
2	CTBN	1,31	1,64	1,91	1,42	1,44	1,54
3	DPNS	1,96	1,85	2,21	2,3	1,72	2,01
4	FASW	1,68	1,63	1,46	1,38	1,31	1,49
5	IGAR	1,39	1,52	1,59	1,49	1,44	1,49
6	INAI	1,8	1,69	1,56	1,71	1,62	1,68
7	INRU	1,58	1,22	1,63	1,46	1,69	1,52
8	INTP	2,15	2,41	2,63	2,37	2,15	2,34
9	IPOL	1,58	1,65	1,82	1,65	1,6	1,66
10	KMTR	1,16	1,14	1,15	1,09	1,19	1,15
11	LTLS	5,5	4,14	4,12	3,67	3,32	4,15
12	NIKL	1,12	1,23	1,18	1,2	1,14	1,17
13	OKAS	4,67	4,38	3,43	3,57	3,26	3,86
14	SMBR	2,62	3,04	3,15	3,15	3,04	3,00
15	SMCB	14,89	16,13	21,56	15,79	15,97	16,87
16	SMGR	3,31	3,7	3,71	3,53	3,25	3,50
17	TKIM	1,96	2,11	2,34	2,23	2,06	2,14
Average		3,47	3,56	3,96	3,64	3,29	3,58
Minimum		1,12	1,14	1,15	1,09	1,14	
Maximum		14,89	16,13	21,56	15,79	15,97	

Source: SPSS (processed, 2024)

Based on Table 6. the average eco-efficiency for 5 years is 3.58, there are 4 companies above the average, namely ANTM, LTLS, OKAS, and SNCB. The rest, namely 13 companies, are below the average.

2. Carbon Emission Disclosure in basic materials companies listed on the Indonesia Stock Exchange in 2018-2022.

Table 7. Carbon Emission Disclosure in basic materials sector companies listed on the IDX 2018-2022

No	Issuer Code	Carbon Emission Disclosure					Average 5 Years
		2018	2019	2020	2021	2022	
1	ANTM	1	1	1	1	0,91	0,98
2	CTBN	0,55	0,55	0,55	0,82	0,82	0,66
3	DPNS	0,27	0,27	0,36	0,82	0,82	0,51

15	SMCB	1,43	1,11	1,03	1,19	1,05	1,16
16	SMGR	1,7	1,44	1,46	1,02	0,94	1,31
17	TKIM	1,39	1,3	1,21	0,96	0,77	1,13
Average		1,61	1,2	1,33	1,18	1,04	1,27
Minimum		0,46	0,38	0,39	0,51	0,52	
Maximum		4,95	2,69	2,6	2,03	1,74	

Source: SPSS (processed, 2024)

Based on Table 9. the average company value for the 5 Years measured by Tobin's Q is 1.27, there are 4 companies above the average, namely: FASW, INTP, NIKL, and SMBR, and the remaining 13 companies are below the average.

The results of statistical tests using SPSS can be seen in Table 10

Table 10. Descriptive Statistics

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
Eco-Efficiency	85	1.09	21.56	3.5859	4.15147
Carbon Emission Disclosure	85	.09	1.00	.5396	.28142
Green Innovation	85	.25	1.00	.4971	.18296
Nilai Perusahaan	85	.38	4.95	1.2729	.71908
Valid N (listwise)	85				

Source: SPSS 25 (processed data 2024)

Based on Table 10. the results of the descriptive test show that the maximum value of the eco-efficiency variable is 21.56 and the minimum value is 1.09. The average value is 3.58. The carbon emission disclosure variable shows a maximum value of 1.00 and a minimum value of 0.09. The average value is 0.5396. The green innovation variable shows a maximum value of 1.00 and a minimum of 0.25. The average value is 0.4971. Furthermore, the company value variable shows a maximum value of 4.95 and a minimum of 0.38. The average value is 1.2729.

4.2 Results of Classical Assumption Testing

The Classical Assumption Test consists of 4 tests, namely Data normality results, multicollinearity tests, heteroscedasticity tests, and autocorrelation tests. The 4 tests aim to determine the certainty of the regression equation so that it is not biased and consistent.

1. Data Normality Test Results

The Kolmogorov-Smirnov test is used to conduct normality tests in this study. The results of the normality test are as follows:

Table 11. Normality Test Results

One-Sample Kolmogorov-Smirnov Test

		Unstandardized Residual
N		85
Normal Parameters [a, b]	Mean	.0000000
	Std. Deviation	.70354391
Most Extreme Differences	Absolute	.142
	Positive	.142
	Negative	-.115
Test Statistic		.142
Asymp. Sig. (2-tailed)		.000[c]

a. Test distribution is Normal.
b. Calculated from data.
c. Lilliefors Significance Correction.

Source: SPSS 25 (Processed data 2024)

Based on Table 11. shows the results of the Kolmogorov-Smirnov asymp. Sig. (2-tailed) test of 0.000, this figure is smaller than 0.05, So, that the residual data is not normally distributed. Therefore, it is necessary to make improvements using an outliner, namely deleting extreme data. After making improvements to the data on eco-efficiency, carbon emission disclosure, green innovation, and company value variables, the results of the normality test are as follows:

Table 12. Kolmogorov-Smirnov Test Results

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		64
Normal Parameters [a, b]	Mean	.0000000
	Std. Deviation	.50170860
Most Extreme Differences	Absolute	.087
	Positive	.087

Negative	-.062
Test Statistic	.087
Asymp. Sig. (2-tailed)	.200[c,d]

a. Test distribution is Normal.
b. Calculated from data.

Source: SPSS 25 (processed data 2024)

Based on the retesting that has been done, it can be seen that the results of the normality test using Kolmogorov-Smirnov show a value of 0.200, the value is greater than 0.05 so that the data can be concluded to have a normal distribution. 2. Multicollinearity Test

Table 13. Multicollinearity Test Results

Coefficients [a]

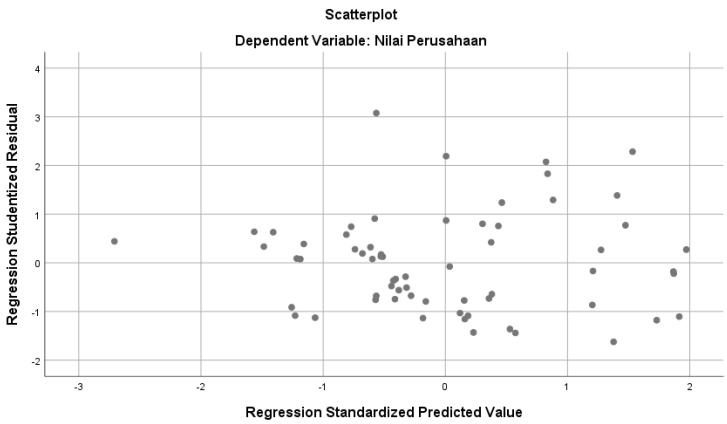
Model		Collinearity Statistics	
		Tolerance	VIF
1	Eco-Efficiency	.971	1.030
	Carbon Emission Disclosure	.953	1.049
	Green Innovation	.980	1.020

a. Dependent Variable: Nilai Perusahaan

Source: SPSS 25 (processed data 2024)

Based on Table 13. eco-efficiency has a tolerance value of 0.971, carbon emission disclosure is 0.953 and green innovation is 0.980, from the three variables it can be said that they have met the tolerance value of more than 0.10. So, it can be concluded that there is no multicollinearity.

3. Heteroscedasticity Test



Source: SPSS 25 Output Results (processed data 2024)

Figure 1 Heteroscedasticity Test Results

It can be seen in Figure 1 that the Scatterplot above does not form a clear pattern but is spread out and does not accumulate at just one point, so it can be concluded that there is no heteroscedasticity so that it is feasible to predict the independent variable on the dependent variable and can continue the next classical assumption test.

4. Autocorrelation Test

Table 14. Autocorrelation Test Results

Model Summary [b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.372[a]	.139	.096	.51410	2.504

a. Predictors: (Constant), Green Innovation, Eco-Efficiency, Carbon Emission Disclosure
b. Dependent Variable: Nilai Perusahaan
Source: Output SPSS 25 (processed data 2024)

Based on Table 14, it shows that multicollinearity occurs because the Durbin-Watson value is 2.504. Based on the DW table for k = 3 and n = 64, the lower limit value of d1 is 1.6946. The Durbin value is not between the du value of 1.6946 and the 4-du value of 2.3054, so it can be concluded that there is autocorrelation in this regression equation. So, that treatment must be carried out using the Cochrane-Orcutt method. Here are the results of Cochrane-Orcutt:

Table 15 Cochrane Results – Orcutt

Model Summary [b]					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.366[a]	.134	.090	.47630	2.183

a. Predictors: (Constant), Lag_X_3, Lag_X_1, Lag_X_2
b. Dependent Variable: Lag_ Y
Source: Output SPSS 25 (processed data 2024)

In Table 15. After the Cochrane-Orcutt treatment was carried out, the new DW value was obtained, namely 2.183. Based on the DW table for k = 3 and n = 64, the lower limit value, or d1 is 1.6946. The DW value obtained through Cochrane-Orcutt, namely 2.183, is between the du value of 1.6946 and the 4-du value of 2.3054. So, it can be concluded that there is no autocorrelation in the variables in this study.

4.3 Results of Multiple Regression Analysis

Table 16 Results of Multiple Regression Analysis

Coefficients [a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	.653	.293		2.228	.030
	Lag_X1	.042	.056	.092	.747	.458
	Lag_X2	.303	.217	.174	1.398	.167
	Lag_X3	.838	.376	.274	2.227	.030

a. Dependent Variable: Lag_ Y

Source: Output SPSS 25 (processed data 2024)

Based on Table 16. the multiple linear regression equation is as follows:

$$Y = 0.653 + 0.042X_1 + 0.303X_2 + 0.838X_3 + \epsilon$$

then the effect of the independent variable on the dependent variable is known. The explanation of the effect of each variable is described as follows:

a) The constant value of 0.653 shows the magnitude of the company value coefficient in basic materials companies listed on the Indonesia Stock Exchange (IDX) in 2018-2022, which is influenced by eco-efficiency, carbon emission disclosure, and green innovation. Changes in the independent variable will change if the independent variable does not exist,
b) The eco-efficiency regression coefficient value (X_1) of 0.042 shows a significant positive effect on company value. If eco-efficiency increases by one percent, it will be followed by an increase in company value of 0.042 assuming that the other independent variables of the regression model remain constant.
c) The regression coefficient value of carbon emission disclosure (X_2) of 0.303 indicates a significant positive effect on company value. If carbon emission disclosure increases by one percent, it will be followed by an increase in company value of 0.303 assuming that other independent variables of the regression model remain constant.
d) The regression coefficient value of green innovation (X_3) of 0.838 indicates a significant positive effect on company value. If green innovation increases by one percent, it will be followed by an increase in company value of 0.838 assuming that other independent variables of the regression model remain constant.

4.4. Results of Correlation Analysis

The results of the partial correlation analysis are as follows:

Table 17. Correlation Analysis

Correlations

		Lag_ X_1	Lag_ X_2	Lag_ X_3	Lag_ Y
Lag_ X_1	Pearson Correlation	1	.155	.001	.119

	Sig. (2-tailed)		.225	.995	.353
	N	63	63	63	63
Lag_ X_2	Pearson Correlation	.155	1	.163	.233
	Sig. (2-tailed)	.225		.201	.066
	N	63	63	63	63
Lag_ X_3	Pearson Correlation	.001	.163	1	.302*
	Sig. (2-tailed)	.995	.201		.016
	N	63	63	63	63
Lag_ Y	Pearson Correlation	.119	.233	.302*	1
	Sig. (2-tailed)	.353	.066	.016	
	N	63	63	63	63

Correlation is significant at the 0.05 level (2-tailed).

Source: Output SPSS 25 (processed data 2024)

Based on Table 17. The relationship between the independent variable and the dependent variable is known through the guidelines in knowing the level of relationship between variables. The results of the correlation analysis above can be seen in the following table:

Table 18. Results of Partial Correlation Test Interpretation

Variable Independent	Correlation Coefficient	Coefficient Interval	Degree of relationship
Eco-Efficiency (X_1)	0,119	0,00-0,199	Very low
Carbon Emission Disclosure (X_2)	0,233	0,20-0,399	Low
Green Innovation (X_3)	0,302	0,20-0,399	Low

Source: Output SPSS 25 (processed data 2024)

Based on Table 18. It can be interpreted that the relationship between eco-efficiency and company value is very low, the coefficient value shows a positive number so that every increase in eco-efficiency will be accompanied by an increase in company value. While the relationship between carbon emission disclosure and company value is low, the coefficient value shows a positive number so that every increase in carbon emission disclosure will be accompanied by an increase in company value. Furthermore, the relationship between green innovation and company value is low, the coefficient value shows a positive number so that every increase in green innovation will be accompanied by an increase in company value.

4.5. Results of the Determination Coefficient Analysis Test

The results of the determination coefficient test are as follows:

Table 19. Analysis of Determination Coefficient

Model Summary [b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.366[a]	.134	.090	.47630

a. Predictors: (Constant), Lag_X_3, Lag_X_1, Lag_X_2

b. Dependent Variable: Lag_ Y

Source: Output SPSS 5 (processed data 2024)

Based on Table 19, it can be seen that the R square value is 9%. This value shows that the variables eco-efficiency, carbon emission disclosure, and green innovation can predict the company's value by 13.4%, while the remaining 86.6% is influenced by other variables not examined in this study.

4.6. Research Results

1. Partial Hypothesis Test Results (t-Test)

The results of the partial hypothesis test (t-test) are as follows:

Table 20 Partial Hypothesis Test (t-Test)

Coefficients [a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	T	Sig.
1	(Constant)	.653	.293		2.228	.030
	Lag_X1	.042	.056	.092	.747	.458
	Lag_X2	.303	.217	.174	1.398	.167
	Lag_X3	.838	.376	.274	2.227	.030

a. Dependent Variable: Lag_ Y

Source: Output SPSS 25 (processed data 2024)

Based on Table 20. The error rate is 5% with degrees of freedom df = n-k-1, n = number of samples as many as 64 data k = number of independent as many as 3 variables so that df = 63-3-1 = 59 is obtained, then the t table value is obtained which is 1.67109.

a. Results of Independent variable X_1

The results obtained by t count on the independent variable eco-efficiency are 0.747 <1.67109 and significance 0.458> 0.050 this means that H0 is accepted and Ha is rejected, meaning that eco-efficiency does not affect company value.

b. Results of Independent Variable X_2

The results obtained by t count on the independent variable carbon emission disclosure are 1.398 <1.67109 and significance 0.167> 0.050 means that H0 is accepted and Ha is rejected, meaning that carbon emission disclosure does not affect company value.

c. Results of Independent Variable X_3

The results obtained by t count on the independent variable green Innovation are 2.227> 1.67109 and significance 0.030 <0.050 means that H0 is rejected and Ha is accepted, so it can be concluded that green innovation has a positive and significant effect on company value.

4.7. Results of Simultaneous Hypothesis Testing (F Test)

In testing this F hypothesis, it can be done by comparing the calculated f with the f table with a d distribution with degrees of freedom, namely (df) = n-k-1 and using a significance of 5% where n = number of research samples, namely 64 data and k = 3 independent variables so that 63-3-1 = 59 can be obtained so that the f table is 2.761. The results of the f hypothesis test are as follows:

Table 21. Simultaneous Hypothesis Testing (F Test)

ANOVA [a]

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	2.071	3	.690	3.042	.036[b]
	Residual	13.385	59	.227		
	Total	15.455	62			

a. Dependent Variable: Lag_ Y
b. Predictors: (Constant), Lag_X_3, Lag_X_1, Lag_X_2
Source: Output SPSS 25 (processed data 2024)

Based on Table 21. The f test is 3.042 > 2.761, meaning that the calculated f is greater than the table f and the significance value is less than 0.050, namely 0.032 < 0.050, meaning that H0 is rejected and Ha is accepted. So, it can be concluded that the independent variables in this study, namely eco-efficiency, carbon emission disclosure, and green innovation, have a simultaneous influence on the dependent variable, namely company value.

4.8. Discussion of Results

4.8.1. The Influence of Eco-Efficiency on Company Value

The results obtained through the t-statistical or partial test show that eco-efficiency does not affect company value. This is proven by the significance of 0.458> 0.050 and the calculated t value shows 0.747 <1.67109 where the calculated t is smaller so that H0 is accepted and Ha is rejected. The results of this study are in line with the research of Yuliandhari et al., (2023), (Damas et al., 2021), and (Kumala & Bakar, 2021). The results are that eco-efficiency does not influence company value.

Eco-efficiency in this study turned out to be unable to provide efficiency in reducing environmental impacts due to the company's operational activities. In addition, the company cannot increase public trust through the management carried out by the company.

4.8.2. The Influence of Carbon Emission Disclosure on Company Value

The results obtained show the significance for the carbon emission disclosure variable of 0.167> 0.05 and the calculated t value shows 1.398 <1.67109 t count is smaller than t_{-Table}, so H0 is accepted and Ha is rejected. So, it can be concluded that carbon emission disclosure does not affect company value, the results of this study are following with research (Kurnia et al., 2020) that carbon emission disclosure does not influence company value.

The results of this study are different from research conducted by (Yuliandhari et al., 2023) and others that carbon emission disclosure has a significant positive influence on company value.

4.8.3. The Influence of Green Innovation on Company Value

The results obtained through the hypothesis test show the significance for the green innovation variable 0.030 <0.05 and a calculated t value of 2.227> 1.67109 with a calculated t greater than the t table and a significance smaller than 0.05, then H0 is rejected and Ha is accepted. So, it can be concluded that green innovation does not influence company value.

Based on the results of the research that has been conducted above, it can provide evidence that environmentally friendly innovations carried out to reduce the impact of environmental damage can increase company value. Companies that implement green innovation will be considered responsible for the environment and can utilize their resources efficiently, this will increase investor confidence and company value (Yuliandhari et al., 2023).

The results of the study are in line with the research conducted by Dewi & Rahmianingsih, (2020), Damas et al., (2021), Putri Fabiola & Khusnah, (2022), Yuniarti et al., (2022), (Arini et al., 2023), (Setyawan & Wijayanti, 2023). In contrast to the research conducted by (Tonay & Murwaningsari, 2022), (Roza Mulyadi & Maulana, 2022), and (Ramadhan et al., 2023) the results of the study stated that Green Innovation has no positive effect on Firm Value.

5. Conclusions and Suggestions

5.1 Conclusions

Based on the results of the study, it can be concluded as follows:

Eco-efficiency does not affect the value of the company so it cannot prove that if a company implements efficiency in the use of operational costs it will increase the value of the company. Carbon emission disclosure does not affect the value of the company, the high cost of disclosing carbon emissions which is still voluntary makes companies still consider disclosing carbon emissions. Green innovation has a positive and significant effect on the value of the company so it can prove that environmentally friendly innovations carried out to reduce the impact of environmental damage can increase the value of the company. Eco-efficiency, carbon emission disclosure, and green innovation have a simultaneous effect on the value of the company in the basic materials sector companies listed on the Indonesia Stock Exchange in 2018-2022.

5.2 Suggestions

Suggestions that are expected to be useful for further research:

it is recommended for further research to use other sectors to find out how the independent and dependent variables in this study affect other sectors. Companies are expected to pay more attention to the environment related to company operations by being efficient in the use of resources and reducing operational costs, in addition to disclosing carbon emissions. In this study, it can be seen that eco-efficiency using the World Council for Sustainable Development WBCSD 2006 indicator does not affect the company's value, so it is recommended to use other indicators. In this study, it can be seen that carbon emission disclosure does not affect the company's value using the Global Reporting Initiative (GRI) 103 and 305 indicators, so it is expected to use other indicators to measure these variables.

MUSLIM CONSUMERS' PERCEIVED VALUE ON REVISIT INTENTION TO SYAICHONA MOH CHOLIL BANGKALAN WITH CUSTOMER SATISFACTION AS MEDIATING VARIABLE

Mohammad Irfandi Iqbal[1], Nurita Andriani[1], Miftahul Jannah[1]

[1]Universitas Trunojoyo Madura, Indonesia

Abstract

This study aims to analyze the effect of perceived value by Muslim consumers on the intention to revisit the tomb of Syaichona Moh Cholil in Bangkalan, with customer satisfaction as a mediating variable. In the context of growing halal tourism, understanding the factors that influence Muslim travelers' decisions is very important. The methodology used is a quantitative survey involving 94 respondents who have visited the tomb. The results of the analysis show that there is a significant positive influence between perceived value and customer satisfaction, as well as between customer satisfaction and return visit intention. The findings indicate that a positive experience felt by visitors can increase their likelihood to return, thus emphasizing the importance of service quality in attracting Muslim tourists. This research provides insights for stakeholders in the tourism sector to develop more effective strategies in meeting the needs of Muslim consumers and increasing the attractiveness of tourism destinations.

Keywords**:** *Muslim Consumers' Perceived Value, Customer Satisfaction, Revisit Intention.*

1. Introduction

Halal lifestyle is not only a trend in Muslim countries, but also in non-Muslim countries. One of the sectors affected by halal lifestyle is the tourism sector (Juliana et al., 2022). The Muslim travel market has shown resilience and strong growth despite global challenges, with international arrivals reaching 68% of pre-pandemic levels by 2022. The sector is on a promising recovery path, projected to reach 87% of 2019 levels by 2023 and full recovery by 2024. Going forward, this market is expected to expand significantly, with a projected 230 million Muslim tourist arrivals and USD 225 billion in spending by 2028. Asia leads the way in terms of Muslim traveler arrivals, followed by Europe, Africa, the Americas, and Oceania, indicating the potential for growth and better accommodation for Muslim travelers in different regions (GMTI, 2023).

Minister of Tourism and Creative Economy/Head of the Tourism and Creative Economy Agency (Menparekraf/Kabaparekraf) Sandiaga Salahuddin Uno revealed that Indonesia won the title of Top Muslim Friendly Destination of the Year 2023 in the Mastercard Crescent Rating Global Muslim Travel Index (GMTI) 2023 in Singapore on Thursday (1/6/2023). That way sharia tourism has a contribution in increasing the income of the government, the community, and has a good impact on the surrounding environment. So it can be seen that the global halal tourism ranking is very good. However, it is not supported by Sharia standardized business facilities. This is evidenced by the small number of sharia hotels and halal restaurants operating in Indonesia. Halal tourism arrangements can be made such as Regional Regulations or Pergub, as in West Nusa Tengara (NTB), but can only be done for local governments that are concerned about halal tourism and the regulation cannot be used as a national reference (Putri & Wakhid, 2023). That way halal tourism is directly able to improve the economy of a region. With the potential for attractive destinations plus the empowerment of the concept and implementation of halal tourism such as the selected tourism location is a model of tourism that is allowed in Islamic rules and can increase spiritual value, consume halal food and drinks, and facilities provided in line with Sharia principles (Putri & Wakhid, 2023). East Java

Province ranks 9th in Indonesia on provinces that have successfully positioned themselves as a top destination for Muslim travelers (IMTI, 2023). It is certainly interesting to discuss what influences the province of East Java, especially in the city of Bangkalan in terms of religious tourism.

Muslim consumers' value in (Eid & El-Gohary, 2015) contains 6 dimensions, namely, quality, price, emotional, social, Islamic physical attributes, and Islamic nonphysical attributes. However, in the research (Rodrigo & Turnbull, 2019) ignores the effects of epistemic values and conditional values associated with Muslim consumers' values. This is in line with the statement (Sheth et al., 1991) shows that Muslim consumers' values represent a much broader construct consisting of functional, social, emotional, epistemic, conditional, and Islamic values sourced from the Faith.

2. Literature review

2.1 Muslim Consumers' Perceived Value

The theory of consumption values, as developed by (Sheth et al., 1991), suggests that consumption choices are influenced by five values, namely, functional, emotional, social, economic, and epistemic and conditional values, which guide a consumer's decision to purchase/consume a particular product (Sheth et al., 1991). Previous studies (Eid & El-Gohary, 2015) on Muslim consumers' perceived value have only focused on six dimensions, namely, quality, price, emotions, social, Islamic physical attributes, and Islamic nonphysical attributes. These studies have ignored the effect of epistemic and conditional values associated with Muslim tourists. Therefore, understanding Muslim consumers' perceived value from a consumption values perspective suggested by (Sheth et al., 1991) would enable marketers to obtain a more comprehensive understanding of the value-adding attributes of products and services associated with halal holidays. (Rodrigo & Turnbull, 2019) says that the perceived value Muslim consumers seek goes beyond the basic functional, emotional, social, epistemic, and conditional values when choosing a halal holiday, and it is clear that Islamic values such as Iman (faith) play a significant role. These values reflect the broader consumption values and are associated with a number of personal values, such as fun and enjoyment, sense of belongingness, respect, security, and need for uniqueness.

H1: It is suspected that Muslim Consumers' Perceived Value has a positive effect on customer satisfaction of visitors to the tomb of Syaichona Moh Cholil bases.

H2: It is suspected that Muslim Consumers' Perceived Value has a positive effect on the revisit intention of visitors to the tomb of Syaichona Moh Cholil bases.

2.2 Customer Satisfaction

Customer satisfaction is a combination of cognitive and affective responses that arise from a customer's evaluation of their experience with a product or service. It can be defined as the feeling of contentment or discontentment derived from the experience or as the cognitive assessment of whether the rewards received align with the service experienced. It can also be understood as the perceived difference between pre- and post-consumption value. Cognitive responses stem from rational evaluations, whereas affective responses reflect emotional reactions. Together, these elements shape a customer's judgment of a product or service (Mannan et al., 2019). Customer satisfaction plays a critical role in the business process, as it reflects users' responses to the degree of satisfaction or frustration based on their cognitive and emotional evaluations (De Leon et al., 2020).

H3: It is suspected that customer satisfaction has a positive effect on the revisit intention of visitors to the tomb of Syaichona Moh Cholil bases.

2.3 Revisit Intention

Revisit intention is a form of customer's behavioral intention to come back to a site, providing positive word of mouth and visitor perceptions on quality service that leads to behavioral closeness (Jeong et al., 2020). Revisit intention has two dimensions, namely, intention or willingness to recommend something to others and intention or willingness to revisit a place (Bayih & Singh, 2020). Intention to return involves the desire to make a repeat purchase and post-purchase behavior, where the desire is influenced by previous consumption experiences, thus driving interest in consuming that product again in the future (Juliana et al., 2022). One of the most important factors influencing customer revisit intentions is satisfaction (Wu et al., 2015). Satisfaction is a decisive factor in determining whether a customer intends to revisit a destination or repeat a purchase (Y. K. Kim & Lee, 2011). It is also a key variable in consumer behavior research, due to its strong impact on customer loyalty and intention to revisit a location (Y. H. Kim et al., 2015). Customer satisfaction is a function of expectations and perceived product or service attributes. It is actually an emotional reaction that arises when the perceived performance of a product or service exceeds expectations (Marinkovic et al., 2014). The literature shows that tourists' perceived image is a significant indicator of satisfaction as well as post-visit behavioral intentions such as intention to revisit. (Alexandris et al., 2006) mentioned that satisfaction plays a very important role in making visitors return to the place. (Campo-Martínez et al., 2010) have conducted research on return visitors in Spain. The results of their research show that overall satisfaction has the greatest influence on tourists' decisions to revisit a destination. (Gholipour Soleimani & Einolahzadeh, 2018).

H4: It is suspected that Muslim Consumers' Perceived Value has a positive effect on the revisit intention of visitors to the tomb of Syaichona Moh Cholil bases through customer satisfaction.

3. Methodology

As this study is aimed at investigating the influence between Muslim consumers' perceived value and revisit intention with customer satisfaction as mediation to the visitors of Syaichona Moh Cholil Bangkalan's tomb, both directly and mediated, this study uses a survey method with a quantitative approach. This approach is chosen because of its ability to represent the visitor population and answer statistical hypotheses. To ensure that the intention to revisit is consistent with the observed sample conditions, this study selects the visitors to Syaichona Moh Cholil Bangkalan's tomb. As the number of populations of the study was uncertain, the sampling technique used is non-probability sampling with purposive sampling type. With the main criteria of this questionnaires is having visited the tomb of Syaichona Moh Cholil bangkalan once.

Questionnaires with a Likert scale of 1-5 are used to measure the effectiveness of Muslim consumers' perceived value, revisit intention and customer satisfaction as a mediation. In addition, data was processed and analysed using the least squares method using Smart PLS 3 software.

4. Results and discussions

This research involved 100 respondents spread from various regions who were taken through online questionnaire distribution. 6 of these 100 respondents were eliminated because they did not match the specified criteria. Where a total of 94 respondents were tested in this study.

4.1 Measurement Model Evaluation

The measurement model in this study consists of a reflective measurement model where the variables of Muslim Consumers' Perceived Value (X), Customer Satisfaction (Z), Revisit Intention (Y) are measured reflectively. According to Chain (1998), reflective measurement evaluation consists of loading factor >0.60, cronbach alpha >0.70, composite reliability >0.70, and average variance extracted (AVE >0.50).

Table 1. Outer loading, Composite reability, Cronbach alpha, and Average variance extracted

Variable	Measurement items	Outer Loading	Cronbach Alpha	Composite Reability	AVE
Muslim Consumers' Perceived Value	X1.1	0,662	0,860	0,891	0,507
	X2.1	0,715			
	X2.2	0,659			
	X2.3	0,673			
	X3.1	0,717			
	X3.2	0,768			
	X3.3	0,785			
	X5.1	0,704			
Customer Satisfaction	Z1.1	0,868	0,862	0,906	0,707
	Z1.2	0,889			
	Z1.3	0,779			
	Z1.4	0,824			
Revisit Intention	Y1.1	0,786	0,791	0,878	0,705
	Y1.2	0,843			
	Y1.3	0,888			

The Muslim Consumers' Perceived Value variable is measured by 7 measurement dimensions, where only 8 out of 20 indicators are valid with outer loading between 0.659-0.785 which validates the measurement of Muslim Consumers' Perceived Value. The level of variable reliability is acceptable as indicated by Cronbach's alpha (0.860) and composite reliability (0.891) above 0.70 which means reliable. The level of convergent validity shown by the AVE value of 0.507 is greater than 0.50, which means that it has met the requirements for good convergent validity. Overall, the variation of measurement items contained by the variables reaches 50.7%.

Among the eight measurement indicators, measurement indicators X3.3 and X3.2 have the highest outer loading, namely, 0.785 and 0.768, which indicates that the two measurement indicators need to be maintained. Both are included in the social value dimension.

The Customer Satisfaction variable is measured by 4 valid measurement indicators with outer loading between 0.779-0.889, which means that the four measurement items are valid to reflect the measurement of Customer Satisfaction. The level of variable reliability is acceptable as indicated by Cronbach's alpha (0.862) and composite reliability (0.906) both have values above 0.70 which means reliable. The level of convergent validity shown by the AVE value is 0.707 where this value is higher than 0.50 which indicates good convergent validity requirements. Overall, the variation of measurement items contained by the variables reaches 70.7%.

The Revisit Intention variable is measured by 3 valid measurement indicators with outer loading between 0.786-0.888, which means that the three measurement items are valid to reflect the measurement of Revisit Intention. The level of variable reliability is acceptable as indicated by Cronbach's alpha (0.791) and composite reliability (0.878) both have values above 0.70 which means reliable. The level of convergent validity shown by the AVE value is 0.705

where this value is higher than 0.50 which indicates good convergent validity requirements. Overall, the variation of measurement items contained by the variables reaches 70.5%.

4.2 Evaluation of Drisciminant Validity

Evaluation of discriminant validity needs to be seen by looking at the Fornell and Lacker criteria. Discriminant validity is a form of evaluation to ensure that variables are theoretically different and empirically proven/ statistical testing. Fornell and lacker's criterion is that the root AVE of the variable is greater than the correlation between variables.

Table 2. Fornell Lacker Criterion

	Muslim Consumers Perceived Value	Customer Satisfaction	Revisit Intention
Muslim Consumers Perceived Value	0,712		
Customer Satisfaction	0,630	0,840	
Revisit Intention	0,706	0,524	0,841

The Muslim Consumers' Perceived Value variable has a root AVE (0.712) greater than its correlation with Customer Satisfaction (0.630) and Revisit Intention (0.706). This indicates that the discriminant validity of the Muslim Consumers' Perceived Value variable is met.

The Customer Satisfaction variable has a root AVE (0.840) greater than its correlation with Revisit Intention (0.524). This indicates that the discriminant validity of the Customer Satisfaction variable is fulfilled.

Table 3. Cross Loading

	Muslim Consumers Perceived Value	Customer Satisfaction	Revisit Intention
X1.1	**0,662**	0,447	0,562
X2.1	**0,715**	0,526	0,398
X2.2	**0,659**	0,517	0,377
X2.3	**0,673**	0,556	0,436
X3.1	**0,717**	0,314	0,535
X3.2	**0,768**	0,421	0,528
X3.3	**0,785**	0,391	0,682
X5.1	**0,704**	0,411	0,460
Y1.1	0,541	**0,786**	0,439
Y1.2	0,402	**0,843**	0,409
Y1.3	0,609	**0,888**	0,463
Z1.1	0,629	0,408	**0,868**
Z1.2	0,679	0,503	**0,889**
Z1.3	0,494	0,442	**0,779**
Z1.4	0,554	0,404	**0,824**

Based on the table above, it can be seen that the cross loading factor value of each indicator against its construct is greater than other constructs. That way it can be concluded that it has met the discriminant validity criteria.

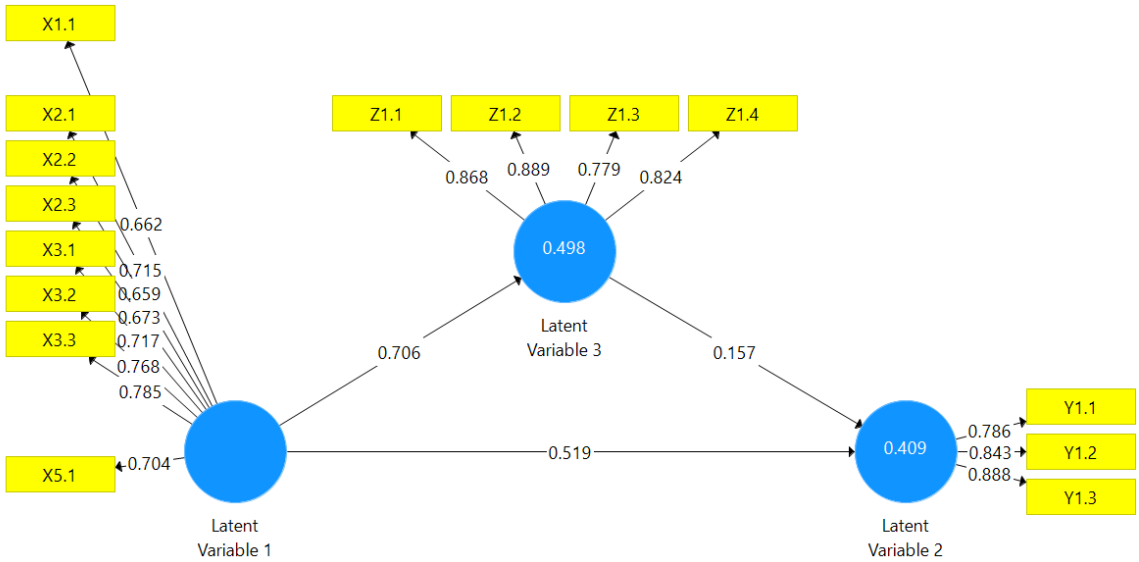
4.3 Structural Model Evaluation

Structural model evaluation is related to hypothesis testing of the influence between research variables. Structural model checking is carried out in three stages, namely first checking the absence of multicollinearity between variables with the Inner VIF (Variance Inflated Factor) measure. Inner VIF values below 5 indicate no multicollinearity between variables (Hair, 2021). The second is hypothesis testing between variables by looking at t statistics or p-value. If the t statistic calculated is greater than 1.96 (t table) or the p-value of the test results is smaller than 0.05, there is a significant influence between the variables. In addition, it is necessary to convey the results and 95% confidence interval of the estimated path coefficient parameters. The third is the f square value, which is the effect of direct variables at the structural level with criteria (f square 0.02 is low, 0.15 is moderate and 0.35 is high), (Hair, 2021). And the f square of the mediation effect is called the upsilon v statistic which is obtained by squaring the mediation coefficient, (Lachowicz et al., 2018) interpreted in (Ogbeibu et al., 2022) is a low mediation effect (0.02), moderate mediation effect (0.075) and high mediation effect (0.175).

Table 4. Inner VIF

	Muslim Consumers' Perceived Value	Customer Satisfaction	Revisit Intention
Muslim Consumers' Perceived Value		1.994	1.000
Customer Satisfaction			
Revisit Intention		1.994	

Before testing the hypothesis of the structural model, it is necessary to see whether there is multicollinearity between variables, namely with the inner VIF statistical measure. The estimation results show the Inner VIF value <5, so the level of multicollinearity between variables is low. These results strengthen the results of parameter estimation in SEM PLS is robust (unbiased).



Picture 1. Path Diagram

Table 5. Hypothesis Testing (Direct influence)

Hipotesis	Path Coefficient	p-value	97.5% Confidence Interval Path Coefficient		F square
			Lower limit	Upper limit	

H1. Muslim Consumers' Perceived Value to Customer Satisfaction	0.519	0.000	0,323	0,747	0.229
H2. Muslim Consumers' Perceived Value to Revisit Intention	0.706	0.000	0,608	0,799	0.994
H3. Customer Satisfaction to Resvisit Intention	0.157	0.281	-0,169	0,409	0.021

Based on the results of hypothesis testing above, it is known as follows

The first hypothesis (H1) has a positive influence of Muslim Consumers' Perceived Value on Customer Satisfaction with path coefficient (0.519) and p-value (0.000) below 0.05. In the 97.5% confidence interval, the effect of Muslim Consumers' Perceived Value on Customer Satisfaction lies between 0.323-0.747. And the existence of Muslim Consumers' Perceived Value in Customer Satisfaction has a moderate influence at the structural level (f square = 0.229).

The second hypothesis (H2) there is a significant effect of Muslim Consumers' Perceived Value on Revisit Intention with a path coefficient (0.706) and p-value (0.000) below 0.05. In the 97.5% confidence interval, the effect of Muslim Consumers' Perceived Value on Revisit Intention lies between 0.608-0.799. And the presence of Muslim Consumers' Perceived Value in Revisit Intention has a high influence at the structural level (f square = 0.994).

The third hypothesis (H3) there is an effect of Customer Satisfaction on Revisit Intention with a path coefficient (0.157) and p-value (0.281) below 0.05. In the 97.5% confidence interval, the effect of Muslim Customer Satisfaction on Revisit Intention lies between (-0.169)-0.409. And the presence of Customer Satisfaction in Revisit Intention has a moderate influence at the structural level (f square = 0.021).

Table 6. Mediation Testing

Hipotesis	Path Coefficient	p-value	97.5% Confidence Interval Path Coefficient		Upsilon V
			Lower limit	Batas atas	
H4. Muslim Consumers' Perceived Value to Customer Satisfaction to Revisit Intention.	0.111	0.302	-0.119	0.296	0,024

Based on the results of the above calculations, the fourth hypothesis (H4) is accepted where the Customer Satisfaction variable as a mediating variable is mediating the indirect effect between Muslim Consumers' Perceived Value on Revisit Intention with a mediation path coefficient of 0.111 and a p-value of 0.302. At the structural level, the mediating role of Customer Satisfaction has a moderate mediating effect with an upsilon v value of 0.024 which lies between 0.20 and 0.075.

4.4 Evaluation of Goodness and Fit of The Model

PLS is a variance-based SEM analysis with the aim of testing models that publish on prediction studies. Therefore, several measures were developed to declare acceptable models such as R square, Q square, SRMR, PLS predict (Hair et al., 2019) and Goodness of Fit Index, (Henseler & Sarstedt, 2013), as well as checking the robustness of the model by testing the linearity of the relationship between variables.

Table 7. R Square and Q Square

	R square	R square adjusted	Q square
Revisit Intention	0.409	0.396	0.254
Customer Satisfaction	0.498	0.493	0.338

The R square measure illustrates the amount of variation in endogenous variables that can be explained by other exogenous/ endogenous variables in the model. According to (Chin et al., 1996) the interpretation value of R square quantitatively is 0.19 (low influence), 0.33 (moderate influence) and 0.66 (high influence). Based on the results of data processing above, it can be said that the magnitude of the influence of Muslim Consumers' Perceived Value on Customer Satisfaction is 40.9% (moderate influence). The magnitude of the influence of Customer Satisfaction on Revisit Intention is 49.8% (moderate influence).

Q square describes a measure of predictive accuracy, namely how well each change in exogenous/ endogenous variables is able to predict endogenous variables. This measure is a form of validation in PLS to state that the model has predictive relevance. The q square value above 0 states that the model has predictive relevance, but in (Hair et al., 2019) the quantitative Q square interpretation value is 0 (low influence), 0.25 (moderate influence), and 0.5 (high influence). The results of data processing above the Q square value of the Revisit Intention variable is 0.254 (moderate prediction accuracy) and for Customer Satisfaction is 0.338 (moderate prediction accuracy).

Table 8. PLS Predict

Indikator	Model PLS SEM		Model LM	
	RMSE	MAE	RMSE	MAE
Y1.1	0.748	0.590	0.797	0.621
Y1.2	0.862	0.665	0.911	0.710
Y1.3	0.605	0.501	0.625	0.517
Z1.1	0.594	0.473	0.609	0.475
Z1.2	0.594	0.483	0.639	0.511
Z1.3	0.888	0.645	0.909	0.644
Z1.4	0.731	0.573	0.746	0.581

(Hair et al., 2019) stated that PLS is an SEM analysis with predictive purposes. Therefore, it is necessary to develop a form of model validation measure to show how good the predictive power of the capital it proposes. PLS predict works as a form of validation of the strength of the PLS prediction test. To show that the PLS results have a good measure of predictive power, it needs to be compared with the basic model, namely the linear regression model (LM). The PLS model is said to have predictive power if the RMSE or MAE size of the PLS model is lower than the LM model.

Based on the processing results of the data above, it shows that all PLS model measurement items with RMSE values are lower than the LM model, while there is 1 PLS model measurement item with an MAE value higher than the LM model. This shows that the proposed PLS model has medium predictive power.

5. Conclusion

The influence of perceived value by Muslim consumers on intention to revisit Syaichona Moh Cholil's tomb in Bangkalan, with a focus on customer satisfaction as a mediating variable. In the context of tourism, the value perceived by Muslim consumers covers various dimensions, including functional, emotional, social, and Islamic values rooted in faith. This research shows that customer satisfaction plays an important role in shaping return visit intentions, where positive experiences felt by visitors can increase their likelihood of returning.

The research methodology used was a survey with a quantitative approach, involving 94 respondents who met the criteria. The results of the analysis show that there is a positive relationship between perceived value and customer satisfaction, as well as between customer satisfaction and intention to return. These findings are in line with previous research that emphasizes the importance of satisfaction in tourists' decision to revisit a destination.

With the increasing interest in halal tourism and the recognition of Indonesia as a Muslim-friendly destination, it is important for stakeholders in the tourism sector to understand and cater to the needs of Muslim consumers. Efforts to improve the quality of Shariah-compliant services and facilities will contribute to positive visitor experiences, which in turn can increase return visit intentions. Therefore, this study provides valuable insights for the development of more effective tourism destination marketing and management strategies to attract Muslim tourists.

THE EFFECT OF FINANCIAL LITERACY AND LIFESTYLE ON FINANCIAL BEHAVIOUR WITH FINTECH AS A MODERATING VARIABLE AMONG STUDENTS RECEIVING KIP KULIAH SCHOLARSHIPS AT UNIVERSITAS TRUNOJOYO MADURA

Regina Erlychasna br Surbakti[1], Aprilina Susandini[2]

[1,2]Management Department, Faculty of Economics and Business, Universitas Trunojoyo Madura, Indonesia

Abstract

This study aims to determine and analyze the influence of financial literacy and lifestyle on financial behavior, with fintech as a moderating variable, among KIP scholarship recipients at Trunojoyo University, Madura. This study uses a quantitative descriptive method with primary data collected through questionnaires. A total of KIP scholarship recipients participated as respondents. Data analysis was conducted using Path Analysis with SmartPLS version 4. The results indicate that financial literacy and lifestyle positively and significantly influence students' financial behavior. However, fintech does not moderate the relationship between financial literacy and financial behavior, nor between lifestyle and financial behavior. These findings provide insights into the financial behavior of scholarship recipients and emphasize the limited moderating role of fintech in this context.

Keywords: *financial literacy, lifestyle, financial behaviour and fintech*

1. Introduction

The development of digital technology, particularly in the financial sector, has changed the way people manage their finances, especially among millennials and Generation Z, who dominate Indonesia's productive demographic (OJK, 2021). Despite the increasing national financial inclusion, there remains a significant gap due to low financial literacy rates (49.68%), indicating the unwise use of financial products (Suleiman et al., 2022). This low level of financial literacy impacts poor financial decision-making, a consumerist lifestyle, and unhealthy financial behaviour such as impulsive buying and getting trapped in illegal online loans. With the rise of financial technology (fintech), the ease of access and use of digital financial services has also influenced individual financial behaviour. However, the use of fintech without adequate literacy can exacerbate consumptive behaviour, especially among students (Firlianti et al., 2023). Some studies have found a positive influence of fintech on financial behaviour, but others have reported the opposite, indicating the presence of moderating factors. Scholarship recipients of the KIP Kuliah programme, who are both financially vulnerable and represent Generation Z, are an important group to study. In addition to managing educational funding, they are also expected to have good financial literacy and the ability to adapt to the digital financial ecosystem. Universitas Trunojoyo Madura (UTM), as one of the public universities with the highest number of KIP recipients in 2024 (Caesaria, 2024) is a strategic location for this research. This study aims to analyse the influence of financial literacy and lifestyle on the financial behaviour of KIP Kuliah scholarship recipients at UTM, with fintech as a moderating variable, to contribute to efforts to improve the financial literacy of young people in the digital era.

2. Literature Review

2.1 Theory of Planned Behaviour (TPB)

Theory of Planned Behaviour (TPB) is a theory that was originally named the Theory of Reasoned Action (TRA), developed in 1967, and subsequently revised and expanded by Icek Ajzen and Martin Fishbein. Starting in 1980, this theory was used to understand human behaviour and to develop more effective interventions. In 1988, additional elements were added to the existing reasoned action model, and it was subsequently renamed the Theory of Planned Behaviour (TPB) (Achmad, 2019).

The Theory of Planned Behaviour (TPB) describes an individual's intention to engage in a pre-determined behaviour, defined by their attitude towards the behaviour, subjective norms, and perceived behavioural control as the ability to carry out the intention, as well as the individual's resources and opportunities to perform an action (Rizky & Gunawan, 2022). The relationship between knowledge and consumer behaviour can be well explained by the Theory of Planned Behaviour (Rizky & Gunawan, 2022). According to TPB, individuals' attitudes and beliefs are shaped by knowledge. Therefore, studies on the impact of knowledge on human behaviour are implicitly underpinned by TPB (Ishak & Zabil, 2012).

2.2 Financial Behaviour

Financial behaviour is an individual's ability to manage and use money wisely to make decisions (Listiyani et al., 2021). In line with this opinion, Sufyati HS & Alvi Lestari, (2022) state that financial behaviour is related to how individuals treat, control, and use their financial resources. Furthermore, Wulandari et al., (2022) state that if an individual does not understand proper financial concepts, their financial behaviour cannot develop properly, thereby failing to provide benefits for their future. Additionally, according to Haqiqi & Pertiwi, (2022), indicators of financial behaviour include: (1) Paying obligations on time; (2) Budgeting for expenses and purchases; (3) Recording expenses and purchases; (4) Allocating funds for unexpected situations; (5) Saving regularly to accumulate funds; (6) Comparing prices to make decisions about spending and shopping. Therefore, every individual must pay attention to their financial behaviour, because the level of success in life decreases as a result of poor financial behaviour (Wulandari et al., 2022)

2.3 Financial Literacy

In a broad sense, financial literacy is knowledge that can be used to make decisions and participate in economic activities, such as saving, investing, and consuming (Khan et al., 2024). According to the Financial Services Authority (2017), financial literacy is the knowledge, skills, and confidence that influence attitudes and behaviours to improve effective decision-making and financial management to achieve well-being (U. S. Wahyuni & Setiawati, 2022).

Meanwhile, according to Sufyati HS & Alvi Lestari, (2022), financial literacy is very important for everyone to be able to overcome financial problems, because individuals often have to choose between various interests in trade-off situations. Additionally, financial skills are also very important to master so that individuals can manage their finances wisely (Sri Wahyuni Abdurrahman & Serli Oktapiani, 2020). Tribuana, (2020) in his research explains financial literacy as an individual's ability to manage their own finances so that they do not experience financial problems in their lives.

According to Murti et al., (2022), financial literacy is the knowledge and skills an individual uses to make decisions with the ultimate goal of achieving good financial outcomes, leading to a prosperous and meaningful life while avoiding risks from poor financial decision-making. Through financial literacy, individuals will find it easier to understand and recognise various aspects related to finance, so that they are able to avoid various financial problems (Gustika & Yaspita, 2021).

2.4 Lifestyle

Lifestyle refers to activities related to how a person lives their life, spends their money, and spends their time (Amelia et al., 2023). In line with this opinion, lifestyle is how a person spends their time, manages their finances, and interacts with their surroundings (Kenale Sada, 2022). According to Gunawan et al., (2020), lifestyle is a person's pattern of life as demonstrated in their activities, hobbies, and income in spending their money and how they allocate their time. Lifestyle is an individual's attitude when directly describing issues in their mind, which is often associated with various aspects related to psychological and emotional issues, or may also be linked to their interests and opinions about certain matters (Laksono & Iskandar, 2018). Meanwhile, Izzani & Yosepha, (2021) define lifestyle as when someone buys something, how they use it, and what they think and feel when using it, which is referred to as their lifestyle.

2.5 Financial Technology

Financial technology or fintech, is an innovation in the financial services sector that facilitates access to financial products and makes transactions more efficient and practical (Hijir, 2022). Fintech is an innovation in financial services, meaning that it can help improve the effectiveness, efficiency, and economy of transactions related to lending, buying and selling, and payments more effective, efficient, and economical (Wajuba et al., 2021).

According to Bank Indonesia Policy No. 19/PBI/2017, financial technology (fintech) is defined as the use of technology in the financial system that produces technology-based service products and innovative business models, which have the potential to affect financial stability, efficiency, speed, security, and effectiveness in the payment system. Fintech is a financial technology innovation that offers new products, applications, and business models that can influence the provision of financial services and the development of the financial industry, as well as create a culture of market competition and reputation among service providers (Daragmeh et al., 2021).

3. Methodology

3.1 Profile of Respondents

The population in this study consists of 917 scholarship recipients at the Faculty of Economics and Business, Universitas Trunojoyo Madura. The sampling technique used purposive sampling with the following criteria: (1) students in at least their fifth semester and (2) active users of fintech. The sample size was determined using the Slovin formula with a 5% error rate, resulting in a sample of 279 respondents.

Table 1 describes the characteristics of respondents based on demographic factors. Based on their academic background, there were 122 respondents from the Management Study Programme, which was higher than the 68 respondents from the Accounting Study Programme and the 89 respondents from the Development Economics Study Programme out of the total number of respondents. All respondents were recipients of the KIP Kuliah scholarship and users of fintech, in line with the characteristics required for this study. Based on semester, the largest number of respondents were from the seventh semester, with 157 respondents, followed by the fifth semester with 121 respondents, and the smallest number were from the ninth semester with 1 respondent. Meanwhile, based on place of residence, the number of respondents living with their parents was 30, fewer than those living in dormitories, which numbered 249 respondents.

Table 1

Sample characteristic based on Demographic Factor

Demographic Factor	Frequency	Percent (%)
Study Programme:		
Management	122	43,7
Accounting	68	24,4
Development Economics	89	31,9
Recipient of the KIP scolarship:		
Recipient	279	100
Not recipient	0	0
User Fintech:		
User	279	100
Not User	0	0
Semester:		
5	121	43,4
7	157	56,2
9	1	0,4
Residence:		
With parents	30	10,8
Boarding house	249	89,2
Total	n = 279	100,0

3.2 Measures/Scale

The questionnaire in this study consisted of nine items to measure financial literacy, adopted from (Chen and P. Volpe, 1998); six items to measure lifestyle from (R. Wahyuni et al., 2019); and six items to measure financial behaviour, covering aspects of saving behaviour, credit management, and savings and investment, as adapted from (Hilgert et al., 2003). The fintech variable was measured using eight items adopted from (Kurniawan & Helen, 2022).

Indicators of all variables as given in Table 2 were measured using 5 points Likert's scale starting from 1 to represent "strongly disagree" to 5 to represent "strongly agree".

3.3 Validity and Reliability Test

Validity test indicates that each indicator is able to consistently represent a single latent variable. Validity testing is typically conducted by examining the correlation between construct scores and the scores of each indicator item. The expected and acceptable correlation value is above 0.70 (Hair et al., 2019). Table 2 presents data from various statement items that have been tested using convergent validity and found to be valid. However, there are several invalid statement items from the overall variables, namely statement item X2.2 about shopping, X2.4 about digital transaction services, X2.6 about pleasure and self-confidence thanks to being praised by friends. X1.5 about a person's consistency in paying debts, X1.6 about the purpose of having insurance, X1.7 on the appropriate type of insurance for students, Y.3 on purchasing goods in cash, Y.4 on dependence on borrowing, and Y.6 on investment.

Table 2

Factor loading of the outer model

Indicator of latent variable	**Factor loading**	**Result**
Financial Literacy (X1)		
Saving and Borrowing		

Establishing a consistent saving routine and sticking to it is very important for every individual	0.762	Valid
I am able to plan my long-term finances according to my study and daily living needs	0.723	Valid
Investment		
Investing can help increase the value of your assets over time, potentially generating greater returns than simply keeping your money in a savings account.	0.759	Valid
It is important to understand the level of risk you are willing to tolerate before investing	0.791	Valid
Lifestyle (X2)		
Activities		
I set aside time to do activities that I enjoy	0.786	Valid
Interest		
I have a habit of living frugally by taking advantage of the KIP Kuliah scholarship	0.754	Valid
Opinion		
I realise the importance of having savings as an emergency fund from the money I receive	0.865	Valid
Financial Behavior (Y)		
A person's approach/attitude towards managing the inflow and outflow of money		
I always prepare a budget to manage my finances for the next month	0.793	Valid
I manage my expenses effectively by allocating KIP Kuliah scholarship funds for priority needs	0.843	Valid
Savings and Investments		
I have a habit of saving regularly from the KIP Kuliah scholarship funds that I receive	0.749	Valid
Fintech (Z)		
Perceived benefits		
Fintech provides efficiency in terms of time, costs and other resources	0.795	Valid
Fintech helps me manage my KIP Kuliah scholarship funds more easily	0.836	Valid
Ease of use		
I often use fintech applications for daily financial transactions	0.749	Valid
I feel comfortable using fintech services to manage my personal finances	0.819	Valid
Security guarantees		
Fintech uses advanced technology such as encryption and two-factor authentication to protect user data	0.816	Valid
I believe that fintech services are secure and reliable for educational transactions	0.862	Valid
Investment interest		
Fintech provides a platform that allows users to invest easily, even with small capital	0.812	Valid
I use fintech to access financial products that support my academic studies	0.791	Valid

After considering the loading factor, thus the second criteria to test the construct validity refers to the value of Average Variance Extracted (AVE). If AVE is more than 0.5, it means that the construct explains more than a half of the variance of its indicators. Table 3 shows that the test of validity using AVE for each variable is significant with p-value 0.000; it can be

concluded that the instrument to measure latent variable have been matched with the criteria required in construct validity.

Table 3

Construct validity and reliability

Latent variable	AVE	p-value	Cronbach's Alpha	p-value	Cronbach's reliability	p-value
Financial Literacy (X1)	0.585	0.000	0.857	0.000	0.894	0.000
Lifestyle (X2)	0.645	0.000	0.725	0.000	0.844	0.000
Financial Behavior (Y)	0.634	0.000	0.712	0.000	0.838	0.000
Fintech (Z)	0.657	0.000	0.925	0.000	0.939	0.000

To ensure that the instrument was reliable, reliability tests were applied based on composite reliability values and Cronbach's Alpha. The combined reliability value of the four variables exceeded 0.7, indicating that all reliability factors were satisfactory as a measurement instrument.

3.4 Data Analysis Techniques

The analysis was conducted using Partial Least Squares - Structural Equation Modeling (PLS-SEM) with the assistance of SmartPLS 4 software. This analysis included testing the outer model, which involved assessments of convergent validity (Average Variance Extracted/AVE), discriminant validity (using the Fornell-Larcker criterion and cross loading), as well as reliability through Cronbach's Alpha and Composite Reliability. Furthermore, the inner model was evaluated based on R-square values, F-square effect sizes, and the significance of path coefficients. A moderation analysis was also performed to determine the effect of fintech as a moderating variable, specifically in assessing whether its interaction strengthens or weakens the relationship between the independent and dependent variables.

3.5 Hypotheses

The research hypothesis will be tested using two-tailed with a t-value of 1.96 (5% significance level) according to (Ghozali, I., & Latan, 2015). The hypothesis will be accepted if the p-value is smaller than α, or the t-statistic value is greater than the t-table (two tailed test = 1.96). This research develops four hypotheses that will be tested with a quantitative approach, as follows:

H1 : There is a positive and significant impact of financial literacy on financial behaviour.
H2 : There is a positive and significant impact of lifestyle on financial behaviour.
H3 : There is a fintech can strengthen or increase the influence of financial literacy on financial behaviour
H4 : There is a fintech can strengthen or increase the influence of lifestyle on financial behaviour

4. Results and Discussions

Table 4 shows the direct and moderating effects of each variable in the internal model. This table explains the path coefficients that describe the direct and moderating effects of each variable, namely: (1) the effect of financial literacy on financial behaviour, (2) the effect of lifestyle on financial behaviour, (3) the effect of fintech in moderating financial literacy on financial behaviour, and (4) the effect of fintech in moderating lifestyle on financial behaviour.

Table 4

Path Coefficient

Direct and Moderating Effects	Original Sample (O)	t-statistics	p-value	
Financial Literacy → Financial Behavior	0.339	4.666	0.000	Accepted
Lifestyle → Financial Behavior	0.264	4.264	0.000	Accepted
Fintech*Financial Literacy → Financial Behavior	0.038	0.692	0.489	Reject
Fintech*Lifestyle → Financial Behavior	-0.066	1.189	0.234	Reject

Based on the tested hypotheses, the direct effect of financial literacy on financial behavior was found to be significant (path coefficient = 0.339; t-statistic = 4.666; p = 0.000), thus supporting the first hypothesis (H1). This indicates that students with higher financial literacy tend to make more responsible financial decisions and demonstrate better financial management. Key contributing indicators include general knowledge, saving and borrowing habits, insurance awareness, and investment understanding. These findings are consistent with previous studies (Chen and Volpe, 1998); (Wahyuni et al., 2023); (Ariska et al., 2023); (Khan et al., 2024).

The second hypothesis (H2) is also accepted, confirming that lifestyle significantly affects financial behavior (path coefficient = 0.264; t-statistic = 4.264; p = 0.000). Students with structured and mindful lifestyles exhibit healthier financial behaviors, such as emergency saving and prioritizing essential expenses. The most dominant indicator was opinion (loading factor = 0.865), highlighting the importance of saving for emergencies. This result aligns with Ajzen's Theory of Planned Behavior (2005) and is supported by research from (Andana & Yuniningsih, 2023), (Nuraeni & Ari, 2021), and (Sufyati & Lestari, 2022).

In contrast, the third hypothesis (H3) is rejected, as the moderating effect of fintech on the relationship between financial literacy and financial behavior is not statistically significant (path coefficient = 0.038; t-statistic = 0.692; p = 0.489). Although many students reported moderate to high levels of fintech usage, their use remains limited to basic transactions rather than strategic financial planning. This finding aligns with the Technology Acceptance Model (Davis, 1989) and is supported by studies conducted by Wardani & Sari (2022) and Putri & Sudarsono (2021).

Similarly, the fourth hypothesis (H4) is also rejected, indicating that fintech does not moderate the relationship between lifestyle and financial behavior (path coefficient = -0.066; t-statistic = 1.189; p = 0.234). Internal factors such as personal values, frugality, and intrinsic motivation appear to be more influential than technological tools. These findings are in line with (Radianto et al., 2025) who emphasize that psychological and behavioral factors such as self-efficacy and financial attitudes have a stronger impact on financial behavior than the use of financial technology.

5. Conclusion

This study aimed to examine the influence of financial literacy and lifestyle on financial behavior, with financial technology (fintech) as a moderating variable, among KIP Kuliah scholarship recipients at the Faculty of Economics and Business, Universitas Trunojoyo Madura. The findings indicate that financial literacy has a positive and significant effect on students' financial behavior. Similarly, lifestyle also shows a positive and significant influence on financial behavior. However, fintech does not moderate the relationship between financial literacy and financial behavior, nor does it moderate the relationship between lifestyle and financial behavior. These results suggest that while both financial literacy and lifestyle are

important determinants of students' financial behavior, the role of fintech as a moderating factor is not supported in this context.

Abstract

This study investigates the influence of liquidity and bank size on the profitability of banks in Indonesia, with a focus on institutions listed on the Indonesia Stock Exchange (IDX) from 2022 to 2024. Utilizing a quantitative approach and multiple linear regression analysis, the research measures profitability using Return on Assets (ROA) and Return on Equity (ROE). Liquidity is assessed by the ratio of current assets to current liabilities, while bank size is categorized using the OJK's KBMI classification. The findings reveal that both liquidity and bank size have a significant positive impact on bank profitability. Higher liquidity enables banks to meet short-term obligations, enhance operational stability, and increase lending capacity, all of which contribute to greater profitability. Larger banks benefit from economies of scale, allowing for cost efficiencies, broader market reach, and enhanced income generation. These results support the agency theory and economies of scale theory, indicating that sound liquidity management and strategic capital accumulation are critical for sustaining profitability in the banking sector. The study offers implications for bank management, regulators, investors, and academics, emphasizing the importance of liquidity optimization and scalable growth. It also provides practical suggestions for improving financial performance through strategic liquidity planning, capital consolidation, and digital infrastructure investment.

Keywords: *liquidity, bank size, profitability, ROA, ROE, Indonesia, agency theory, economies of scale*

1. Introduction

Banks are an industry that plays a central role in driving the country's economy. Banks act as the driving force of the economy by providing access to capital and financial services utilized by various sectors. By providing credit to the agricultural, industrial, trade, and service sectors, banks accelerate increased consumption and production which are the foundation of economic growth. Banks also help people manage their money through filtered products and investments, which ultimately increases financial inclusion. Banks also play a role in helping the smooth running of an efficient and secure national payment system, as well as maintaining public trust in the financial system.

Banks showed optimism about credit expansion, especially in key industries such as investment loans, high demand for capital-intensive industries such as mining and mineral processing. Consumer loans remained stable, although mostly driven by high-income households, while micro, small and medium enterprises (MSMEs) had lower growth, reflecting the economic challenges in the high labor force. Although there were concerns about non-performing loans (NPLs) in consumer loans, the overall quality of properties remained stable. OJK maintained its Risk Perception Index (IPR) at 55, indicating that bank risks are manageable.

Table 1: Indonesia's Loan-to-NPL Development, 2024

Month	Loan (in IDR Bn)	NPL (%)
Jan	7,057,558	2.35
Feb	7,094,514	2.35
Mar	7,244,637	2.25
Apr	7,310,683	2.33
May	7,376,114	2.34
Jun	7,478,404	2.26
Jul	7,514,618	2.27
Aug	7,507,704	2.26
Sep	7,579,250	2.21
Oct	7,656,895	2.20
Nov	7,717,257	2.19
Dec	7,827,148	2.08

Source: OJK

This credit expansion is also supported by the recovery in economic growth reaching 6.7% in annualized sliding in October 2024, mainly driven by the increase in current accounts and savings (CASA). However, the growth of term deposits is still lagging, reflecting the changing interests of liquidity and family businesses. To further enhance savings mobilization, the government requires a number of new regulations, including the extension of the holding period for export earnings and taxpayers. At the same time, the adoption of digital banking continues to grow, with the increasing use of QRIS and online savings accounts contributing to broader finance.

While deposit growth has provided lending facilities, banks are also seeking to diversify their income streams to maintain the benefits of high interest rates. Many banks have increased their assets in government securities and used liquidity management tools for Indonesian banks, as well as adjusting their portfolios to comply with structural changes in the economy, prioritizing high-program industries. In this regard, large banks still dominate loans and deposits, while smaller banks continue to face challenges, especially with increasing NPLs in the SME sector.

Healthy profitability in banking positions banks to operate better, serve more customers, fund more credit through stronger balance sheets, and ultimately boost economic productivity, growth, and job creation. Conversely, banks with lower profitability will be more constrained in supporting productive sectors, leading to lower overall economic growth.

Several factors, including macroeconomic conditions, monetary and fiscal policies, financial system stability, and regulations from relevant authorities such as Bank Indonesia and the Financial Services Authority (OJK), have a significant impact on the dynamics of the profitability of the banking sector in Indonesia. New issues related to asset quality, operational effectiveness, and the ability to adapt to digitalization and changes in consumer behavior have emerged, especially in the post-COVID-19 era.

Many researchers have studied how profitability can directly increase in developed countries, but few studies in developing countries like Indonesia have examined the KBMI as a measure of bank size. This study aims to examine the relationship between liquidity and bank size and profitability in the Indonesian banking sector by using the KBMI to measure bank size.

2. Literature review

9.1. Agency Theory

The main objective of agency theory is to analyze the principles that can adjust the incentive system and control mechanisms for agents to act in accordance with their preferences. Agency theory emphasizes that conflicts of interest arise when management preferences are not aligned with principal interests (Jensen & Meckling, 1976). The tendency of management to increase their personal benefits, to the detriment of the principal, can occur through the use of company resources for personal interests, risk avoidance, or neglect of responsibility.

The banking industry has a complex organizational structure, related to several interdependent classes. In the banking corporate structure, shareholders as owners of capital restoration control operations for bank management. Conflicts of benefit can occur when management focuses more on personal goals, such as achieving short-term bonuses, rather than increasing long-term business value. Investment Decisions - To make loans that are too risky is also a form of opportunistic behavior agents.

Conflicts between managers (agents) and owners (principals) can be managed well through agency mechanisms such as monitoring and incentive systems, then managers will be actualized to make decisions that maximize company profitability. Performance-based incentives compensation systems can encourage bank management to reduce operational costs, improve credit efficiency, maximize interest and non-interest income, so that it will have continuous implications in increasing ROA (Return on Assets) and ROE (Return on Equity) as indicators of profitability (Miswanto et al., 2022). In addition, in the banking sector, supervision from the board of commissioners, audit committee, and financial regulations can be tools to align the goals of agents and principals.

9.2. Economies of scale theory

The theory of economies of scale explains that as a firm increases its production level, the average cost of producing each product or unit of service begins to decrease. This concept was first emphasized by Adam Smith (1776) in the wealth of nations, where he emphasized the importance of labor assignment as an effective increase. In the context of global banking, economies of scale mean that large banks can distribute fixed costs (such as IT systems, staff training and product development) across more customers and transactions, thereby reducing the cost per unit of service. Therefore, large banks tend to have effective profits that have a positive impact on their profits.

9.3. Liquidity

Bank liquidity reflects the bank's ability to meet its short-term obligations, such as customer withdrawals. Banks with high levels of liquidity are seen as being able to manage financial risks and maintain customer trust (Shakatreh, 2021). Liquidity plays an important role in the success of a business to take advantage of opportunities and overcome financial obstacles (Maxim, 2023). Companies with high liquidity can allocate their cash to invest in projects that can increase greater profit margins in the future (Hossain & Alam, 2019).

Zaharum et al., (2022) research on the top 5 commercial banks in Malaysia in 2011-2020 found that liquidity has a positive effect on profitability. These results are also consistent with Nguyen et al., (2024) research on the top 100 companies in Vietnam in 2016-2021 that liquidity has a positive effect on profitability. In contrast to the research conducted by Lee & Alam, (2024) on banks in G7 countries in 2001-2022, which found that liquidity had no effect on profitability. In line with the research conducted by Eltweri et al., (2024) on 10 commercial banks in the UK in 2015-2021, liquidity had no effect on profitability.

Based on the agency theory, high liquidity can help a company's ability to carry out its intermediary function, thereby increasing profitability. It should be noted that if liquidity is too high, it can eliminate the company's potential to earn income because the funds are not managed productively.

9.4. Bank Size

Bank size is an indicator to explore the size of a bank in carrying out its commercial activities. It is believed that large-scale banks have the strength of operational efficiency, risk support, access to cheaper financial resources and technology investment and service innovation capacity. The theory of economies of scale states that the larger the firm, the lower the unit costs due to production and operational efficiencies.

The Financial Services Authority (OJK) has updated its bank classification system from the BUKU model to the KBMI (Bank Groups Based on Core Capital), as outlined in POJK Number 12/POJK.03/2021 on the Consolidation of Commercial Banks. The regulation mandates a phased increase in the capital of commercial banks—including Indonesian-incorporated banks, sharia-based banks, and overseas branches—to meet a minimum Core Capital and CEMA requirement of at least IDR 3 trillion by December 31, 2022.

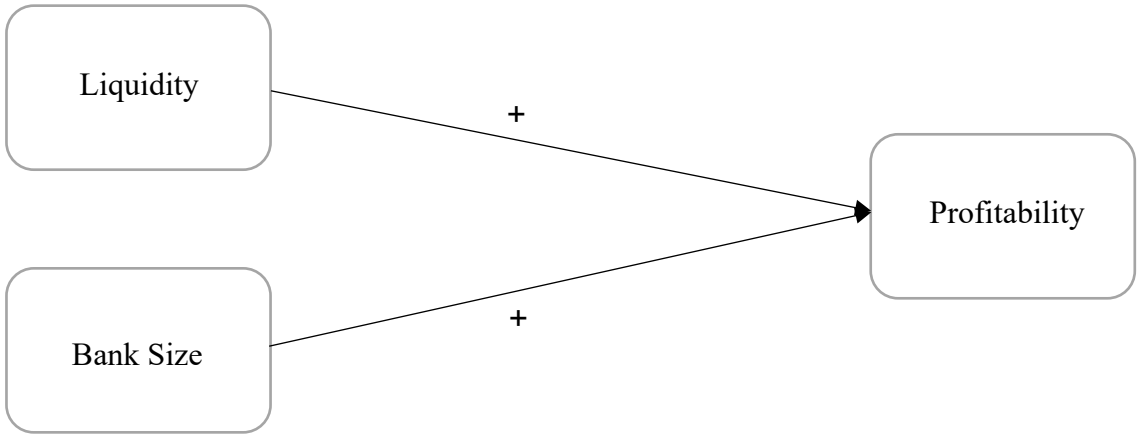
The reclassification of commercial banks from BUKU to KBMI was implemented under POJK Number 12/POJK.03/2021. KBMI categorizes banks into four groups based on core capital: KBMI I (up to IDR 6 trillion), KBMI II (over IDR 6 trillion to IDR 14 trillion), KBMI III (IDR 14 trillion to IDR 70 trillion), and KBMI IV (over IDR 70 trillion). This new framework also provides guidance for stakeholders such as Bank Indonesia and relevant ministries. With the enactment of this regulation, the previous BUKU classification—originally issued by Bank Indonesia—has been rendered invalid.

In the banking context, large banks can lower their transaction costs with better information technology and distribution systems so they can operate widely at low marginal costs (Bolívar et al., 2023). Research conducted by (Le et al., 2020) on banks in Vietnam in 2006-2015 found that bank size can affect profitability. In addition, this research is supported by Aladwan (2015) on banks in Jordan that bank size can affect profitability. In contrast to research conducted by (Jahan, 2020) which found that bank size had no effect on profitability.

9.5. Research model

Based on the introduction and literature review, the research model and hypothesis can be described as follows:

Figure 1: Model Framework



H1: There is a positive influence of liquidity on profitability
H2: There is a positive influence of bank size on profitability

3. Methodology

This study uses quantitative research with data sourced from the annual reports of 40 banks listed on the Indonesia Stock Exchange (IDX) for 2022-2024 and multiple linear regression used in the analysis of this study which was then processed using IBM SPSS 25 software.

Table 2: Variables Measurement

Variable	Description	Measure
Dependent variables		
ROA	Return on Assets	Net income/Total assets
ROE	Return on Equity	Net income/Total equity
Independent variables		
LIQ	Liquidity	Current assets/Current liabilities
SIZE	Bank Size	1 = KBMI 1, 2 = KBMI 2, 3 = KBMI 3, 4 = KBMI 4

The regression models utilized to test the effect of bank size and liquidity on profitability is as follows.

$ROA = a + \beta 1LIQ + \beta 2SIZE + e$

$ROE = a + \beta 1LIQ + \beta 2SIZE + e$

4. Results and discussions

This study aims to determine the effect of liquidity and bank size on profitability. Using data from the annual reports of banks listed on the Indonesia Stock Exchange in 2022-2024 with data collected as many as 120 samples. The measurement of profitability research is measured using ROA and ROE, liquidity is measured by current assets divided by current liabilities, and bank size in this study is based on POJK Number 12/POJK.03/20 using KBMI by providing numbers 1-4. The regression used uses multiple linear regression.

Table 3: Descriptive Statistics

	LIQ	SIZE	ROA	ROE
Mean	1.500739	2.033333	0.011984	0.063715
Median	1.260982	1.500000	0.009497	0.051521
Maximum	5.439005	4.000000	0.084093	0.383468
Minimum	0.691404	1.000000	-0.040065	-0.210720
Std. Dev.	0.840526	1.159059	0.016069	0.077967

Probability	0.000000	0.000978	0.000000	0.000000
Sum	180.0886	244.0000	1.438085	7.645822
Sum Sq. Dev.	84.07165	159.8667	0.030728	0.723381
Observations	120	120	120	120

Table 3 reports descriptive statistics for the variables, including minimum and maximum values, mean, median, and standard deviation. For Return on Assets (ROA), the minimum value observed is -0.04, while the maximum value is 0.084 over 120 observations. The mean value is 0.0119 described the average return generated from total assets was 1.2%, showing modest profitability levels across banks in the sample. Standard deviation of 0.01606, the small standard deviation shows that most banks had similar ROA values, indicating consistent asset performance across institutions. However, outliers with negative or very high ROA still exist. For Return on Equity (ROE), the minimum value observed is -0.21, while the maximum value is 0.38 over 120 observations. The mean value is 0.0637 pointed on average, banks generated a 6.37% return on shareholders' equity, reflecting decent financial returns for investors. Standard deviation of 0.07797, there is a higher variability in ROE, implying that while some banks provide strong returns to shareholders, others perform poorly. This could result from differences in risk strategies, leverage, or capital efficiency. The minimum value of SIZE observed is 1.00, while the maximum value is 4.00 over 120 observations. The mean value is 2.0333 meaning the average bank falls between KBMI 1 and KBMI 2 categories, indicating that most sample banks are small to medium in size under OJK classifications. Standard deviation of 1.159606, There is a relatively wide variation in bank sizes across the sample, reflecting the diversity between KBMI 1 and KBMI 4 banks. This dispersion highlights structural differences in the Indonesian banking landscape. Liquidity (LIQ), the minimum value observed is 0.69, while the maximum value is 5.044 over 120 observations. The mean value is 1.5007 pointed on average the banks had 1.5 times more current assets than current liabilities, suggesting a relatively healthy short-term financial position. Standard deviation of 0.84075, liquidity ratios varied moderately among banks, suggesting some differences in how banks manage short-term assets and liabilities. While some banks maintain very high liquidity, others operate with tighter margins.

A mean liquidity ratio above 1.0 suggests that, on average, banks are capable of covering their short-term obligations without distress. A moderate dispersion in liquidity shows some banks are more conservative in holding liquid assets, while others are more aggressive, potentially trading off liquidity for profitability. The average classification of 2.03 indicates that most banks are still in the early KBMI categories, which may explain why efforts to scale

up operations and improve efficiency are central to increasing profitability. The high variation is expected due to the inclusion of banks from all KBMI categories. This heterogeneity supports the study's finding that bank size significantly affects profitability. Most banks cluster near the average ROA, indicating relatively consistent asset profitability across the industry. Greater variation in ROE reflects differences in financial structure and equity efficiency. Some banks may utilize equity more effectively or face varying levels of financial risk. Although modest, the ROA and ROE figures suggest that Indonesian banks are operating profitably. However, there is room for improvement through better asset utilization (to increase ROA) and more effective capital deployment (to increase ROE).

Figure 2: Multicolinearity Test Model 1

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-.009	.003		-2.582	.011		
	LIQ	.011	.001	.564	7.356	.000	.985	1.015
	SIZE	.002	.001	.171	2.228	.028	.985	1.015

a. Dependent Variable: ROA

Figure 3: Multicolinearity Test Model 2

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-.015	.019		-.786	.433		
	LIQ	.021	.008	.229	2.662	.009	.985	1.015
	SIZE	.023	.006	.342	3.984	.000	.985	1.015

a. Dependent Variable: ROE

The purpose of the multicollinearity test is to measure whether there is a correlation between the independent variables in the regression. Independent variables that do not have a correlation in the regression are the right regression model. If the independent variables are correlated, they are not orthogonal. Determining each independent variable has a multicollinearity problem can be calculated through the variance inflation factor (VIF) value. If the tolerance value is less than 0.10 and the VIF is greater than 10, then there is a multicollinearity problem (Algifari, 2014). Model 1 and Model 2 have tolerance values of $0.985 > 0.1$ and VIF values of $1.015 < 10$. It can be assumed that there is no multicollinearity problem in both models.

Figure 4: Heteroscedasticity Test Model 1

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	.007	.003		2.561	.012
	LIQ	.002	.001	.146	1.586	.115
	SIZE	-.001	.001	-.062	-.675	.501

a. Dependent Variable: ABS_RES1

Figure 5: Heteroscedasticity Test Model 2

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	.033	.014		2.390	.018
	LIQ	.003	.006	.046	.493	.623
	SIZE	.005	.004	.112	1.215	.227

a. Dependent Variable: ABS_RES2

The Heteroscedasticity Test in this study uses the Glejser test. The basis for decision making if the variables experience heteroscedasticity symptoms is a significance value lower than the significance set at 10% (Algifari, 2014). In model 1, the LIQ and SIZE significance values of 0.115 and 0.501 are higher than 10%, meaning that the variables in model 1 are free from heteroscedasticity. In model 2, the LIQ and SIZE significance values of 0.623 and 0.227 are higher than 10%, meaning that the variables in model 2 are free from heteroscedasticity.

Figure 6: Hypothesis Result Model 1

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	-.009	.003		-2.582	.011
	LIQ	.011	.001	.564	7.356	.000
	SIZE	.002	.001	.171	2.228	.028

a. Dependent Variable: ROA

Figure 7: Hypothesis Result Model 2

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	-.015	.019		-.786	.433
	LIQ	.021	.008	.229	2.662	.009
	SIZE	.023	.006	.342	3.984	.000

a. Dependent Variable: ROE

Based on data processing from SPSS 25, regression model 1 and model 2 can be written as follows:

$$Model\ 1: ROA = -0.009 + 0.011LIQ + 0.002SIZE + e$$

$$Model\ 2: ROE = -0.015 + 0.021LIQ + 0.023SIZE + e$$

In model 1 and model 2, the significance value of LIQ are 0.000 and 0.009, which is lower than the significance value set at 5%. It can be concluded that LIQ has a significant positive effect on ROA and ROE. Banks that have high liquidity are a reflection that the bank can settle short-term debts without having to sell the bank's assets. The bank's operations remain stable and avoid net profit losses that have a negative impact on ROA (Nguyen et al., 2024). In addition, good liquidity can help banks reduce very high external funding. With high liquidity, banks can provide more loans, so they can increase interest income and increase bank profits (Haris et al., 2024). According to agency theory, optimized liquidity indicates that management can align the interests of management and principal. High liquidity is a reflection of good risk management and effective corporate governance, it can increase the efficiency of asset use and bank profitability (E'Leimat et al., 2024). This research supports the research conducted by Nguyen et al., (2024), Zaharum et al., (2022), and Hossain & Alam (2019) which states that liquidity has a positive effect on profitability.

The significance value of SIZE is 0.002 and 0.023, which is lower than the significance value set at 5%. It can be concluded that SIZE has a significant positive effect on ROA and ROE. Banks that have a wide customer base and a high reputation can obtain third party funds at lower interest rates. It increasing profit margins and have a positive effect on profitability (Mkhaiber & Werner, 2021). Large banks (KBMI 3 & KBMI 4) have higher operational efficiency. Fixed costs such as infrastructure, IT systems, and risk monitoring can be spread across a larger business volume. This can reduce operational costs and increase profitability (Terraza, 2015). When large banks are more operationally efficient due to economies of scale, net income increases while total assets remain relatively stable or grow commensurately. Economies of scale also allow banks to maximize the use of their capital. With higher efficiency and revenues, net income increases, while equity can remain efficiently used (Hamdy et al., 2025).

5. Conclusion

5.1. Conclusion

The research analyzed how bank profitability depended on liquidity and bank size at Indonesia Stock Exchange (IDX) during 2022–2024. The study evaluated bank profitability

using Return on Assets (ROA) and Return on Equity (ROE) through quantitative analysis of multiple linear regression while considering liquidity and bank size as independent variables. Liquidity has a significant positive effect on profitability (both ROA and ROE). A bank that maintains high liquidity levels can easily fulfill its short-term duties while keeping its operations stable and decreasing its need for external funding and expanding its loan offerings that generate more interest revenue and enhance total profitability. This research confirms agency theory predictions which state that when management and shareholders have their interests aligned through effective liquidity management it leads to improved profitability. Profitability increases notably with the size increase of banks. KBMI 3 and KBMI 4 banks achieve economies of scale which lead to reduced transaction expenses and enhanced capital availability and better technological infrastructure and broader operational efficiency. Larger banks achieve superior profit margins while operating more efficiently than smaller competitors due to these advantages. The findings demonstrate how agency theory and economies of scale theory serve as effective frameworks to analyze Indonesian banking sector profitability. The research reveals that Indonesian banks can enhance their profitability through better liquidity management and their KBMI classification-based capital strengthening initiatives.

5.2. Implications

The significant positive influence of liquidity and bank size on profitability underscores the importance of prudent liquidity management and strategic capital growth. Banks should maintain optimal liquidity—not excessively high or low—to avoid idle assets and to maximize interest income. Additionally, investing in infrastructure and expanding operations to move up the KBMI classification can yield operational efficiencies and higher profitability. KBMI framework evaluation in the study confirms its ability to differentiate bank capacity along with risk management. Regulatory organizations now have concrete evidence to back their decisions when implementing and developing capital adequacy measures and liquidity management frameworks. The main focus needs to be on helping smaller banks develop their capacity through initiatives that enable them to enhance liquidity and grow their business in a sustainable manner. This study extends the existing literature which is emerging from developing economies specifically in Indonesia by showing the importance of agency theory and economies of scale for banking profitability. The study generates new directions for future researchers who wish to explore how digital adoption and risk appetite and corporate governance influence banking profitability.

5.3. Suggestion

Banks should improve liquidity forecasting and management tools to balance the need for liquidity with profitability. Initiatives such as digital cash management systems and improved credit risk modeling can help optimize asset utilization. Smaller banks should consider mergers, acquisitions, or strategic alliances to scale operations and progress to a higher KBMI classification. Such growth can lead to better access to funding, reduced unit costs, and improved profitability. To ensure that increased liquidity and size translate into sustainable profitability, banks must also strengthen internal controls, governance structures, and compliance with prudential norms. Risk-based supervision should be intensified, especially for banks showing rapid growth. Technological innovation can enable cost efficiencies and broaden market access. Banks should prioritize investment in digital banking services, which support liquidity and help expand market share without proportional increases in fixed costs. Future studies should examine other variables such as credit risk, cost-to-income ratio, and

digital banking adoption as possible mediators or moderators in the relationship between liquidity, size, and profitability. Including post-2024 data could also provide insights into long-term trends and policy effectiveness.

THE INFLUENCE OF THE NUMBER OF BRAND AMBASSADOR ON PURCHASING DECISIONS FOR SCARLETT WHITENING PRODUCTS FOR MANAGEMENT STUDY PROGRAM STUDENTS

Abel Gandhy[1], Bayu Dwi Prasetyo[2], Lieca Arsky Andali[1*], Esa Nur Shabrina[3]

[1,2,1*,3] Faculty of Economics and Business, Pakuan University, Indonesia

Abstract

The development of skincare and body care companies increasingly shows fierce competition. The presence of e-commerce is well utilized by companies as a medium for promoting and marketing their products. Scarlett whitening is one of the local skincare brands that uses brand ambassadors as a promotional medium for products marketed through e-commerce. This research is a quantitative research, with respondents of Management Study Program Students of Pakuan University. The selection of respondents was carried out by probability sampling with a stratified sampling method with a total of 100 respondents. Data collection was done through questionnaires and data analysis methods using descriptive analysis, classical assumption testing, and simple linear regression analysis. The results showed that the number of brand ambassadors had a significant positive effect on the purchase decision of Scarlett Whitening products in Management Study Program Students of Pakuan University. Test results show that brand ambassadors have a simultaneously positive influence on purchasing decisions. The contribution of brand ambassadors is 32.1% to purchasing decisions, while the remaining 67.9% is influenced by other variables that are not studied such as price, product quality, product image, service quality, lifestyle, and many more.

Keywords: Multiple Brand Ambassador; Purchasing Decisions; Skincare; Scarlett Whitening.

1. Introduction

Tranggono and Latifah (2007) proposed the classification of cosmetics based on their application to the skin which is divided into 2 types, the first is skincare cosmetics which are cosmetics used to maintain, care for and maintain skin conditions, and the second is decorative makeup cosmetics (makeup) used to beautify the face. Indonesia is expected to become the fifth largest cosmetics market in the world in the next 10 to 15 years (Rizaty, 2021). Seeing the growing growth of the skincare industry, resulting in the emergence of other local skincare companies that are relatively new in coloring the skincare industry. Based on the research results, there are ten skincare brands with best-selling sales in e-commerce, namely Scarlett Whitening, Somethinc, MS Glow, Avoskin, Whitelab, Azarine, Wardah, Erha, Emina, and Bio Beauty Lab (Compass, 2022).

The presence of e-commerce is well utilized by companies as a medium to promote and market their products. One of the promotional activities commonly carried out by skincare products is through brand ambassadors. The use of brand ambassadors can improve product image so that this can be an opportunity for skincare brands to reach consumers through brand ambassadors, In promotional activities through brand ambassadors, the company will display

its products through visuals and messages that have been planned in advance with the intention to attract consumers and increase brand awareness which is expected to increase sales.

Scarlett Whitening is one of the local skincare brands that uses brand ambassadors as a promotional medium for products marketed through e-commerce. Since the beginning of Scarlett Whitening releases its products until 2023, Scarlett Whitening has collaborated with approximately 19 local and international artists. Another skincare brand that also uses brand ambassadors as promotional media is Somethinc. Through monitoring from Somethinc's official Instagram, from 2022 to 2023 Somethinc only collaborates with approximately 3 local and international artists. Unlike what Scarlett Whitening often does to upgrade brand ambassadors, in 2021 Scarlett Whitening announced 6 different brand ambassadors which they refer to as "Scarlett's Family".

The strategy carried out by Scarlett Whitening is not without reason, but there is a message conveyed through the use of various brand ambassadors that Scarlett Whitening products are safe for use by women and men from the age of 15-50 years and over. This can be seen from the table below through research conducted on Scarlett Whitening's official Instagram regarding the use of Scarlett Whitening's brand ambassadors from 2021-2022:

Table 40: Brand Ambassador of Scarlett Whitening

No.	Years	*Brand Ambassador of* Scarlett Whitening	Profession
1	2021	1. Agnez Monica 2. Ria Ricis 3. Natasha Wilona 4. Laudya Cynthia Bella 5. Song Joong Ki 6. Twice	Singer, Songwriter, Dancer, YouTuber, Actress, Model, Host, Idol Group.
2	2022	1. Rossa 2. Dinda Hauw 3. Rey Mbayang 4. Fadil Jaidi 5. Oki Setiana Dewi	Singer, Songwriter, Designer, Motivator, Host, Influencer, Actor, Actress, Model, Entrepreneur.

No.	Years	*Brand Ambassador of* Scarlett Whitening	Profession
		6. Shireen Sungkar 7. Zaskia Sungkar 8. Zaskia Adya Mecca 9. Cassandra Lee 10. Sarwendah 11. Sandrinna Michelle 12. Teuku Ryan 13. Muhammad Jaidi	

The use of Muhammad Jaidi or Pak Muh as the brand ambassador of Scarlett Whitening products in 2022 at the age of 61 gives a message that Scarlett Whitening products can be used by all ages and circles because the product content is safe and has been clinically tested by BPOM-RI. Brand ambassador characters that match the brand image will create chemistry and create attachment between the brand ambassador and the product brand image so that it can influence purchasing decisions. In accordance with Firmansyah's opinion (2019), that consumer purchasing decisions can be influenced by brand ambassadors.

Purchasing decisions can occur due to the emergence of a need and want, so it includes determining what to buy. The purchase decision process describes a reason why consumers prefer, choose and buy a product with a certain brand (Firmansyah, 2019). Along with the development of technology, it makes it easier for consumers to carry out transaction activities through digital platforms. Based on the results of research conducted by the author on the official Scarlett Whitening account in e-commerce by looking at reviews provided by consumers related to the products purchased, the author found that of the 15 reviews that the author took, 3 of them bought the product because they were interested in merchandise in the form of Song Joong Ki and Twice photocards, while the other 12 reviews bought because they were satisfied with the benefits of Scarlett Whitening products.

Ease in shopping activities not only has a positive impact, but also has a negative impact, one of which is impulse purchases. One of the factors that influence the occurrence of impulse purchases is the buyer's emotions, when consumers buy a product that is not really needed. A person's way of thinking will also determine the activity of buying goods that suit their needs or not. Therefore, companies can promote by utilizing emotional ways in influencing potential buyers, because it is likely that someone when seeing an ad then turns into a purchase decision and will increase sales (Savitri, 2022).

The purpose of this study is to analyze how much the purchasing decisions of students of the Management Study Program of Pakuan University are influenced by the number of brand ambassadors Scarlett Whitening.

2. Literature Review

2.1 Brand

One form of product marketing strategy is by branding, branding is done to introduce products through brands to potential customers. Firmansyah (2019) that a brand is a name, sign, design, or combination of them that is used as the identity of an individual, organization or company on goods and services owned to be distinguished from other service products.

2.1.1 Brand Ambassador

Companies are required to always develop following the times. Various kinds of marketing strategies have emerged, one of which is using brand ambassadors to help promote the products sold, by utilizing the popularity and personality of a brand ambassador who is able to influence consumers and increase consumer desire for a product. Brand ambassadors are individuals or groups selected by the company and then contracted to participate in branding a product or service owned by the company Ainurrofiqin (2021).

Wang & Hariandja (2016), in carrying out marketing activities, the use of public figures in an advertisement should be reviewed using the presenter effect in advertising (VisCAP) model. The VisCAP model proposes four dimensions, which are as follows:

1. Visibility
   Visibility is the fame attached to celebrities who can reflect a product.
2. Credibility
   Credibility includes relevant skills, beliefs and experience.
3. Attraction
   Not only physical, but non-physical appearance that is attractive and can support a product or advertisement.
4. Power
   Power is a charisma emitted by celebrities to be able to influence consumers so that consumers are influenced to use or purchase products.

2.2 Purchase Decision

Purchasing decision is the process of formulating various alternative actions to make a choice on one particular alternative to make a purchase Firmansyah (2019). Purchasing decision is an individual activity that is directly involved in making decisions to buy products offered by sellers (Indrasari, 2019).

Kotler and Keller (2016), there are six indicators in purchasing decisions, namely:

1. Product Selection

Consumers make purchases because the products offered are in accordance with what is needed and it is easy to find the goods needed.

2. Brand Selection
   Consumers actively search for information about brands, because each brand has its own differences and characteristics.
3. Choice of Reseller
   Consumers use the information obtained to determine the choice of dealer to be addressed, the selection of suppliers can be due to factors such as location, price, completeness of products and so on.
4. Number of Purchase
   Consumer decisions buy how much product is needed or wanted, in this case the company must prepare product inventory in accordance with consumer wishes.
5. Time of Purchase
   A situation where consumers decide to buy a product every day, once a week, once a month or maybe once a year.
6. Payment Methods
   When making transactions, consumers can pay with cash, credit or debit card payments though.

Along with the development of technology, it makes it easier for consumers to carry out transaction activities through digital platforms. The emergence of this digital platform not only has a positive impact, but also has a negative impact, one of which is impulsive buying in the form of purchase decisions that are made suddenly and do not require much consideration (Firmansyah, 2019). Impulsive buying is influenced by the buyer's emotions, when consumers buy a product that is not really needed.

H1: The number of Brand Ambassadors positively influences purchasing decisions.

3. Methodology

In this study, the sample of respondent data was students of the Management Study Program, Faculty of Economics and Business, Pakuan University, Class of 2019 – 2022, with a total of 1,590 students. Samples are selected based on the minimum requirement of knowing and having purchased or used Scarlett Whitening products. Sampling in each batch was calculated using the Slovin formula with a significant rate of 10% with a total sample of 100 people. The samples in each batch can be seen in the table below:

Table 41: Sample of Management Students 2019-2022

Generation	Sample	Persentase
2019	22	22%
2020	25	25%
2021	27	27%
2022	26	26%
Total	**100**	**100%**

4. Results and Discussion

4.1 Normality Test

The data normality test in this study used the Kolmogorov-Smirnov test. A data is said to be normal if the significance value > 0.05.

Table 42: Normality Test

One-Sample Kolmogorov-Smirnov Test

		Unstandardized Residual
N		100
Normal Parameters[a,b]	Mean	0,0000000
	Std. Deviation	3,54026332
Most Extreme Differences	Absolute	0,068
	Positive	0,046
	Negative	-0,068
Test Statistic		0,068
Asymp. Sig. (2-tailed)		.200[c,d]

Sourch: Data Primer, 2023.

Based on the results of the normality test above, it is known that the significance value of Asymp. Sig. (2-tailed) of 0.200 which means that the significance value is greater than 0.05 (0.200 > 0.05), then the residual value is normally distributed.

4.2 Heterocedasticity Test

The heteroscedasticity test in this study uses the Glejser test, aiming to ensure that the regression model is really the largest of heteroscedasticity. If the significance value is greater than 0.05, heteroscedasticity does not occur.

Table 43: Heterocedasticity Test

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	0,874	1,408		0,620	0,536
		0,079	0,056	0,140	1,395	0,166

Brand Ambassador					

a. Dependent Variable: ABS_RES

Based on the Glejser test above, it is known that the significance value of the brand ambassador is 0.166 which means that the value is greater than 0.05 (0.166 > 0.05). So the brand ambassador variable has no symptoms of heteroscedasticity.

4.3 Linearity Test

This linearity test was conducted to determine the form of the relationship between brand ambassador variables and purchase decision variables. If the significance value of deviation from linearity > 0.05, then there is a linear relationship between the brand ambassador variable and the purchase decision variable.

Table 44: Linearity Test Result

ANOVA Table

			Sum of Squares	df	Mean Square	F	Sig.
Keputusan Pembelian * Brand Ambassador	Between Groups	(Combined)	747,698	16	46,731	3,591	0,000
		Linearity	586,947	1	586,947	45,105	0,000
		Deviation from Linearity	160,751	15	10,717	0,824	0,649
	Within Groups		1080,062	83	13,013		
	Total		1827,760	99			

Source: Data Primer, 2023.

Based on the results of the linearity test above, it is known that the significance value of deviation from linearity is 0.649 which means that the value is greater than 0.05 (0.649 > 0.05). So the brand ambassador variable has a linear relationship with the purchase decision variable.

4.4 Simple Linear Regression

This simple linear regression analysis is used to analyze the influence between brand ambassador variables and purchasing decisions. The simple linear regression analysis formula in this study is as follows:

$$KP = a + b_{BA}$$

Notes:
KP = Keputusan Pembelian (Variabel Y)
a = Konstanta
b = Koefisien Regresi
BA = *Brand Ambassador* (Variabel X)

Table 45: Simple Linear Regression Test Result

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	19,738	2,368		8,334	0,000
	Brand Ambassador	0,645	0,095	0,567	6,809	0,000

a. Dependent Variable: Keputusan Pembelian

Source: Data Primer, Diolah 2023.

Based on the results of the simple linear regression test above, a simple linear regression equation is obtained as follows:

$KP = a + b_{BA}$

$KP = 19{,}738 + 0{,}645_{BA}$

Based on the results of the equation it can be explained that:

1. If the brand ambassador variable (X) is considered zero or not counted, then the purchase decision variable (Y) already exists which is 19,738.
2. If there is an increase in the brand ambassador variable by 1 unit, then the purchase decision variable (Y) will increase by 0.645 units, because the regression value is marked positive, this indicates that the brand ambassador has a positive effect on the purchase decision. This indicates that if there is an increase in the number of brand ambassadors, the purchase decision of Scarlett Whitening products will increase.

4.5 Hypothesis Test

The step used is to compare Fcalculate against Ftable, with the following conditions:

1. If Fcalculate < Ftabel then H0 is accepted and H1 is rejected
2. 2. If Fcalculate > Ftable then H0 is rejected and H1 is accepted

Table 46: F Test Result

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	586,947	1	586,947	46,357	.000[b]
	Residual	1240,813	98	12,661		
	Total	1827,760	99			

a. Dependent Variable: Keputusan Pembelian

b. Predictors: (Constant), Brand Ambassador

Source: Data Primer, Diolah 2023.

Based on the results of the F test above, it is known that Fcalculate is 46.357 with the value of Ftabel is 3.938, so that the value of Fcalculate > Ftable or 46.357 > 3.938, with a significance level of 0.000 < 0.05 then H0 is rejected and H1 is accepted. So the number of brand ambassadors has a significant influence on the purchase decision of Scarlett Whitening products.

4.6 Test Coefficient of Determination (R^2)

The coefficient of determination test is carried out to determine what percentage of the ability of the brand ambassador variable in the regression model can explain changes or variations in the value of purchase decision variables.

Table 47: Test Coefficient of Determination Result

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0,567[a]	0,321	0,314	3,558

a. Predictors: (Constant), Brand Ambassador

Source: Data Primer, 2023.

The table above explains that the magnitude of the correlation value is 0.567, from these results obtained a coefficient of determination (R Square) of 0.321, which contains the understanding that the brand ambassador variable contributes to purchasing decisions by 32.1%, while the remaining 67.9% is influenced by other variables that were not studied in this study.

Based on the results of the analysis that has been done, it is known that the number of brand ambassadors has a significant positive effect on the purchase decision of Scarlett Whitening products for students of the Management Study Program of Pakuan University by looking at the attractiveness and strength given by each brand ambassador. The number of brand ambassadors Scarlett Whitening has different influences due to the characteristics and professions of brand ambassadors who are also diverse. In this study, consumers tend to see the appeal of an attractive and multitalented brand ambassador.

The attraction of a brand ambassador as a communication facility that will attract the attention of consumers so that they are moved to buy marketed products (Andaru et al., 2023). The higher the attractiveness of a brand ambassador, the purchase decision will also increase. After seeing the attractiveness, consumers will see in terms of the strength of brand ambassadors. A brand ambassador becomes a tool or mediator used by companies to represent the brand of a product by branding in the hope of promoting products sold in the hope of influencing consumers to the purchase stage through the reputation of the brand ambassador, as conveyed by Halim et at., (2020) that one of the benefits of using a brand ambassador is to influence fans of a famous artist so that it can increase Sales.

5. Conclusion

Based on the results of research on the influence of the number of brand ambassadors on the purchase decision of Scarlett Whitening products (study on Management Study Program Students of Pakuan University), the following conclusions can be drawn:

The number of brand ambassadors simultaneously affects the purchase decision of Scarlett Whitening products for Management Study Program Students of Pakuan University. The value of the coefficient of determination shows that the brand ambassador variable contributes 32.1% to the purchase decision, while the remaining 67.9% is influenced by other variables that were not studied in this study such as price, product quality, product image, service quality, lifestyle, and many more.

Abstrak

This study aims to analyze the influence of Corporate Social Responsibility (CSR), fixed asset intensity, and profitability on tax avoidance in health sector companies listed on the Indonesia Stock Exchange (IDX) for the 2019–2023 period. The phenomenon underlying this research is the inconsistency between the dynamics of CSR disclosure, fixed asset intensity, and profitability with corporate tax compliance in this sector. The research method used is quantitative with a purposive sampling technique, resulting in a final sample of 5 companies with a total of 25 panel data observations. Secondary data sourced from annual reports and sustainability reports were analyzed using panel data regression with the Fixed Effect Model (FEM). The results show that partially, CSR and profitability have a significant influence on tax avoidance, while fixed asset intensity does not have a significant influence. The direction of the influence of CSR and profitability indicates that the higher their levels, the higher the practice of tax avoidance. Simultaneously, all three independent variables have a significant influence.

Kata Kunci: *Tax Avoidance, Corporate Social Responsibility, Fixed Asset Intensity, Profitability, Health Sector*

1. INTRODUCTION

Tax plays a crucial role as the main source of income in Indonesia, used to finance national development, from infrastructure to essential public services such as health and education. The significant contribution of the tax sector is evident from the continuously increasing revenue realization each year, which confirms the position of tax as a vital element in supporting public welfare and national economic stability. However, there is a fundamental conflict of interest between the government, which seeks to optimize tax revenue, and companies, which tend to minimize their tax burden for efficiency. This conflict encourages companies to engage in tax avoidance practices, which are legal efforts to reduce the amount of tax owed by utilizing loopholes in applicable regulations. Tax avoidance practices are influenced by various internal company factors. One of them is Corporate Social Responsibility (CSR), where the costs incurred for social activities can encourage companies to achieve tax efficiency as compensation. This phenomenon is seen in data from health sector companies for the 2019-2023 period, where an increase in the average CSR disclosure in 2022 was actually followed by a decrease in the Effective Tax Rate (ETR), indicating higher tax avoidance practices. Another factor is fixed asset intensity, where depreciation expense

can theoretically reduce taxable income. However, the data shows an inconsistency: in the 2021-2022 period, a decrease in fixed asset intensity should have increased the ETR, but the ETR actually decreased drastically. In addition, high profitability is also a major driver, because the greater the profit earned, the greater the incentive to conduct aggressive tax planning to maintain that profit. The health sector was chosen as the object of research due to its strategic role for public welfare and the complexity of its operational and tax regulations, including various fiscal incentives from the government. The existence of various phenomena and inconsistencies between theory and empirical data in this sector indicates a research gap that is interesting to study further. Therefore, this study aims to analyze the influence of Corporate Social Responsibility (CSR), fixed asset intensity, and profitability on tax avoidance practices in health sector companies listed on the Indonesia Stock Exchange for the 2019–2023 period. The results of this study are expected to provide academic contributions and practical insights for companies and tax regulators in understanding the dynamics of tax compliance in the health sector.

2. LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

2.1 The Influence of Corporate Social Responsibility (CSR) on Tax Avoidance

Corporate Social Responsibility (CSR) is a company's commitment to participate in sustainable economic development to improve the quality of life and the environment. However, in practice, costs incurred for CSR can be accounted for as a reduction in taxable income. This creates an opportunity for companies to use CSR as a strategic tool to reduce their tax burden. Research by Susanto & Veronica (2022) found that CSR can play a dual role, both as a tax reducer and as a deterrent to the negative impact on company image due to aggressive tax practices.

H_1: Corporate Social Responsibility (CSR) has an influence on tax avoidance in health sector companies listed on the Indonesia Stock Exchange in 2019-2023.

2.2 The Influence of Fixed Asset Intensity on Tax Avoidance

Fixed asset intensity reflects the proportion of a company's investment in long-term assets such as property and equipment. High investment in fixed assets will result in significant depreciation expense in financial statements. In tax regulations, depreciation expense is a non-cash expense that can be a tax-deductible item. Therefore, companies with high fixed asset intensity have a greater opportunity to reduce their tax liabilities through the allocation of these depreciation costs. This is supported by research by Yulyanti & Abbas (2022) and Prapitasari & Safrida (2019) which shows that fixed asset intensity has a positive effect on tax avoidance actions.

H_2: Fixed Asset Intensity has an influence on tax avoidance in health sector companies listed on the Indonesia Stock Exchange in 2019-2023.

2.3 The Influence of Profitability on Tax Avoidance

Return on Asset (ROA) is the company's ability to generate profit, which is directly related to the amount of tax burden that must be borne. The higher the profit earned, the greater the potential tax to be paid, thus encouraging management to carry out tax avoidance to reduce this burden. This relationship is supported by various previous studies, such as

those conducted by Rachmat Sulaeman (2021) and Alvionita Br. Kaban (2024), who found that profitability has a significant influence on tax avoidance practices.

H_3: Profitability has an influence on tax avoidance in health sector companies listed on the Indonesia Stock Exchange in 2019-2023.

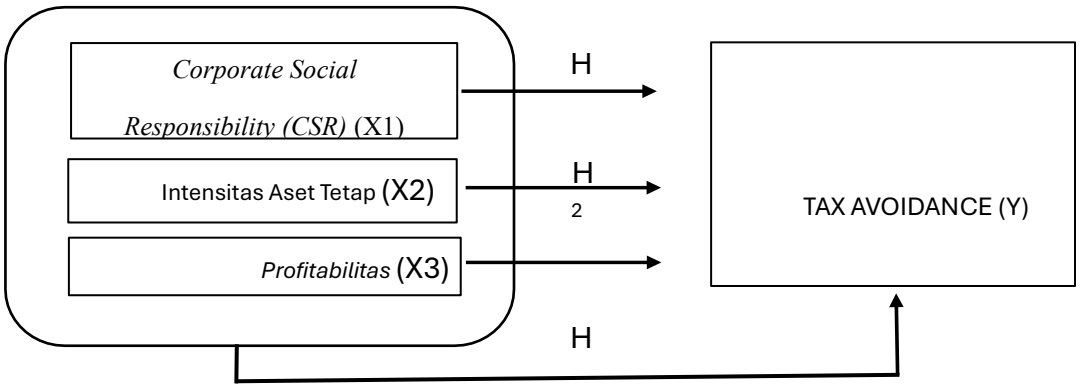
2.4 The Simultaneous Influence of CSR, Fixed Asset Intensity, and Profitability on Tax Avoidance

Corporate tax decisions are not influenced by a single factor, but are the result of the interaction of various strategies and internal conditions. The incentive to compensate for CSR costs , the opportunity to utilize depreciation expense from fixed assets , and the incentive to protect high profits are factors that collectively shape corporate tax policy. The interaction between social commitment, asset structure, and financial performance together determines the extent to which companies will engage in tax avoidance practices. Therefore, it can be assumed that these three independent variables simultaneously have a significant influence on tax avoidance.

H_4:CSR, Fixed Asset Intensity, and Profitability simultaneously have an influence on tax avoidance in health sector companies listed on the Indonesia Stock Exchange in 2019-2023.

Based on the explanation above, the author creates a conceptual framework with three independent variables, namely CSR, Fixed Asset Intensity, and Profitability and one dependent variable, namely tax avoidance.

Berikut merupakan gambar diagram berfikir.



Gambar 1. Konstelasi Penelitian

3. RESEARCH METHODS

This research uses a verificative research type with a quantitative approach, which aims to test hypotheses regarding the influence of Corporate Social Responsibility (CSR), fixed asset intensity, and profitability on tax avoidance. The population in this study is 34 health sector companies listed on the Indonesia Stock Exchange (IDX) during the 2019–2023 period. Sampling was carried out using the purposive sampling method based on a series of specific criteria. These criteria include: companies operating in the health sector and listed on the IDX for the full period 2019-2023 , companies that consistently publish annual

financial reports and sustainability reports and provide the necessary data for research variables , companies not delisted from the exchange during the observation period , and companies not experiencing pre-tax losses (having positive pre-tax profit) to enable the calculation of the Effective Tax Rate (ETR). Based on this selection process, a final sample of 5 companies was obtained with a total of 25 panel data observations. This research uses quantitative secondary data obtained through documentation techniques from published annual reports and sustainability reports.

In this study, the independent variables used are Corporate Social Responsibility (CSR), Fixed Asset Intensity, and Profitability. Meanwhile, the dependent variable is Effective Tax Rate (ETR). The operationalization of variables in this study is summarized in the following table:

Tabel 1. Operasional variable

Variabel	Indikator	Ukuran	Skala
Corporate Social Responbility Index (CSR)	Corporate Social Responsibility Disclosure Index	$\frac{\sum Xi}{n}$	Rasio
Fixed Asset Intensity	Fixed Asset Intensity	$\frac{Total\ Fixed\ Assets}{Total\ Asset}\ X\ 100$	Rasio
Profitability	*Return on Asset* (ROA)	$\frac{Profit\ After\ Tax}{Total\ Aotal\ Assets}\ X\ 100$	Rasio

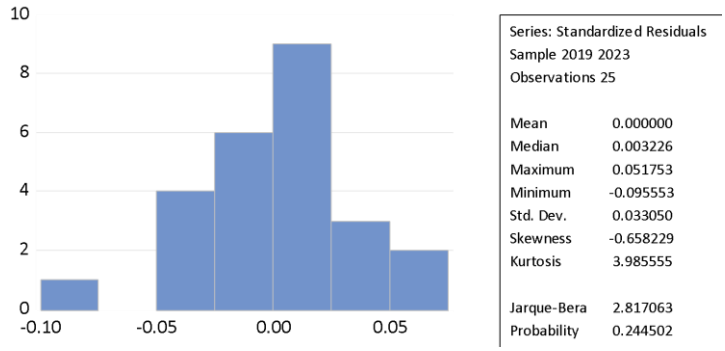
4. RESULTS AND DISCUSSION

4.1 Best Regression Model Section

To determine the most appropriate panel data regression model, a series of statistical tests were performed. Based on the Chow Test results, the Cross-section Chi-square probability value was 0.0254, which is smaller than the significance level of 0.05, so it can be concluded that the Fixed Effect Model (FEM) is more appropriate to use than the Common Effect Model (CEM). This test was further strengthened by the Hausman Test results, which showed a Cross-section random probability value of 0.0304, which is also less than 0.05, confirming that FEM is more suitable for this research than the Random Effect Model (REM). Therefore, based on these two consistent test results, the model chosen and used for analysis in this study is the Fixed Effect Model (FEM) for panel data.

4.2 Normality Test

The data normality test in this study identifies the presence or probability of Jarque-Bera. Data is normally distributed if the probability value is more than 0.05. The following are the results of the normality test processed using Eviews 12:



Picture 2. Normality Test

The Jarque-Bera value is 0.244502. Since this value is greater than the significance level of 0.05, it can be concluded that the regression model residuals in this study are normally distributed and have met the normality assumption.

4.3 Multicollinearity Test

Tabel 2. Multicollinearity Test

	CSR	CI	ROA
CSR	1.000000	-0.021361	-0.149882
CI	-0.021361	1.000000	-0.142687
ROA	-0.149882	-0.142687	1.000000

Data processed with Eviews 12, 2025

Based on the table above, it can be seen that all correlation coefficient values between independent variables are below the threshold of 0.80. Thus, it can be concluded that the regression model in this study does not have multicollinearity problems.

4.4 Heteroscedasticity Test

Tabel 3. Heteroscedasticity Test

Dependent Variable: ABS(RESID)
Method: Panel Least Squares
Date: 07/03/25 Time: 16:25
Sample: 2019 2023
Periods included: 5
Cross-sections included: 5
Total panel (balanced) observations: 25

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-0.011880	0.068108	-0.174426	0.8636
CSR	0.208078	0.165623	1.256334	0.2260
CI	0.007172	0.203522	0.035240	0.9723
ROA	0.032223	0.133532	0.241314	0.8122

Data processed with Eviews 12, 2025

Based on the table above, it can be concluded that this regression model does not contain heteroscedasticity problems. The test results show that the probability value for each independent variable is greater than the significance level of 0.05; CSR (0.2260), CI (0.9723), and ROA (0.8122). Since all these probability values are above 0.05, the homoscedasticity assumption is met.

4.5 Autocorrelation Test

Table 4. Autocorrelation Test

R-squared	0.437489	Mean dependent var	0.232143
Adjusted R-squared	0.109358	S.D. dependent var	0.043559
S.E. of regression	0.041108	Akaike info criterion	-3.256043
Sum squared resid	0.020279	Schwarz criterion	-2.857750
Log likelihood	40.56043	Hannan-Quinn criter.	-3.178292
F-statistic	1.333275	Durbin-Watson stat	1.674413
Prob(F-statistic)	0.315387		

Data processed with Eviews 12, 2025

The Durbin-Watson (DW) value is 1.674413. This value is then compared to the critical value from the Durbin-Watson table at a 5% significance level, where the upper bound (dU) is 1.66. According to the criteria, the model is considered free from autocorrelation if the DW value is between dU and (4-dU). Since the DW value (1.674) is greater than dU (1.66) and less than (4-1.66 = 2.34), it can be concluded that there is no autocorrelation problem in this regression model.

4.6 T-Test

Table 5. Uji T

Dependent Variable: ETR
Method: Panel Least Squares
Date: 07/03/25 Time: 16:27
Sample: 2019 2023
Periods included: 5
Cross-sections included: 5
Total panel (balanced) observations: 25

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	0.354772	0.126277	2.809472	0.0121
CSR	-0.690048	0.307077	-2.247148	0.0382
CI	0.165655	0.377345	0.439002	0.6662
ROA	-0.533228	0.247579	-2.153772	0.0459

Data processed with Eviews 12, 2025

Based on the results in the table above, the hypothesis testing can be elaborated as follows:

H_1: The Influence of Corporate Social Responsibility (CSR) on Tax Avoidance

The results of the first hypothesis test (H1) for the CSR variable obtained a t-Statistic value of -2.247148 and a probability value of 0.0382. Since the probability value (0.0382) is smaller than the significance level of 0.05, H1 is accepted. This indicates that Corporate Social Responsibility (CSR) has a significant influence on tax avoidance. The negative coefficient direction indicates that the higher the CSR disclosure, the higher the tax avoidance practices tend to be.

H_2: The Influence of Fixed Asset Intensity (CI) on Tax Avoidance

The second hypothesis test (H2) for the Fixed Asset Intensity (CI) variable shows a t-Statistic value of 0.439002 with a probability value of 0.6662. Since the probability value (0.6662) is greater than the significance level of 0.05, H2 is rejected. Thus, it can be

concluded that Fixed Asset Intensity does not have a significant influence on tax avoidance in this study.

H_3; The Influence of Profitability (ROA) on Tax Avoidance

For the third hypothesis (H3), the Profitability (ROA) variable obtained a t-Statistic value of -2.153772 and a probability value of 0.0459. Since the probability value (0.0459) is smaller than the significance level of 0.05, H3 is accepted. These results prove that Profitability has a significant influence on tax avoidance. The negative coefficient indicates that companies with higher profitability tend to engage in higher tax avoidance.

4.7 F-Test (Simultaneous)

Table 6. F-Test (Simultaneous

R-squared	0.552090
Adjusted R-squared	0.367656
S.E. of regression	0.039269
Sum squared resid	0.026215
Log likelihood	50.28025
F-statistic	2.993433
Prob(F-statistic)	0.030635

Data processed with Eviews 12, 2025

Based on the test results in the table above, the F-statistic value is 2.993433 with a Prob(F-statistic) value of 0.030635. Since the probability value (0.030635) is smaller than the significance level of 0.05, H4 is accepted. This proves that the independent variables (Corporate Social Responsibility, Fixed Asset Intensity, and Profitability) jointly or simultaneously have a significant influence on the dependent variable (Tax Avoidance).

4.8 Discussion

4.8.1 The Influence of Corporate Social Responsibility (CSR) on Tax Avoidance

The results of this study prove that CSR has a significant influence on tax avoidance, thus H1 is accepted. The negative coefficient direction indicates that the higher the level of CSR disclosure, the lower the Effective Tax Rate (ETR) value, which indicates higher tax avoidance practices. This finding supports legitimacy theory, where companies use CSR disclosure as a strategic tool to build a positive image in the eyes of the public and stakeholders. By having a reputation as a socially responsible company, companies can "compensate" or divert attention from aggressive tax practices.

In addition, costs incurred for CSR activities can be a reduction in taxable income, which directly provides an opportunity to achieve tax efficiency. This phenomenon is seen in the research data, where the trend of CSR disclosure continues to increase, but it is not followed by a proportional increase in ETR; in fact, ETR tends to decrease. These results are consistent with the majority of previous studies, such as those conducted by Susanto & Veronica (2022) and Yutaro Zoebar (2020), which also found that CSR has a significant influence on corporate tax practices.

4.8.2 The Influence of Fixed Asset Intensity on Tax Avoidance

Fixed Asset Intensity does not have a significant influence on tax avoidance, so H2 is rejected. Theoretically, companies with a high proportion of fixed assets are expected to be able to utilize depreciation expense to reduce taxable income. However, this finding shows that in the health sector companies that were sampled, this mechanism is not a major determining factor in tax avoidance strategies. This is strongly suspected because the characteristics of the health industry's operations are more dominated by current assets than large-scale fixed assets. Pharmaceutical and healthcare companies rely heavily on the turnover of drug inventories, accounts receivable, and cash for daily operational activities.

Therefore, their tax planning strategies are likely to focus more on working capital management or other more complex schemes, so the role of depreciation from fixed assets becomes less significant. This inconsistency is also seen in the data, where a small decrease in the average fixed asset intensity was actually followed by a deeper decrease in ETR, indicating other more influential factors. These results are consistent with the findings of Shafira Kumala (2023) and Nita Enggelina (2024) who also did not find a significant influence from this variable.

4.8.3 The Influence of Profitability on Tax Avoidance

The research results prove that Profitability (ROA) has a significant influence on tax avoidance, thus H3 is accepted. The negative coefficient direction indicates that the higher the company's profitability, the more aggressive its tax avoidance practices. High profits create a large potential tax burden, so management has strong incentives to undertake aggressive tax planning to minimize tax payments and maintain net profit. Highly profitable companies also tend to have greater resources to access tax consultant services and implement sophisticated tax avoidance strategies. This is confirmed by data for the 2021-2022 period, where an increase in average ROA was actually followed by a decrease in average ETR, which is strong justification for this research. These findings strengthen the results of the majority of previous studies by Uliya Utami (2024) and Rachmat Sulaeman (2021) who also concluded that profitability is a major driver of tax avoidance practices.

4.8.4 The Influence of Corporate Social Responsibility, Fixed Asset Intensity, and Profitability on Tax Avoidance

Based on the F-test results, it was found that the three independent variables jointly have a significant influence on tax avoidance, thus H4 is accepted. The Adjusted R-squared value of 0.367656 indicates that 36.8% of the variation in tax avoidance can be explained by the combination of CSR, fixed asset intensity, and profitability. The significance of the overall model illustrates a complex company strategy. Although fixed asset intensity individually has no influence, the combination of tax efficiency incentives from high profitability (as the main motive) and the use of CSR as a strategic tool together is strong enough to create a detectable influence on tax avoidance practices. This confirms that corporate tax decisions are not the result of a single factor, but rather an interaction of various motives, including financial performance and company image management.

5. CONCLUSION

Based on the data and analysis that has been outlined previously, Corporate Social Responsibility (CSR) is proven to have a significant influence on Tax Avoidance in health

sector companies listed on the Indonesia Stock Exchange for the 2019-2023 period. The direction of the influence shows that the higher the CSR disclosure, the higher the tax avoidance practices carried out by the company. Fixed asset intensity is not proven to have a significant influence, and this is emphasized due to the operational characteristics of the health industry, which relies more dominantly on current assets (such as drug inventory and receivables) compared to large-scale fixed assets, so the role of depreciation as a tax planning loophole becomes less relevant. Profitability (ROA) is proven to have a significant influence on Tax Avoidance in health sector companies listed on the Indonesia Stock Exchange for the 2019-2023 period. The direction of the influence shows that the higher the profitability, the higher the tax avoidance practices. Corporate Social Responsibility (CSR), Fixed Asset Intensity, and Profitability together (simultaneously) are proven to have a significant influence on Tax Avoidance in health sector companies listed on the Indonesia Stock Exchange during the 2019-2023 period.

6. SUGGESTIONS

Based on the research findings, several practical suggestions are proposed. For company management, considering that high profitability drives tax avoidance, it is suggested to substantively integrate CSR commitments with ethical governance practices, not just as a strategic tool to build an image. For the government and tax authorities, these findings have two important implications. First, supervision and audits need to be specifically increased for highly profitable companies. Second, the insignificance of the influence of fixed asset intensity indicates that tax examinations should not only focus on depreciation but should be broadened to detect other more complex tax planning schemes. For investors, it is suggested to be more critical and not only rely on CSR reports as a proxy for company ethics, but also to consider tax transparency. For future research, it is suggested to develop models by testing other relevant variables such as corporate governance mechanisms. In addition, expanding the research to other industrial sectors or adding macroeconomic factors can provide a more comprehensive picture of the dynamics influencing tax avoidance practices in Indonesia.

THE INFLUENCE OF PROMOTION AND PRODUCT QUALITY ON THE PURCHASING DECISIONS OF SCREAMOUS BOGOR DISTRO CONSUMERS

Agung Rahmatullah[1], Abel Gandhy[2], Yetty Husnul Hayati[3], Ikhfa Aulia Aska[4]

[1, 2, 3, 4] Faculty of Economics and Business, Pakuan University, Indonesia
e-mail: agungbgr2015@gmail.com

Abstract

This research aims to determine the Influence of promotion and product quality on the purchasing decisions of Screamous Bogor distro consumers. This research is a quantitative study using descriptive analysis methods. The data collection techniques were obtained through observation and questionnaires. The population in this study consists of 100 screamous consumers, with the sampling method being a saturated or census sampling. The data analysis methods used are descriptive analysis, classical assumption tests, multiple linear regression, T-test, F-test, and the coefficient of determination. Based on the results of the descriptive analysis, the promotion condition falls into the very good or very high category with an average total score of 84.25%. The condition of product quality falls into the very good or very high category with an average total score of 84.4%. The condition of the purchase decision is in the very good or very high category with an average score of 84.25%. The results of the multiple regression test obtained a constant coefficient value of 13.070 in a positive form, which proves that the three variables, namely (X1) promotion and (X2) product quality, have an influence on (Y) purchasing decisions. Thus, the hypothesis stating that the three variables have a positive influence and can be accepted.

Keywords: Promotion, Product Quality, Purchase Decision

1. Introduction

Fashion is something that is very important and has a big influence in the current era of globalization, in this modern era, there will definitely be significant developments and changes because there will definitely be a lot of people following fashion trends, especially among teenagers. The development of the fashion world has become an important thing for various groups, both young and old. Recently, the promising business in Indonesia is the world of fashion. Fashion is the primary reason consumers visit malls and boutiques, offering clothing for women, men, and children, as well as cosmetics and other accessories. Java, particularly Bogor, is renowned for its rapidly evolving fashion trends. Anggia Petrisa Wintar, (2019).

Screamous is a retail company operating in the clothing industry that was founded on May 29, 2004. The company is registered under the name of CV. Rotasindo and carries the brand name Screamous. Screamous's principle is to provide a differentiated choice in the fashion industry. Their target market are teenagers and anyone who is open-minded, independent, and part of a modern society. They strive to incorporate every aspect of human culture and behavior into their products.

Initially, this company set up a shop at Cipaganti Street No. 56 for about two years, then to get closer to the market and a more strategic location in early 2006, this company has now moved to Trunoyo Street No. 23. Until now, they have two official stores in Bandung. In addition to the official store, they have branches in major cities in Indonesia and collaborate

with other companies such as (Distro) located in these major cities.

Bogor is Screamous' choice to open the store to market the products more widely. Located at Lodaya Street II No. 6, Bogor Tengah District, Bogor. Bogor itself has several distro who dominates in the fashion field. Screamous Distro is spread across various cities such as Bogor, Bekasi, and Surabaya. Consumers can also shop online through the website www.screamous.com.

So, based on the various phenomena and problems that have been described above, the researcher is interested in conducting research entitled **"The Influence of Promotion and Product Quality on the Purchasing Decisions of Screamous Bogor Distro Consumers"**.

2. Literature review and hypotheses development

2.1 Marketing

According to (Sudaryono, 2022) marketing is a management process that seeks to maximize profits (returns) for shareholders in establishing relationships with key customers (valued customers) and create competitive advantages. According to (Kotler and Keller, 2021) marketing management is the art and science of attracting, retaining, and growing customers by selecting target markets and creating, delivering, and communicating superior customer value. According to (Tjiptono and Diana, 2020) marketing is the process of creating, distributing, promoting, and pricing goods, services and ideas to facilitate satisfying exchange relationships with customers and to build and maintain positive relationships with stakeholders in a dynamic environment. According to (Laksana, 2019), marketing is the meeting of sellers and buyers to conduct transactions for goods or services. Therefore, the concept of a market no longer refers to a location but rather to the activity or meeting of sellers and buyers to offer a product to consumers. Meanwhile According to (Sunyoto, 2019) marketing is a human activity that aims to satisfy the needs and desires of customers through an exchange process and parties who have an interest in the company.

From the opinions of the experts above, it can be concluded that marketing is one of the main activities that need to be carried out by companies, whether goods or service companies, in an effort to maintain the survival of their business.

2.2 Promotion

According to Purba (2019), promotion is an effort made by a company to influence consumers to buy the products they produce or to convey news about products by communicating with listeners in a persuasive manner. According to Tjiptono (2017), promotion is a form of marketing communication in the form of marketing activities that seek to disseminate information, influence or persuade and remind the market of the company or its products so that they are willing to accept, buy and be loyal to the products offered by the company concerned. Meanwhile, according to Rheza (2019), promotion is an effort to provide or introduce products or services to attract customers who have the potential to use the product or service.

From these three definitions according to experts, it can be concluded that promotion is a company's effort to communicate with consumers with the aim of influencing their interest in the products or services offered. Promotion aims to disseminate information, persuade, and remind consumers to accept, purchase, and remain loyal to a particular product or service. Essentially, promotion is a marketing strategy to introduce a product or service and attract potential customers.

2.3 Product Quality

According to Amilia (2019) product quality is the ability of a product to carry out its functions, this ability includes durability, reliability, accuracy produced, ease of operation and repair and other valuable attributes of the product as a whole. According to Purnama (2021), product quality is the ability of a product to carry out its functions, including durability, reliability, accuracy, ease of operation and repair, and other valuable attributes. Meanwhile According to Chandra (2019) Quality is a dynamic condition related to products, services, human resources, processes, and the environment that meets or exceeds expectations.

Based on the description above, product quality is the ability of a product to perform its function optimally, including aspects of durability, reliability, accuracy, ease of operation, and ease of repair. In addition, other valuable attributes such as design, additional features, and aesthetics are also an important part of the overall product quality. Quality is not only limited to the basic function of the product, but also involves dynamic factors such as service, human resources, production processes, and a supporting environment. From the definition above, it can be concluded that product quality is the physical condition, function and nature of a product, whether goods or services, based on the level of quality expected by consumers or customers with the aim of meeting and satisfying the needs of consumers or customers.

2.4 Purchase decision

According to Gunawa (2022), a purchasing decision is defined as an activity, action, and psychological process undertaken by consumers before making a final decision to purchase a product or service with the aim of fulfilling the needs and desires of individuals, groups, and organizations. According to Putra (2022), a purchasing decision is a decision-making process that begins with identifying a problem, then evaluating it, and deciding on the product that best suits the needs. Meanwhile, according to Kotler (2019), a consumer purchasing decision is a decision to purchase the most preferred brand. And according to Warsito et al (2022),that the purchasing decision is the stage when the consumer has a choice and is ready to make a purchase.

Based on the definitions provided by these experts, it can be concluded that a purchasing decision is an action taken by consumers before deciding to purchase a product, good, or service. This process begins with identifying the problem, then evaluating it, and then deciding which product, good, or service best meets their needs. This allows consumers to decide whether or not to make a purchase.

3 Research methods

The type of research used in this study is quantitative with a qualitative approach, which aims to prove and analyze the causal relationships of the variables studied by testing hypotheses, which generally explain phenomena in the form of relationships between variables. The research technique used is quantitative statistics.

Based on the title of this research, the object of the research is Promotion and Product Quality on Consumer Purchasing Decisions of Screamous Bogor Distro. Promotion is the independent variable (X1), Product Quality is the variable (X2), and Purchasing Decision is the dependent variable (Y).

In this study, the unit of analysis was Screamous consumers. The research location was

Bogor.

The type of data examined in this study is quantitative data, in the form of numbers or figures, which can be processed numerically. The data sources used in this study are two data sources, namely primary and secondary data. Data processing is carried out by collecting, processing, and presenting it in tabular form with multiple linear regression analysis, hypothesis testing and coefficient of determination through research instrument tests such as validity and reliability tests, classical assumption tests, descriptive analysis, t-test, f-test, and R2 test.

Meanwhile, the activities in data analysis are grouping data based on variables and types of respondents, tabulating data based on variables for all respondents, presenting data for each variable studied, and performing calculations to test the hypotheses that have been proposed.

4 Results and discussion

4.1 Respondent Characteristics

In this study, the author used a questionnaire with the help of Google Form by distributing Screamous to consumers to obtain the necessary data, involving 100 respondents as a research sample. The respondent descriptions used in this study include gender and age.

4.2 Descriptive Analysis Table of Descriptive Analysis Results

Variables	Average	Notes
Promotion	84,25%.	Very good
Product Quality	84,4%.	Very good
Purchase Decision	84,25%.	Very good

Based on these results, it can be concluded that social media promotion and purchasing decisions are good but need to improve things that are still lacking based on respondents' assessments.

4.3 Instrument Test 1

4.3.1 Validity test

a. Promotion Validity Test

Variables	Statement Items	Calculated-R	R-Table	Information
Promised (X1)	Question 1	676	0,361	Valid
	Question 2	800	0,361	Valid

	Question 3	399	0,361	Valid
	Question 4	564	0,361	Valid
	Question 5	487	0,361	Valid
	Question 6	461	0,361	Valid

Based on the results of the table above, the statement of the promotion variable shows that all statements on work discipline, totaling 6 statements, are said to be valid, because the calculated r value is > r table.

b. Product Quality Validity Test

Variables	**Statement Items**	**Calculated-R**	**R-Table**	**Information**
Product Quality (X2)	Question 1	551	0,361	Valid
	Question 2	537	0,361	Valid
	Question 3	643	0,361	Valid
	Question 4	630	0,361	Valid
	Question 5	641	0,361	Valid
	Question 6	645	0,361	Valid
	Question 7	652	0,361	Valid
	Question 8	599	0,361	Valid
	Question 9	550	0,361	Valid
	Question 10	415	0,361	Valid
	Question 11	406	0,361	Valid
	Question 12	653	0,361	Valid
	Question 13	554	0,361	Valid
	Question 14	551	0,361	Valid
	Question 15	537	0,361	Valid

Based on the results of the table above, the product quality variable statement shows

that all 15 statements on work discipline are valid, because the calculated r value is > r table.

c. Test the Validity of Purchasing Decisions

Variables	Statement Items	Calculated-R	R-Table	Information
Purchase Decision (Y)	Question 1	388	0,361	Valid
	Question 2	427	0,361	Valid
	Question 3	665	0,361	Valid
	Question 4	678	0,361	Valid
	Question 5	694	0,361	Valid
	Question 6	740	0,361	Valid
	Question 7	672	0,361	Valid
	Question 8	722	0,361	Valid
	Question 9	643	0,361	Valid
	Question 10	408	0,361	Valid

Based on the results of the table above, the statement of the purchasing decision variable shows that all 10 statements on work discipline are said to be valid, because the calculated r value is > r table.

4.3.2 Reliability Test

Questionnaire Items	Conclusion Criteria			Information
	Cronbach Alpha	R table	N of items	
Promotion	0,771	0,771 > 0,60	6	Reliable
Product Quality	0,715	0,715 > 0,60	15	Reliable
Decision Purchase	0,753	0,753 > 0,60	10	Reliable

The results of the reliability test on the social media promotion and purchasing

decision variables show a Cronbach Alpha (α) value > 0.60 so that it can be declared reliable because it has a Cronbach Alpha (α) value > 0.60.

4.4 Classical Assumption Test

4.4.1 Normality Test

Tests of Normality

	Kolmogorov-Smirnov[a]			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
VAR00001	.182	100	.360	.930	100	.000
VAR00002	.072	100	.200*	.981	100	.168
VAR00003	.161	100	.489	.957	100	.003

*. This is a lower bound of the true significance.

a. Lilliefors Significance Correction

Based on the results of the normality statistical test with Kolmogorov Smirnov above, it shows a significant value for the promotion variable of 0.360, the product quality variable has a significant value of 0.200 and the significant value of the purchasing decision variable is 0.489 which means it is greater than 0.189. so that the H0 provision is accepted and it is concluded that the normality assumption is met.

4.4.2 Linearity Test

ANOVA TABLE

			Sum of Squares	df	Mean Square	F	Sig.
purchase decision * promotion	Between Groups	(Combined)	86.856	12	7.238	.569	.862
		Linearity	1.554	1	1.554	.122	.728
		Deviation from Linearity	85.303	11	7.755	.609	.816
	Within Groups		1107.504	87	12.730		
	Total		1194.360	99			

Based on the results of the linearity test presented in the ANOVA table, the

relationship between the promotion variables, product quality, and purchasing decisions can be considered linear. In the linearity test, the Sig value**.** for Linearity is 0.728, which is greater than 0.05, indicating that the relationship between the three variables is linear. Meanwhile, the Sig value**.** The Deviation from Linearity value is 0.816, which is also greater than 0.05, indicating no significant deviation from the linear relationship. Thus, it can be concluded that there is a significant linear relationship between the promotion variables, product quality, and purchasing decisions.

4.4.3 Multiple Linear Regression Test

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	13.070	3.820		3.421	.614
	Promotion	.523	.118	.399	6.521	.726
	product quality	.628	.071	.796	8.817	.688

a. Dependent Variable: purchasing decision

The table above shows that the constant coefficient value is 3.576, the social media promotion coefficient is 0.907. So the regression equation is Y = 3.576 + 0.907 X. Based on the equation above, the constant value is 3.576. Systematically, this constant value states that when social media promotion is 0, the purchasing decision has a value of 3.576.

4.5 Hypothesis Test

4.5.1 Partial Test (T Test)

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	13.070	3.820		3.421	.614

	Promotion	.523	.118	.399	6.521	.726
	Product Quality	.628	.071	.796	8.817	.688
a. Dependent Variable: purchasing decision						

a. The value of the t-test results between Promotion and Purchasing Decisions produces a calculated t of 6.521, while the t table is 0.676 and a significance value of 0.726 which is greater than α (0.05). This means that Ha is accepted and H0 is rejected, thus the Promotion variable has a significant influence on Discreet Purchasing Decisions.
b. The value of the t-test results between Product Quality and Purchasing Decisions produces a calculated t of 8.817, while the t table is 0.676 and a significance value of 0.688 which is greater than α (0.05). This means that Ha is accepted and H0 is rejected, thus the Product Quality variable has a significant influence on discreet purchasing decisions.

4.5.2 Simultaneous Test (F Test)

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	532.228	2	266.114	38.985	.563b
	Residual	662.132	97	6.826		
	Total	1194.360	99			
a. Dependent Variable: purchasing decision						
b. Predictors: (Constant), product quality, promotion						

It is known that the significance value for the (simultaneous) influence of Promotion and Product Quality on Purchasing Decisions is 0.018 < 0.05 and the calculated F value is 67.811 > F table 38.985. So it can be concluded that H0 is rejected and Ha is accepted, which means the regression model

This can be used to examine the Promotion and Product Quality variables, which simultaneously influence Purchasing Decisions. Thus, it can be said that the Promotion and Product Quality variables simultaneously have a significant influence on Purchasing Decisions.

4.6 Coefficient of Determination

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.668[a]	.446	.434	2.613
a. Predictors: (Constant), product quality, promotion				

Based on the table above, the R-Square value of 0.446 indicates that the Promotion and Product Quality variables influence the Purchase Decision variable by 43.4%. This means that Promotion at Screamous and Product Quality have a proportion of influence on the Purchase Decision at Screamous of 43.4%, while the remaining 56.6% is influenced by other variables not examined in this study.

4.7 The Influence of Promotion and Product Quality on Screamous Purchasing Decisions

Based on the results of the Simultan test, it was found that the promotion and product quality variables simultaneously influenced purchasing decisions. The results of this study showed a calculated F value of 67,811 with a significance value of 0.018, which is below 0.05. This means that Ha is accepted and Ho is rejected, meaning that statistically, promotion and product quality in this study simultaneously have a significant effect on purchasing decisions. The better the promotion and the better the product quality, the more it will increase purchases through purchasing decisions made by consumers at the Screamous distro. Thus, it can be said that the promotion and product quality variables simultaneously have a significant effect on purchasing decisions. This is in line with research conducted by Gandhy & Hairuddin, (2018) on the influence of purchasing decisions can be influenced by product differentiation, evidenced by research results showing that purchasing decisions can be influenced by several factors. First, promotions have been shown to have a positive impact on consumer purchasing decisions. Various promotional strategies carried out, such as exhibitions, word of mouth, the use of social media, and news, can increase purchasing decisions. Second, product differentiation is the most dominant factor in influencing purchasing decisions. Third, premium prices also play an important role in purchasing decisions. This is proven through a partial T-test, where for the promotion variable, the T-count of 3.576 is greater than the T-table of 1.985 at a significance level of 5%, and for product differentiation, the T-count of 5.482 is also greater than the T-table of 1.985, which indicates a significant influence on purchasing decisions. This research is strengthened by the study of Gandhy & Hairuddin, (2018) entitled "Analysis of Promotion and Product Differentiation: The Influence of Jukajo on Consumer Purchasing Decisions", which states that purchasing decisions are influenced by factors such as promotions, product differentiation, and premium prices.

Based on the description above, promotion and product quality simultaneously have a significant influence on purchasing decisions at the Screamous distribution center. This research finding aligns with research by Astuti & Abdullah (2024), which states that promotion and product quality variables significantly influence purchasing decisions. Promotion and product quality are the main factors influencing consumer purchasing decisions at the Screamous distribution center. Effective promotions, such as discounts and loyalty programs, can attract consumer attention, while maintaining product quality builds trust and encourages loyalty and repeat purchases. To achieve company goals, it is important to motivate individual employees, as their maximum contribution to product promotion and quality maintenance will directly influence consumer purchasing decisions.

5. Conclusion

Based on the results of calculations and data analysis that have been carried out in the research, the following conclusions can be drawn.

1. Based on the research results, there is a positive influence between promotions on purchasing decisions, this can be seen from the results of the analysis that t count > t table (6.521>0.676), meaning that Ho is rejected and Ha is accepted, which means that promotions have an influence on purchasing decisions made by consumers of the Screamous distro.
2. There is a positive influence between product quality on purchasing decisions at the Scramous distro, this can be seen from the results of the analysis that t count > t table (8.817>0.676), meaning that Ho is rejected and Ha is accepted, which means that product quality has an influence on purchasing decisions made by consumers of the Scramous distro.
3. Based on the results of simultaneous testing (F test), it can be seen that promotion and product quality have a simultaneous influence on purchasing decisions at dsitro screamous. This is proven by the results of simultaneous testing calculations (F test) where the calculated F value > F table, namely 67.811 > 38.985 or the sig value of F (0.018) < α = 0.05.
4. There is a positive influence between promotion and product quality on purchasing decisions at dsitro screamou, this can be seen from the results of the analysis of the coefficient of determination of the independent variables on the related variables showing that the R value of r2 = 0.446 means that the influence of promotion and product quality on purchasing decisions has a contribution (R) of 43.4% and the rest is influenced by other variables not included in this model.

6. Suggestion

Based on the discussion and conclusions that have been outlined previously in this research, there are several suggestions that the researcher can provide, namely as follows:

1. This research is expected to be used as a consideration for screamous distributors regarding the importance of promotion and product quality in determining consumer purchasing decisions.
2. Maintaining and Improving Promotion Quality, considering the significant positive influence between promotions on purchasing decisions, Distro Screamous needs to ensure that promotional activities remain routine and attractive to consumers. Offering various types of promotions, such as discounts and loyalty programs, as well as maximizing the use of social media as the main promotional channel, can further increase consumer purchasing interest and expand market reach.
3. Improving Product Quality. Given the positive influence of product quality on purchasing decisions, Distro Screamous must continue to focus on improving product quality. This includes product innovation that aligns with market trends and ensuring products have visual appeal and functionality that meet consumer expectations.
4. Collaboration between Promotion and Product Quality. The analysis results show that promotion and product quality simultaneously influence purchasing decisions. Therefore, Distro Screamous is advised to integrate its promotional strategy with an

emphasis on product quality. Combining attractive promotions with quality products can have a greater impact on consumer purchasing decisions.

Abstract

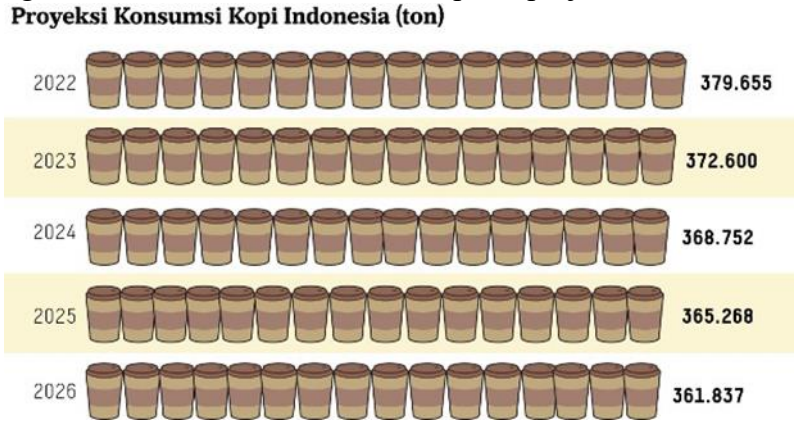
This study aims to determine the effect of store atmosphere and word of mouth on purchasing decisions at Coger Kujang Coffee & Resto Bogor. The coffee shop industry in Bogor City is experiencing rapid growth along with changes in people's lifestyles. However, Coger Kujang Coffee & Resto has experienced a decrease in the number of visitors and sales. This study uses a quantitative approach with 100 respondents selected through purposive sampling technique. Data was collected using a questionnaire and analyzed using SEM-PLS through SmartPLS 4.0 software. The results showed that store atmosphere has a positive and significant effect on purchasing decisions (t-statistic = 3.023), as well as word of mouth (t-statistic = 7.643). This study concludes that both variables significantly influence consumer purchasing decisions.

Keywords: Store Atmosphere, Word Of Mouth, Purchase Decision, Coffee Shop

1. Introduction

The coffee shop and restaurant industry in Indonesia is experiencing rapid growth until 2024. This growth is not only driven by the increasing number of coffee lovers, but also by the development of lifestyle trends and the need for a comfortable hangout place.

Figure1 : Indonesian coffee consumption projection 2022-2026



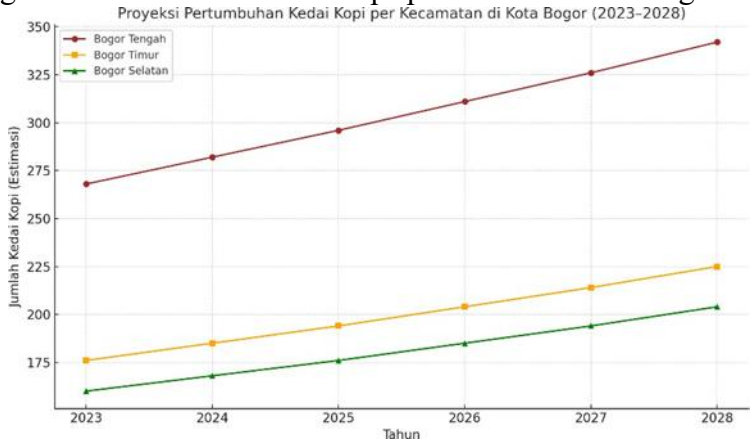
Source: Secondary data, 2024

In 2024 the ministry of agriculture shows domestic projection data amounting to around 368,752 tons. However, according to Kompas.id, (2024) in 2023 Indonesian coffee consumption is still relatively low compared to other countries. Although the projections change, Indonesia has a great opportunity to develop in the coffee management industry because of its rich natural resources as potential raw materials and supported by a large market.

Bogor City is one of the cities that has highlighted the rapid development of the coffee and restaurant industry in recent years. One of the most prominent phenomena is the rise of

coffee shops that have sprung up in various corners of the city, the competition for coffee shops in Bogor is getting tighter.

Figure2 : Growth of coffee shops per sub-district in Bogor City



Source: Secondary data, 2025

Based on data from the Bogor City Central Bureau of Statistics, the projected growth in the number of coffee shops in the three main sub-districts of Bogor City (Central, East, South) from 2023-2028 shows a fairly rapid development in recent years. The projection graph illustrates a stable expansion trend in the three main sub-districts, influenced by the increasing public interest in coffee culture, easy access to infrastructure, and the strategy of developing culinary areas by the local government. This phenomenon encourages more and more coffee shops to emerge with various concepts and uniqueness of each, thus creating intense competition in this industry.

Store atmosphere is a factor that must be considered in the cafe business. With an attractive store atmosphere, it can encourage consumers to come back. All the elements contained in the store atmosphere affect the atmosphere of the store that you want to create and can determine the image of a place itself.

Coger Kujang Coffee & Resto is one of the coffee shop business actors in Bogor which comes with a minimalist tropical concept with Balinese nuances that is aesthetic and contemporary. Despite having a high rating on Google Rating, in recent times there has been a decrease in the number of visitors and transactions.

Image3 : Display of Coger Kujang Coffee & Resto Bogor

Source: Secondary data, 2024

Creating a store atmosphere needs to be done so that the appearance of the store becomes attractive to potential customers and is able to attract them to enter it. In addition, marketers also need to build an atmosphere that supports consumer comfort while in the cafe. A comfortable atmosphere is a separate consideration for consumers before deciding to come or visit a particular cafe.

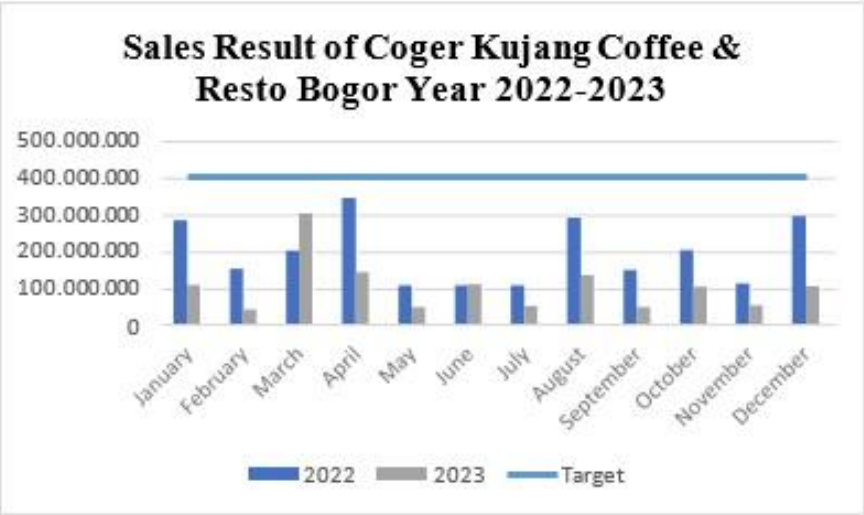
Table1 .Visitor Data Coger Kujang Coffee & Resto Bogor

Month	**Year**	
	2022	**2023**
January	520	400
February	452	290
March	500	500
April	600	450
May	400	315
June	410	420
July	497	335
August	555	425
September	455	300
October	504	415
November	405	350
December	597	490
Total	**5.895**	**4.690**

Source: Primary Data, 2024

Visitor data presented in table 1. The year 2023 shows a significant decline, the number of visitors is seen decreasing almost every month. This decline is quite significant and can be a concern for further evaluation.

Figure4 . Sales results of Coger Kujang Coffee & Resto Bogor



Source: Secondary data, 2024

Sales results in 2022 and 2023 fluctuated and did not reach the target set by Coger Kujang Coffee & Resto Bogor.

To find out what consumer complaints about store atmosphere and word of mouth on purchasing decisions at Coger Kujang Coffee & Resto Bogor, the researchers conducted a pre-survey, namely by distributing to 30 consumers of Coger Kujang Coffee & Resto Bogor.

Table2 . Pre-survey of consumers of Coger Kujang Coffee & Resto Bogor

No	Question	Respondent's Answer		Total	Number of Respondents
		YES	NO		
Store Atmosphere					
1	Is the signage at Coger Kujang Coffee & Resto Bogor clearly visible?	8 (26,7%)	22 (73,3%)	100%	30
2	Does the music played at Coger Kujang Coffee & Resto make you feel comfortable?	7 (23,3%)	23 (76,7%)	100 %	30
3	Is the interior design of Coger Kujang Coffee & Resto attractive?	13 (43,3%)	17 (56,7%)	100%	30
Word Of Mouth					
4	Did you find out about Coger Kujang Coffee & Resto Bogor through Instagram? Did you visit Coger Kujang	18 (60%)	12 (40%)	100%	30
5	Coffee & Resto Bogor because of a recommendation from friends or family?	12 (40%)	18 (60%)	100%	30
Purchase Decision					
6	Does Coger Kujang Coffee & Resto Bogor match your expectations?	12 (40%)	18 (60%)	100%	30
7	Would you recommend Coger Kujang Coffee & Resto Bogor to friends or family?	10 (33,3%)	20 (66,7%)	100%	30
8	Do you feel that Coger Kujang Coffee & Resto Bogor is your first choice when looking for a place to eat or drink?	9 (30%	21 (70%)	100%	30

Source: Primary data, 2024

Based on the pre-survey results in table 1. shows that in the first statement related to store atmosphere, 73.3% of respondents felt that the signboard at Coger Kujang Coffee & Resto was not clearly visible. In the second statement 76.7% of respondents stated that the music presented made them uncomfortable. In the third statement, 45.7% of respondents felt that the interior design was not attractive. This shows that improvements are needed in visual aspects, atmosphere and aesthetics to improve the consumer experience. In statements related to word of mouth, 60% of respondents stated that they knew more through Instagram and the second statement respondents did not visit based on recommendations. This shows that word of mouth has not been very effective, promotion through word of mouth or word of mouth carried out by Coger Kujang Coffee & Resto Bogor is still relatively low. In statements related to purchasing decisions, 60% of respondents felt that it did not match expectations. In the second statement 66.7% did not recommend it to friends / family. In the last statement, 70% of respondents did not consider Coger Kujang coffee & restaurant to be the first choice. From the three statements related to purchasing decisions, this shows that Coger Kujang must improve store atmosphere and word of mouth so that consumers are interested in coming back to visit and getting many new consumers.

According to Sudarsono, (2020) promotion is a process in which business actors persuade, convey information, and influence consumers to make purchasing decisions. One of the strategic steps that companies must take to achieve their goals is to first understand the needs and desires of customers or target markets thoroughly. Most individuals show a tendency to trust marketing delivered through word-of-mouth communication more than other formal promotional methods. This is because the recipient of the recommendation feels confident that the information conveyed by the recommendation buyer is honest and free from ulterior motives. Therefore, word of mouth marketing is considered more effective in building consumer trust (Baskara & Ernasari, 2018).

Purchasing decisions involve consumers and their level of trust in a product or service. In the context of the coffee shop business, consumer attractiveness is not only focused on the variety of menus and drinks offered, but also on the atmosphere of a cafe that is visually appealing or has an instagramable impression.

2. Literature review and hypothesis development

2.1 Store Atmosphere

According to Ijup, (2020) store atmosphere is a store atmosphere that involves affection (feelings) in the form of emotions in a store that consumers may not fully realize, including various displays of store elements on the exterior and interior of the store as an attraction for consumers in the desire to buy. Sambara et al., (2021) states that one of the marketing mix in outlets is store atmosphere, which is very important to attract buyers, make customers feel comfortable when they come to the store, and remind them of what products they want. Indicators of store atmosphere in this study include:

1. Store exterior
2. General interior
3. Layout and room design

2.2 Word of mouth

According to Karlina & Haryanti, (2021) word of mouth is a promotion carried out by consumers verbally, in writing, or through electronic media to spread information about brands

or products to other consumers. According to Rayhaniah, (2022) word of mouth (WOM) is an expression from mouth to mouth or known as "getok tular, WOM is a personal communication between two or more individuals. According to Berger, (2023) word of mouth (WOM) is a word of mouth promotion activity carried out by consumers based on experiences with products or services because they get satisfaction. The indicators of word of mouth variables in this study:

1. Talking about
2. Suggest
3. Encourage

2.3 Purchase decision

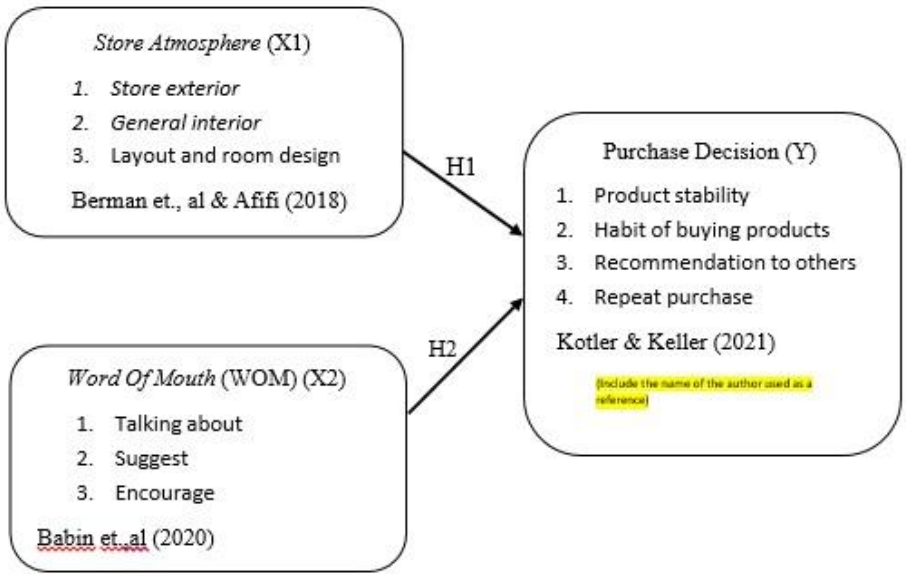
According to Arfah, (2022) purchasing decisions are the result of a process influenced by various factors, in which consumers consciously consider various things before finally choosing the product that best suits their preferences. According to Manik et al., (2021) states that purchasing decisions are the real actions of consumers to obtain the desired product or service. Thus, purchasing decisions can be understood as a process of selecting the best solution from a number of available alternatives, which ends with a purchase action. Indicators of purchasing decisions in this study are:

1. Product stability
2. Habit of buying products
3. Recommendations to others
4. Repurchase

2.4 Research constellation

Purchasing decisions are the result of a consumer consideration process in choosing a product or service based on various influencing factors, the two main factors that play a role in shaping purchasing decisions are store atmosphere and word of mouth (WOM). Meanwhile, research conducted by Nabila Ayu Khairunnisa et al., (2024) . The Effect of Word Of Mouth and Store Atmosphere on Consumer Purchasing Decision (Study on Kasungka Coffee Consumers in Majalengka City) "shows that word of mouth partially has a significant effect on purchasing decisions, then store atmosphere partially has a significant effect on purchasing decisions. Research conducted by Gultum Miranda, (2021) with the title "The Effect of Store Atmosphere and Word of Mouth Promotion on Purchasing Decisions at the Jambi Inland Coffee Café" shows that both variables, both simultaneously and partially, have a significant influence on consumer purchasing decisions. Based on the above framework, the researcher can make a research constellation as follows:

Figure5 . Research constellation



2.5 Research Hypothesis

H1: Store atmosphere has a positive effect on purchasing decisions for Coger Kujang Coffee & Resto Bogor.

H2: Word of mouth has a positive effect on purchasing decisions for Coger Kujang Coffee & Resto Bogor.

3. Research method

The type of research in this study is quantitative research with causal associative methods. The object of this research which is the independent variable is store atmosphere and word of mouth, while the dependent variable is purchasing decisions. The unit of analysis in this study were consumers of Coger Kujang Coffee & Resto Bogor. The research location is on Jl. Bincarung No. 17, Tanah Sereal, Kec. Tanah Sereal, Bogor City, West Java 16161. The type of data used is quantitative. Data sources consist of primary data and secondary data. The sampling method in this study was NonProbability sampling with a sample size of 100 respondents, using accidental sampling technique.

4. Results and Discussion

4.1 Validity Test

In this study, the validity test process was carried out using the help of SPSS software version 25. The test was carried out on 30 respondents (N = 30) with a significant level of 0.05. The instrument is declared valid if the r-count> r-table value.

Table3 . Validity Test Results

No	Item	R Count	R Table	Description
1	SA1.1	0,687	0,361	Valid
2	SA1.2	0,543	0,361	Valid
3	SA1.3	0,676	0,361	Valid
4	SA2.1	0,596	0,361	Valid
5	SA2.2	0,602	0,361	Valid
6	SA2.3	0,550	0,361	Valid

7	SA3.1	0,604	0,361	Valid
8	SA3.2	0,484	0,361	Valid
9	SA3.3	0,657	0,361	Valid
10	WOM1.1	0,677	0,361	Valid
11	WOM1.2	0,623	0,361	Valid
12	WOM1.3	0,623	0,361	Valid
13	WOM2.1	0,629	0,361	Valid
14	WOM2.2	0,738	0,361	Valid
15	WOM2.3	0,803	0,361	Valid
16	WOM3.1	0,484	0,361	Valid
17	WOM3.2	0,597	0,361	Valid
18	WOM3.3	0,475	0,361	Valid
19	KP1.1	0,589	0,361	Valid
20	KP1.2	0,519	0,361	Valid
21	KP1.3	0,688	0,361	Valid
22	KP2.1	0,481	0,361	Valid
23	KP2.2	0,594	0,361	Valid
24	KP2.3	0,678	0,361	Valid
25	KP3.1	0,518	0,361	Valid
26	KP3.2	0,571	0,361	Valid
27	KP3.3	0,641	0,361	Valid
28	KP4.1	0,486	0,361	Valid
29	KP4.2	0,610	0,361	Valid
30	KP4.3	0,539	0,361	Valid

Source: Primary data, 2025

The validity test results in table 4.1, all instruments or items on the questionnaire obtained an r-count value> r- table value, it can be concluded that each statement item in the questionnaire is declared valid.

4.2 Reliability Test

Table4 . Reliability Test Results

Variable	**Cronbach`s Alpha**	**N of items**	**Description**
Store atmosphere	0.765	9	Reliable
Word of mouth	0.803	9	Reliable
Purchase decision	0.795	12	Reliable

Source: Primary data, 2025

Variables are said to be reliable if the Cronbach`s Alpha value is> 0.70. Based on the reliability test results in table 4, the Cronbach's alpha value on each variable has results greater than 0.70. It is concluded that all research instruments are declared reliable.

4.3 Structural Equation Model-Partial Least Square (outer model)

4.3.1 Convergent Validity

This stage is evaluated through a loading factor with a straight assassment greater than 0.7, but the range of 0.5 - 0.6 is still acceptable Hair et al., (2021) , so in this study the loading factor above 0.5 is considered valid.

Table5 . Outer Loading Results

Variable	Indicator	Code	Loading Factor	Evaluation
Store Atmosphere	Store Exterior	SA1.1	0.804	Valid
		SA1.2	0.835	Valid
		SA1.3	0.733	Valid
	General Interior	SA2.1	0.840	Valid
		SA2.2	0.745	Valid
		SA2.3	0.761	Valid
	Layout and Room Design	SA3.1	0.863	Valid
		SA3.2	0.807	Valid
		SA3.3	0.842	Valid
Word of Mouth	Talking about	WOM1.1	0.718	Valid
		WOM1.2	0.705	Valid
		WOM1.3	0.784	Valid
	Suggest	WOM2.1	0.845	Valid
		WOM2.2	0.793	Valid
		WOM2.3	0.766	Valid
	Encouraging	WOM3.1	0.774	Valid
		WOM3.2	0.729	Valid
		WOM3.3	0.759	Valid
Purchase Decision	Product Stability	KP1.1	0.803	Valid
		KP1.2	0.807	Valid
		KP1.3	0.713	Valid
	Habits in Buying Products	KP2.1	0.824	Valid
		KP2.2	0.813	Valid
		KP2.3	0.751	Valid
	Recommendations to Others	KP3.1	0.777	Valid
		KP3.2	0.813	Valid
		KP3.3	0.757	Valid
	Repeat purchase	KP4.1	0.743	Valid
		KP4.2	0.780	Valid
		KP4.3	0.737	Valid

Source: Primary data, 2025

Store atmosphere, word of mouth, and purchasing decision variables show item values that meet convergent validity standards because all factors have a value of more than 0.5. Therefore, it can be concluded that all constructs or variables tested are valid. The next stage in the convergent validity analysis is to evaluate the average variance extracted (AVE) value, with the criteria that the AVE value must be greater than 0.5.

Table6 . AVE value

Variable	AVE

Store Atmosphere	0.604
Word of Mouth	0.647
Purchase Decision	0.585

Source: Primary data, 2025

4.3.2 Discriminant Validity

Discriminant validity is tested to ensure that the research instrument can appropriately reflect the latent variable, which can be seen through the cross loading value. The model is said to have good discriminant validity if each cross loading value of a latent variable is higher than the loading value of that variable on other latent variables.

Table7 . Cross Loading Value

Code	Store Atmosphere	Word of Mouth	Purchase Decision
SA1.1	0.804	0.563	0.578
SA1.2	0.835	0.687	0.679
SA1.3	0.733	0.518	0.541
SA2.1	0.840	0.706	0.696
SA2.2	0.745	0.605	0.651
SA2.3	0.761	0.671	0.657
SA3.1	0.863	0.753	0.712
SA3.2	0.807	0.756	0.756
SA3.3	0.842	0.752	0.718
WOM1.1	0.594	0.718	0.599
WOM1.2	0.606	0.705	0.616
WOM1.3	0.657	0.784	0.753
WOM2.1	0.716	0.845	0.765
WOM2.2	0.656	0.793	0.686
WOM2.3	0.582	0.766	0.650
WOM3.1	0.674	0.774	0.718
WOM3.3	0.639	0.729	0.658
WOM3.3	0.634	0.759	0.725
KP1.1	0.677	0.692	0.803
KP1.2	0.711	0.743	0.807
KP1.3	0.606	0.601	0.713
KP2.1	0.672	0.736	0.824
KP2.2	0.669	0.784	0.813
KP2.3	0.638	0.684	0.751
KP3.1	0.599	0.717	0.777
KP3.2	0.663	0.743	0.813
KP3.3	0.624	0.641	0.757
KP4.1	0.612	0.673	0.743
KP4.2	0.635	0.690	0.780
KP4.3	0.660	0.667	0.737

Source: Primary data, 2025

Based on table 7, it can be concluded that the indicators in a latent variable have differences with indicators in other variables, indicated by a higher cross loading value than the construct itself.

4.3.3 Composite Reliability

Table8 . Composite Reliability Value

Variable	Cronbach`s alpha	Composite Reliability
Store Atmosphere	0.940	0.948
Word of Mouth	0.911	0.943
Purchase Decision	0.940	0.927

Source: Primary data, 2025

The composite reliability value is declared reliable if the value is> 0.6. The composite reliability value of the store atmosphere, word of mouth and purchasing decision variables is> 0.6, so it can be stated that all variables in this study are reliable.

4.4 Structural-Partial Least Square (inner model)

4.4.1 R-Square

Table9 . R-Square Value

Endogenous Variable	R-square
Purchase Decision	0.831

Source: Primary data, 2025

The resulting R-square value in the purchasing decision variable is 0.831 or 83.1%. This shows that the store atmosphere and word of mouth variables can explain the construct of purchasing decisions by 83.1% and the remaining 16.9% is explained by other variables that are not included in this research variable. So that based on the results of the R^2 calculation, it shows that R^2 is included in the strong category.

4.4.2 Path Coefficient

This coefficient value is in the range 0 to 1 to indicate a positive relationship between constructs or variables, and between -1 to 0 to indicate a negative relationship.

Table10 . Path Coefficient Value

Endogenous Variable	Purchase Decision	Relationship
Store Atmosphere	0.265	Positive
Word of Mouth	0.678	Positive

Source: Primary data, 2025

The store atmosphere variable has a coefficient value of 0.265, indicating a positive relationship to the purchasing decision variable. This shows that the store atmosphere can provide a positive relationship in encouraging consumer purchasing decisions. Meanwhile, the word of mouth variable has a coefficient value of 0.678, indicating a positive relationship to purchasing decisions.

4.4.3 F-Square

The f-square value of 0.02, 0.05 and 0.35 can be interpreted whether the latent variable has a small, medium or large effect at the structural level.

Table11 . F-Square Value

F-Square	Purchase Decision
Store Atmosphere	0.124
Word Of Mouth	0.808

Source: Primary data, 2025

The results of the f-square value show that the store atmosphere variable has a moderate influence on purchasing decisions, with a value of 0.124. In contrast, the word of mouth variable shows a strong influence, characterized by an f-square value of 0.808. This indicates that word of mouth has a much more dominant contribution in influencing consumer purchasing decisions than store atmosphere.

4.4.4 Boostrapping

Furthermore, boostrapping analysis is carried out to measure the effect of exogenous variables on endogenous variables by paying attention to the t-statistic value on each relationship path.

Table12 . Boostrapping Value

Effect of	Original Sample	t-statistic	p-value	Effect of
Store Atmosphere on Purchasing Decision	0.265	3.087	0.002	Significant
Word of Mouth on Purchasing Decision	0.678	7.926	0.000	Significant

Source: Primary data, 2025

The boostripping test results show that store atmosphere has a positive effect on purchasing decisions, with an original sample value of 0.265, a t-statistic value of 3.087, and a p-value of 0.002. These results indicate a significant influence. Meanwhile, the word of mouth variable shows a stronger influence on purchasing decisions, with an original sample value of 0.678, a t-statistic of 7.926, and a p-value of 0.000, which also indicates a significant influence.

4.4.5 Predictive Relevance (Q-Square)

If the Q^2 value is greater than 0.35, the model is considered to have good predictive relevance. Conversely, if the Q^2 value is less than 0, the model is considered to have insufficient predictive relevance.

Table13 . Q-Square Values

Q-Square Value	Description	Q-Square Value Purchase Decision Variable
0.02 to <0.15	Weak	

0.15 to <0.35	Medium	
➢ **0,35**	**Large**	**0,705**

Source: Primary data, 2025

The Q-square value of the purchasing decision variable is 0.705 and is classified as large. This shows that the model has a large predictive power of purchasing decisions. This means that the model in this study has good predictive quality and is able to explain the dependent variable strongly.

4.4.6 Model Fit

In this study, an NFI value of 0.734 was obtained, which indicates that the level of model fit reached 73.4%.

	Saturated model	**Estimated model**
SRMR	0.063	0.063
d_ULS	1.827	1.827
d_G	1.600	1.600
Chi-Square	730.361	730.361
NFI	0.734	0.734

Source: Primary data, 2025

4.5 Hypothesis Test Results

Based on the data processing carried out in the outer model and inner model, this research then conducts hypothesis testing. Hypothesis testing is done by processing data through the boostrapping method in the SmartPLS 4.0 application.

Table14 . Direct Effect Calculation Results

No	**Direct Effect**	**T-statistic**	**P-value**
1.	Store Atmosphere Purchase Decision	3.023	0.002
2.	Word of Mouth Purchase Decision	7,643	0.000

Source: Primary data, 2025

The results of the direct effect calculation show that the influence of the store atmosphere variable on purchasing decisions is significant, because the t-statistic value is 3.023> 1.96. This means that the store atmosphere variable affects consumer purchasing decisions at Coger Kujang Coffee & Resto Bogor. Meanwhile, the word of mouth variable has a significant effect on purchasing decisions, indicated by the t-statistic value of 7.643> 1.96. This means that word of mouth has a significant influence on purchasing decisions at Coger Kujang Coffee & Resto.

Table15 . Hypothesis Test Results

No	**Hypothesis**	**Analysis**	**Decision**

1	There is a significant influence between store atmosphere on purchasing decisions.	The results of the path coefficient analysis store atmosphere has a positive relationship with purchasing decisions with a value of 0.225 and is significant with a t-statistic value of 3.087> 1.96.	Accepted
2	There is a significant influence between word of mouth on purchasing decisions.	The results of the path coefficient analysis word of mouth has a positive relationship with purchasing decisions with a value of 0.678, and has been significant with a t-statistic value of 7.692> 1.96.	Accepted

Source: Primary data, 2025

The t-statistic value of the store atmosphere variable is 3.087 and word of mouth with a t-statistic value of 7.926, both of these variables have a value exceeding the t-table of 1.96. then both hypotheses can be accepted.

4.6 Discussion and Interpretation of Results

4.6.1 The effect of store atmosphere on purchasing decisions

Based on the results of descriptive analysis, it shows that the store atmosphere variable is a factor considered good, this is in accordance with the responses of respondents who on average agree. This indicates that although the respondents considered the overall atmosphere of the place to be good, there is still room for improvement in the aspects of room temperature comfort and room layout that support consumer activities such as working or relaxing. The results of the SEM-PLS analysis of the path coefficient value resulted in a positive relationship of 0.265 with a value range of 0-1, while the boostrapping results obtained store atmosphere has a significant influence on purchasing decisions with a t-statistic value of 3.087 greater than the t-table of 1.96 and a P-value of 0.002 <0.05, so the hypothesis is accepted, with an original sample value of 0.265, this means that purchasing decisions increase if the store atmosphere increases by one unit. This means that the store atmosphere has a direct effect on purchasing decisions.

4.6.2 The effect of word of mouth on purchasing decisions

Based on the results of descriptive analysis, it shows that word of mouth is a factor that is considered good and approved by respondents in increasing consumer confidence in Coger Kujang Coffee & Resto Bogor. This means that even though the consumer experience is good, not all consumers actively suggest or talk about this place, so it can be a potential that can be optimized through word of mouth communication strategies. The results of the SEM-PLS analysis of the path coefficient value resulted in a positive relationship of 0.678 with a value

range of 0-1 while the boostrapping results obtained word of mouth has a significant influence on purchasing decisions with a t-statistic value of 7.643 greater than the t-table of 1.96 and a P-value of 0.000 <0.05, the hypothesis is accepted, with an original sample value of 0.678, this means that purchasing decisions increase if word of mouth simultaneously influences purchasing decisions. This shows that the word of mouth variable can influence purchasing decisions directly and indirectly.

5. Conclusion

1. Store atmosphere is proven to have a significant influence on purchasing decisions. This is supported by the t- statistic value of 3.023 which is higher than the t-table value of 1.96, as well as a p-value of 0.002 which is smaller than 0.05. Based on these results, it can be concluded that store atmosphere directly influences consumer purchasing decisions at Coger Kujang Coffee & Resto Bogor.
2. Word of mouth also shows a significant influence on purchasing decisions. The t-statistic value obtained of 7.643 exceeds the t-table of 1.96, and the p-value of 0.000 is smaller than 0.05. Thus, it can be concluded that word of mouth plays a direct role in influencing consumer purchasing decisions at Coger Kujang Coffee & Resto Bogor. This indicates that the higher the intensity of word of mouth communication, the more likely consumers are to make a purchase. Conversely, low word of mouth tends to directly reduce purchasing decisions.

MITIGATING AGENCY CONFLICTS THROUGH ESG: A STUDY ON PROFITABILITY AND TAX AVOIDANCE BEHAVIOR IN CORPORATIONS

Abstract

This study examines the effect of profitability on corporate tax avoidance. It investigates the moderating role of Environmental, Social, and Governance (ESG) performance in this relationship, grounded in the framework of agency theory. Using a sample of 224 firm-year observations from manufacturing companies listed on the Indonesia Stock Exchange (IDX) during the period 2020–2023, the analysis applies panel data regression with a random effects model, as determined by the Hausman test. The results indicate that profitability has a statistically significant positive effect on tax avoidance, suggesting that more profitable firms tend to employ tax minimization strategies. However, ESG performance is found to significantly moderate this relationship, reducing the impact of profitability on tax avoidance. These findings highlight the role of ESG as a soft governance mechanism that can mitigate agency-driven behaviors by enhancing transparency and ethical compliance. The study provides important implications for corporate decision-makers and regulators in emerging markets, emphasizing the strategic value of ESG integration to promote responsible financial practices.

Keywords: *Tax Avoidance; Profitability; ESG Performance; Agency Theory; Corporate Governance; Emerging Markets; Panel Data*

1. Introduction

In recent years, the increasing scrutiny of corporate ethical conduct has intensified academic interest in the intersection of profitability, tax avoidance, and Environmental, Social, and Governance (ESG) practices. Tax avoidance, while often legal, presents a classic dilemma within agency theory, where the misalignment between managers (agents) and shareholders (principals) may incentivize opportunistic behavior aimed at short-term gains through aggressive tax strategies ((Ajmal et al., 2025); (Adegbite & Bojuwon, 2019)).

Highly profitable firms are particularly exposed to such behavior due to the greater flexibility in managing discretionary financial policies, including tax planning (Armstrong et al., 2015a). This dynamic creates tension between profit maximization and ethical financial stewardship, often exacerbated by opaque corporate governance mechanisms. Recent empirical evidence supports the notion that profitability positively correlates with tax avoidance intensity, particularly in environments with weak institutional monitoring ((Permatasari et al., 2024); (Handayani & Ibrani, 2019)).

Against this backdrop, ESG performance has emerged as a pivotal moderating factor that could potentially mitigate these agency-driven tendencies. ESG disclosures are not merely corporate signaling mechanisms; they represent embedded organizational values and governance structures that can restrict managerial latitude in exploiting tax strategies for personal or short-term gain ((Addison & Mueller, 2015); (Khuong et al., 2020)). Firms with robust ESG practices

are found to demonstrate greater transparency and accountability, leading to reduced information asymmetry and enhanced trust among stakeholders ((Elgharbawy & Aladwey, 2025); (Karbala, 2023)).

Several studies support the premise that strong ESG engagement is associated with lower levels of tax aggressiveness ((Friede et al., 2015); (Mayangsari et al., 2024)). ESG acts as a constraint on agency costs, redirecting management behavior towards long-term sustainable goals. This is especially critical in emerging economies, where regulatory environments are often fragmented and susceptible to opportunistic corporate practices ((Yoon et al., 2021); (Tawfiq et al., 2024)).

However, the literature on how ESG moderates the relationship between profitability and tax avoidance remains limited, especially in emerging markets and within specific sectors such as manufacturing, where environmental and labor compliance pressures are intense. This study, therefore, investigates whether ESG practices attenuate the link between profitability and tax avoidance, providing insights from an emerging economy context and grounding its framework in agency theory.

2. Literature Review

Agency theory provides a foundational lens for understanding the behavior of managers in corporate decision-making, particularly regarding tax avoidance. Within this framework, tax avoidance is often viewed as a manifestation of agency conflict, where managers exploit informational asymmetry and prioritize their interests over those of shareholders. (Armstrong et al., 2015a) argue that tax minimization strategies can serve as tools for managerial opportunism, especially when internal governance mechanisms are weak. Empirical findings support this claim, suggesting that firms with higher agency costs are more prone to aggressive tax planning (Armstrong et al., 2015). Profitability plays a dual role in this context. On one hand, it equips firms with greater resources to engage in sophisticated tax avoidance schemes; on the other, it may increase scrutiny from regulators and stakeholders. Studies by Permatasari et al., (2024) and Paramita & Andika, (2021) show that more profitable Indonesian firms tend to exhibit higher levels of tax avoidance, reinforcing the notion that financial strength can facilitate opportunistic behavior in the absence of strong governance structures.

In recent years, Environmental, Social, and Governance (ESG) practices have gained prominence as potential mitigators of agency-related issues. ESG not only reflects a firm's commitment to ethical and sustainable operations but also functions as a soft governance mechanism that can constrain managerial discretion. Prior research has found a negative association between ESG performance and tax aggressiveness, suggesting that firms committed to ESG are less likely to engage in opaque tax practices ((Lanis & Richardson, 2015); (Friede et al., 2015)). This aligns with findings by (Fadhila & Handayani, 2019), who reported that ESG disclosures reduce tax avoidance behavior in Indonesian firms. Khan et al., (2022) further explain that ESG enhances transparency and builds trust among stakeholders, thus increasing the reputational and ethical costs of tax avoidance. From the agency theory perspective, ESG initiatives improve monitoring, reduce information asymmetry, and align managerial decisions with long-term shareholder value (Vincenzo, 2023). However, despite these insights, there remains limited empirical evidence on the moderating role of ESG in the relationship between profitability and tax avoidance, particularly in emerging markets. Existing studies tend to examine these variables in isolation, with few addressing how ESG can potentially weaken the link between firm profitability and aggressive tax behavior. Therefore, this study aims to fill this gap by empirically testing the moderating effect of ESG practices on the relationship between profitability and tax avoidance, drawing evidence from the manufacturing sector in an emerging economy.

The Effect of Profitability on Tax Avoidance

Agency theory posits that conflicts of interest arise when management (agents) pursues actions that may not align with the interests of shareholders (principals). In the context of tax avoidance, this conflict becomes evident when managers exploit their control over financial reporting and tax planning to reduce tax obligations, not necessarily to maximize long-term firm value, but often to boost short-term performance indicators, secure bonuses, or divert attention from inefficient management. Profitability enhances the agency problem because more profitable firms generate higher taxable income, which increases both the incentive and the ability to engage in aggressive tax strategies (Armstrong et al., 2015b). When governance mechanisms are weak, management may channel the firm's financial strength into complex avoidance schemes that are difficult to detect and monitor.

From this perspective, profitability is not merely an enabler of tax avoidance through access to resources but also a signal of potential managerial discretion over tax decisions. Highly profitable firms often face external expectations to maintain or exceed performance benchmarks, creating pressure on managers to minimize tax liabilities and artificially inflate after-tax profits. These practices may include income shifting, strategic use of tax havens, or exploiting loopholes, actions that can be masked within larger profit margins. Without effective oversight mechanisms, such as board independence or ethical frameworks, profitability can thus amplify agency costs, manifesting in greater tax avoidance behavior. Therefore, understanding the link between profitability and tax avoidance through the lens of agency theory is crucial to uncovering the behavioral motivations behind corporate tax planning decisions.

H1: Profitability has a positive effect on tax avoidance, indicating that more profitable firms are more likely to engage in tax avoidance behavior due to agency conflicts.

The Moderating Role of ESG in the Relationship Between Profitability and Tax Avoidance

While agency theory suggests that higher profitability increases the opportunity for tax avoidance due to greater managerial discretion and weaker oversight, the presence of robust Environmental, Social, and Governance (ESG) practices may alter this dynamic. ESG serves as a non-financial governance mechanism that enhances transparency, ethical behavior, and long-term stakeholder alignment. Firms with strong ESG frameworks are typically subject to greater external scrutiny from investors, regulators, and the public, making it more difficult for managers to engage in opportunistic tax practices without reputational consequences. As such, ESG can constrain the agency-driven link between profitability and tax avoidance by promoting accountability and discouraging excessive risk-taking in tax planning.

Empirical studies support the idea that ESG engagement is associated with reduced levels of corporate tax aggressiveness ((Lanis & Richardson, 2015); (Islam et al., 2025)). In firms with high profitability, ESG may function as a moderating force that weakens the positive relationship between profitability and tax avoidance. Managers in ESG-committed firms are more likely to adopt socially responsible financial practices, including ethical tax compliance, to maintain alignment with sustainability goals and public expectations. Thus, while profitability may still enable tax avoidance through resource availability, the effect is likely to be mitigated when ESG performance is high, as ESG principles impose reputational and ethical boundaries that deter aggressive tax behavior.

H2: ESG performance moderates the relationship between profitability and tax avoidance, such that the positive effect of profitability on tax avoidance is weaker in firms with high ESG performance.

3. Methodology

Research Design

This study employs a quantitative explanatory research design using secondary data from publicly listed companies. The objective is to examine the effect of profitability on tax avoidance, with ESG performance as a moderating variable, under the lens of agency theory. The approach is deductive, using panel regression analysis to test the hypothesized relationships across multiple years and firms.

Population and Sample

The population of this study comprises non-financial corporations listed on the Indonesia Stock Exchange (IDX), with a particular focus on the manufacturing sector, considering its relatively high environmental impact and regulatory sensitivity. The sample is selected using purposive sampling based on the following criteria:

- Companies that published complete annual reports and ESG disclosures between 2020 and 2023
- Availability of key data: profitability (ROA), tax payments, and ESG indicators
- Exclusion of financial firms due to different tax regulations and capital structures

The final sample is expected to consist of 224 observations.

Variable Operationalization

Table 1. Variable Operationalization

Variable	Indicator	Measurement
Tax Avoidance	Effective Tax Rate (ETR)	ETR = Tax Expense / Pre-Tax Income
Profitability	Return on Assets (ROA) or Return on Equity (ROE)	ROA = Net Income / Total Assets
ESG Performance	Composite ESG Score or Dummy (1 = ESG Disclosed, 0 = Not Disclosed)	ESG disclosure index based on GRI items or third-party rating sources

Note: A lower ETR indicates higher tax avoidance.

Model Specification and Data Analysis

The following moderated regression model will be used to test the hypotheses:

Model 1: Direct Effect

$$TA_{it}=\beta 0+\beta 1PROF_{it}+\varepsilon it$$

Model 2: Moderation with ESG

$$TA_{it}=\beta 0+\beta 1PROF_{it}+\beta 2ESG_{it}+\beta 3(PROF_{it}\times ESG_{it})+\varepsilon it$$

Where:

- TA = Tax Avoidance (proxied by ETR)
- PROF = Profitability
- ESG = ESG performance
- PROF×ESG = Interaction term for moderation
- ϵ = Error term

The data will be analyzed using panel data regression (Fixed Effect or Random Effect based on the Hausman Test), and tested for multicollinearity, heteroskedasticity, and autocorrelation to ensure model validity. Statistical analysis will be conducted using EVIEWS.

4. Results and Discussion

Results

Descriptive Statistics

Based on the results of the sample selection for this study, the following descriptive statistics are presented:

Table 2. Descriptive Statistics

	Tax Avoidance	Profitability	ESG
Mean	0.227517	0.091755	0.571429
Median	0.220509	0.072367	1.000000
Maximum	0.806903	0.363620	1.000000
Minimum	0.000000	0.001254	0.000000
Std. Dev.	0.080306	0.073976	0.495980
Observations	224	224	224

Source: Data Processed, 2025

Table 2 presents the descriptive statistics for the three main variables used in this study: tax avoidance, profitability, and ESG performance, based on 224 firm-year observations. The mean value of tax avoidance is 0.2275, with a median of 0.2205, suggesting that, on average, firms pay approximately 22.75% of their pre-tax income in taxes. The values range from 0.0000 (indicating total tax avoidance) to 0.8069, showing significant variation across the sample. The standard deviation of 0.0803 indicates a moderate level of dispersion, reflecting differences in corporate tax planning behavior. The closeness of the mean and median implies a relatively symmetrical distribution, though some firms may be engaging in more aggressive tax strategies than others.

Profitability, measured by return on assets (ROA), has a mean of 0.0918 and a median of 0.0724, indicating that firms in the sample generate an average return of about 9.18% on their assets, with most firms earning slightly below this level. The minimum profitability value is 0.0013, while the maximum reaches 0.3636, showing that some firms achieve considerably higher profitability than others. The standard deviation of 0.0740 reveals that profitability varies substantially across the sample. This variation may be attributed to differences in operational efficiency, industry sub-sectors within manufacturing, or firm-specific factors such as size and leverage.

Regarding ESG performance, the average value is 0.5714, indicating that approximately 57% of the observed firms disclose ESG-related activities. The median value of 1.0000 implies that more than half of the companies in the sample engage in ESG reporting, although a substantial portion (minimum = 0.0000) does not. The standard deviation of 0.4960 reflects a near-even split between ESG-adopting and non-adopting firms, which is consistent with the binary nature of this variable in many emerging market contexts. Overall, these descriptive statistics highlight considerable variability across all key variables, justifying further examination into how profitability and ESG relate to corporate tax avoidance behavior.

Data Panel Testing

This research employs panel data regression. Therefore, it is necessary to select the appropriate panel data model by conducting the following tests using Eviews 13 software.

Hausman Test

Table 3. Hausman Test
Model with Moderation

Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Cross-section random	1.805394	1	0.1791

Source: Data Processed, 2025

The Hausman test results presented in Table 3 are used to determine the appropriate panel data estimation model between fixed effects and random effects in the moderated regression analysis. The Chi-square statistic is 1.8054 with 1 degree of freedom and a p-value of 0.1791. Since the p-value exceeds the 0.05 significance level, the null hypothesis cannot be rejected, indicating that the random effects model is more appropriate than the fixed effects model for this study. This suggests that unobserved heterogeneity across firms is not significantly correlated with the independent variables, and thus, the random effects approach is preferred for estimating the moderating effect of ESG on the relationship between profitability and tax avoidance.

The Effect of Profitability on Tax Avoidance

Table 4. Panel Least Squares

Variable	Coefficient	Std Error	t-Statistics	Prob.
C	0.241569	0.010371	23.29230	0.0000
X1	0.153133	0.086877	1.762654	0.0093

Source: Proceed Data, 2025

Table 4 presents the results of the panel least squares regression examining the effect of profitability (X1) on tax avoidance. The coefficient for profitability is 0.1531 with a p-value of 0.0093, which is below the 0.05 significance threshold, indicating that profitability has a positive and statistically significant effect on tax avoidance. This means that as firms become more profitable, they are more likely to engage in tax avoidance strategies, consistent with agency theory, which suggests that higher profitability gives managers greater discretion to pursue opportunistic financial practices. Therefore, the first hypothesis (H1), which states that *profitability has a positive effect on tax avoidance*, is accepted based on the empirical evidence.

ESG Moderates the Effect of Profitability on Tax Avoidance

Table 5
Panel Least Squares 1

Variable	Coefficient	Std Error	t-Statistics	Prob.
C	0.254723	0.013320	19.12265	0.0000
X1	-0.166982	0.086550	-1.929315	0.0450
Z	-0.020797	0.013335	-1.559557	0.0203

Source: Proceed Data, 2025

Table 6

Panel Least Squares 2

Variable	Coefficient	Std Error	t-Statistics	Prob.
C	0.270001	0.016922	15.95541	0.0000
X1	-0.317633	0.135600	-2.342426	0.0201
Z	-0.044655	0.021110	-2.115358	0.0355
X1Z	0.252180	0.174575	1.444535	0.0500

Source: Proceed Data, 2025

Based on the regression results in Table 5, the independent variable profitability (X1) shows a negative and statistically significant effect on tax avoidance, with a coefficient of -0.16698 and a p-value of 0.0450, which is below the 0.05 threshold. This result is somewhat contrary to the initial expectation under agency theory, suggesting that in the presence of ESG performance (Z), the direct relationship between profitability and tax avoidance becomes negative. Additionally, the ESG variable itself also has a negative and significant coefficient (-0.0208, p = 0.0203), implying that ESG performance alone reduces the tendency of firms to avoid taxes. These findings support the notion that ESG acts as a governance mechanism that discourages aggressive tax practices and aligns firm behavior with stakeholder expectations for transparency and ethical conduct.

In Table 6, the regression model includes an interaction term (X1Z) to test the moderating effect of ESG on the relationship between profitability and tax avoidance. The coefficient for the interaction term is +0.2522 with a p-value of 0.0500, indicating a statistically significant moderation at the 5% level. This positive coefficient suggests that although profitability alone has a negative association with tax avoidance in this model, the presence of ESG moderates this relationship, reducing the negative effect, or even reversing it as ESG scores increase. In essence, ESG acts as a moderator that reshapes how profitability influences tax behavior, possibly by limiting managerial discretion or increasing public and investor scrutiny. Therefore, the second hypothesis (H2), which states that *ESG performance moderates the relationship between profitability and tax avoidance*, is accepted.

Discussion

The Effect of Profitability on Tax Avoidance

The results of this study indicate that profitability has a statistically significant effect on tax avoidance, as evidenced by the positive regression coefficient and p-value below the 5% threshold. This finding is consistent with the core principles of agency theory, which posits that managers of highly profitable firms may have greater discretion and incentives to engage in aggressive tax planning to maximize reported after-tax income, potentially at the expense of shareholder interests. When firms generate higher profits, they often possess greater resources and flexibility to exploit tax loopholes, utilize tax havens, or defer income, especially in the absence of effective oversight mechanisms. This outcome aligns with prior research by (Armstrong et al., 2015a) and (Richardson et al., 2015), who observed that profitability enables tax avoidance by increasing both opportunity and pressure to minimize tax liabilities.

Moreover, the result strengthens the view that profitability alone may not necessarily reflect responsible financial conduct, especially in environments where internal controls are weak or where managerial incentives are closely tied to short-term performance metrics. In line with studies conducted in emerging markets (Permatasari et al., 2024), this study reinforces the idea that without adequate governance constraints, profitability can act as a driver of opportunistic tax behavior. However, the findings also raise questions about the broader ethical and reputational implications of tax avoidance in profitable firms, which may appear financially

healthy while eroding public trust through aggressive tax strategies. These insights highlight the importance of incorporating non-financial governance mechanisms, such as ESG, to curb the adverse impacts of agency problems that are magnified by increased profitability.

ESG Moderates the Effect of Profitability on Tax Avoidance

The findings from the regression analysis demonstrate that ESG performance significantly moderates the relationship between profitability and tax avoidance, as indicated by the positive and significant coefficient of the interaction term (profitability × ESG). This suggests that while profitability alone may enable or even reduce tax avoidance depending on the context, the presence of ESG alters this relationship. In particular, when ESG engagement is high, the potential for agency-driven tax avoidance behavior among profitable firms is constrained. ESG operates as a governance-enhancing mechanism that increases transparency, encourages ethical corporate behavior, and subjects managerial decisions to greater stakeholder scrutiny. This is consistent with prior studies by Lanis & Richardson (2015), Alomair & Metwally (2025), and Handayani (2020), which highlights ESG's role in discouraging aggressive tax practices by improving corporate accountability and reputation management.

The moderating effect of ESG also aligns with agency theory, which emphasizes the role of oversight in mitigating managerial opportunism. In this study, ESG appears to function as a form of soft governance, limiting the discretionary power of managers in high-profit firms to engage in tax avoidance. This is especially relevant in emerging markets, where traditional regulatory enforcement may be less robust, and ESG initiatives provide an alternative pathway for aligning corporate behavior with stakeholder expectations. The interaction effect underscores that ESG is not only a corporate responsibility tool but also a strategic moderating variable that reshapes how financial indicators like profitability translate into behavioral outcomes such as tax avoidance. These results emphasize the need for firms especially those with high profitability, to institutionalize ESG practices not just for compliance, but as a long-term strategy to reduce agency conflicts and enhance ethical financial conduct.

5. Conclusion

Based on the results of this study, it can be concluded that profitability has a significant effect on tax avoidance, supporting the agency theory notion that more profitable firms possess greater discretion and incentive to engage in tax planning strategies. However, the findings also reveal that ESG performance plays a critical moderating role, weakening the positive influence of profitability on tax avoidance. This suggests that firms with stronger ESG commitments are less likely to exploit their profitability for opportunistic tax behavior, as ESG acts as a governance mechanism that promotes transparency, ethical conduct, and accountability. These results highlight the importance of integrating ESG principles into corporate strategy, not only to meet stakeholder expectations but also to mitigate agency conflicts and enhance the integrity of financial practices, particularly in emerging market contexts where regulatory enforcement may be limited.

Abstract

This study aims to examine the influence of income, financial literacy, and financial attitude on financial freedom, with hedonistic lifestyle as a moderating variable. a quantitative approach with an explanatory research design was employed. The sample consisted of 106 productive-age individuals (25–55 years) residing in urban areas of Indonesia, selected using purposive sampling. Data were analyzed using Structural Equation Modeling-Partial Least Squares (SEM-PLS). The results indicate that income, financial literacy, and financial attitude significantly affect financial freedom. Furthermore, hedonistic lifestyle negatively moderates the relationship between income and financial attitude with financial freedom, but does not moderate the effect of financial literacy. These findings underscore the importance of lifestyle control in achieving financial independence.

Keywords: *financial freedom, income, financial literacy, financial attitude, hedonistic lifestyle.*

1. INTRODUCTION

Financial freedom, often referred to as financial independence, is the dream of many people. It is not merely about having a large amount of money, but rather about having the freedom to live according to our own choices without being constrained by financial pressures. Imagine being able to spend time with loved ones, pursue your passions, or even travel without worrying about bills that need to be paid or a monthly salary that arrives late. This is what makes financial freedom such a highly desired life goal for many.

However, achieving financial freedom is not easy. Many factors influence whether someone can attain it, starting from how we earn income and whether that income is sufficient, excessive, or even insufficient to meet daily needs; financial literacy to manage money effectively; and the attitude to make wise financial decisions, as well as the financial habits we build from an early age. In fact, many of us struggle to find a balance between meeting daily living expenses and investing for the future.

Based on research findings, nearly half of Indonesia's population (46%) is classified as financially vulnerable. According to tSurvey.id cited in Nada naurah (2025), 46% of respondents admitted feeling uncertain about their ability to handle emergency situations

requiring expenses of at least IDR 10 million. On the other hand, 62% of respondents demonstrated a high level of financial capability, indicating that this proportion of individuals falls into the category of Financial Freedom. Financial capability refers to a person's ability to manage and grow their financial resources, assessed by their confidence in their future financial capacity.

Referring to the findings from tSurvey.id in Nada naurah (2025), these differing conditions are likely influenced by variations in the availability of initial financial resources across economic groups. Generally, middle- to upper-class individuals have greater awareness of the potential risks involved in managing large sums of money, leading them to exercise more caution in financial decision-making.

Several previous studies have identified income, financial literacy, and financial attitude as factors predicted to influence financial freedom. "Income is a fundamental factor that determines an individual's ability to save, invest, and build assets to achieve financial freedom" (Lusardi & Mitchell, 2017). Meanwhile, "financial literacy relates to an individual's understanding and ability to manage finances effectively" (Huston, 2010), supported by research from Wahyuni et.al (2024), which states that "individuals with good financial understanding accompanied by proper financial management behaviors tend to have higher levels of financial well-being." Financial attitude reflects an individual's psychological orientation toward money management, which can influence financial behavior and decision-making (Ajzen, 2011). This is further supported by Agus Dwi Cahya, et.al (2021), who explain that "financial attitude is the evaluation, insight, or thought process regarding finance applied to one's attitudes. The more positive the attitude toward management, supported by extensive financial knowledge, the more effective practices can be implemented."

On the other hand, a hedonistic lifestyle—characterized by a tendency toward consumption and short-term pleasure orientation—has the potential to hinder the attainment of financial freedom (O'Loughlin & Szmigin 2009). In modern society, increases in income do not always correspond to improvements in financial well-being due to the phenomenon of lifestyle inflation, where expenditures rise alongside income growth.

Various previous studies have examined the relationship between income, financial literacy, and financial attitude on financial well-being. However, a gap remains in the literature regarding how a hedonistic lifestyle moderates the relationship between these factors and financial freedom. This study aims to fill that gap by analyzing the moderating role of

hedonistic lifestyle in the relationship between income, financial literacy, financial attitude, and financial freedom.

The Theory of Planned Behavior, according to Ajzen (1991) as cited in Novia Regita Cahyani (2022), is "a theory related to individual attitudes." A person's behavior and attitude are generally influenced by intentions and specific goals they aim to achieve, which can serve as indicators of changes in individual behavior. Intention is considered a key factor in predicting an action. The Theory of Planned Behavior combines several important concepts from social science and behavioral psychology. This theory explains how to understand and predict individual behavior in certain situations. Within this theoretical framework, there are three main components that influence a person's behavior: attitude toward the behavior, subjective norm, and perceived behavioral control (Ajzen, 2005, as cited in Novia Regita Cahyani (2022).

Furthermore, according to Ajzen (2005) Novia Regita Cahyani (2022), background factors can also influence a person's behavior, including: "personal factors such as personality, attitudes, life values, intelligence, and emotions; social factors such as age, gender, ethnicity, religion, income, and education; and informational factors such as knowledge, skills, and media exposure." Thus, the Theory of Planned Behavior is used as the theoretical basis to explain how income, financial literacy, financial attitude, and hedonistic lifestyle relate to behavior.

Financial freedom can be defined as being financially independent (Rahman, M.A., 2022). In terms, it refers to when a person has broad control over their finances." When in a state of financial freedom, it becomes possible to work freely or earn additional income through passive income, which is money earned without actively working.

Income is defined as "the amount of money obtained from business activities and individual performance" (Muntahanah, S., Cahyo, H., Setiawan, H., & Rahmah 2021). Asih S & Khafid M (2020) show that a person's income enables them to meet their needs and desires. This means that individuals with higher income find it easier to fulfill their needs and even desires, while those with lower income may struggle to meet their needs and responsibilities.

Financial literacy is "the knowledge, skills, and confidence that influence attitudes and behaviors to improve the quality of decision-making and financial management to achieve financial well-being" (OJK 2024, as cited in Angguliyah Rizqi Amaliyah, et,al 2025).

"Financial attitude is the psychological orientation of a person toward financial matters, reflected in beliefs, values, and preferences related to money management" (Icek Ajzen 2011).

Financial attitude affects how individuals perceive and handle money, which in turn impacts their financial behavior.

Sudiantara (2003), as cited in Refianti & Intan Zoraya (2024), states that "hedonism is a doctrine or school of thought that considers pleasure or enjoyment as the highest good for humans." A hedonistic lifestyle is "a way of living that pursues pleasure as something to be chased and made a life goal" (Mahmudah & Retnosari, 2021, as cited in Refianti & Intan Zoraya, 2024).

H6 = The effect of Financial Attitude on Financial Freedom mediated by Hedonistic Lifestyle

2. RESEARCH METHOD

This study employs a quantitative approach with an explanatory research design. Explanatory research aims to explain causal relationships among research variables through

hypothesis testing (Sekaran U & Bougie R 2016). This approach was chosen because the study intends to analyze the influence of income, financial literacy, and financial attitude on financial freedom, with hedonistic lifestyle as a moderating variable.

The population in this study consists of productive-age individuals (25–55 years) residing in urban areas of Indonesia. This age group was selected based on the consideration that individuals within this range generally have income and financial decision-making independence. The sampling technique used purposive sampling, resulting in a total sample of 106 respondents. The data were analyzed using SEM-PLS software.

3. RESULT AND DISCUSSION

The Effect of Income on Financial Freedom

Based on the research results, the P-value is 0.029, which is less than the significance level of 0.05, indicating that income has a positive effect on financial freedom. This finding reinforces that income is a crucial factor in achieving financial freedom. Income is defined as "the amount of money earned from business activities and individual performance" (Muntahanah, S., Cahyo, H., Setiawan, H., & Rahmah 2021). Asih S & Khafid M (2020) show that income enables individuals to meet their needs and desires. In other words, higher income makes it easier for someone to fulfill their needs and even desires, whereas lower income leads to difficulties in meeting needs and responsibilities.

Adequate income plays a vital role as the foundation for achieving financial freedom. With sufficient earnings, individuals can not only cover basic needs but also have opportunities to save, invest, avoid unnecessary debt, and prepare for emergencies. Consistent income also contributes to improved quality of life, including mental health, by providing a sense of security against financial risks. Through careful financial management, income can serve as a solid basis for achieving sustainable financial stability and well-being.

Income can come from active sources (direct work) or passive sources (investments or other businesses) and represents the financial resources received by individuals or families over a certain period as compensation for goods or services provided. Income is essential in building economic stability. Indicators of financial freedom include the availability of liquid funds, sufficient savings, efficient asset management, protection against inflation, optimal tax management, household expenditures aligned with financial capacity, and prudent credit risk

control. A person can be considered financially free if their income exceeds total expenditures, enabling overall financial improvement (Astuti & Kharisma, 2024, as cited in Wahyuni, et. al 2024).

The Effect of Financial Literacy on Financial Freedom

The research results show a P-value of 0.000, which is less than 0.05, indicating that financial literacy positively affects financial freedom. Financial literacy is defined as "knowledge, skills, and confidence that influence attitudes and behaviors to improve the quality of decision-making and financial management to achieve financial well-being" (OJK 2024, as cited in Angguliyah Rizqi Amaliyah, et. al, 2025). However, a high level of financial literacy does not automatically guarantee financial freedom, especially if financial management skills are lacking. Even if someone understands financial concepts deeply, without effective management skills, they remain at risk of financial problems. Conversely, good financial management skills enable individuals to avoid financial obstacles that could disrupt economic stability. According to Radiman et al. (2022) in Wahyuni et. al (2024), "individuals with good financial understanding accompanied by proper financial management behaviors tend to have higher levels of financial well-being." Therefore, financial literacy must play a role in shaping good financial behavior to achieve financial well-being. Financial management behavior acts as an important mediator in the relationship between financial literacy and financial freedom.

The Effect of Financial Attitude on Financial Freedom

The study shows a P-value of 0.000, less than 0.05, indicating that financial attitude positively affects financial freedom. Financial attitude refers to opinions and evaluations about one's financial situation. It relates to financial challenges faced by young people. Financial attitude can be viewed from perspectives such as self-confidence, self-development, and security (Herdjiono & Damanik, 2016, as cited in Wahyuni et. al 2023). Agus Dwi Cahya, et. al (2021) define financial attitude as "the evaluation, insight, or thought process about finance applied to one's attitude. The more positive the attitude toward management, supported by extensive financial knowledge, the more effective practices can be implemented."

Financial attitude reflects beliefs, views, and behaviors regarding money and its management. It includes how individuals perceive the importance of saving, investing, managing debt, and planning finances for the future. In the context of achieving financial freedom, financial attitude plays a crucial role. Even with high income or good financial

knowledge, without a positive and disciplined attitude toward money, achieving financial stability and independence can be difficult.

Individuals with good financial attitudes tend to make wiser financial decisions, such as avoiding a consumptive lifestyle, prioritizing finances, setting aside income for savings and investments, and preparing emergency funds. Such attitudes foster healthy and consistent financial behaviors that directly support the achievement of financial freedom. Conversely, attitudes characterized by extravagance, neglect of financial planning, or focus on short-term satisfaction hinder long-term economic stability. Therefore, a positive financial attitude not only improves daily money management but also forms a vital foundation for sustainable and stable financial freedom.

The Effect of Income on Financial Freedom Moderated by Hedonistic Lifestyle

The research results show a P-value of 0.022, which is less than 0.05, indicating that income's effect on financial freedom is moderated by hedonistic lifestyle. A hedonistic lifestyle is associated with excessive consumption, wastefulness, and a focus on fulfilling short-term desires. Such behavior tends to ignore long-term financial planning, such as saving, investing, or managing debt. Consequently, individuals with stable or high income may struggle to achieve financial stability due to uncontrolled consumptive spending.

This finding shows that the positive effect of income on financial freedom weakens as individuals exhibit higher levels of hedonistic lifestyle. Conversely, if a person's lifestyle is more frugal, simple, or non-consumptive, the effect of income on financial freedom becomes stronger. Lifestyle acts as an important filter in income management. Two individuals with the same income may have vastly different levels of financial freedom depending on how they manage their spending and lifestyle habits.

The Effect of Financial Literacy on Financial Freedom Moderated by Hedonistic Lifestyle

The P-value is 0.026, which is greater than 0.05, indicating that the moderating effect of hedonistic lifestyle on the relationship between financial literacy and financial freedom is not significant. This suggests that in individuals with a high hedonistic lifestyle, the positive influence of financial literacy on financial freedom is weakened. In other words, even good financial literacy will struggle to translate into financial freedom if accompanied by a

hedonistic lifestyle. Conversely, financial literacy combined with a healthy lifestyle facilitates easier achievement of financial freedom.

The Effect of Financial Attitude on Financial Freedom Moderated by Hedonistic Lifestyle

The P-value is 0.011, less than 0.05, indicating that financial attitude's effect on financial freedom is moderated by hedonistic lifestyle. This means that even if someone has a good financial attitude, the positive effect of this attitude on financial freedom diminishes if their lifestyle is hedonistic. In this context, positive financial attitudes such as awareness of saving or investing may become ineffective if consistently countered by excessive consumptive behavior. Conversely, individuals with good financial attitudes and a more frugal or minimalist lifestyle have a much higher potential to achieve financial freedom. This highlights the importance of balancing mindset and lifestyle in attaining financial independence.

4. CONCLUSION

Based on the results of the study on the influence of income, financial literacy, and financial attitude on financial freedom with hedonistic lifestyle as a moderating variable, the following conclusions are drawn: Income positively influences financial freedom; the higher the income, the greater the financial stability, making it easier for individuals to achieve financial freedom. Financial literacy positively affects financial freedom; with adequate financial knowledge, individuals can manage their income effectively to reach financial freedom. Financial attitude positively impacts financial freedom; good financial attitudes encourage individuals to manage their finances wisely, facilitating achievement of financial freedom. Hedonistic lifestyle moderates the effect of income on financial freedom; a hedonistic lifestyle makes achieving financial freedom more difficult, even with good income, if not accompanied by a proper lifestyle. Hedonistic lifestyle also moderates the effect of financial literacy on financial freedom; good financial knowledge alone cannot provide real benefits without lifestyle control. Finally, hedonistic lifestyle moderates the effect of financial attitude on financial freedom; individuals with good financial attitudes and a frugal or minimalist lifestyle have a much higher potential to achieve financial freedom, and vice versa.

Abstract

This study aims to analyze the influence of entrepreneurial education, entrepreneurial spirit, and self-efficacy on entrepreneurial intention among Generation Z in the Special Region of Yogyakarta (DIY). A purposive sampling technique was employed, with 115 respondents participating in the research. Primary data were collected through a validity- and reliability-tested Google Form questionnaire. Data analysis included descriptive statistical analysis, instrument tests (validity and reliability), classical assumption tests (normality, linearity, heteroscedasticity, and multicollinearity), and hypothesis testing (t-test and F-test). The coefficient of determination (R^2) was used to measure the extent to which the independent variables influence the dependent variable. Multiple linear regression analysis was applied, and quantitative data were processed using IBM SPSS version 25. The results indicate that entrepreneurial education, entrepreneurial spirit, and self-efficacy individually exert a positive influence on entrepreneurial intention. Furthermore, these three variables collectively demonstrate a significant positive impact on entrepreneurial intention. This research underscores the critical role of fostering entrepreneurial competencies and psychological factors to enhance entrepreneurial aspirations among Generation Z.

Keywords: Entrepreneurial education, Entrepreneurial intention, Entrepreneurial spirit, Self-efficacy.

1. Introduction

An interconnected world in an increasingly competitive global economy, according to Fadhlurrahman (2025), the number of Indonesia's population currently reaches 283.49 million people, this number places Indonesia in the fourth most populous position in the world. Based on data BPS (2021), the composition of Indonesia's population shows that 70.72% of the population is in the productive age group. Indonesia still faces a number of economic and social challenges, one of the main problems faced is poverty caused by the high unemployment rate, according to BAPPENAS data (2023), the Open Unemployment Rate (TPT) reaches 5.35%. According to Pujiastuti and Cahyo (2020), one way to overcome the unemployment problem is to open new jobs through entrepreneurial activities.

Youth empowerment in economic independence is a solution to overcome unemployment problems (Octavia et al, 2023). However, interest in entrepreneurship among Generation Z is still relatively low (Nasri, 2024). This research focuses on the Special Region of Yogyakarta (DIY) Province because Yogyakarta is known as a student city that has a dynamic education and entrepreneurship ecosystem (Ciputra, 2022).

2. Literature review

2.1 Theory of planned behavior

Theory of Planned Behavior (TPB) developed by Ajzen & Schmidt (2020), is widely used as a reference in explaining the mechanism of formation *entrepreneurial intention*. *Theory of planned behavior* emphasizes the three main factors that affect a person's intention to start a business, attitude toward entrepreneurship, subjective norms and perceived control of behavior. By understanding these three factors, it is possible to design more effective interventions to encourage entrepreneurial intent, such as programs of *entrepreneurial education* comprehensive and social support.

2.2 Entrepreneurial education

Entrepreneurial education is a learning program that aims to improve the skills, knowledge and characteristics of individuals that support entrepreneurial activities (Jiatong et al, 2021). According to Fayolle dan Gailly (2016) *entrepreneurial education* is an educational intervention designed to instill entrepreneurial competence, raise awareness about entrepreneurship as a career option and develop a positive attitude towards entrepreneurial activities. *Entrepreneurial education* is all educational activities with the ultimate goal of developing entrepreneurial intentions (Li and Wu, 2019).

2.3 Entrepreneurial spirit

Entrepreneurial spirit is attitudes and behaviors that encourage individuals to take risks, innovate and pursue business opportunities, including the ability to adapt to change, collaborate and have social responsibility (Q. Liu & Xiao, 2023). According to Saputra et al. (2023), an entrepreneurial spirit is someone who dares to take risks in making an effort of his own will based on his creativity and soul.

2.4 Self-efficacy

Self-efficacy is an individual's belief in his or her ability to complete tasks and achieve goals that result in the expected (Wang et al, 2016). According to Pebriyanti & Rizky (2024), *self-efficacy* is a person's belief in his ability to solve a problem. *Self-efficacy* is the belief that drives individuals to do and achieve something (Hutasuhut, 2018).

2.5 Entrepreneurial intention

Entrepreneurial intention is a self-acknowledged belief and preparation to establish a new business venture, add value to an existing organization or consciously plan to do so in the future(Wang et al, 2016). According to Nurfitriana (2019), entrepreneurial intention is the desire, interest and willingness to work hard or have a strong will to be independent or try to meet their life needs without feeling afraid of the risks that will occur, and always learning from the failures experienced. *Entrepreneurial intention* is a state of mind that attracts a person's attention and behavior in entrepreneurship rather than an employee of an organization/company (Wach dan Głodowska, 2019).

2.6 Hypotheses development

The results of the research conducted by Wiranta & Aziz (2024), Wu et al. (2022), Vernanda & Rokhmani (2021) and Liu et al. (2019) state that entrepreneurial education has a positive and significant influence on entrepreneurial intention.

H1: Entrepreneurial education has a positive effect on entrepreneurial intention.

Research conducted by Saputra et al. (2023), W. Safitri & Nurasik (2022), Rachmawati (2020) and Nasrullah (2016) showed that entrepreneurial spirit has a positive and significant effect on entrepreneurial intention.

H2: Entrepreneurial spirit has a positive effect on entrepreneurial intention.

Research Taneja et al. (2024), S. Santoso & Oetomo (2018), Wang et al. (2016) and Wu et al. (2022) that self-efficacy has a positive and significant influence on entrepreneurial intention.

H3: Self-efficacy has a positive effect on entrepreneurial intention

Research results in Wiranta & Aziz (2024) entrepreneurial education and entrepreneurial spirit have a positive and significant effect on entrepreneurial intention, Wu et al. (2022), Prayitno et al. (2024) and Martyajuarlinda & Kusumajanto (2018) states that entrepreneurial education and self-efficacy have a positive and significant effect on entrepreneurial intention.

H4: Entrepreneurial education, entrepreneurial spirit and self-efficacy simultaneously have a positive effect on entrepreneurial intention.

3. Methodology

3.1 Population and Sample

The population used in this study is generation Z in the Special Region of Yogyakarta (DIY). The sampling technique in this study uses purposive sampling. The criteria used for sampling in this study are generation Z who have received entrepreneurial education.

3.2 Variable and Operation Definitions

3.2.1 Independent Variables

In this study, the independent variables are entrepreneurial education, entrepreneurial spirit and self-efficacy. According to Jiatong et al. (2021), entrepreneurial education is a learning program that aims to improve the skills, knowledge and characteristics of individuals who support entrepreneurial activities. Measured by entrepreneurial knowledge, values and motives, social interactions, entrepreneurial skills and abilities. According to Q. Liu & Xiao (2023), entrepreneurial spirit is attitudes and behaviors that encourage individuals to take risks, innovate and pursue business opportunities, including the ability to adapt to change, collaborate and have social responsibility. Measured by willingness and confidence, focus on goals, daring to take risks, being responsible, hardworking, creative and innovative. According to Wang et al. (2016), self-efficacy is an individual's belief in his or her ability to complete tasks and achieve goals that result in the expected results. Measured by confidence, persistence and optimism, leadership and mentality.

3.2.2 Dependent Variable

The dependent variable in this study is entrepreneurial intention. According to Wang et al. (2016), the entrepreneurial intention is a self-acknowledged belief and preparation to establish a new business venture, add value to an existing organization or consciously plan to do so in the future. Measured through a career as an entrepreneur, individual beliefs and desires.

3.3 Data Analysis Methods

The data analysis method in this study is a quantitative method using SPSS (Statistical Product and Service Solution) software version 25. Data analysis used descriptive statistical analysis, instrument tests (validity and reliability), classical assumption tests (normality, linearity, heteroscedasticity and multicollinearity), multiple regression equations and hypothesis tests (partial t-test, determination coefficient and simultaneous test F).

4. Results and discussions

4.1 Descriptive Statistics

This study uses primary data collected through a questionnaire survey from the people of generation Z in the Special Region of Yogyakarta, The respondents of this study consist of 115 individuals with the majority of the male gender as many as 73 respondents, based on the

last education of bachelor (S1) as many as 47 respondents, domicile in the city of Yogyakarta as many as 41 respondents and based on the business field of interest, namely food & beverage as many as 35 respondents.

Table 1 Descriptive Statistics

No	Respondents	Characteristics	Total	Percentage
1	Gender	Man	73	63,53%
		Woman	42	36,5%
2	Final Education	Junior High School/Equivalent	1	0,9%
		High School/Vocational School/Equivalent	46	40,0%
		Diploma (D1/D2/D3/D4)	18	15,7%
		Bachelor (S1)	47	40,9%
		Magister (S2)	3	2,6%
3	Regional Domicile	Bantul	9	7,8%
		São Paulo	11	9,6%
		Gunungkidul	15	13%
		Sleman	39	33,9%
		Yogyakarta	41	35,7%
4	Business Fields of Interest	Tourism	7	6,1%
		Property and Real Estate	10	8,7%
		Creative and Craft Industries	12	10,4%
		Healthcare Industry	14	12,2%
		Fashion	17	14,8%
		Agribusiness	20	17,4%
		Food & Beverage	35	30,4%

4.2 Classic Assumption Test

4.2.1 Normality

The normality test aims to find out whether the data used in this study is normally distributed or not. The results of the normality test can be seen in the following table:

Table 2 Kolmogorov-Smirnov Normality Test Results

One-sample Kolmogorov-Smirnov Test	
N	*Unstandardized Residual*
	115
Monte Carlo sig. (2-tailed)	0,877

Based on Table 2 on the results of the normality test, the significance result of the normality test was 0.877 where the result had a value greater than the significance level used, which was 0.05. So it can be concluded that the normality test of the variables of entrepreneurial education, entrepreneurial spirit, self-efficacy and entrepreneurial intention has been distributed normally.

4.2.2 Linearity

The linearity test is aimed at seeing whether the specifications of the model used are correct or not. The results of the linearity test can be seen in the following table:

Table 3 Results of the linearity test X1 to Y

Variable	*Deviation form Linearity*	
Entrepreneurial education and entrepreneurial intention	F	Sig.
	1,576	0,099

Based on Table 3, the linearity test of the variable X1 against Y can be seen that the Deviation from Linearity F calculated by 1.576 is smaller than the F of the table of 2.690. The

sig value of 0.099 is greater than 0.05 which means that there is a linear and significant relationship between the variables of entrepreneurial education and entrepreneurial intention.

Table 4 Results of the Linearity Test X2 Against Y

Variable	*Deviation form Linearity*	
Entrepreneurial spirit and entrepreneurial intention	F	Sig.
	1,292	0,235

Based on Table 4 of the linearity test of the variable X2 against Y, it can be seen that the Deviation from Linearity F calculated by 1.292 is smaller than the F of the table of 2.690. The sig value of 0.235 is greater than 0.05 which means that there is a linear and significant relationship between the variable entrepreneurial spirit and entrepreneurial intention.

Table 5 Results of the linearity test X3 Against Y

Variable	*Deviation form Linearity*	
Self-efficacy and entrepreneurial intention	F	Sig.
	1,140	0,333

Based on Table 5 of the linearity test of the variable X3 against Y, it can be seen that the Deviation from Linearity F calculated by 1.140 is smaller than the F of the table of 2.690. The sig value of 0.333 is greater than 0.05 which means that there is a linear and significant relationship between the self-efficacy variable and entrepreneurial intention.

4.2.3 Heteroskedastisitas

In this study, the researcher conducted a heteroscedasticity test using the Glejser test to determine the occurrence of heteroscedasticity or homoscedasticity. The results of the heteroscedasticity test can be seen in the following table:

Table 6 Heteroscedasticity Results

Coefficients						
Model		*Unstandardized Coefficients*		*Standardized Coefficients*	t	Sig.
		B	*Std. Error*	*Beta*		
1	(*Constant*)	4,090	0,886		4,614	0,000
	X1	-,013	0,037	-,055	-,360	0,719
	X2	-,092	0,046	-,308	-1,977	0,051
	X3	0,006	0,040	0,029	0,154	0,878
a. Dependent Variable: ABS_RES						

Based on the results of the Glejser test in Table 6 in the sig column, it shows that all significance values > 0.05 for the variables of entrepreneurial education (X1), entrepreneurial spirit (X2) and self-efficacy (X3), so it is concluded that based on the results of the Glejser test, heteroscedasticity does not occur.

4.2.4 Multikolinearitas

The multicollinearity test is a test aimed at testing whether there is a correlation between independent variables in the regression model. The results of the multicollinearity test can be seen in the following table:

Table 7 Multicollinearity Results

Coefficients[a]			
Model		*Collinearity Statistics*	
		Tolerance	VIF
1	X1 entrepreneurial education	0,349	2,868
	X2 entrepreneurial spirit	0,332	3,015
	X3 self-efficacy	0,231	4,326
a. Dependent Variable: Y entrepreneurial intention			

Based on the results of the multicollinearity test in Table 7, it shows that the entrepreneurial education variable has a VIF value of 2.868 < 10 and a tolerance value of 0.349 > 0.10, the entrepreneurial spirit variable has a VIF value of 3.051 < 10 and a tolerance value of 0.332 > 0.10 and the self-efficacy variable has a VIF value of 4.326 < 10 and a tolerance value 0.231 > 0.10. So in this test of all independent variables, multicollinearity does not occur.

4.3 Multiple Regression Equation Results

To analyze the influence of the variables of entrepreneurial education (X1), entrepreneurial spirit (X2) and self-efficacy (X3) on entrepreneurial intention (Y), which can be seen in the following table:

Table 8 Multiple Linear Regression Equation Results

Coefficients[a]						
Model		*Unstandardized Coefficients*		*Standardized Coefficients*	t	Sig.
		B	*Std. Error*	*Beta*		
1	(*Constant*)	1,458	1,498		,974	,332
	X1	0,281	0,062	0,402	4,544	,000
	X2	0,180	0,078	0,209	2,302	,023
	X3	0,183	0,067	0,294	2,709	,008
a. Dependent Variable: Y						

It can be concluded from the multiple regression model that all independent variables have a constant value of positive value, which means that if the factor in the independent variable increases, it will increase the intention of generation Z to become an entrepreneur.

4.4 Hypothesis Test Results

4.4.1 Statistical Test t

The t-test is aimed at measuring the extent to which an independent variable influences a dependent variable. The basis for decision-making is that if the value of t is calculated > t of the table and the significance value is < 0.05, it means that there is a significant influence between the independent variable and the dependent variable. The results of the t-test in this study can be seen in the following table:

Table 9 Results of the t-test of the effect of X1 on Y

Model		*Unstandardized Coefficients*		*Standardized Coefficients*	t	Sig.
		B	*Std. Error*	*Beta*		
1	(*Constant*)	1,458	1,498		0,974	0,332
	Entrepreneurial education	0,281	0,062	0,402	4,544	0,000
a. Dependent Variable: Entrepreneurial Intention						

Based on Table 9, it can be concluded that there is an influence between entrepreneurial education and entrepreneurial intention, therefore H1 is accepted.

Table 10 Results of the t-test of the effect of X2 on Y

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1,458	1,498		0,974	0,332
	Entrepreneurial spirit	0,180	0,078	0,209	2,302	0,023
a. Dependent Variable: Entrepreneurial Intention						

Based on Table 10, it can be concluded that there is an influence between entrepreneurial spirit and entrepreneurial intention, therefore H2 is accepted.

Table 11 Results of the t-test of the effect of X3 on Y

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1,458	1,498		0,974	0,332
	Self-efficacy	0,183	0,067	0,294	2,709	,008
a. Dependent Variable: Entrepreneurial Intention						

Based on Table 11, it can be concluded that there is an influence between self-efficacy and entrepreneurial intention, therefore H3 is accepted.

4.4.2 F Test (Simultaneous)

The F test or simultaneous test is used to find out whether all independent variables together or simultaneously affect the dependent variable The results of the F test can be seen in the table below:

Table 12 F Test Results

ANOVA						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	554,816	3	184,939	85,435	,000b
	Residual	240,280	111	2,165		
	Total	795,096	114			

Based on Table 4.18, it can be seen that the F value is calculated as 85.435 > F of the table is 2.690 and the significance value is 0.000 < 0.05. So it can be concluded that the variables of Entrepreneurial Education, Entrepreneurial Spirit and Self-Efficacy simultaneously or together have a positive effect on Entrepreneurial Intention. It can be concluded that H4 is acceptable.

4.5 Coefficient of Determination (R2)

To measure how far the model is able to explain the variation of dependent variables. The results of the determination coefficient (R2) in this study can be seen in the following table:

Table 13 Determination Coefficient Results

Model Summary

Model	R	*R Square*	*Adjusted R Square*	*Std. Error of the Estimate*
1	0,835a	0,698	0,690	1,47129
a. Predictors: (Constant), X1, X2, X3.				

Table 13 shows that the Adjusted R Square is 0.690 which means that the variables of entrepreneurial education, entrepreneurial spirit and self-efficacy affect the entrepreneurial intention variable by 69.0%, and the remaining 31.0% is influenced by other variables outside the model.

4.6 Discussion

4.6.1 The Influence of Entrepreneurial Education on Entrepreneurial Intention

Based on the test results in Table 9, the data processing was obtained t calculation of 4,544 > t table of 1.981 and the significance value obtained was 0.000 < 0.05. So it can be concluded that there is an influence between entrepreneurial education and entrepreneurial intention. The results of this study are in line with the research conducted by Wiranta and Aziz (2024), Vernanda dan Rokhmani (2021), Wu et al. (2022) and X. Liu et al. (2019)that entrepreneurial education has a positive effect on entrepreneurial intention By getting entrepreneurship education, generation Z will gain knowledge and experience about entrepreneurship, so it will have an impact on increasing the intention of generation Z to be entrepreneurial.

4.6.2 The Influence of Entrepreneurial Spirit on Entrepreneurial Intention

Based on Table 10, the results of the data processing were obtained t calculation of 2.302 > t table of 1.981 and the significance value was obtained of 0.023 < 0.05. So it can be concluded that there is an influence between entrepreneurial spirit with entrepreneurial intention. The results of this study are in line with the research conducted by Saputra et al. (2023), W. Safitri and Nurasik (2022), Rachmawati (2020) and Nasrullah (2016) that entrepreneurial spirit has a positive effect on entrepreneurial intention. The entrepreneurial spirit or entrepreneurial spirit that Generation Z has can be a supporting factor so as to encourage Generation Z's intention to be entrepreneurial.

4.6.3 The Effect of Self-Efficacy on Entrepreneurial Intention

Based on Table 11, the results of the data processing were obtained t-count of 2.709 > t of the table of 1.981 and the significance value was obtained of 0.008 < 0.05. So it can be concluded that there is an influence between self-efficacy with entrepreneurial intention. The results of this study are in line with the research conducted by Taneja et al. (2024), S. Santoso and Oetomo (2018), Wang et al. (2016) and Wu et al. (2022) that self-efficacy has a positive effect on entrepreneurial intention. Self-confidence or self-efficacy owned by generation Z, is one of the driving factors for the creation of entrepreneurial intentions.

4.6.4 The Simultaneous Influence of Entrepreneurial Education, Entrepreneurial Spirit and Self-Efficacy on Entrepreneurial Intention.

Based on the results of the F test in Table 12, the F value of the calculation was obtained at 85.435 > F of the table of 2.690 and the significance value was 0.000 < 0.05. It can therefore be concluded that entrepreneurial education, entrepreneurial spirit and self-efficacy simultaneously have a positive effect on entrepreneurial intention. The results of this study are in line with the research conducted by Wiranta and Aziz (2024), Wu et al. (2022), Prayitno et al. (2024) and Martyajuarlinda and Kusumajanto (2018) who found that entrepreneurial education, entrepreneurial spirit and self-efficacy simultaneously have a positive effect on entrepreneurial intention. Of these three variables, they can complement in forming

entrepreneurial intention in generation Z. Entrepreneurial education provides the knowledge base and skills necessary for entrepreneurship, entrepreneurial spirit supporting generation Z to work hard and not give up easily to be entrepreneurial, self-efficacy Increased confidence to face challenges.

5. Conclusion, Limitations and Suggestions

Based on the results of the tests that have been carried out, several conclusions can be drawn as follows:

5.1 H1 is accepted, *entrepreneurial education* has a positive and significant effect on *entrepreneurial intention*.

5.2 H2 is accepted, *entrepreneurial spirit* has a positive and significant effect on *entrepreneurial intention*.

5.3 H3 is accepted, *self-efficacy* has a positive and significant effect on *entrepreneurial intention*.

5.4 H4 is accepted, *entrepreneurial education*, *entrepreneurial spirit* and *self-efficacy* simultaneously have a positive and significant effect on *entrepreneurial intention*.

This research has several limitations. First, the data collection method used in this study is an online questionnaire through google form, so there is a possibility of bias. Second, this study is limited to the Province of the Special Region of Yogyakarta (DIY), so the findings cannot represent conditions in other regions. Third, the independent variables used in this study are entrepreneurial education, entrepreneurial spirit and self-efficacy, there are still other variables that are suspected to affect entrepreneurial intention. Fourth, the dependent variable in this study is the entrepreneurial intention, which cannot necessarily be used to measure the real actions of generation Z to be entrepreneurial.

Based on the conclusions and limitations that have been presented, there are several suggestions that can be conveyed. First, for further research, it is recommended to expand the scope of the research area in order to see the consistency of the results. Second, for future researchers, it is recommended to add other variables that are suspected to affect entrepreneurial intention. Third, for future researchers, it is recommended to develop dependent variables that can measure the extent to which Generation Z implements their entrepreneurial abilities. Fourth, for educational institutions, it is recommended to develop an entrepreneurship curriculum, so that generation Z will gain knowledge and experience about entrepreneurship, thereby having an impact on increasing the intention of generation Z to be entrepreneurial.

THE INFLUENCE OF MANAGEMENT INFORMATION SYSTEM (MIS) INTEGRATION AND ENTERPRISE RESOURCE PLANNING (ERP) ON EMPLOYEE WORK PRODUCTIVITY

Hari Mudjiarto[1,*], Karsinah[2], Adya Putri Kusumaningrum[3]

[1,2,3] Buddhist Business and Management, Jinarakkhita College of Buddhism, Lampung, Indonesia

Abstract

This research aims to analyze the effect of Management Information System (MIS) integration and Enterprise Resource Planning (ERP) on employee work productivity in processing industry companies specializing in agricultural product processing. The research method used is a survey approach with a quantitative design. The sampling technique employed is a total sampling, considering the population size is less than 100 people. The number of respondents in this study is 98 employees. Data collection was carried out using structured questionnaires with a five-point Likert scale. Data analysis was performed using SPSS version 24.0 software. The results showed that both individually and simultaneously, MIS and ERP integration have a positive and significant effect on employee work productivity. MIS integration facilitates more efficient and real-time information management, while ERP supports automation of business processes and inter-departmental coordination. Additionally, when combined, both systems contribute to achieving optimal productivity more effectively. These findings emphasize the importance of strategic utilization of information technology to improve employee performance and work effectiveness in the industrial sector.

Keywords: *Management Information System, Enterprise Resource Planning, Work Productivity, Information Technology, Employees.*

1. Introduction

In the era of digitalization and increasingly fierce global competition, organizations are required to continually innovate in managing their resources and business processes. One strategic step taken by many companies is integrating Management Information Systems (MIS) with Enterprise Resource Planning (ERP). These two systems are believed to enhance operational efficiency, accelerate decision-making, and create transparency and accountability in the management of company data and information (Santo Fernandi Wijaya et al., 2023). Management Information System (MIS) functions as a means to collect, process, and present relevant information for management to perform their functions effectively (Syahfitri et al., 2023). Meanwhile, ERP is a software-based system that integrates core business functions such as finance, human resources, production, and distribution into a centralized system (Gessa et al., 2023). The integration of MIS and ERP is expected to create synergy that drives employee efficiency and productivity (Puig-Denia et al., 2023).

Employee work productivity is a crucial factor in achieving organizational goals. Improvements in productivity are not only determined by individual competencies but are also highly influenced by the availability of supporting information systems and technology (Muttaqien et al., 2023). Therefore, it is essential to investigate how the integration of information systems, particularly MIS and ERP, positively impacts employee productivity. Based on data released by the Central Statistics Agency (BPS) in the 2023 Indonesia Labor Productivity Index report, the Indonesian labor productivity rate is recorded at 19.1 thousand

US dollars per worker. This figure is still relatively low compared to ASEAN countries such as Malaysia (34.7 thousand USD) and Thailand (25.4 thousand USD). The low productivity level serves as an indicator of structural challenges in workforce management and work systems in many organizations across Indonesia (Fahrezi & Sudibyo BO, 2023).

Furthermore, the World Bank report (2022) highlights that one of the causes of low employee productivity is the lack of integrated utilization of information technology in work processes. Many organizations in Indonesia, especially in the manufacturing and service sectors, still manage data manually or use fragmented systems, leading to data duplication, input errors, delays in information, and decreased work efficiency (Herdianzah et al., 2023). In this context, the integration of Management Information Systems (MIS) and Enterprise Resource Planning (ERP) becomes a strategic solution that companies can adopt. However, not all organizations are capable of or succeed in implementing this system integration effectively. Several studies indicate that without proper planning and management, ERP systems—which are supposed to improve performance—can actually become burdensome due to system complexity and user resistance (Suharto, 2023). Therefore, the underlying problem of this research is the still-low employee productivity in various organizations in Indonesia, partly caused by insufficient integration and optimization of management information systems and ERP. It is thus important to explore the extent to which the integration of these two systems contributes to improving work productivity, serving as a basis for policy-making and digital transformation strategies in the workplace.

2. Literature Review

2.1 Management Information System

A Management Information System (MIS) is an integrated framework that utilizes information technology to support decision-making processes, coordination, control, data analysis, and information visualization within an organization. According to (Darwis et al., 2023), MIS defines as a set of interconnected components that gather, process, store, and distribute information to support managerial operations and decision-making. MIS serves as the backbone of operational efficiency, enabling companies to manage data systematically and generate accurate reports (Ta & Nguyen, 2023). Research by Alfahl, (2023), shows that effective MIS implementation can enhance information access speed, reduce data redundancy, and support inter-departmental collaboration. Furthermore Kim et al., (2023), emphasize that the success of MIS depends on alignment between business needs, technological infrastructure, and user competencies. In this context, organizations need to ensure that the systems employed are appropriate for the company's operational characteristics and supported by adequate human resources.

A study by Al-Faouri et al., (2023), highlights that MIS functions not only as an operational support tool but also contributes to a company's competitive advantage through the use of real-time data and predictive analytics. They suggest that organizations conduct periodic evaluations of their systems to ensure adaptability to technological developments. Meanwhile, Dewi et al., (2023), explain that primary challenges in MIS implementation include user resistance, data security, and integration with other systems. Overall, MIS is a critical component in promoting organizational efficiency and effectiveness. However, its success is highly influenced by technical factors, human resources, and the organization’s readiness to face digital transformation.

2.2 Enterprise Resource Planning

Enterprise Resource Planning (ERP) is an integrated system designed to manage and automate various business functions such as finance, human resources, supply chain, and manufacturing within a centralized platform. According to Sastrodiharjo & Khasanah, (2023),

ERP is defined as a software solution that enables companies to consolidate business processes, enhance data transparency, and accelerate workflows. ERP has become a vital foundation in organizational digital transformation because of its ability to connect various departments in real-time. Research by Kolmykov & Logunova, (2023), indicates that successful ERP implementation can generate operational efficiency, reduce redundant costs, and improve data accuracy. However, a study by Juturi, (2023), reveals that many organizations face obstacles in ERP deployment, such as high implementation costs, system complexity, and the need for user training. Therefore, companies need to undertake strategic planning and select appropriate vendors to minimize failure risks.

Furthermore, Nurdaya et al., (2023), highlights that ERP not only functions as an automation tool but also plays a role in supporting data-driven decision-making. They emphasize the importance of conducting needs analysis before choosing the suitable ERP system. Meanwhile, studies by Kunduru & Kandepu, (2023), explain that organizations that successfully integrate ERP with their business strategies tend to achieve increased productivity and customer satisfaction. Overall, ERP is a strategic solution for enhancing business integration and efficiency. However, its successful implementation depends heavily on organizational readiness, management commitment, and user adaptation to system changes.

2.3 Employee Work Productivity

Employee work productivity is an indicator of performance that measures the efficiency and effectiveness of labor in achieving organizational targets. According to Galanti et al., (2021), productivity is defined as the ratio of output produced relative to the input of resources (time, labor, and costs) used. High productivity reflects employees' ability to work optimally by utilizing available resources efficiently. Research Husainah, (2023) shows that factors such as job satisfaction, a conducive work environment, training, and motivation significantly influence employee productivity. Furthermore Setyawati et al., (2023), emphasize that supportive leadership and recognition of employees' contributions can increase engagement and productivity. In this context, organizations need to establish clear reward and career development systems to encourage optimal performance.

A study of Herman Sjahruddin et al., (2023), highlights that technology, such as MIS and ERP, also plays a role in boosting productivity by reducing administrative workload and speeding up business processes. They suggest conducting regular training to ensure employees can effectively utilize technology. Meanwhile, research Demas Hafiyyan et al., (2023), explains that productivity is influenced not only by individual factors but also by job design, organizational culture, and work-life balance. Overall, employee productivity results from the interaction of personal, organizational, and technological factors. Companies that create supportive work environments, provide adequate tools, and offer appropriate incentives are more likely to achieve higher productivity levels. However, productivity is also affected by market dynamics, competitive pressure, and generational shifts in the workforce.

3. Methodology

The research method used in this study is a survey approach with a quantitative design. The research sample consists of 98 employees working in an agricultural processing industry company. The sampling technique employed is purposive sampling, with specific criteria such as employees who have worked for at least two years in the company. This is to ensure that respondents have sufficient experience and understanding. Data collection was conducted through the distribution of structured questionnaires designed to measure respondents' perceptions of the integration of Management Information Systems (MIS) and Enterprise Resource Planning (ERP), as well as their influence on employee work productivity. The questionnaire instrument uses a five-point Likert scale, ranging from "strongly disagree" (1) to

"strongly agree" (5), to ensure that the data obtained is measurable, objective, and can be analyzed statistically using SPSS software version 24.0.

4. Results and Discussions

4.1 The Normality Test

The normality test aims to determine whether the data for each variable follow a normal distribution. In this study, the normality test was conducted using the One-Sample Kolmogorov-Smirnov Test method of SPSS software. The variables tested include Management Information Systems, Enterprise Resource Planning, and Employee Work Productivity. The results of the normality test can be seen in the following table.

Table 1. Normality Test

One-Sample Kolmogorov-Smirnov Test				
		Management Information Systems	Enterprise Resource Planning	Employee Work Productivity
N		98	98	98
Normal Parameters[a,b]	Mean	129.54	121.10	134.21
	Std. Deviation	13.034	14.975	15.271
Most Extreme Differences	Absolute	.044	.062	.062
	Positive	.063	.045	.045
	Negative	-.055	-.051	-.025
Test Statistic		.063	.065	.053
Asymp. Sig. (2-tailed)		.200[c,d]	.200[c,d]	.200[c,d]
a. Test distribution is Normal.				
b. Calculated from data.				
c. Lilliefors Significance Correction.				
d. This is a lower bound of the true significance.				

Based on the normality test results using the One-Sample Kolmogorov-Smirnov Test for the three variables: Management Information System, Enterprise Resource Planning, and Employee Work Productivity, the obtained Asymp. Sig. (2-tailed) values are each 0.200. These values are greater than the significance level used, which is $\alpha = 0.05$. Therefore, the decision is to accept the null hypothesis (H_0), stating that the data originate from a normal distribution. This indicates that the three variables have data distributions that are normal or approximately normal. The test also employs the Lilliefors significance correction, which is appropriate for normal distribution testing with parameters estimated from the data. As a result, the data for all three variables are considered to meet the normality assumption, which is an important prerequisite for conducting further parametric statistical analyses such as regression analysis, Pearson correlation analysis, or t-tests.

4.2 The Homogeneity Test

The homogeneity test is conducted to determine whether the data used have equal or homogeneous variances across groups. Homogeneity of variances is one of the prerequisites in parametric statistical analysis, particularly when performing regression analysis. If the data are not homogeneous, the analysis results can become biased and inaccurate. The homogeneity test can be performed using Levene's Test. If the significance value (Sig.) is greater than 0.05, then the data are considered homogeneous or to have equal variances.

Table 2. Homogeneity Test

Variable	Levene Statistic	df1	df2	Sig. (p-value)
Productivity based MIS (X1)	1.812	1	96	0.182
Productivity based ERP (X2)	0.964	1	96	0.329

Based on the results of Levene's Test for Equality of Variances, the significance values for variable X1 against Y is 0.182, and for X2 against Y is 0.329. Both significance values are greater than 0.05, indicating no significant difference in variances between groups in each independent variable. Therefore, it can be concluded that the variances of Management Information System and ERP variables are homogeneous regarding Employee Work Productivity. This condition shows that the assumption of homogeneity is met, making the data suitable for further analysis using multiple linear regression.

4.3 The Multicollinearity Test (Coefficients Table))

Multicollinearity can be detected by examining the values of Tolerance and Variance Inflation Factor (VIF). A Tolerance value less than 0.10 or a VIF value greater than 10 indicates the presence of multicollinearity. Conversely, if the Tolerance value is greater than 0.10 and the VIF is less than 10, it can be concluded that multicollinearity does not occur. In this study, the multicollinearity test was conducted on two independent variables, namely Management Information System (X1) and Enterprise Resource Planning (ERP/X2), which are used to predict Employee Work Productivity (Y), with a sample of 98 respondents. The results of the multicollinearity test are presented in the following table.

Table 3. Multicollinearity Test

Model	Collinearity Statistics: Tolerance	Collinearity Statistics: VIF
X1 (MIS)	0.552	1.812
X2 (ERP)	0.552	1.812

Based on the table above, it can be seen that the Tolerance values for the Management Information System (X1) and ERP (X2) variables are 0.552, which is greater than 0.10. This means there are no issues of multicollinearity based on the Tolerance value. Additionally, the Variance Inflation Factor (VIF) for both variables is 1.812, which is well below the critical limit of 10. This indicates that there is no evidence of multicollinearity among the independent variables in this regression model.

4.4 The Hypothesis Test

Table 4. Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.801	0.641	0.632	3.214

In the Model Summary table, the R value obtained is 0.801, indicating a strong relationship between the independent variables (Management Information System and ERP) and the dependent variable (Employee Work Productivity). The R Square value is 0.641, meaning that 64.1% of the variation or change in Employee Work Productivity can be explained by Management Information System and ERP simultaneously. The remaining 35.9% is explained by other variables not included in this model. The Adjusted R Square value of 0.632 further confirms that this model is sufficiently good and stable when used to generalize the population.

Table 5. ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	1854.432	2	927.216	89.78	0.000
Residual	1037.528	95	10.921		
Total	2892.000	97			

The ANOVA table shows that the calculated F value is 89.78 with a significance (Sig.) value of 0.000. Since the Sig. value is less than 0.05, it can be concluded that this multiple linear regression model is statistically significant. In other words, collectively, the variables Management Information System (X1) and ERP (X2) significantly influence Employee Work Productivity (Y). Thus, the regression model used is proper and capable of explaining the relationships among the variables studied.

Table 6. Coefficients

Model	B	Std. Error	Beta	t	Sig.
(Constant)	11.258	2.114	—	5.326	0.000
X1 (MIS)	0.478	0.097	0.482	4.928	0.000
X2 (ERP)	0.395	0.093	0.413	4.247	0.000

Based on the Coefficients table, the constant (intercept) value is 11.258, indicating that if variables X1 and X2 are assumed to have no effect (value zero), then the Employee Work Productivity (Y) remains at 11.258. Additionally, the Management Information System (X1) has a regression coefficient of 0.478 with a significance value of 0.000, which means that a one-unit increase in the Management Information System will increase Employee Work Productivity by 0.478 units, assuming other variables are constant. Since the significance value is less than 0.05, this influence is statistically significant. Similarly, for the Enterprise Resource Planning (ERP/X2) variable, the regression coefficient is 0.395 with a significance value of 0.000, indicating that each one-unit increase in ERP usage will increase Employee Work Productivity by 0.395 units. The significance value being less than 0.05 also shows that this influence is statistically significant. Therefore, the regression equation derived from this analysis can be written as: Y = 11.258 + 0.478X1 + 0.395X2. This means that both Management Information System and ERP, both individually and jointly, have a positive and significant effect on Employee Work Productivity.

4.5 The Effect of Management Information System (MIS) Integration on Employee Work Productivity

Management Information System (MIS) integration plays a vital role in enhancing the efficiency and effectiveness of work processes within an organization. Based on the analysis conducted, it was found that there is a positive and significant influence of MIS integration on employee productivity. This indicates that the higher the level of MIS integration and utilization within a company, the greater the level of productivity achieved by the employees. MIS integration enables employees to access the information they need quickly, accurately, and in real-time (Rahmisyari Rahmisyari & Musafir Musafir, 2023). This accelerates decision-making, reduces work duplication, and improves coordination between work units.

Additionally, an integrated system helps employees plan, execute, and evaluate their tasks in a more structured manner (Depiansah & Mellita, 2023). The availability of centralized data through MIS also minimizes the likelihood of information errors and enhances accountability in employee performance.

These findings align with previous studies showing that implementing an integrated information system can improve the productivity of individuals and teams (Azizah et al., 2023; Iswanto et al., 2023). This is due to increased operational efficiency, easier access to data, and the ability to monitor and evaluate performance continuously. Thus, it can be concluded that MIS integration is not only an administrative support tool but also a crucial strategy in human resource management to improve employee performance and productivity. Therefore, organizations should continuously develop and strengthen MIS integration to effectively support the achievement of work objectives.

4.6 The Effect of Enterprise Resource Planning (ERP) on Employee Work Productivity

Enterprise Resource Planning (ERP) is an integrated system designed to manage various business processes within an organization, including planning, production, finance, and human resources. Based on the analysis conducted in this study, it was found that ERP has a positive impact on employee productivity. This means that the more optimal the implementation of ERP within an organization, the higher the level of productivity achieved by employees. ERP systems provide numerous benefits for daily tasks, such as automating work processes, facilitating interdepartmental integration, and enabling faster and more accurate information access. With ERP, employees no longer need to record data manually, allowing them to focus more time and energy on strategic, value-added tasks. Additionally, ERP supports better collaboration among departments, ultimately creating a more efficient and effective workflow (A. S. Dewi et al., 2023).

These results reinforce the theory that the appropriate use of information technology, such as ERP, can increase productivity by reducing work cycle times, minimizing errors, and improving transparency and accountability in performance (Rahmadoni et al., 2023). In the context of human resources, ERP also aids in performance management, work evaluation, and more structured employee training (Dharma et al., 2024; Ditha et al., 2024; Wahyuni et al., 2024). Therefore, it can be concluded that the implementation of ERP not only impacts overall operational efficiency but also directly promotes the enhancement of employee productivity. Consequently, companies need to ensure that the ERP system used is accessible and fully utilized by all employees, supported by adequate training and development.

4.7 The Effect of Management Information System (MIS) Integration and Enterprise Resource Planning (ERP) on Employee Work Productivity

Based on the results of multiple linear regression analysis conducted in this study, it was found that MIS integration and ERP, both jointly and individually, have a significant influence on employee work productivity. The F-test results show that the significance value is less than the predetermined significance level ($\alpha = 0.05$), indicating that collectively, the variables MIS integration and ERP significantly affect productivity. This suggests that the combined implementation of these two systems can create a more efficient, structured, and responsive work environment that meets organizational needs, thereby directly contributing to an increase in employee output. Furthermore, the t-test results reveal that both independent variables (MIS integration and ERP) each have a positive and significant effect on employee productivity. The MIS integration variable makes a significant contribution because an integrated information system can provide accurate, real-time data, accelerate decision-making processes, and improve work efficiency across various organizational units (Ardianto et al., 2025; Mega Julianti et al., 2023; Putri et al., 2024). Similarly, the ERP variable also has a significant impact

because this system supports automation of work processes, interdepartmental integration, and minimizes administrative errors, all of which contribute to increases in individual and team productivity (Gusnadi et al., 2024; Yusdhika et al., 2024).

These findings indicate that both information technology systems used by the company MIS and ERP complement each other in creating a more productive work system (Eka Apriyani et al., 2023; Jo & Park, 2023; Kolmykov & Logunova, 2023; Ramadhan & Zailani, 2023). Proper information management through MIS, combined with effective business process management via ERP, has proven to positively impact employee performance (Ardianto et al., 2020, 2025). Therefore, organizational management is advised to continue developing and strategically integrating the use of MIS and ERP to maximize the benefits of both systems and achieve a direct increase in employee productivity.

5. Conclusion

Based on the analysis and discussion conducted, it can be concluded that the integration of Management Information Systems (MIS) and Enterprise Resource Planning (ERP) has a significant impact on employee work productivity, both individually and simultaneously. Individually, these two variables have shown to contribute positively to increasing work productivity, where MIS integration supports effective and efficient information management, while ERP helps automate work processes and improves cross-functional coordination within the organization. These systems provides a stronger impact in creating a structured work environment, enabling faster decision-making, and minimizing errors, thus leading to an overall increase in employee productivity. This finding indicates that the strategic utilization of appropriate and integrated information technology is a crucial factor in enhancing human resource performance in the digital era. Therefore, organizations or companies are advised to continuously develop their management information systems and ERP systems, and ensure that all employees receive adequate training to optimize the use of these systems in supporting productivity.

BURNOUT AND EMPLOYEE PRODUCTIVITY: A STUDY OF OCCUPATIONAL STRESS IN THE WORKPLACE

Henny Meyliana[1,*], Widi Astuti[2], Viola[3]

[1,2,3] Buddhist Business and Management, Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

This study aims to analyze how employee productivity at the workplace is affected by experiences of burnout. Burnout is a state of physical, emotional, and mental exhaustion caused by excessive work pressure, which often negatively impacts employee performance and motivation, leading to a decrease in productivity. The survey used a quantitative approach, employing a questionnaire distributed to 45 respondents working in the sales and marketing department at Auto2000 Bandar Lampung. The results of the regression analysis indicate that burnout has a negative and significant effect on employee productivity, with an R^2 coefficient of 0.765. This means that 76.5% of the variance in employee productivity can be explained by the level of burnout experienced. The higher the burnout level, the lower the productivity. These findings highlight the importance of implementing stress management programs and efforts to maintain a work-life balance to improve workforce productivity.

Keywords: Burnout, Employee Productivity, Work Stress, Work-Life Balance

1. Introduction

In the modern, highly competitive work environment, expectations for employee performance continue to rise. Companies demand optimal productivity levels to remain competitive amidst dynamic market changes. However, this intense pressure often has negative effects on employees' psychological and physical well-being, one of which can manifest as work fatigue or burnout (Taufik & Wijiastuti, 2021). Burnout is a condition characterized by emotional, physical, and mental exhaustion resulting from prolonged stress caused by continuous work pressure (Septiani et al., 2024; Yusdhika et al., 2024). This phenomenon is increasingly observed across various sectors, including sales and marketing, which require high performance, consistent target achievement, and frequent interaction with customers. In automotive companies like Auto 2000, particularly in the Sales and Marketing Department, the work pressure is quite high due to sales target demands, dealer competition, and rapidly changing consumer preferences. These conditions make employees more susceptible to burnout. If not properly addressed, burnout can negatively impact employee productivity.

Employee productivity is a key factor in supporting company performance and operational sustainability. Employees with high productivity levels are able to complete tasks effectively and efficiently, contributing significantly to the achievement of organizational goals. However, when employees experience burnout, their enthusiasm and energy tend to decrease, ultimately leading to reduced productivity (Ardianto et al., 2020b; Putri et al., 2024). The impact of burnout on declining employee productivity can be reflected in various aspects, such as decreased service quality, delays in task completion, increased absenteeism, and internal conflicts within the team (Fairnandha, 2022). This situation poses a significant challenge for management, especially in maintaining the performance of departments focused on target achievement, such as the sales and marketing division. Many studies have explored burnout and its effects on productivity across different sectors, but research specifically examining the context of automotive dealers in Indonesia, especially in major cities like Bandar Lampung,

remains limited. Therefore, a more in-depth investigation is needed to understand how burnout influences employee productivity in such a competitive work environment.

Auto2000 Bandar Lampung, as an official Toyota dealer with a significant market share in the region, relies heavily on its sales and marketing team as the front line for product sales. The pressure to meet increasing targets, tight work schedules, and demands for excellent customer service make this department highly vulnerable to burnout symptoms (Sundari & Meria, 2022). Recognizing the importance of maintaining a balance between job demands and employees' psychological well-being, this study aims to examine the extent to which burnout affects employee productivity at the Sales and Marketing Department of Auto2000 Bandar Lampung. The results are expected to provide a deeper understanding of the real situations faced in the field. Furthermore, this research intends to offer recommendations to company management for designing effective strategies or policies to reduce the risk of burnout while simultaneously enhancing employee well-being and productivity (Pranitasari et al., 2023). An approach based on data and empirical analysis is expected to support more accurate and targeted decision-making by management. Based on this background, the focus of this study is to analyze the influence of burnout on employee productivity in the Sales and Marketing Department of Auto2000 Bandar Lampung. It is hoped that this research can contribute both academically and practically to the development of human resource management and support the sustainability and competitiveness of the company in the future.

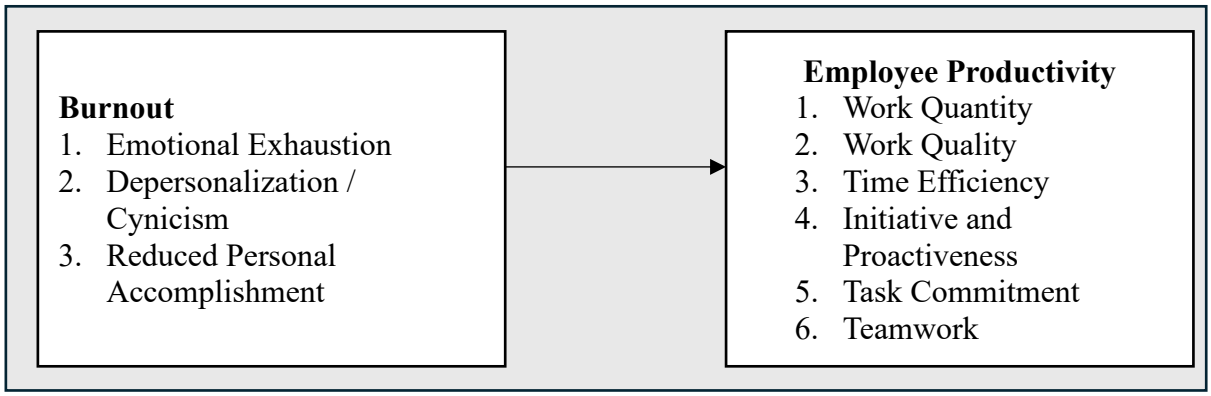

Figure 1. Variable Relationship Structure Model

2. Literature Review

2.1 Burnout

Burnout is a psychological condition characterized by emotional, physical, and mental exhaustion resulting from prolonged stress. This phenomenon is commonly experienced by individuals facing excessive pressure, especially due to high workload, unrealistic demands, or a lack of social support in the workplace. Burnout can negatively affect individual performance, reduce motivation, decrease job satisfaction, and damage the quality of interpersonal relationships within the work environment. In an organizational context, if not properly addressed, burnout can have adverse effects on productivity, employee loyalty, and can increase turnover rates.

2.2 Employee Productivity

Employee productivity refers to an individual's ability to produce maximum output efficiently, considering both the quality and quantity of work results. Several factors influence employee productivity, including motivation, skills, physical and mental conditions, and a supportive work environment. Employees with high productivity tend to be more effective in

completing tasks and make positive contributions toward achieving organizational objectives. In the organizational context, increasing employee productivity can drive overall company performance, encompassing aspects such as customer satisfaction and profitability.

3. Methodology

This study adopts a quantitative approach with a survey design to analyze the effect of burnout on employee productivity. The sample consists of 45 respondents working in a company environment characterized by high dynamism and stress-related risks. Data collection was carried out through questionnaires that measure the respondents' levels of burnout and its impact on work productivity. The questionnaires used a 5-point Likert scale to assess both variables—burnout and productivity. The data analysis included validity and reliability tests, linear regression, and t-tests to identify the significant influence of burnout on employee productivity. This research also limited respondents to employees working in companies with high work pressure. Ethical considerations were maintained by ensuring data confidentiality and obtaining respondents' consent before they completed the questionnaires.

4. Result and Discussions

4.1 Instrument Test Output.

Based on the validity test results for the instrument measuring the effect of burnout on employee productivity, it was found that out of 90 statement items tested, 80 items were valid. These valid items are used to measure the variables of burnout and employee productivity in the Sales and Marketing Department of Auto2000 Bandar Lampung. These results indicate that the instrument used has a good level of validity for assessing the impact of burnout on employee productivity.

4.2 Instrument Reliability Test

Based on the reliability test results for the variables of burnout and employee productivity, high consistency reliability coefficients were obtained. The Reliability Analysis using SPSS 26 output produced Cronbach's Alpha values that meet the standards for good reliability. Therefore, it can be concluded that the instruments used in this study have good validity and reliability and are ready for further analysis regarding the influence of burnout on employee productivity in the Sales and Marketing Department of Auto2000 Bandar Lampung.

Table 1. Validity Test

	Reliability Statistics	
	Cronbach's Alpha	N of Items
Burnout	.890	40
Employee Productivity	.870	40

4.3 Normality Test

The results of the Kolmogorov-Smirnov test indicate that the data for the burnout and employee productivity variables are normally distributed, as the significance values are below the required threshold. Meanwhile, the burnout variable for some respondents shows a distribution close to normal, with significance values approaching the accepted limit. Therefore, for further analysis, this data can be analyzed using parametric statistical methods, given that the data meet the normality assumption. If necessary, data transformation can be

performed to ensure a more appropriate distribution. The normality test results using the One Sample Kolmogorov-Smirnov test are presented in the following table:

Table 2. Normality Test

One-Sample Kolmogorov-Smirnov Test				
		X^1	X^2	Y
N		79	77	85
Normal Parametersa	Mean	1.286	1.232	1.185
	Std. Deviation	1.738	1.765	1.941
Most Extreme Differences	Absolute	.180	.166	.119
	Positive	.180	.166	.114
	Negative	-.113	-.111	-.119
Kolmogorov-Smirnov Z		1.509	1.607	1.784
Asymp. Sig. (2-tailed)		.108	.132	.187
a. Test distribution is Normal.				

Source: Data processed in 2025 using SPSS 26 software

The results of the Homogeneity of Variances test indicate that the variance data for the burnout and employee productivity variables are homogeneous. This is evidenced by the significance values being above the required threshold, i.e., > 0.05. Therefore, it can be concluded that the assumption of equal variances is met. Consequently, the data qualifies for further analysis using parametric statistical methods that require homogeneity of variances. For more detailed information, the test results are presented in the following table:

Table 3. Homogeneity Test

Test of Homogeneity of Variances Instrument Validity Test on Employee Productivity			
Levene Statistic	df1	df2	Sig.
1.125	50	220	.314
1.055	50	220	.457

Source: Data processed in 2025 using SPSS 26 software

Table 4. Regression Equation Output

Coefficientsa						
		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	25.701	7.619		4.146	.006
	Burnout	.697	.086	.982	15.277	.000
a. Dependent Variable: Employee Productivity						

Source: Data processed in 2025 using SPSS 26 software

The coefficient analysis results indicate that the burnout variable has a significant effect on the dependent variable, which is employee productivity. The unstandardized regression coefficient shows the magnitude of burnout's influence on employee productivity in its original units, while the standardized coefficient indicates the impact on a normalized scale. The high t-value and the very small significance value suggest a strong and significant relationship between burnout and employee productivity. Therefore, burnout is an important predictor in influencing the level of employee productivity, particularly in the Sales Marketing Department of Auto2000 Bandar Lampung.

Table 5. Anova Analysis Output

ANOVA[b]						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	22929.745	22	849.031	43.554	.000
	Residual	1501.798	57	24.839		
	Total	28231.443	78			
2	Regression	24718.913	24	1182.329	39.416	.000
	Residual	1738.441	56	32.517		
	Total	29358.354	78			
a. Predictors: (Constant), Burnout						
b. Dependent Variable: Employee Productivity						

Source: Data processed in 2025 using SPSS 26 software

The ANOVA test results show that the regression model used is significant in explaining the variation in the dependent variable, which is employee productivity. The high F-value accompanied by a very low significance level indicates that the overall regression model can accurately predict employee productivity based on burnout. Therefore, it can be concluded that there is a significant relationship between the independent variable (burnout) and the dependent variable (employee productivity), and the model used is sufficiently reliable for further analysis within the context of the Sales Marketing Department of Auto2000 Bandar Lampung.

Table 6. Coefficients

	Unstandardized Coefficients		Standardized Coefficients		
Model	B	Std. Error	Beta	t	Sig.
(Constant)	34.100	6.917		7.588	.000

(Constant)	28.368	8.051		6.418	.000
Employee Productivity	.738	.061	.869	17.007	.000

Source: Data processed in 2025 using SPSS 26 software

Table 7. Determination Coefficient Analysis (R)

Model Summary[b]				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.862[a]	.896	.693	7.09724
2	.880[a]	.708	.886	7.81557
3	.820[a]	.765	.865	7.63499

a. Predictors: (Constant), Burnout

b. Dependent Variable: Employee Productivity

Source: Data processed in 2025 using SPSS 26 software

The regression analysis results indicate that burnout has a significant effect on employee productivity. The regression coefficient of 0.697 with a significance value of 0.000 signifies that burnout contributes substantially to changes in employee productivity. This is further supported by an R-squared value of 0.765, meaning that 76.5% of the variation in employee productivity can be explained by the burnout variable. Thus, the higher the level of burnout experienced by employees, the greater its impact on decreasing productivity, especially in the Sales Marketing Department of Auto2000 Bandar Lampung. This study aims to examine the extent to which burnout affects employee productivity (Erma Wati et al., 2022). Based on data collected from 45 respondents, it was found that the majority of employees experience burnout symptoms with varying levels. The identified burnout symptoms encompass three main dimensions: emotional exhaustion, depersonalization, and a decreased sense of personal accomplishment at work. Results from validity and reliability tests show that all items in the instrument used to measure burnout and employee productivity are valid and reliable. This indicates that the instrument accurately represents the psychological state and productivity levels of employees in the field.

Normality testing using the Kolmogorov-Smirnov method shows that the data follow a normal distribution, allowing the use of simple linear regression analysis in this study. Additionally, the homogeneity test results indicate that the data have uniform variances, further supporting the validity of the chosen analysis method. The regression analysis results reveal that burnout significantly affects employee productivity. The negative regression coefficient indicates that an increase in burnout levels results in a decrease in employees' work productivity. The significance value in the regression test is below 0.05, indicating that the effect of burnout on employee productivity is significant and not due to chance. With an R-squared value of 0.765, it can be concluded that 76.5% of the variation in employee productivity is explained by burnout factors. This finding aligns with previous research that identifies burnout as a primary factor leading to decreased motivation, concentration, and energy at work (Ardianto et al., 2020a, 2025). Employees experiencing burnout tend to lose focus, make more mistakes, and show decreased enthusiasm in completing their tasks.

More specifically, emotional exhaustion the core aspect of burnout strongly influences employees' ability to meet sales targets and interact with customers. Negative interactions with customers caused by work-related stress directly affect the performance of the sales team (Kardiawan, 2018). Additionally, feelings of being unappreciated and losing meaning in work (the dimension of decreased personal achievement) are also found to worsen productivity (Ardianto et al., 2024, 2025, 2023). Employees who feel unrecognized for their efforts tend to reduce their work intensity (Ngailia et al., 2024). Although some respondents did not

experience high levels of burnout, the majority acknowledged that target pressures, lack of rest, and an imbalance between work and personal life are primary factors triggering their burnout (Pujayanti et al., 2024). Based on these results, it is recommended that Auto2000 management focus more on employees' psychological well-being, especially in the sales marketing department facing high work pressure. Implementing stress management programs, providing adequate rest periods, and recognizing achievements are essential steps to reduce burnout and maintain employee productivity.

5. Conclusion

In conclusion, based on the research conducted in the Sales Marketing Department of Auto2000 Bandar Lampung, burnout has a significant influence on employee productivity. The higher the burnout level, the lower the productivity, as reflected in the dimensions of emotional exhaustion, decreased personal achievement, and depersonalization. Regression analysis shows that burnout explains 76.5% of the variation in employee productivity, highlighting the importance of managing burnout within the work environment. Therefore, management needs to implement effective stress management strategies to improve employee well-being and sustain optimal productivity.

THE RELATIONSHIP BETWEEN EMPLOYEE RECOGNITION AND ORGANIZATIONAL LOYALTY IN BANDAR LAMPUNG INDUSTRIES

Partama Nagatirtha[1,*], Elivinsia[2], Widi Astuti[3]

[1,2,3] Buddhist Business and Management Department, Jinarakkhita Buddhist College of Lampung, Indonesia.

Abstract

This study aims to explore the relationship between the recognition given to employees and the level of loyalty to the organization. Recognition, whether financial or non-financial, is considered a crucial element that can enhance job satisfaction and employees' sense of belonging to the company. In this research, a quantitative approach was employed by distributing questionnaires to 100 employees from various industries in Bandar Lampung. The linear regression analysis results show that recognition has a positive and significant influence on employee loyalty, with an R-squared value of 0.608. This means that 60.8% of the variation in employee loyalty can be explained by the recognition they receive. These findings underscore the importance of implementing effective recognition strategies to retain loyal and committed employees. Additionally, companies that prioritize employee acknowledgment are more likely to foster a positive organizational culture. A well-designed recognition system can also boost employee motivation and overall organizational performance. Therefore, organizations are encouraged to continually evaluate and improve their recognition management practices to maintain employee loyalty in the long term.

Keywords: *Employee Recognition, Organizational Loyalty, Job Satisfaction, Employee Retention.*

1. Introduction

In the face of increasingly fierce business competition, companies are not only required to continuously innovate in products and services but also need to pay serious attention to human resource management (HRM). One crucial aspect of HRM is how companies treat their employees, especially in terms of recognizing and rewarding their contributions. Employee recognition becomes a strategic factor that plays a role in shaping work attitudes and behaviors and can enhance their loyalty to the organization (Rambe, 2024). Recognition can be given in two forms: financial and non-financial. Financial rewards include salaries, bonuses, and incentives, while non-financial rewards can be in the form of acknowledgment, promotions, certificates of appreciation, or opportunities for career development. When employees feel valued, they tend to show higher work enthusiasm, feel more respected, and are motivated to make greater contributions to the company. High employee loyalty to the organization is one of the indicators of successful human resource management (Sinaga et al., 2023). Loyalty reflects the level of commitment, attachment, and the desire of employees to stay and grow with the company in the long term. Employees with high loyalty are not only physically present but also contribute maximally through their effort, time, and thought for the company's progress.

Various studies have proven a positive relationship between employee rewards and loyalty toward the organization (Adha et al., 2022). Employees who receive fair and performance-based rewards tend to feel more satisfied and develop a strong emotional bond with the company. Conversely, unfair reward systems can demotivate employees, lead to dissatisfaction, and ultimately increase the risk of turnover. The current industrial situation in Bandar Lampung shows how important it is to maintain employee loyalty. With growth in

manufacturing, trade, and services sectors, competition among companies to attract and retain qualified workers becomes a significant challenge. Therefore, companies need to design fair and transparent reward systems to retain their top human resources. However, in practice, some companies in Bandar Lampung still do not optimally provide rewards to their employees. Several industries still adopt a transactional approach to work, without paying enough attention to the importance of non-material appreciation. This condition can lead to dissatisfaction among employees, which ultimately impacts decreased loyalty and productivity (Pratiwi & Fauzan, 2024). Based on this situation, it is crucial to conduct an in-depth study on the relationship between employee recognition and organizational loyalty within the industry context in Bandar Lampung. This research is expected to provide a more comprehensive understanding of how employees perceive the reward systems implemented and to what extent these influence their commitment to stay with the organization in the long term.

This study focuses on employees working in medium and large industries in the Bandar Lampung area, aiming to identify which forms of recognition have the most significant influence and to assess how these rewards contribute to shaping employee loyalty. In addition, this research will analyze differences in employee loyalty levels based on the types of rewards they receive (Pertiwi & Adi, 2023). Using a quantitative approach through distribution of questionnaires to employees, this research aims to measure the statistical relationship between employee recognition variables and organizational loyalty. It is expected that the findings will provide meaningful contributions for companies in Bandar Lampung to develop more precise and effective human resource policies. Overall, this research plays an important role in efforts to improve organizational performance through effective human resource management. By understanding the impact of recognition on employee loyalty, companies can create a supportive work environment and build long-term, mutually beneficial relationships between the organization and its employees.

2. Literature Review

2.1 Concept of Employee Recognition.

Employee recognition encompasses the organization's acknowledgment of an individual's contributions, achievements, and performance within the workplace. This recognition can be in the form of financial rewards, such as salaries, bonuses, and incentives, or non-financial rewards, such as promotions, symbolic awards, and opportunities for career development. Several studies have shown that fair and timely recognition can boost motivation, job satisfaction, and strengthen employees' attachment to the organization. Therefore, implementing an effective recognition system is a key strategy in human resource management to maintain and enhance employee productivity.

2.2. Concept of Organization

An organization can be understood as a social entity consciously formed by two or more individuals working together towards a predetermined goal. In management, organizations serve as a means for individuals to collaborate in a structured manner, through role division, authority, and responsibility, to achieve desired results. Elements such as organizational structure, work culture, and operational systems significantly influence members' attitudes and performance. Therefore, a comprehensive understanding of organizational dynamics is essential to realize operational efficiency, harmonious work relationships, and the optimal achievement of organizational goals.

2.3 The Relationship Between Recognition and Loyalty

The level of recognition received by employees, whether through financial or non-financial compensation, has a significant impact on their loyalty to the organization. When recognition is given fairly and proportionally, it can increase job satisfaction, strengthen emotional bonds, and foster employees' commitment to continue contributing in the long term. Conversely, unfairness or inadequacies in recognition can trigger dissatisfaction, reduce loyalty, and increase turnover tendencies. Therefore, the proper implementation of recognition systems is a critical factor in maintaining employee loyalty and supporting the organization's stability and sustainability.

3. Methodology

This study employs a descriptive quantitative approach aimed at illustrating and analyzing the relationship between two primary variables: employee recognition and organizational loyalty. The research design is structured to address the formulated research questions while anticipating potential challenges during the implementation process. The steps include developing the background, identifying and formulating research problems, reviewing relevant theories on employee recognition and loyalty, establishing research variables, and selecting appropriate data collection techniques. Data will be gathered through closed-ended questionnaires using a Likert scale, designed to measure respondents' responses, perceptions, and attitudes toward the recognition system implemented and their level of loyalty to the organization. A sample of 100 employees from various medium and large-scale industries in Bandar Lampung will be surveyed. Each variable indicator is translated into statements, which respondents will answer based on their level of agreement. The collected data will then be analyzed to determine the extent of the relationship between the recognition provided by the company and employee loyalty to the organization.

4. Result and Discussions

4.1 Normality Test.

Table 1. One Sample Kolmogorov-Smirnov Test

		Employee Recognition	Organizational Loyalty
N		100	100
Normal Parameters	Mean	75.2300	81.4500
	Std. Deviation	8.45000	7.98000
Most Extreme Differences	Absolute	.075	.062
	Positive	.075	.062
	Negative	-.065	-.059
Kolmogorov-Smirnov Z		.750	.620
Asymp. Sig. (2-tailed)		.629	.835
a. Test distribution is Normal.			
b. Calculated from data.			

Source: Data processed using SPSS 26 software

Based on the results of the Kolmogorov-Smirnov normality test for the two research variables, namely employee recognition and organizational loyalty, the significance values (Asymp. Sig. 2-tailed) are 0.629 and 0.835, respectively. These values are greater than 0.05, indicating that the data for both variables are normally distributed. With the normality

assumption met, the data are suitable for further analysis using parametric statistical techniques.

4.2 Linearity Test

Scatter Plot and Regression Line of Employee Rewards vs Organizational Loyalty

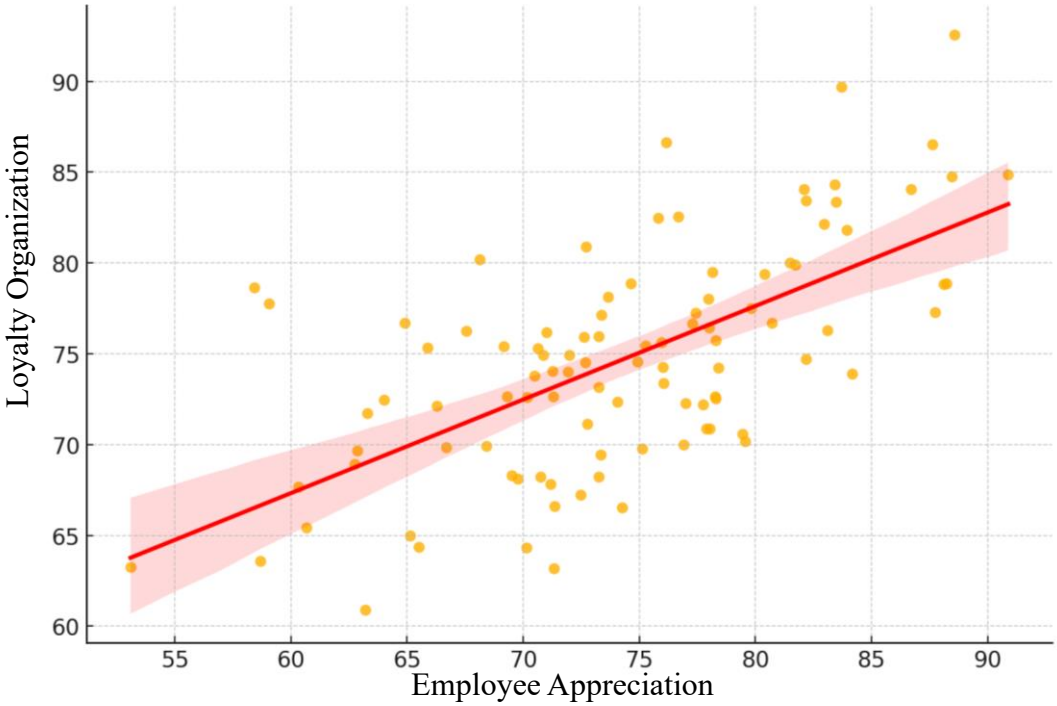

Figure 1. Scatter Plot

Based on the scatter plot, it appears that the data points are dispersed in a pattern close to a straight line, indicating a linear relationship between employee recognition and organizational loyalty. The regression line, fitted through the data, suggests that the higher the recognition employees receive, the more likely their loyalty to the organization increases. This linearity test reinforces that the relationship between the variables can be further analyzed using Pearson correlation or simple linear regression, as the linearity assumption is satisfied.

Table 2. Coefficients

Model	Unstandardized Coefficients B	Std. Error	Standardized Coefficients Beta	t	Sig.
(Constant)	36.414	0.062	–	585.624	0.000
Employee Recognition	0.515	0.062	0.642	8.286	0.000
a. Dependent Variable: Organizational Loyalty					

Source: Data processed using SPSS 26 software

The results of the simple linear regression indicate that the employee recognition variable has a significant effect on organizational loyalty, with a significance value (Sig.) of 0.000 (less

than 0.05). The regression coefficient of 0.515 suggests that a one-unit increase in employee recognition will increase organizational loyalty by 0.515 units, in a linear manner. The standardized coefficient Beta value of 0.642 indicates that the relationship between the two variables is fairly strong. This supports the conclusion that employee recognition is a significant predictor of organizational loyalty.

4.3 Homogeneity Test

The homogeneity test was conducted to determine whether the variances between two groups of data are equal (homogeneous). Specifically, it tested whether the variances of the employee recognition variable and the organizational loyalty variable are homogeneous.

Table 3. Homogeneity Test (Levene's Test)

Variable	Levene Statistic	df1	df2	Sig. (p-value)
Recognition-Loyalty	1,284	1	98	0,260

The test results indicate that the Levene's Statistic value is 1.284, with a significance level (Sig.) of 0.260. Since the significance value is greater than 0.05 (Sig. > 0.05), it can be concluded that the variances between the two variables are homogeneous. This means there is no significant difference in variance between employee recognition and organizational loyalty. Consequently, the data meet the assumption of homogeneity and are suitable for further analysis using parametric statistical techniques.

4.4 Simple Regression Analysis Results

To determine the extent of the influence of work stress on employee performance, a simple linear regression analysis was conducted using 100 respondents. The analysis results are presented in the table below:

Table 4. Coefficients

Model	Unstandardized Coefficients	Std. Error	Standardized Coefficients (Beta)	t	Sig.
	B				
(Constant)	35,420	2,616		13,538	.000
Organizational Loyalty	-0,511	0,116	-0,813	-4,418	.001

a. Dependent variable: Employee Recognition

Based on the results of a simple linear regression analysis, it is known that employee recognition significantly affects organizational loyalty. The testing results show that the constant value is 35.420, indicating that if no recognition is given to employees, the organizational loyalty would be at 35.420. The regression coefficient for the employee recognition variable is negative at -0.511, meaning that for every one-unit increase in employee recognition, there is a corresponding decrease in organizational loyalty by 0.511 units. However, the t-statistic test results show a value of -4.418 with a significance level of 0.001, which is less than 0.05, indicating that the relationship is statistically significant. The standardized beta value of -0.813 indicates that employee recognition has a strong but negative influence on organizational loyalty. Therefore, it can be concluded that there is a significant and negative relationship between employee recognition and organizational loyalty in this study.

Hypothesis testing was conducted to determine whether there is a significant effect of employee recognition on organizational loyalty. Based on the regression analysis results, a significance (Sig.) value of 0.001 was obtained, which is less than the significance threshold of 0.05. This indicates that the employee recognition variable statistically has a significant effect on organizational loyalty. Thus, the hypothesis stating that "employee recognition affects organizational loyalty" is accepted. This means that the higher or lower the recognition received by employees, the more it impacts their loyalty to the organization. Although the direction of the relationship shows a negative regression coefficient of -0.511, the significant influence means that employee recognition remains a key factor in shaping loyalty to the organization.

4.5 Relationship Between Employee Recognition and Organizational Loyalty

The results of this study indicate that there is a significant relationship between employee recognition and organizational loyalty (Putri et al., 2024). This finding suggests that the form of recognition received by employees, whether financial or non-financial, influences the extent to which an employee is willing to stay and commit to the organization they work for (Gusnadi et al., 2024; Nyanabhadra et al., 2024). Employee recognition is an important factor in human resource management, as it can enhance work motivation, job satisfaction, and ultimately impact employee loyalty (Ardianto et al., 2025b; Luwiha et al., 2025b; Suryanadi et al., 2021; Tupari et al., 2023). When employees feel valued for their contributions and achievements, they tend to feel more respected and have a stronger emotional bond with the organization (Ardianto et al., 2020, 2025a; Dharma et al., 2024). This fosters a loyal attitude, characterized by a desire to remain employed long-term, a positive attitude towards the organization, and a commitment to the institution's progress (Yusdhika et al., 2024). Conversely, when employees feel they are not receiving adequate recognition for their performance, it can lead to disappointment, decreased work enthusiasm, and even a desire to seek employment elsewhere that is perceived to value their contributions more (Burmansah et al., 2024; Ngailia et al., 2024). Therefore, recognition is not merely a form of compensation but also a strategic tool for retaining the best talent within the organization (Safira & Kurbani, 2024).

These findings align with previous theories, such as Herzberg's two-factor theory, which states that recognition falls into the category of motivator factors that can enhance job satisfaction and loyalty (Kawulur et al., 2018 ; Septiani et al., (2024). Additionally, this finding reinforces earlier research that indicates a fair and transparent reward system can improve employee retention and strengthen organizational commitment (Ardianto et al., 2025a; Luwiha et al., 2025a; Taridi et al., 2024). However, it is important to note that employee loyalty is not only influenced by recognition but also by various other factors such as work climate, interpersonal relationships, leadership, and career development opportunities. Therefore, while recognition plays a crucial role, organizations must also consider other factors holistically to create a work environment that supports long-term loyalty.

5. Conclusion

Based on the research conducted, it can be concluded that there is a significant relationship between employee recognition and organizational loyalty. Recognition provided by the organization, whether in material or non-material forms, has been shown to affect the level of employee loyalty. The higher the level of recognition received, the greater the tendency for employees to demonstrate loyalty to the organization. This finding emphasizes the importance of a fair and transparent reward system in building long-term employee commitment. Organizations that can appropriately appreciate their employees' contributions will have a better chance of retaining quality and dedicated workforce. Therefore, organizational

management is advised to continuously evaluate and improve recognition policies to not only motivate employees in the short term but also foster strong loyalty and attachment to the organization in the long term.

REVIEWING GENERATION Z'S INVESTMENT INTEREST THROUGH MOBILE BANKING

Arfatun[1,*], Henny Meyliana[2], Hari Mudjiarto[3]

[1,2,3]Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

The development of financial technology has transformed the way people interact with banking services, particularly through mobile banking. This study aims to explore Generation Z's investment interest by considering the influence of the Technology Acceptance Model (TAM) and subjective norms. Using a quantitative approach, the research involved 310 respondents from Generation Z and analyzed the data using the SEM PLS method. The findings indicate that perceived usefulness and perceived ease of use have a significant impact on attitudes, which in turn positively affects investment interest. However, subjective norms did not show a significant influence on investment interest. This research fills a gap in the literature by examining investment interest through mobile banking from the perspectives of TAM and subjective norms.

Keywords: Investment Interest, Mobile Banking, Technology Acceptance Model, Generation Z

1. Introduction

The development of information and communication technology, particularly in the field of artificial intelligence (AI), has drastically changed digital financial services. In recent years, technological innovations have accelerated the way people interact with various financial services (Liu et al. 2025; Perdana et al. 2025; Sandhu et al. 2025). With advancements in AI, financial services have become more responsive, efficient, and secure. This technology enables the analysis of large amounts of data to provide more accurate and tailored recommendations for users. For example, AI can help identify spending patterns and offer investment suggestions that align with individual risk profiles. Additionally, transaction security has been further strengthened through the use of biometric technology and more advanced encryption methods (Desyatnyuk et al. 2024; Onyshchenko et al. 2022). This not only enhances the security of services but also builds public trust in the use of digital platforms. Thus, this technology not only facilitates transactions but also reinforces the public's understanding of the importance of good financial management.

Mobile banking has become one of the primary solutions for providing accessible financial services to various segments of society (Siano et al. 2020). The applications that can be downloaded to smartphones, users can conduct various financial transactions anytime and anywhere without the need to visit a physical bank. This convenience is particularly important for the younger generation, who seek fast and efficient services. Moreover, mobile banking offers various features that allow users to check balances, pay bills, and transfer money easily (Arcand et al. 2017). With real-time notifications, users can monitor their transactions, which aids in better financial management. In this context, mobile banking plays a crucial role in accelerating the development of digital finance, encouraging society to shift from cash transactions to digital ones (Jun and Palacios 2016; Kamboj et al. 2022). This not only benefits individuals but also contributes to overall economic growth by enhancing efficiency and transparency in the financial system.

The functions of mobile banking are now increasingly diverse, extending beyond just transfers and payments. Many mobile banking applications provide dedicated menus for investments, allowing users to purchase investment products such as stocks, mutual funds, and bonds. These investment menus are designed to attract users who want to start their investment journeys in a more accessible way. With intuitive interfaces and clear information, users can quickly understand the products offered and make more informed investment decisions (Goswami and Raghavendran 2009). Additionally, educational features often included in mobile banking applications help users, especially Generation Z, learn about investments and risk management. With this approach, mobile banking not only serves as a transaction tool but also as a financial education platform that encourages users to invest. Financial companies are increasingly recognizing the importance of these features, as they can attract more users, particularly among the younger generation who are more open to investing (Ammer and Aldhyani 2022).

In Indonesia, the development of mobile banking shows a very positive trend (Rahmi and Handayani 2024). Many banks and financial institutions have invested in developing mobile banking applications that not only facilitate daily transactions but also provide investment features. These initiatives aim to attract the younger generation to be more active in investing, in line with global trends showing high interest in investments among Generation Z. Some applications even offer investment simulation features that allow users to try investing without financial risk. In this context, the government also plays a role with policies that encourage the digitization of financial services (Zhou et al. 2023), making it easier for the public to access information and investment products. With an increasing number of options and conveniences offered, it is hoped that the younger generation, particularly Generation Z, can become more engaged in the world of investments. This is expected not only to enhance individual well-being but also to have a positive impact on the national economy.

Despite the progress in financial inclusion in Indonesia, challenges remain. According to reports from the Financial Services Authority (OJK), although the number of digital financial service users has increased, there are still segments of society that remain unserved, particularly in remote areas (Miranti Midu and Sri Dewi Yusuf 2024). Generation Z, who have grown up in the digital era, have great potential for investing as they are more familiar with technology and information (Kim et al. 2022; Park et al. 2024). They tend to be more open to the concept of investing and have better access to information through the internet. By utilizing mobile banking, this generation can easily make small investments that may have previously seemed difficult or unattainable. Furthermore, with the increasing awareness of the importance of financial planning among young people, it is hoped that they can contribute to enhancing financial inclusion in Indonesia. This will help create a more inclusive and sustainable financial ecosystem.

However, despite numerous studies on the use of mobile banking, specific research on Generation Z's investment interest through this platform is still very limited. Many studies focus more on the technical aspects and general adoption of mobile banking, while investment interest as a key element in the development of the digital economy has not been extensively researched. One study conducted in Saudi Arabia attempted to examine the intention to use virtual assistants (Alkadi and Abed 2025) and utilized the TAM model in its research. The current study aims to fill this gap. This gap is important to address because understanding the factors influencing Generation Z's investment interest can help design better strategies to attract them into the world of investing. This includes understanding their preferences, behaviors, and the challenges they face in using investment services through mobile banking. By identifying this gap, we can provide more relevant recommendations for application developers and financial institutions to enhance the features and services offered.

Therefore, research on Generation Z's interest in investing through mobile banking is crucial. Understanding how this generation adapts to technology in the context of mobile banking can provide valuable insights for application developers, financial institutions, and policymakers. This study is expected to uncover the motivations, barriers, and expectations of Generation Z in investing, thereby creating an environment that supports investment growth. With a better understanding of the needs and preferences of this generation, financial institutions can design more relevant and appealing products, as well as improve marketing strategies to reach them more effectively. Additionally, the results of this research can also be used to formulate policies that promote financial inclusion and enhance financial literacy among young people, enabling them to contribute more significantly to the national economy.

2. Literature Review

2.1 Theory Acceptance Model

This study proposes a framework based on the Technology Acceptance Model (TAM) (Davis 1989) to investigate the factors influencing Generation Z's interest in investing using mobile banking. TAM has proven effective in predicting user acceptance of information technology (Belanche et al. 2019), making it a suitable model for exploring user responses to innovative technology over the past two decades. This model has been widely applied to study consumer intentions in adopting various electronic services in the banking sector, such as internet banking (Salimon et al. 2017) and fintech (Belanche et al. 2019). however, much of the literature indicates that TAM often receives criticism for overlooking other important factors that influence user behavior, such as social aspects. TAM was originally designed to explain the factors affecting technology adoption in general, rather than to explain the adoption of specific types of technology (Rezaei et al. 2024). his limitation indicates the need to complement attitudes with subjective norms, in line with the approach proposed by Ajzen (1997) in the Theory of Reasoned Action (TRA). Therefore, to address this criticism, our model extends TAM by including subjective norms.

2.2 Technology Acceptance Model

TAM indicates that there are two main components that influence an individual's attitude toward technology: perceived usefulness (PU) and perceived ease of use (PEU) (Davis 1989). Based on the cost-benefit paradigm, a person's attitude toward technology significantly affects their intention to accept and adopt it (Davis 1989). Attitude reflects the extent to which an individual considers a particular behavior, such as using new technology, as desirable or undesirable (She et al. 2024). In today's digital era, attitude has become a crucial predictor of consumer behavior (She et al. 2024). PEU refers to the extent to which a person believes that using a particular technology does not require much effort, while PU refers to the extent to which they believe that the technology can enhance their performance (Davis 1989). Several studies related to AI in the banking sector have analyzed factors within TAM (Belanche et al. 2019; Rahman et al. 2023). Thus, the relevant hypotheses are proposed.

H1: Perceived usefulness significantly positively influences attitudes toward investment interest using mobile banking

H2: Perceived ease of use significantly positively influences attitudes toward investment interest using mobile banking

H3: Attitude significantly positively influences investment interest using mobile banking

Various studies have shown a significant influence of PU on behavioral intention (Belanche et al. 2019). Salimon et al. (2017) found a strong positive relationship between PU, perceived security, and acceptance of e-banking. Additionally, Alalwan et al. (2016) demonstrated that PU has a significant impact on behavioral intention in the context of

consumer acceptance of mobile banking in Jordan. Therefore, we propose the following hypothesis.
H4: Perceived usefulness significantly positively influences investment interest using mobile banking.
Furthermore, research has also shown that PEU is an important predictor of consumer intention to adopt electronic banking (Salem and Rassouli 2025; Singh et al. 2025). When consumers perceive a particular system as easier to use, they tend to have a positive attitude toward that system and are more likely to accept it. Therefore, the following hypothesis is proposed.
H5: Perceived ease of use significantly positively influences investment interest using mobile banking

2.3 Subjective Norms

In social psychology, normative influence refers to the perception that others believe one should or should not perform a certain behavior (Ajzen 1997). Social norms depend on social information and encourage individuals to adopt specific behaviors based on the views of others. In the context of digital finance, subjective norms (SN) are often influenced by interpersonal and external sources of information (Bhattacherjee 2000). This aligns with research on technology-based innovations, where public opinion shapes behavior through comments, actions, and media reports (Liao et al. 2024). Several studies have shown that SN positively influences behavioral intention in AI-based banking services (Belanche et al. 2019). Given the importance of social confirmation and incentives in the adoption of AI in the banking sector, we propose the following hypothesis.
H6: Subjective norms significantly positively influence investment interest using mobile banking.

3. Methodology

3.1 Research Approach

This research is quantitative, research by obtaining data in the form of numbers or quantitative data that is added up (Sugiyono, 2018). The research approach used is associative which looks at the relationship between two or more variables. This study examines Islamic financial literacy and religiosity on interest in saving at Islamic Banks and examines whether the mediating variable trust, can support the effect of Islamic financial literacy and religiosity on interest in saving at Islamic Banks.

3.2 Sample Selection and Data Collection

The use of convenience sampling is an economical method that allows for a variation of different participants (Golzar et al. 2022). To enhance the representativeness of the sample and reduce bias in sampling, a larger sample size is required without restricting demographic factors such as gender, income, or place of residence (Golzar et al. 2022). An online survey was distributed using Google Forms between January and February 2025. Potential biases in online data collection include technology familiarity bias, where respondents' comfort level with technology may affect their participation rate. To address this issue, the survey was designed to be user-friendly and distributed across various platforms to reach a broader segment of Generation Z, resulting in a more representative sample. The questionnaire targeted members of Generation Z, yielding 310 respondents aged 18-28 who completed the survey, a sufficient number to validate the research methodology and test the hypotheses (Hair et al. 2019). The questionnaire consisted of closed-ended questions assessed using a 5-point Likert scale.

3.3 Definitions, Variable Measurement, and Data Analysis

The definitions and measurements for each variable are presented in Table 1, and the questionnaire statements for data collection are presented in Table 2. Subsequent data analysis utilized SEM PLS by testing the Outer Model and Inner Model to assess validity and reliability, leading up to the hypothesis testing of the research.

Table 1. Variable Definition

Variable	Definition	Indicator	Reference
Investment Interest	Investment interest, referring to the tendency or interest of individuals to make investments with the aim of achieving future profits.	Desire to find out about investing; Willingness to spend time learning about investing; Confidence to try investing	(Che Hassan et al. 2023)
Perceived Usefulness	Perceived Usefulness is defined as the extent to which a person believes that the use of a particular technology will improve their work performance or results..	Improves job performance; Increase productivity; Increase Effectiveness; Useful	(Davis 1989)
Perceived Ease of Use/PE	Perceived Ease of Use/PEOU is defined as the extent to which a person believes that the use of technology will make their tasks easier and require less effort.	Easy to learn; Easy to use; Clear and understable; Become skillful	(Davis 1989)
Attitude	Attitude is an expression of an individual's feelings that reflect his or her likes or dislikes towards an object, idea, or situation.	Wealth Building; Practical; Advantages Over Other Instruments; Old Age Benefits	(Doob 1947)
Subjective Norm	Subjective norm is an individual's view of the beliefs of others that may influence his or her intention to perform or not perform the behaviour under consideration.	Friend Influence; Parent Influence; Sibling Influence	(Latimer and and Martin Ginis 2005)

Table 2. Research Questionnaire Statement

Variable	Statement
Investment Interest	- I look for information about investing - I consider news about investment - I find out the advantages and disadvantages of investment
	- I take the time to participate in activities related to investment - I read information about investment
	- I have sufficient capital for investment - I am interested in trying to invest - By considering the benefits and risks, I am more interested in investing

Usability Perception	- The use of mobile banking services can expedite all kinds of transactions - The use of mobile banking services minimizes banking activities, especially in transactions
	- Through mobile banking I get the information I need - By using mobile banking services, I can make transactions practically
	- Using mobile banking services allows me to make transactions faster - Using mobile banking allows me to make transactions more easily
	- The benefits of mobile banking services can save time in making transactions - The benefits of mobile banking services can save costs in making transactions
Perceived Ease of Use	- The use of mobile banking services is easy to learn - The menu layout of mobile banking services is easy to understand
	- Mobile banking can be easily used anywhere and anytime - Mobile banking can be easily accessed
	- Mobile banking can facilitate frequent transactions - Fitur yang ada pada layanan mobile banking mudah dimengerti
	- The features available in mobile banking services are easy to comprehend - Using mobile banking services can enhance skills
Attitude	- Personally, activities that can develop wealth are good activities - Investment is an activity that can develop wealth
	- For me, engaging in practical activities is a good thing - Investment is a practical activity to undertake
	- For me, choosing profitable activities is a good thing - Investment is a profitable activity
	- For me, activities that provide additional capital in old age are good - Investment is an activity that provides additional capital in old age
Subjective Norm	- I usually follow what my friends recommend - My friends will support me in investing
	- I usually follow what my parents recommend - My parents will support me in investing
	- I usually follow what my siblings recommend - My siblings will support me in investin

4. Results and Discussions

4.1. Validity Test (Convergent Validity)

Convergent validity test is the correlation between indicator scores and latent variable scores. The convergent validity of a construct with reflective indicators is evaluated by Average Variance Extracted (AVE). A good AVE value is equal to 0.5 or more, and an AVE value of 0.5 or more means that the construct can explain 50% or more of the item variance (Ahmad et al., 2017). Table 3 shows that the AVE value for each variable is more than 0.5, which means this value explains that each indicator can explain or represent more than 50% of the latent variable.

Table 3. Validity and Reliability Test Results

Variable	Cronbach's Alpha	rho_A	Composite Reliability	Average Variance Extracted (AVE)	Fornell Lacker Criterion				
					Variable				
					AT	II	PEU	PU	SN
AT	0.926	0.931	0.940	0.661	0.813				
II	0.893	0.898	0.918	0.652	0.500	0.808			
PEU	0.944	0.952	0.954	0.750	0.600	0.728	0.866		
PU	0.919	0.923	0.940	0.757	0.578	0.802	0.841	0.870	
SN	0.921	0.929	0.938	0.717	0.634	0.732	0.855	0.868	0.847

Note: AT (Attitude), II (Investment Interest), PEU (Perceived Ease of Use), PU (Perceived Usefulness), dan SN (Subjective Norms).

4.2. Discriminant Validity

The test is carried out to compare the AVE square root value of each construct with the correlation between other constructs in the model (Fornell Lacker Criteria). If the AVE square root value of each construct is greater than the correlation value between constructs and other constructs in the model, then the model is said to have good discriminant validity value (Cheah et al., 2017). Table 3 shows that the value of each construct is greater when correlated with other constructs in the model, meaning that each construct in the model has good discriminant validity.

4.3. Reliability Test

The Cronbach's Alpha test aims to measure the lower limit of the reliability value of a construct; the construct is declared reliable if the Cronbach's Alpha value is more than 0.60. Composite reliability aims to measure the true value of the reliability value of a construct. A construct can be said to be reliable if the composite reliability value is above 0.70 (Cheah et al., 2017). In Table 4 it can be seen that the Cronbach's Alpha value for each construct is greater than 0.60, and the composite reliability value for each construct is above 0.70. This means that each instrument used in the construct is accurate, precise, and consistent to measure a construct.

4.4. Structure Model/Inner Model

4.4.1. R Square (R2)

The test is conducted to show the extent to which exogenous variables affect endogenous variables. A good R-Square value is expected to be more than 0.67. The R-Square value is said to be strong if it is at 0.75, moderate if 0.50, and weak if 0.25 (Cheah et al., 2017). Based on table 4, it can be seen that the R-Square value of Investment Interest is 0.649 or 64%, this value means that the Investment Interest variable is 64% influenced by the independent variable and the remaining 36% is influenced by other variables outside those studied. The attitude variable based on the R-Square value of 0.573 or 57% is influenced by the perceived usefulness and perceived ease of use variables, while the remaining 33% is influenced by other variables outside the study.

4.4.2. Predictive Relevance (Q^2)

Testing is done to see the value that shows how well the observations are made or to measure how well the observation values are produced by the model and parameter estimates. The value that shows good observation results is > 0 and if on the contrary < 0 then the observation results have a bad value (Cheah et al., 2017). Table 4 shows the Q-Square / Predictive Relevance Value of the endogenous variables is more than 0 or 0.408 which means it has a good observation value. The Attitude variable based on the Q-Square table shows a value of 0.239, which means that the variable has a good observation value.

Table 4. R Square and Predictive Relevance test results

Variable	R Square (R^2)	Predictive Relevance (Q^2)
Attitude	0.573	0.239
Invesment Interest	0.649	0.408

4.5 Hypothesis Test

The results of hypothesis testing were tested and presented in table 5. The test results show that perceived usefulness and perceived ease of use are significantly positively related to attitude and investment interest, which further supports the hypothesis. Furthermore, attitude significantly has a positive effect on investment interest, and subjective norms are the opposite, namely not significantly affecting investment interest.

Table 5. Hypothesis Testing Results

Variable	Original Sample (O)	P Values
Attitude -> Investment Interest	0.027	0.016
Perceived Ease of Use -> Attitude	0.403	0.000
Perceived Ease of Use -> Investment Interest	0.049	0.006
Perceived Usefulness -> Attitude	0.227	0.013
Perceived Usefulness -> Investment Interest	0.656	0.000
Subjective Norm -> Investment Interest	0.101	0.311

Discussion

In this study, we applied the Technology Acceptance Model (TAM) and subjective norms to explore Generation Z's investment interest using mobile banking. The findings indicate that perceived usefulness and perceived ease of use have a positive and significant impact on attitudes, supporting hypotheses 1 and 2. This suggests that when Generation Z perceives real benefits and ease of use in mobile banking, they are likely to develop a positive attitude toward

the application. This highlights the importance of a user-friendly interface and relevant features that can enhance the user experience. Previous research also indicates that ease of access and clarity of information significantly contribute to the formation of positive attitudes. Therefore, mobile banking service providers need to focus on enhancing features that can strengthen these positive perceptions to attract Generation Z as potential investors.

Furthermore, we found that perceived usefulness, perceived ease of use, and attitude significantly positively influence Generation Z's investment interest in using mobile banking. These findings support hypotheses 3, 4, and 5. This indicates that the positive attitude formed from these two factors perceived usefulness and perceived ease of use directly motivates Generation Z to invest through mobile banking. This research is consistent with the theory that individuals tend to take actions they perceive as beneficial and easy (Septiani et al. 2024). Generation Z, being tech-savvy, is more likely to be motivated to use mobile banking as an investment tool if they feel that the application can provide financial benefits and is easily accessible (Putri et al. 2024; Yusdhika et al. 2024). Therefore, it is important to provide education and clear information regarding the real advantages of investing through mobile banking platforms to instill greater confidence in Generation Z's investment decisions.

However, the results of this study also indicate that subjective norms do not have a significant impact on Generation Z's investment interest in using mobile banking, meaning hypothesis 6 is rejected. Although social norms are often considered a key factor in decision-making, these findings suggest that Generation Z prioritizes personal experience and their perceptions of technology over social pressure from their surroundings (Pujayanti et al. 2024). This may be due to Generation Z's characteristics, which include being more independent in decision-making and more open to technological changes . They tend to seek information independently through the internet and various digital platforms, thereby forming their own views without being overly influenced by others' opinions. This research provides important insights that to attract Generation Z's interest, a more individualized experience and education about technology are needed, rather than relying on existing social norms.

Overall, the results of this study indicate that the findings can be relied upon to predict Generation Z's investment interest using mobile banking. By understanding the factors that influence their attitudes and interests, financial service providers can design more effective strategies to engage Generation Z in using mobile banking as an investment tool. This research also opens opportunities for further studies on how technological developments and changes in social behavior may influence Generation Z's investment attitudes in the future. Therefore, it is essential for the financial industry to continuously adapt to changes in consumer behavior to remain relevant and provide services that meet the needs of the younger generation. With the right approach, mobile banking can be an effective tool in enhancing financial literacy and investment interest among Generation Z.

5. Conclusion

The development of banking technology, particularly through mobile banking, has prompted researchers to investigate Generation Z's investment interest. In this study, we combined the Technology Acceptance Model (TAM) and subjective norms to understand the factors influencing this group's investment decisions. We employed a quantitative approach and SEM PLS as a data analysis tool. The findings indicate that perceived usefulness and perceived ease of use significantly impact attitudes toward using mobile banking. Additionally, the results suggest that positive attitudes, along with these two factors, contribute to Generation Z's investment interest. However, subjective norms did not show a significant influence on investment interest, indicating that Generation Z is more influenced by personal experience and their perceptions of technology than by social pressure. Overall, this research provides

valuable insights for financial service providers to understand Generation Z's behavior in utilizing mobile banking as an investment tool, emphasizing the importance of enhancing features and education to attract this group's attention.

ENTREPRENEURSHIP EDUCATION COMPETENCE AS THE KEY TO INDONESIA'S ECONOMIC DEVELOPMENT IN THE DIGITAL AGE

Nurwahdania[1,*], Partama Nagatirtha[2], Henny Meyliana[3]

[1,2,3]Jinarakkhita Buddhist College of Lampung, Indonesia

Abstract

Entrepreneurship competencies are key to driving Indonesia's economic growth and development in the digital era, especially in addressing challenges such as unemployment and economic inequality. This study uses a qualitative approach with a systematic literature review method and semi-structured interviews to analyze the drivers and barriers of entrepreneurship, the role of education, and the impact of digital transformation. The study results show that strengthening entrepreneurship competencies requires the integration of a practice-based curriculum, digital entrepreneurship training, and government policy support. Case studies at the State University of Malang (UM) and Wonogiri UMKM prove that a combination of entrepreneurship education and field experience can create innovative and competitive entrepreneurs. Thus, the development of a holistic entrepreneurial ecosystem through education, technology, and policy collaboration is a strategic solution to improve Indonesia's economic competitiveness.

Keywords: *Entrepreneurship Competency, Digital Economy, UMKM, Digital Transformation*

1. Introduction

In the midst of global economic uncertainty, strengthening the entrepreneurship sector and education has become one of Indonesia's main pillars for enhancing economic competitiveness and creating new job opportunities. According to Rokhim et al., (2024), the open unemployment rate in Indonesia remains at 5.32%, with a predominance of youth unemployment. This underscores the urgency of developing entrepreneurship within education as a strategic approach. Entrepreneurial activities play a strategic role in creating new business actors and companies. There can be no development without the presence of entrepreneurs, as entrepreneurship drives the economy towards national equilibrium (Nguyen & Nguyen, 2023).

Entrepreneurship in education is an approach that integrates the concepts and practices of entrepreneurship into the education system (Azqueta et al., 2023). the aims is to develop entrepreneurial skills, attitudes, and mindsets among students, as well as to encourage innovation and project-based learning in educational institutions rapidly and globally (Dabbous & Boustani, 2023). This condition presents unique challenges for educational institutions in preparing graduates who are competent and ready to enter the workforce or engage in independent entrepreneurship. It is not enough to deliver academic material conventionally; there must be a learning ecosystem that encourages students to become problem solvers, innovators, and business actors capable of creating added value (Hestiningtyas et al., 2023; Gusnadi, Ardianto, and Rapiadi 2024). Therefore, the integration of entrepreneurship into the educational curriculum is a fundamental necessity for building entrepreneurial spirit and competencies.

These competencies are not limited to theoretical knowledge about business but also encompass practical skills and the mental attitudes necessary for success in the entrepreneurial world. Entrepreneurial competencies refer to an individual's ability to identify, develop, and realize business opportunities through innovation, creativity, and measured risk-taking (Wang

et al., 2023). Strong entrepreneurial competencies play a crucial role in fostering the emergence of adaptive, innovative, and competitive entrepreneurs (Sun et al., 2s023). Entrepreneurial competencies include a combination of knowledge, skills, and attitudes required to identify business opportunities, manage businesses, and create sustainable added value (Krishnawati et al., 2023). In the digital era, these competencies are further expanded to include the ability to adapt to technological developments, mastery of digital marketing, and data-driven business management (Yasa et al., 2023; Yusdhika et al., 2024). Nevertheless, strengthening entrepreneurial competencies remains a significant challenge, both in terms of education, training, and government policies.

On the other hand, the Government of Indonesia faces demographic challenges, with more than 64% of the population in the productive age group (15-64 years) compared to the non-productive age group (Setiawan, 2021; Pujayanti et al., 2024). This phenomenon presents a significant opportunity for entrepreneurship development, particularly among the younger generation. According to Zuhroh & Pradhani, (2024), Indonesia's entrepreneurship rate is still relatively low compared to other Southeast Asian countries. The current entrepreneurship ratio in Indonesia is around 3.47%, while Singapore reaches 8.76% and Malaysia 4.74%. One of the reasons for this is the lack of entrepreneurial competencies relevant to the needs of the digital era, such as digital literacy, utilization of online platforms, and technological innovation (Qiu et al., 2023). This condition demands individuals not only to possess theoretical knowledge but also practical skills and an adaptive mentality in facing uncertainty and intense competition.

This condition demands individuals not only to possess theoretical knowledge but also practical skills and an adaptive mentality in facing uncertainty and intense competition (Avelar et al., 2024). Therefore, building a digital-based entrepreneurial ecosystem is an important step for Indonesia. The majority of MSME actors and prospective entrepreneurs in Indonesia still face limitations in digital skills and online marketing, which are major obstacles to their business development (Listyaningsih et al., 2023).

The urgency of strengthening entrepreneurial competencies is further reinforced by the fact that the fourth industrial revolution has shifted the economic paradigm towards the gig economy, where flexibility and innovation are key. Entrepreneurs are required not only to be adaptive to technological changes but also to possess a creative and collaborative entrepreneurial mindset (Di Paola et al., 2023). Digital entrepreneurship training can enhance the motivation of the younger generation to engage in entrepreneurship and expand market access globally (Tiberius & Weyland, 2023; Taridi et al., 2024). Furthermore, the role of entrepreneurship education still needs to be strengthened. The implementation of the *Merdeka Belajar Kampus Merdeka* (MBKM) program has provided space for strengthening entrepreneurial soft skills; however, the effectiveness of this program heavily depends on the capacity of educational institutions to provide curricula relevant to the demands of Industry 4.0 and Society 5.0. Therefore, education combined with structured digital entrepreneurship training will enhance the readiness of the younger generation to face the challenges of the digital business era (Thomas, 2023).

Based on the above discussion, strengthening entrepreneurial competencies is a fundamental need to support Indonesia's economic development in the digital era, and education encompasses elements of teaching, training, and mentoring an individual's potential. Research and development programs focused on strengthening digital entrepreneurial competencies should continue to be enhanced, both in educational environments, MSME communities, and the broader social environment. Thus, Indonesia can optimize its digital economic potential to achieve inclusive and sustainable economic growth towards the era of Society 5.0.

2. Methodology

This study employs a systematic literature review approach, which involves reviewing literature such as books, journals, and other academic works related to the research topic (Herman & Sopiah, 2023). By analyzing these sources, this research aims to produce a comprehensive discussion. The data sources in this study are obtained from various scientific literature, including journal articles, books, research reports, and other academic publications. The data collection process is conducted through systematic searches in electronic databases such as Google Scholar, JSTOR, Science Direct, and university repositories using the keyword "entrepreneurship in education." This research utilizes a qualitative descriptive analysis approach by examining various sources such as national and international journals and books to generate new theories or understandings. The analysis techniques include data grouping, identifying patterns of similarities and differences, and providing insights.

3. Results and Discussions

Competence refers to a set of knowledge, skills, and attitudes that an individual possesses, masters, and manifests in performance to achieve specific results in a particular context. Competence encompasses not only cognitive and technical aspects but also social and emotional skills that support an individual in effectively carrying out tasks and responsibilities (Sitaridis & Kitsios, 2024). Meanwhile, entrepreneurship is the ability of an individual to create something new and valuable through the development of creative ideas, risk-taking, and the utilization of market opportunities to produce goods or services that provide added value to society (Rodrigues, 2023).

Thus, entrepreneurial competence refers to a set of knowledge, skills, and attitudes required for an individual to recognize opportunities, develop innovations, and effectively and sustainably build and manage a business in the face of market dynamics and business challenges. This competence includes dimensions of creativity, managerial skills, communication, decision-making, and the courage to take risks in the context of entrepreneurship (Olutuase et al., 2023). With strong entrepreneurial competence, individuals are not only capable of creating new businesses but also contributing to the improvement of the community's economy through sustainable innovation. On the other hand, entrepreneurship in education is an approach that integrates the concepts and practices of entrepreneurship into the education system.

3.1. Entrepreneurship in Indonesia

The state of entrepreneurship in Indonesia has been steadily increasing year by year, particularly with the rapid development of information and communication technology, especially the growth of the internet. This has sparked enthusiasm for entrepreneurship, encouraging entrepreneurs, including startups in both technology and non-technology sectors. However, it cannot be denied that technological advancements have increased the number of startups in Indonesia.

Currently, the trend among entrepreneurs is predominantly among the youth who possess competencies in accessing technology, particularly Information and Communication Technology (ICT). The interest of young people in entrepreneurship is influenced by digital developments that are an active part of their activities, as well as the availability of facilities for accessing information and ease of communication through ICT (Elyta et al., 2020). The Indonesian Internet Service Providers Association (APJII) 2024 reports that the number of internet users in Indonesia has reached 221,563,479, or about 79.5% of the total population, compared to 212.9 million in 2023 (Rifky Pamungkas et al., 2021).

The phenomenon of building a mindset and motivation among young people to utilize their competencies presents a new opportunity for entrepreneurs to start and develop their

businesses. Therefore, knowledge of entrepreneurship must be possessed by young people as intellectuals who can easily access information digitally to spark innovation in entrepreneurship. The opportunities are expanding, especially with the advent of internet entrepreneurship for young people to initiate entrepreneurial activities, supported by government programs that enable entrepreneurs to engage in entrepreneurial activities through educational entrepreneurship training and funding programs for MSMEs. Entrepreneurship in Indonesia is rapidly developing, especially with the rise of the digital economy and the entry of MSMEs into technology-based business.

3.1.1. Potential and Challenges of Entrepreneurship

Indonesia has significant potential for entrepreneurship development, supported by a large domestic market, abundant natural resources, a growing middle class, a strong entrepreneurial spirit among the community, and government support. The large and diverse population creates broad and specific business opportunities tailored to local needs. The wealth of natural resources in agriculture, fisheries, forestry, mining, and renewable energy provides a strong foundation for various types of businesses. The rapidly growing middle class drives demand for quality products, education services, healthcare, and tourism. A high entrepreneurial spirit, supported by creativity, innovation, and collaborative networks, becomes a unique strength (Rachmawati & Humairoh, 2023). The government also supports this through financing programs, training, ease of licensing, and strengthening digital infrastructure. Law No. 20 of 2008 reinforces the commitment to create a conducive business climate for MSMEs.

However, various challenges still need to be addressed. Access to capital remains difficult, especially for young people with limited experience and assets. Weak competencies, mental resilience, and an instant-gratification mindset also hinder the development of a robust entrepreneurial spirit. Additionally, limited infrastructure and access to technology in remote areas impede the equitable utilization of digital markets. The societal paradigm that favors formal professions over entrepreneurship further weakens the motivation of the younger generation. Furthermore, government policies have not been uniformly implemented, resulting in program benefits not reaching all regions fairly (Rohmanuddin et al., 2023). Therefore, stronger collaboration between the government, private sector, and society is needed to build an inclusive, adaptive, and sustainable entrepreneurial ecosystem.

3.1.2. Demographic Potential and Digital Economy

Indonesia has significant demographic potential through a demographic bonus, where the productive age population is dominant. This presents a golden opportunity to drive economic growth, especially if tech-savvy young people can develop digital businesses (Ratnasari & Levyda, 2021). A low dependency ratio allows for a focus on human and infrastructure development. However, this potential can only be optimally utilized through investments in education, training, and supportive regulations to avoid increasing unemployment and social issues.

On the other hand, Indonesia's digital economy continues to grow rapidly, providing significant opportunities for MSMEs through e-commerce, digital payments, and technological innovations. The ability to adapt to technological changes is key to success in this era. To support inclusive and sustainable digital economic growth, collaboration between the government, private sector, and educational institutions is needed, along with increased financial literacy among entrepreneurs. With a conducive ecosystem, digitalization can expand job opportunities and enhance national competitiveness.

3.1.3. Indonesia's Ranking in the Global Entrepreneurship Index

Indonesia's ranking in the Global Entrepreneurship Index (GEI) remains relatively low, ranging from 45 to 75 out of 137 countries, generally placing it fifth in Southeast Asia. Nevertheless, the entrepreneurial ecosystem shows a trend of improvement, with an increase in the GEI score of about 14% per year. The entrepreneurship ratio in Indonesia is still low at 3.18%, but the Total Early-Stage Entrepreneurial Activity (TEA) rate is relatively high, reaching 9.6% in 2020 the second highest according to the Global Entrepreneurship Monitor (Wijaya & Widjaja, 2023). his reflects a significant interest in entrepreneurship among the population, although it still needs to be supported by strengthening the ecosystem.

3.1.4. Driving and Hindering Factors of Entrepreneurial Competence

The motivation to engage in entrepreneurship is influenced by various factors, such as family and peer environments, education, and strong personal will. The environment significantly impacts an individual's mindset and actions in starting a business, while education provides the foundational knowledge about entrepreneurship. The internal drive is the primary foundation for building and developing a business. However, entrepreneurs often face obstacles stemming from both internal and external factors (Suharyati et al., 2023). Internal obstacles include a lack of financial control, fear of failure, absence of strategic planning, limited market experience, and low risk-taking capacity.

External obstacles include issues related to human resources, strict market regulations, and a lack of practical entrepreneurship training. Entrepreneurs need to understand the importance of cash flow management, plan their businesses with solid strategies, and conduct thorough market research. Additionally, competent workforce support, readiness to face government regulations, and ongoing training are necessary to address market challenges. Without mastering these aspects, the entrepreneurial journey will struggle to develop optimally, even though potential and interest are high.

3.1.5. Impact of Low Entrepreneurial Competence

Low entrepreneurial competence has widespread effects, ranging from weak MSME (Micro, Small, and Medium Enterprises) development to an increase in unemployment rates. Entrepreneurs lacking skills in innovation, leadership, and management struggle to scale their businesses and create new job opportunities. As a result, local economies stagnate, and communities lose opportunities for economic independence (Purnamasari & Ramdani, 2020). Many higher education graduates are also unprepared for entrepreneurship due to a lack of skill training and confidence, as well as minimal experiential learning. This fosters a dependency on formal employment, which has limited capacity, leading to persistently high unemployment rates, especially among the productive age group.

On the other hand, the contribution of MSMEs to GDP is still not optimal, despite their increasing numbers. Many MSMEs operate in the informal sector with low productivity due to limitations in management, marketing, and technology. The inability to adopt digital technology also poses a serious barrier. Many entrepreneurs still rely on conventional methods, leaving them behind in the rapidly evolving digital market. The lack of digital literacy and technological innovation results in a deficiency of technology-based business breakthroughs, even though market opportunities in the digital era are vast and promising.

3.1.6. The Role of Education in Building Entrepreneurial Competence

Entrepreneurship education aims to shape well-rounded individuals who possess character, understanding, and skills as entrepreneurs. This education can be integrated into various school activities and plays a crucial role in fostering interest, attitudes, and motivation for entrepreneurship (Hariyanto & Ie, 2023). Instilling an entrepreneurial spirit from an early age, through the roles of teachers and parental support, is essential for developing mindsets and mental attitudes such as self-confidence, creativity, resilience, and decision-making abilities.

Entrepreneurship learning should not only be cognitive but can also be embedded in thematic activities that naturally build practical values and entrepreneurial character.

Successful examples of entrepreneurship education can be seen in China, where children are guided from an early age to become independent and innovative individuals. Through the Triple Helix approach involving universities, government, and industry, entrepreneurship education in China has proven to enhance students' entrepreneurial intentions and self-efficacy. In Europe, countries like France, Germany, and the Netherlands implement the Junior Enterprise (JE) system, which is an organization run by students to manage real projects for external clients. This model has proven effective, with 21% of JE alumni starting businesses within three years of graduation, significantly above the EU average. These approaches demonstrate that well-designed, practice-based entrepreneurship education from an early age can produce resilient entrepreneurs ready to face global challenges (Aryadi & Hoesin, 2022).

3.1.7. Solutions to Enhance Entrepreneurial Competence

To enhance entrepreneurial competence, the primary solution is to integrate entrepreneurship education into a curriculum that is practical and experience-based. Entrepreneurship education should not be purely theoretical; it must emphasize project-based learning, business skills training, and direct student involvement in real business activities, whether through simulations or campus business incubators. This approach will foster an entrepreneurial mindset, increase risk-taking courage, and encourage innovation from an early age (Annisa et al., 2023). Additionally, entrepreneurship education should also strengthen character traits such as discipline, hard work, and responsibility to ensure graduates have the resilience to face the dynamics of the business world.

Another solution is to strengthen the synergy between the education sector, industry, and government in creating a conducive entrepreneurial ecosystem. Higher education institutions need to establish strategic partnerships with industry players to provide internship programs, mentoring, and market-driven learning (link and match) (Elyta et al., 2020). Meanwhile, the government should implement affirmative policies such as business capital assistance, digital entrepreneurship training, and providing market access through digital platforms. Strengthening digital infrastructure is also crucial to support the growth of digital entrepreneurship, where technologies like e-commerce and social media can be utilized by young people to start and develop businesses independently.

3.1.8. Entrepreneurship at Islamic Universities in Malang and MSMEs in Wonogiri Regency.

Entrepreneurship at State University of Malang (UM) and MSMEs in Wonogiri Regency play a vital role in driving development and economic improvement in the digital era through the enhancement of entrepreneurial competence. Data from the Central Statistics Agency in 2014 indicated a high unemployment rate among higher education graduates, prompting UM, particularly the Faculty of Education, to develop students' entrepreneurial skills through data collection, mentoring, and entrepreneurship training, which has proven to increase students' understanding by up to 94%. UM aims to produce young entrepreneurs who are creative, capable of creating jobs, utilizing technology, and building networks with established entrepreneurs. Meanwhile, MSME actors in Wonogiri Regency have also seen growth, as evidenced by the increase in the Gross Regional Domestic Product (GRDP) index in 2020 compared to 2019, indicating the development of entrepreneurship in the region.

Table 1. Business Category in Wonogiri District

No	Business	Address	Year	Sector

1	Hara Chicken	Jl. Jendral Sudirman No. 204, Wonogiri	3,5	**Food**
2	Jamur Midic	Jl. Sidoharjo – Girimarto, Kendal RT 04 RW 07, Girimarto, Wonogiri	2	**Food**
3	Melani Bakery	Sidoharjo Wonogiri	2	**Food**
4	Klinik Rainbow Therapy	Jl. Srigunting II Sukorejo RT 02 RW 10, Giritirto, Wonogiri	7	**Health**
5	**Buana Pangan**	**Jl. Menur 3, RT 03 RW 10, Wonoboyo, Wonogiri**	**6**	**Food**

The results show that the entrepreneurial spirit emerges before and continues to develop while starting a business, characterized by perseverance, hard work, optimism, innovation, creativity, as well as a spirit of mutual assistance and readiness to face risks. The entrepreneurial spirit is essential for leading a business with an attitude of appreciating differences, thinking openly, and accepting feedback. To develop their businesses, respondents utilize social media promotions, maintain good relationships and customer loyalty, ensure product quality, and target the right market. These findings are consistent with relevant previous research. Based on 5 sources of journal articles that have met the inclusion criteria, the details of the research results are presented in Table 2.

Table 2. Research Results Education Entrepreneurship Competence as the Key to Indonesia's Economic Development in the Digital Age

Researcher & Year	Journal	Research Result
(Suharyati et al., 2023)	Journal of Digital Economic Education	Entrepreneurship education integrated with digital technology improves students' ability to create digital business innovations so as to contribute to the development of local and national economies in Indonesia.
(Pramudita et al., 2025)	Journal of Management and Entrepreneurship	Entrepreneurship competence through digital-based entrepreneurship training can improve graduates' readiness to face global competition and trigger the growth of new businesses that are adaptive in the digital era.
(Putri, 2022)	Journal of Technology and Education	The implementation of an entrepreneurship curriculum with a digital approach strengthens the entrepreneurial mindset of students, which has positive implications for the development of MSMEs and economic development in Indonesia.
(Mahmudah et al., 2023)	Journal of Digital Economics and Business	Mastery of entrepreneurship competencies combined with information technology increases the productivity of MSMEs in the digital era, giving a significant impact on regional economic growth.
(Juhairiah & Yuwono, 2022)	Journal of Education and Development	Technology-based entrepreneurship education supports the improvement of the quality of innovative and adaptive human resources, thereby accelerating economic development and reducing unemployment in Indonesia.

Recent studies have shown that the development of entrepreneurship competencies through education integrated with digital technology is essential in driving Indonesia's economic development in the digital era. Digital-based entrepreneurship education is able to improve innovation capabilities, global competitive readiness, and productivity of MSMEs, which are the backbone of the national economy. Thus, strengthening entrepreneurship education not only equips individuals with practical skills, but also contributes significantly to economic growth and reducing unemployment rates in Indonesia.

5. Conclusion

Entrepreneurship competence is essential to drive Indonesia's economic growth in the digital era, although it is still constrained by access to capital, skills and infrastructure. Early education through practical curriculum, training, and collaboration with industry, such as at the State University of Malang and the development of MSMEs in Wonogiri, has proven effective in increasing the entrepreneurial spirit. Digital transformation through the use of e-commerce, digital marketing, and other technologies is also key, but requires digital literacy and strong policy support. Collaboration between the government, private sector, and educational institutions in creating a supportive ecosystem is needed to reduce unemployment and strengthen the contribution of MSMEs, resulting in a generation of innovative and globally competitive entrepreneurs.

HUMAN RESOURCE DEVELOPMENT STRATEGY IN THE CREATIVE VILLAGE OF JAGOI BABANG, SEKIDA VILLAGE

Maisela[1], Eligia Monixa Salfarini,[2] Dedy[3]

[1]Institut Shanti Bhuana Indonesia

Email : maisela2112@shantibhuana.ac.id[1] , eligia1609@shantibhuana.ac.id[2] , dedy@shantibhuana.ac.id[3]

Abstract

This study aims to create a strategy for developing human resources (HR) in Jagoi Babang Creative Village, Sekida Village, Bengkayang Regency, West Kalimantan. This village has the potential for a creative economy based on local wisdom, especially rattan and bamboo handicrafts that are characteristic of the Dayak Bidayuh Tribe. The research method used is descriptive qualitative. Data were collected through observation, interviews, and documentation. Data were analyzed through SWOT analysis. The results of the study indicate that human resource development can be optimized through local culture-based skills training, strengthening business group institutions, and utilizing digital technology for marketing. This strategy is integrated with the principles of Sustainable Development Goals (SDGs) to improve community welfare and preserve local culture. With targeted human resource development, Jagoi Babang Creative Village is expected to become a model for creative villages in border areas.

Keywords: Human Resources, Creative Village, Local Wisdom

1. Introduction

The border region has a very strategic position and offers great economic potential. Its unique location makes it a gateway for trade and tourism between countries. However, this condition can also hinder economic growth and the welfare of the people in the area. One of the main factors that hinders economic growth is limited infrastructure. Inadequate road access makes it difficult to distribute creative products to a wider market. In addition, limited internet networks are an obstacle in digital marketing, even though technology-based marketing is very important in today's digital era.

To overcome the various challenges that exist, one solution that can be applied is the development of the creative village concept. This concept focuses on utilizing local potential and local cultural wisdom. Creative villages integrate economic, cultural, and environmental aspects into a sustainable ecosystem. By developing culture-based products, maintaining environmental balance, and increasing public awareness, creative villages can be a development model that is not only economically profitable, but also preserves cultural heritage and preserves nature (Sudiar, 2015; Dina, 2020).

Jagoi Babang Creative Village in Bengkayang Regency, West Kalimantan, is one of the border areas that has great potential for development. The majority of its population comes from the Dayak Bidayuh Tribe which is rich in traditions and skills, especially in rattan and bamboo handicrafts. These craft products not only have high artistic and cultural value, but are also able to attract the attention of tourists and consumers who are looking for typical and unique goods from the region (Beni et al., 2021; Gracia, 2021).

The determination of this area as a Creative Tourism Village by the local government is an acknowledgment of the importance of the craft industry based on local wisdom. The Ton Sowa IKM Center in Jagoi Kindau is a center for small and medium industries that support

local craftsmen in producing traditional woven products (Usaha et al., 2024). The development of human resources (HR) in Jagoi Babang Creative Village is very important to increase the capacity of the community in managing local potential optimally. Trained and competent human resources are able to increase creativity, innovation, and product competitiveness in local and global markets (Nurkarim & Anshori, 2024). Therefore, this study aims to analyze the human resource development strategy in Jagoi Babang Creative Village, Sekida Village, in order to support the growth of a creative economy based on local wisdom and improve the welfare of people in border areas.

2. Literature Review

Previous studies have shown that human resource (HR) development in border areas is very important to increase local economic potential and strengthen cultural preservation. Sudiar (2015) and Dina (2020) highlighted that limited infrastructure and access to technology are the main obstacles in developing the creative economy in border areas. However, by prioritizing local strengths and encouraging community creativity, creative villages can become an alternative source of income and encourage more inclusive economic development.

Beni et al. (2021) revealed that rattan and bamboo handicrafts produced by the Dayak Bidayuh community in Jagoi Babang have high artistic and cultural value and strong tourist attractions. Gracia (2021) added that good management of creative villages can improve the tourism sector and provide direct and indirect economic benefits to the local community. In addition, Usaha et al. (2024) highlighted the role of the Ton Sowa IKM Center as a center for small and medium industries that supports local craftsmen in producing traditional woven products and expanding markets through digitalization.

Theoretically, human resource development is a process of improving the quality and capabilities of individuals in a community so that they are able to adapt to change and contribute optimally to economic and social development. According to Nurkarim & Anshori (2024), trained and competent human resources can increase creativity, innovation, and product competitiveness in local and global markets. Ewid and Vuspitasari (2020) also emphasize the importance of local wisdom as a basis for human resource development, because traditional values born from the collective experience of the community are the foundation for building regional identity and excellence.

Micro, Small, and Medium Enterprises (MSMEs) are business groups that have limited scale and capacity but play a strategic role in the national economy. Based on Law Number 20 of 2008, MSMEs are divided into three categories, namely micro, small, and medium enterprises, with the main differences lying in the number of assets, turnover, and number of workers. MSMEs make a major contribution to creating jobs, increasing people's income, and strengthening national economic stability, especially at the local level. Along with the development of digital technology, MSMEs also have the opportunity to expand markets, increase operational efficiency, and build business resilience amidst global economic changes. However, MSMEs are also faced with various challenges such as limited access to technology, capital, and adequate human resources (Agustin et al., 2023).

The framework for thinking of this research is based on the integration of the principles of the Sustainable Development Goals (SDGs) in human resource development, especially SDG 4 (Quality Education), SDG 8 (Decent Work and Economic Growth), SDG 11 (Sustainable Cities and Settlements), SDG 12 (Responsible Consumption and Production), and SDG 17 (Partnerships to Achieve the Goals). The strategy for developing human resources in Jagoi Babang Creative Village is directed at local culture-based skills training, strengthening business institutions, utilizing digital technology, and collaborating with various parties.The hypothesis proposed in this study is: Human resource development based on local wisdom and

integration of SDGs principles has a positive effect on the growth of the creative economy and cultural preservation in Jagoi Babang Creative Village, Sekida Village.

3. Methodology

This study uses a descriptive qualitative method. The population of the study was the community, craft actors, and village officials in Jagoi Babang Creative Village, Sekida Village. The sample was selected purposively, namely key informants who were directly involved in the development of Human Resources and creative village activities. Data collection techniques were carried out through in-depth interviews, observations, and documentation. The main variables studied were Human Resource development, creative villages, and local wisdom. Data were analyzed using the SWOT analysis technique, namely identifying the main themes from the results of interviews and observations.

4. Results and Discussion

In analyzing the human resource development strategy (HRD) in Jagoi Babang Creative Village, Sekida Village, an approach was taken using SWOT analysis which includes aspects of strengths, weaknesses , opportunities, and threats. This analysis aims to formulate the right strategy in developing HRD based on local potential and local cultural wisdom.

From the Strengths (S) side, it was found that the community has high skills in the field of handicrafts, especially in rattan weaving activities. This expertise is a hereditary heritage that is still preserved to this day, and is a strong cultural identity among the Dayak Bidayuh community. In addition, the existence of institutions such as the Ton Sowa IKM Center, Pokdarwis and Bumdesma also strengthen the ecosystem for developing creative villages in the area.

However, the Weaknesses (W) that emerged was the low interest of the younger generation in continuing the weaving tradition. This causes a lack of regeneration of craftsmen, and has the potential to threaten the sustainability of local culture. In addition, limited access to technology, lack of modern skills training, and inadequate infrastructure such as damaged roads and minimal internet connection also weaken the capacity of local human resources to compete in the digital era.

In the Opportunities (O) category, there is great potential from the existence of the younger generation who still live in villages as well as support from local governments and educational institutions. In addition, the trend of culture-based tourism and the increasing interest in local craft products are opportunities that must be utilized optimally.

The Threats (T) that need to be watched out for include the development of palm oil companies around the village area which can shift the economic orientation of the community from the creative sector to the plantation industry sector. In addition, competition from more innovative creative products from outside the region can also threaten the sustainability of local products if design and marketing strategy updates are not immediately carried out.

From the four SWOT aspects, several strategies can be formulated: SO (Strength-Opportunities) strategy is carried out by optimizing existing community skills through training from educational institutions and government support to strengthen the tourism and creative economy sectors. The WO (Weaknesses-Opportunities) strategy can be carried out by inviting the younger generation to participate in creative business training and mentoring in order to be able to grow their interests and skills. Meanwhile, the ST (Strength-Threats) strategy focuses on strengthening branding and differentiation of local products to overcome threats from foreign products and economic shifts. Finally, the WT (Weaknesses-Threats) strategy aims to reduce dependence on certain raw materials by seeking local alternatives and avoiding inequality in the distribution of government attention to the creative sector.

This SWOT analysis provides a comprehensive overview of the internal and external conditions that influence HR development in the Sekida Village Creative Village. By

understanding this strategic position, more targeted and sustainable development can be designed to encourage economic progress, cultural preservation, and community welfare holistically.

The results of the study show that the human resource (HR) development strategy in the Jagoi Babang Creative Village, Sekida Village, has had a positive impact on increasing community capacity and the growth of the creative economy based on local wisdom. Data obtained through interviews and observations show that most of the community have participated in rattan weaving skills training, bamboo craft making, and digital marketing training facilitated by the village government and the Ton Sowa IKM Center.

The improvement of community skills and knowledge in the Jagoi Babang Creative Village has shown significant results, especially in the field of rattan and bamboo-based handicrafts. Through various trainings held, the community not only gains technical skills in production, but is also equipped with knowledge of business management and digital marketing. This allows local products to be marketed more widely, both offline in local markets and online through digital platforms. In addition, institutional strengthening through the formation of joint business groups and cooperatives has increased the bargaining position of MSME actors. Collaboration between the community, government, and educational institutions is increasingly intensive in supporting product development and expanding marketing networks (Usaha et al., 2024).

These findings are in line with the theory of Human Resource Development which emphasizes the importance of continuous training and strengthening the capacity of individuals and communities (Nurkarim & Anshori, 2024). This strategy also supports the achievement of sustainable development goals, especially SDG 4 (Quality Education) and SDG 8 (Decent Work and Economic Growth), which are significantly able to improve the quality of human resources and open up job opportunities based on local potential. From a practical perspective, the approach to human resource development in the Jagoi Babang Creative Village can be used as a model for other villages in border areas. Local culture-based skills training, institutional strengthening, and the use of digital technology have been proven to increase product competitiveness and expand market access. Cross-sector collaboration between the community, government, and educational institutions is a key factor in ensuring the sustainability of human resource development programs in the border area.

The managerial implications of this finding are the need for local governments to continue to support training programs, provide access to digital marketing, and strengthen creative economy institutions at the village level. For business actors, it is important to continue to innovate and maintain product quality in order to be able to compete in a wider market. Overall, the development of Human Resources based on local wisdom and the integration of SDGs principles have made a significant contribution to the growth of the creative economy, cultural preservation, and improving community welfare in the Jagoi Babang Creative Village.

5. Conclusion

Based on the research results, it can be concluded that the human resource (HR) development strategy in Jagoi Babang Creative Village, Sekida Village, has had a real impact in increasing community capacity and encouraging the growth of a creative economy based on local wisdom. Data shows that training in craft skills, business management, and digital marketing facilitated by the village government and the Ton Sowa IKM Center has succeeded in increasing community knowledge and skills. The formation of joint business groups and cooperatives also strengthens institutions and expands market access for local products.

The analysis of the results of this study is in line with the theory of HR development which emphasizes the importance of continuous training and strengthening community capacity (Nurkarim & Anshori, 2024). In addition, the integration of SDGs principles,

especially SDG 4 (Quality Education) and SDG 8 (Decent Work and Economic Growth), has proven effective in creating job opportunities based on local potential and improving community welfare.

Practically, this strategy can be replicated in other border villages by strengthening local culture-based training, supporting creative economy institutions, and utilizing digital technology for marketing. The resulting managerial implications are the need for ongoing support from local governments in providing training, market access, and strengthening business institutions. For business actors, product innovation and quality improvement are the keys to local products being able to compete in a wider market. Thus, targeted and local wisdom-based human resource development in the Jagoi Babang Creative Village has proven to be able to increase the creative economy, preserve culture, and make a significant contribution to the welfare of people in border areas.

Abstract

Nowadays, information and communication technology has a significant impact on both the industrial sector and daily life. The internet acts as an electronic device that facilitates various activities, such as communication, business, and shopping. By utilizing digital information technology, business people can easily market a variety of products in order to attract consumer attention. One of the fashion businesses that is currently developing and actively using the internet, especially social media and other platforms, is the fashion business of Jims Honey. In this case, the main focus of this study is to measure and analyze the extent to which the influence of brand image, product quality, and price on consumer buying interest in Jims Honey products. Using quantitative methods and analyzed by multiple linear regression, the research population refers to all people in Bengkayang City. The sample taken was 151 respondents using purposive sampling technique. The results showed that the brand image variable with a coefficient value of B = -0.032 and a sig value = 0.758, which means that the brand image variable has no positive and significant effect on buying interest in Jims Honey products, the product quality variable with a coefficient value of B = 0.549 and a sig value =< 0.001, which means that the product quality variable has a positive and significant effect on buying interest in Jims Honey products. Then, the price variable with a coefficient value B = 0.404 and a sig value =< 0.001, which means that the price variable has a positive and significant effect on buying interest in Jims Honey products.

Keywords: Brand image, product quality, price, and purchase intention.

1. Introduction

The fashion industry is one of the sectors that is growing rapidly as digital technology advances. Fashion products are now not only a necessity for appearance, but also a medium to express self-identity, especially for teenagers and adults. Jims Honey, as one of the local brands established since 2014, has managed to attract the attention of consumers with a variety of fashion products such as bags, wallets, watches, and other accessories. The main advantages of these products lie in fashionable designs, good quality materials, and affordable prices.

The three main factors that are considered to have an influence on consumer buying interest are *brand image*, product quality, and price. A strong brand image is able to create a positive perception of the product, good product quality increases consumer confidence, while price is a rational consideration in making purchasing decisions. (Endah Setiawati et al., 2021). Interestingly, in Bengkayang City, there are no official Jims Honey resellers, but consumers can still get their products through various online platforms such as Shopee, TikTok, and Instagram. This phenomenon indicates a large market potential while opening up research opportunities on how these marketing factors affect consumer buying interest in the region.

This research is not only motivated by the importance of understanding consumer behavior in a digital context, but also by the different results of previous research related to the influence of *brand image*, product quality, and price on purchase intention. Based on research conducted by Alifiyah, (2024) "The Effect of Brand Image, Product Design and Product Quality on Purchasing Decisions for Jims Honey Bag Products in Sampit" it is known that the variables of brand image, product design and product quality have a positive and significant effect on purchasing decisions for Jims Honey bag products in Sampit. And research conducted by Irawan et al., (2022) "Effect, Price, Brand Image, and Product Quality on Purchase Intention of Eiger Products (Case Study of Eiger Product Consumers in Malang)" it is known that the price variable has no positive and significant effect, the brand image variable and product quality have a positive and significant effect. This shows that consumers may prioritize other aspects such as product quality and brand image. Thus, this study aims to examine empirically the extent to which these three variables affect consumer buying interest in Jims Honey products in Bengkayang City.

2. Literature Review

2.1 Brand Image

Brand image is a collection of associations formed in the mind or mind of consumers. Brand image can be considered positive or negative, depending on the individual's perception of the brand, as well as the perspective that consumers have on the brand. (Arista & Astuti, 2019) . Meanwhile, according to Susanti & Tjahjono, (2015) suggests that brand image is the impression formed in the minds of consumers about a brand. The indicators of *brand image* according to Arista & Astuti, (2019) are brands that change consumer behavior, brands make it easier to take action, the benefits of brand association, the strength of brand association, and the uniqueness of brand association.

2.2 Product Quality

Product quality is the ability of a product to perform its functions, which include durability, reliability, accuracy, ease of use and repair and other artibutes. (Mahanani, (2018) . According to Rusdi, (2019) product quality is a series of characteristics possessed by a product or service, which has an important role in meeting customer needs and expectations. The indicators of product quality according to Winasis et al., (2022) are performance, reliability, conformance, durability, and asthetics.

2.3 Price

Price is one of the main components in marketing that can benefit the company. Pricing needs to be considered carefully, given the many competitors in the market. (Susanti & Tjahjono, 2015) . The price indicators according to Latour, (2018) are price according to quality, affordability, price competitiveness, and price according to benefits.

2.4 Purchase Intention

Purchase interest is a behavior that reflects the desire of consumers to buy, choose, use, or even just want a product. (Fauzan et al., 2023) . Meanwhile, according to Sutrisno & Haryani, (2017) purchase interest is the intention or desire of consumers to buy a product, which can develop from a sense of interest in the product. The indicators of buying interest according to Luthfiana, (2019) are attention, interest, desire, and action.

2.5 Research Conceptual Framework

The conceptual framework of this study was developed based on a predetermined hypothesis. The hypothesis is then used in the development of multiple linear regression equations, which are as follows:

$Y = \alpha + \beta 1\, X1 + \beta 2\, X2 + \beta 3 X3 + e$

Explanation of variables and their relationships:

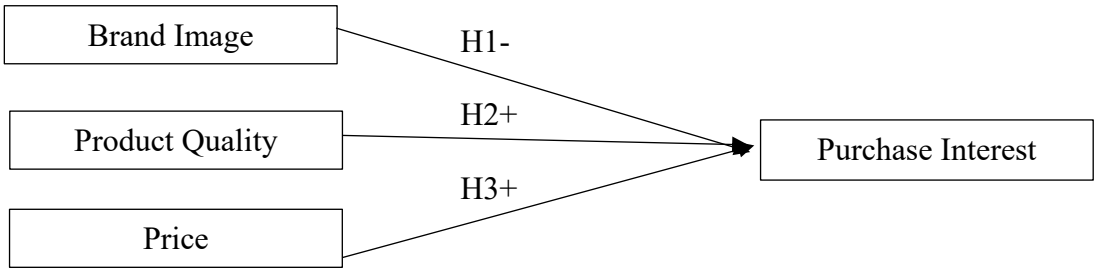

Figure 1. Research conceptual framework

1. *Brand Image* (X1)
   This variable does not have a positive effect on buying interest in Jims Honey products. Based on the results of research conducted by Nuriyah Oktavia Tri et al., (2023) shows that *brand image* has not been able to create strong or attractive perceptions in the minds of consumers, so it is not enough to influence their decision to buy.
2. Product Quality (X2)
   This variable has a positive effect on buying interest in Jims Honey products. Based on the results of research conducted by Oramesti & Wardhana, (2022) , shows that product quality can affect the extent to which consumers are satisfied with what they receive.
3. Price (X3)
   This variable has a positive effect on buying interest in Jims Honey products. Based on the results of research conducted by Fauzan & Rohman, (2020) shows that the price of a product is considered reasonable or comparable to the value or quality offered, consumers will tend to have a higher purchase interest. Thus, consumers feel that the product provides good value and they feel satisfied with what they pay.

3. Methodology

3.1 Research Design

This research is confirmatory research using a quantitative approach and survey method. The purpose of the quantitative approach is to analyze the effect of the independent variable on the dependent variable. (Ruky et al, 2018) . This study will examine the effect of *brand image*, product quality, and price on consumer buying interest in Jims Honey products in Bengkayang city.

3.2 Data Collection Methods

Data collection in this study used two methods of primary data and secondary data. Primary data is data obtained directly from distributing questionnaires. The questionnaire will be distributed to each respondent with a *google* form that will be filled in by participants, namely the community in Bengkayang City. Secondary data is data obtained indirectly, namely through reference sources or related literature obtained, this secondary data can be obtained through books, journal articles, and internet media that support research objectives.

3.3 Definition of Operational Variables

Variables	Operational Definition	Source	Size
Brand Image (X1)	Perceptions formed in the minds of consumers about a brand	(Arista & Astuti, 2019)	1. Maker Image 2. Product/consumer image 3. Brands change consumer behavior. 4. Brand power

			5. Brand uniqueness
Product Quality (X2)	Characteristics of a product that has the ability to satisfy customers	(Winasis *et al.*., 2022)	1. Performance 2. Reliability 3. Compatibility 4. Durability 5. Beauty
Price (X3)	The value of money to be paid by the consumer to the seller for the goods or services purchased.	(Susanti & Tjahjono, 2015)	1. Price conformity to product quality 2. Price affordability 3. Price competitiveness 4. Price compatibility with benefits 5. Price perception
Purchase Intention (Y)	Consumer tendency or intention to buy a product	(Sutrisno & Haryani, 2017)	1. Attention 2. Interest 3. Desire 4. Action 5. Referential interest

This study uses 20 question items so that based on the results of the calculation, 100 to 200 respondents are needed. The sample size in this study was 151 respondents. The research site was conducted in Bengkayang City, Bengkayang Regency, West Kalimantan.

3.4 Sampling Method

The sampling method in this study used *non-probability sampling* with *purposive sampling* technique. The samples taken in this study were people in Bengkayang City with the criteria in the age range 17-50 years and consumers who had purchased or had the intention or desire to purchase the product.

3.5 Research Instruments

This study uses classical assumption tests and multiple linear regression. Instrument testing in this study includes validity and reliability tests, then classical assumption tests are carried out, including normality tests, and multicollinearity tests. In addition, the model accuracy test, including the coefficient of determination ($R^{2)}$, partial test (t test) and simultaneous test (f test). This test is used to statistically evaluate the effect of the independent variable on the dependent variable. To process the data in this study using SPSS 27.0 software. (Husni Arifin, 2014) , (Ruky et al, 2018) .

4. Result and Discussion

4.1 Validity Test

In this study using the value of r table = 0.159 (the value of r table for a = 151). The value of r table is used to compare the value of r count with r table with the provisions of *degree of freedom* (df) = (N-2) in this study using the number of samples (n) = 151.

Table 1 Jims Honey Product *Brand Image* Validity Test Results

Indicator	r count	r table	Description
Brand Image_P1	0,820	0,159	Valid
Brand Image_P2	0,865		
Brand Image_P3	0,865		
Brand Image_P4	0,876		

Brand Image_P5	0,814		

The Brand Image_P1 statement obtained a calculated r value of 0.820, which means more than 0.159 is declared valid. The Brand Image_P2 statement obtained a calculated r value of 0, 865 which means more than 0.159 is declared valid. The Brand Image_P3 statement obtained a calculated r value of 0.865, which means more than 0.159 is declared valid. The Brand Image_P4 statement obtained a calculated r value of 0.876, which means more than 0.159 is declared valid. The Brand Image_P5 statement obtained a calculated r value of 0.814, which means more than 0.159 is declared valid.

Table 2 Jims Honey Product Quality Validity Test Results

Indicator	r count	r table	Description
Product Quality_P1	0,898	0.159	Valid
Product Quality _P2	0,869		
Product Quality _P3	0,918		
Product Quality _P4	0,901		
Product Quality _P5	0,855		

The Product Quality_P1 statement obtained a calculated r value of 0.898, which means more than 0.159 is declared valid. The Product Quality_P2 statement obtained a calculated r value of 0.869, which means more than 0.159 is declared valid. The Product Quality_P3 statement obtained an r value of 0.918, which means that it is more than 0.159 declared valid. The Product Quality_P4 statement obtained an r value of 0.901, which means that it is more than 0.159 declared valid. The Product Quality_P5 statement obtained an r value of 0.855, which means that it is more than 0.159 declared valid.

Table 3 Jims Honey Product Price Validity Test Results

Indicator	r count	r table	Description
Price_P1	0,831	0.159	Valid
Price _P2	0,844		
Price _P3	0,879		
Price _P4	0,909		
Price _P5	0,880		

The Price_P1 statement obtained a calculated r value of 0.831, which means that more than 0.159 is declared valid. The Price_P2 statement obtained a calculated r value of 0.844, which means more than 0.159 is declared valid. The Price_P3 statement obtained a calculated r value of 0.879, which means more than 0.159 is declared valid. The Price_P4 statement obtained a calculated r value of 0.909, which means more than 0.159 is declared valid. The Price_P5 statement obtained a calculated r value of 0.880, which means that it is more than 0.159 declared valid.

Table 4 Validity Test Results of Interest in Buying Jims Honey Products

Indicator	r count	r table	Description
Purchase Intention_P1	0,889	0,159	Valid
Purchase Intention _P2	0,919		
Purchase Intention _P3	0,914		
Purchase Intention _P4	0,867		
Purchase Intention _P5	0,847		

In the Purchase Interest_P1 statement, the calculated r value is 0.889, which means that more than 0.113 is declared valid. The Purchase Intention_P2 statement obtained a calculated

r value of 0.919, which means that more than 0.113 is declared valid. The Purchase Intention_P3 statement obtained an r value of 0.914, which means that it is more than 0.113 declared valid. The Purchase Intention_P4 statement obtained an r value of 0.867, which means that it is more than 0.113 declared valid. The Purchase Intention_P5 statement obtained a calculated r value of 0.847, which means that more than 0.113 is declared valid.

4.2 Reliability Test

Table 5 Reliability Test Results

Variables	Cronbach's Alpha	Description
Brand Image _(X1)	0,901	Reliable
Product Quality_(X2)	0,933	
Price_(X3)	0,918	
Purchase Intention_(Y)	0,933	

>The *brand image* variable has a *Cronbach's Alpha* value of 0.901, the product quality variable has a *Cronbach's Alpha* value of 0.933, the price variable has a *Cronbach's Alpha* value of 0.918 and the consumer purchase interest variable has a *Cronbach's Alpha* value of 0.933, which means that all variables in this study have a value of 0.60 or more than 0.60 and meet the reliability testing criteria.

4.3 Classical Assumption Test

Normality Test

Table 6 Normality Test Results

One-Sample Kolmogorov-Smirnov Test			
			Unstandardized Residual
N			151
Normal Parameters[a,b]	Mean		,0000000
	Std. Deviation		1,80191085
Most Extreme Differences	Absolute		,178
	Positive		,145
	Negative		-,178
Test Statistic			,178
Asymp. Sig. (2-tailed)[c]			,000
Monte Carlo Sig. (2-tailed)[d]	Sig.		,000
	99% Confidence Interval	Lower Bound	,000
		Upper Bound	,000

The normality test results show a significance value of 0.000, which means< 0.05, meaning that the data in this study are not normally distributed. Although the normality assumption in this study is not met, the data in this study are still continued to the next test, this is because the sample size in this study is included in the large sample category.

Multicollinearity Test

Table 7 Multicollinearity Test Results

Variables	Colliniearity Statistic	
	Tolerance	VIF
Brand Image	0,193	5,195
Product Quality	0,181	5,530
Price	0,342	2,928

In the *Brand Image* variable with a *tolerance* value = 0.193 and a VIF value = 5.195, in the Product Quality variable with a *tolerance* value = 0.181 and a VIF value = 5.530, while

in the Price variable with a *tolerance* value = 0.342 and a VIF value = 2.928. So it can be concluded that the variables in this study do not occur multicollinearity.

Multiple Linear Regression Analysis test

Table 8 Multiple Linear Regression Analysis Test Results

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1,416	,996		1,422	,157
	Brand Image	,032	,103	-,031	-,309	,758
	Product Quality	,404	,099	,418	4,076	<,001
	Price	,549	,081	,506	6,788	<,001
Dependent Variable: Minat Beli						

The values interpreted based on the research results in table 1 are as follows:

Y1 = 1,416 α + 0,032 X1 + 0,404 X2 + 0,549 X3 + e

a. The *constant* value (*constant* or α) of the regression results is 1.416. This shows that there is no influence between the independent variable and the dependent variable, even though it is not influenced by the three independent variables. If the value of *brand image,* product quality and price is 0, the value of consumer buying interest in Jims Honey products is 1.416. This shows that there is a basic influence or purchase interest even though it has not been influenced by the independent variables studied, this purchase interest is influenced by other factors such as promotional advertisements on social media, and others.
b. The regression coefficient value on the *brand image* variable is 0.032. This shows that the *brand image* variable has a relatively low value compared to other variables, so that the *brand image* variable has a very weak influence on buying interest. This is because this *brand* is still relatively unknown by the people in Bengkayang City.
c. The regression coefficient value on the product quality variable is 0.404. This shows a positive and quite significant value on consumer buying interest, which means that the better the product quality of Jims Honey that consumers feel, the greater their tendency to buy the product.
d. The regression coefficient value on the price variable is 0.549. This shows a positive and significant value on consumer buying interest, which means that the price is considered more affordable or in accordance with the quality, thus consumer perceptions of price are a factor that determines whether they will buy Jims Honey products or not, therefore, the right pricing strategy is very important to attract buying interest.

5. Conclusion

Based on the results of the research and discussion above, it can be concluded that this study uses a quantitative approach method. This study aims to examine the effect of *brand image*, product quality and price on consumer buying interest in Jims Honey products (case study of consumers in Bengkayang City). This research was conducted in the city of Bengkayang, West Kalimantan, with an age range of 17 years to 50 years with the criteria of consumers who have bought or have an interest or desire to buy Jims Honey products. The results showed that the *brand image* variable did not have a positive and significant effect on

buying interest in Jims Honey products, this is because the level of popularity of Jims Honey in Bengkayang City is still not too high. Even though Jims Honey is quite well known in several big cities, in Bengkayang City itself this *brand* is not fully recognized by the public. This makes the *brand image* that is built not very influential in encouraging consumer buying interest. The product quality variable has a positive and significant effect on buying interest in Jims Honey products. This is because consumers in Bengkayang City pay more attention to product quality before buying, such as durability, design, and function of the product. And the price variable has a positive and significant effect on buying interest in Jims Honey products. This is because the price offered by Jims Honey is considered comparable to the quality provided, so consumers feel the product is worth buying. The combination of good quality and affordable prices makes consumers more confident and interested in buying Jims Honey products.

Abstract

This research aims to understand the leadership role of the Village Head in improving physical development in Untang Village, Banyuke Hulu District, Landak Regency. This research uses qualitative methods with an ethnographic approach to obtain an in-depth understanding of the phenomenon under study. Data collection techniques were carried out through interviews, field observations and documentation. Research participants were selected using a purposive sampling method, involving the Untang Village Head, three village staff and three community leaders. The research results show that the leadership role of the Untang Village Head in the physical development of the village includes three main aspects, namely as a motivator, facilitator and mobilizer. The village head plays a role in encouraging community participation, facilitating development needs, and mobilizing available resources to create better infrastructure. The data obtained was analyzed using reduction, codification and interpretation methods to ensure the validity of the research results.

Keywords: *Village Head Leadership, Motivator, Facilitator and Mobilizer*

1. Introduction

An organization is a social entity that is consciously coordinated, with relatively sustainable boundaries, and clear identification of signs to achieve one or a group of common goals according to Bagus (2021) a group of individuals who collaborate with each other to achieve certain goals. In this case, the organization can be a company, government agency, foundation, or community. Today, leadership plays an important role in organizations, leaders have the ability to direct, motivate, and influence team members to work towards a common goal. Leaders are also responsible for creating collaboration and responsibility among organizational members.

Latifah (2021) states that the core role of a leader is to provide guidance and influence the team. The presence of an effective leader can encourage employees to work optimally to achieve organizational goals. According to Endrawati (2022) leadership is a form of domination based on personal ability to encourage or invite others to act; accepted by the group and has special skills that are appropriate to certain situations. This kind of leadership is basically informal and is always related to the needs of the group in achieving certain goals. This research covers human resources, namely: the village head and other village officials. In addition, the success of an organization is also highly dependent on the leadership exercised by its leader. Nining (2023) states that a village is an organization led by the village head, who plays an important role in leadership in the village environment. A village is also a legal community entity with certain territorial boundaries that has the authority to regulate and manage the interests of the local community, usually based on local origins and traditions. The

smallest unit of government, villages have an organizational structure that is closely related to the social life of the community. In the context of the Indonesian government system, villages are recognized as an important element that supports government programs and national development.

According to Law Number 3 of 2024 concerning villages in article 26, the Village Head has the task of carrying out governance, development, community development, and community empowerment in the village in accordance with the provisions of laws and regulations. The village head manages village finances and assets that are used for the welfare of the community. Community welfare can be improved through sustainable and equitable physical development in the village area. The village head functions in mobilizing the community to be actively involved in every village program, especially in self-help and mutual cooperation activities in village development, (Herlianawati 2022). Self-help and gotong royong activities can increase unity and a sense of kinship among village communities. The leadership of the village head is important in improving community welfare.

Government Regulation No. 37/2003 on the management of transfers to regions, mandates that the use of village funds is prioritized to fund development and community empowerment activities. Village funds, which are managed directly by the village head and village officials, are prioritized to improve community welfare through physical and non-physical development. Mismanagement of village funds will result in ineffective and inefficient development. Planning for the implementation, monitoring and reporting of the use of village funds must be carried out with transparency and good accountability. The leadership role of the village head needs special attention, as it is directly related to the welfare of the community under his leadership.

This research is based on an observation of the significant changes that occurred in Untang Village after the change of village head. During the leadership of the new village head, Untang Village underwent many changes. This can be seen from the fact that services to the community are in accordance with the operational schedule, and the Community Empowerment Agency (LPM) has also begun to be active in mobilizing, coordinating, and fostering various community empowerment activities at the village level. The implementation of infrastructure development such as the construction of concrete rebates for farming roads, bridge construction and toilet assistance for underprivileged residents and many more. With this development, of course, it is one of the efforts in the welfare of the Untang Village community. Untang Village also cooperates with the sub-district government to participate in the house renovation program held by the sub-district government, to support the construction of houses that are no longer suitable for habitation.

Untang Village also now has a clean water barrel to collect clean water for the residents of Untang Village, this is one of the means to meet the community's clean water needs and is very helpful for the community to obtain clean water to meet their daily needs. The construction of a sewer channel that is used to channel excess water mass from a residential area of villagers to prevent flooding. For the women's activities in Untang village, namely family welfare empowerment (PKK) and posyandu cadres. PKK activities in Untang Village are still running and now receive additional funding for PKK women. Untang Village also holds Village Consultative Meetings (MUSDES) which are held 5-6 times a year to reach consensus or mutual agreement.

This research was motivated by the significant changes in Untang Village after the change of village head. We can see that there has been a lot of progress, for example physical development. This makes it interesting to study, therefore the author raises the research title regarding the leadership role of the village head in improving the physical development of Untang Village.

2. Literatur review

Secondo Zuhriyati (2020), la leadership di una persona comprende almeno tre elementi fondamentali: valori socioculturali, strategie e interazioni. I valori sociali tradizionali sono l'obiettivo principale per equiparare i punti di vista dei membri. I piani includono l'etica del lavoro e i passi compiuti per raggiungere gli obiettivi. Secondo Sahadi (2020), la leadership può essere intesa come l'arte di influenzare le persone a fare cose considerate importanti. Syafitri (2019) spiega che il ruolo del capo villaggio nell'aumentare la partecipazione della comunità per lo sviluppo fisico del villaggio può essere visto attraverso fasi come la socializzazione, la deliberazione del villaggio e la pianificazione. Il ruolo del capo villaggio è quello di aumentare la partecipazione della comunità attraverso la socializzazione, la deliberazione e la pianificazione, in modo che i residenti siano più consapevoli dello sviluppo fisico realizzato nel loro villaggio.

La leadership è il processo di influenzare e dirigere gli altri a portare a termine i compiti previsti per raggiungere gli obiettivi prefissati. Secondo Santhi (2024) la leadership comprende le abilità e le competenze di una persona che occupa una posizione di comando. Per influenzare il comportamento degli altri, soprattutto dei subordinati, un leader deve pensare e agire con saggezza. Dimostrando comportamenti positivi, i leader possono effettivamente raggiungere gli obiettivi organizzativi. La leadership è spesso considerata un motore di varie attività e processi e può cambiare le opinioni o gli atteggiamenti dei gruppi, sia nelle relazioni ufficiali che in quelle non ufficiali.

Secondo Latif (2019) la leadership è un processo che ispira tutti i dipendenti a lavorare al meglio per raggiungere i risultati desiderati. Quindi una buona leadership è un leader in grado di ispirare i propri dipendenti a lavorare meglio. Secondo Fahmi (2022), la leadership è una scienza che studia come dirigere, influenzare e supervisionare gli altri per completare i compiti secondo il piano. Un leader deve essere in grado di dirigere i suoi dipendenti e di fornire una supervisione in modo che i suoi subordinati possano portare a termine i loro compiti in modo corretto.

Nurhaeda (2020) afferma che la leadership è un processo che dirige e influenza le attività dei membri del gruppo riguardo ai loro compiti. Nel frattempo. Una buona leadership è in grado di dirigere i propri subordinati e di influenzarli in modo da essere un esempio per i propri subordinati. Rahim (2022) spiega che la leadership è il modo in cui i leader influenzano il comportamento dei loro subordinati affinché lavorino insieme in modo efficace ed efficiente per raggiungere gli obiettivi organizzativi. Quindi un leader è un motivatore che può influenzare i suoi subordinati a lavorare efficacemente per raggiungere gli obiettivi comuni.

3. Methodology

This research uses qualitative methods. Pahleviannur (2022) explains that qualitative research is an approach to understanding phenomena in depth by collecting and analyzing non-numerical data, such as words, images, or sounds. This method focuses on interpreting and understanding the context, process, and meaning behind a phenomenon, and is often used in the social sciences, humanities, and other fields that require a deep understanding of the subject. Nasution (2023) adds that the qualitative approach aims to explore and understand the meaning of social or humanitarian issues that are considered important by individuals or groups.

The phenomenon studied is the role of the village head in improving physical development in the village, which is the main focus of this research. This research was conducted in Untang Village, Banyuke Hulu Sub-district, Landak Regency, with the aim of understanding the role of leadership in the physical development of the village. The data collection methods used were interviews and field observations.

Interviews were conducted with three village staff and three residents of Untang Village. Field observations were conducted to obtain detailed information about Untang Village and to understand the situation and conditions in Banyuke Hulu Sub-district, Landak Regency.

4. Results And Discussion

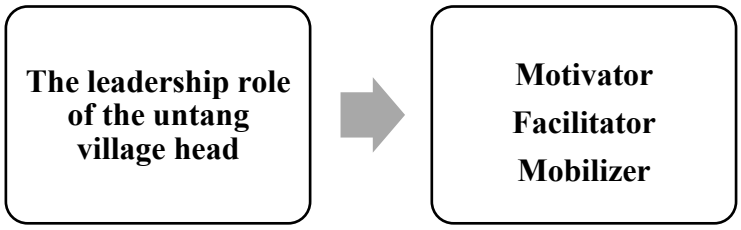
The interview results obtained from the results of statements given to 7 informants. This discussion refers to the leadership role of the village head in improving physical development which is then described or explained in more detail. In this section, researchers discuss the role of the village head in improving the physical development of the village. In this discussion, the researcher presents the findings of the data that has been collected. Motivator As a motivator, the head of Untang Village always sets a good example for other employees, such as being disciplined when coming to work and being able to carry out basic tasks properly. When physical construction is carried out, the village head always motivates the workers to work well. The village head also always encourages community involvement in discussions for village development to increase the sense of ownership among the village community. To find out the complaints and problems of the community, the village head gets closer to the community through daily activities such as having afternoon chats and so on so that the needs of the community can be identified and the difficulties faced by the residents can be conveyed. Some participants said that the village head often motivates village officials during village meetings so that they are always enthusiastic in developing Untang village.

Facilitator In village development, the village head facilitates development planning, development implementation and supervision. The village head provides a space to carry out discussions, forms the RKP APBDES drafting team in determining the APBDES. The village head actively accommodates complaints and input from the community in the village deliberation meetings in village development planning. He is open to communicating with the community on matters related to village interests. In addition to facilitating budget planning meetings and listening to community opinions, the village head also responds to every community complaint and is active in helping residents who are affected by disasters. The village head is able to build relationships between the village government and the kecamatan in improving village development. Thus, implementations such as ID card processing, social assistance distribution, house renovation and PKK activities can run smoothly. The role of the village head as a facilitator is in fact to provide facilities so that development can run well.

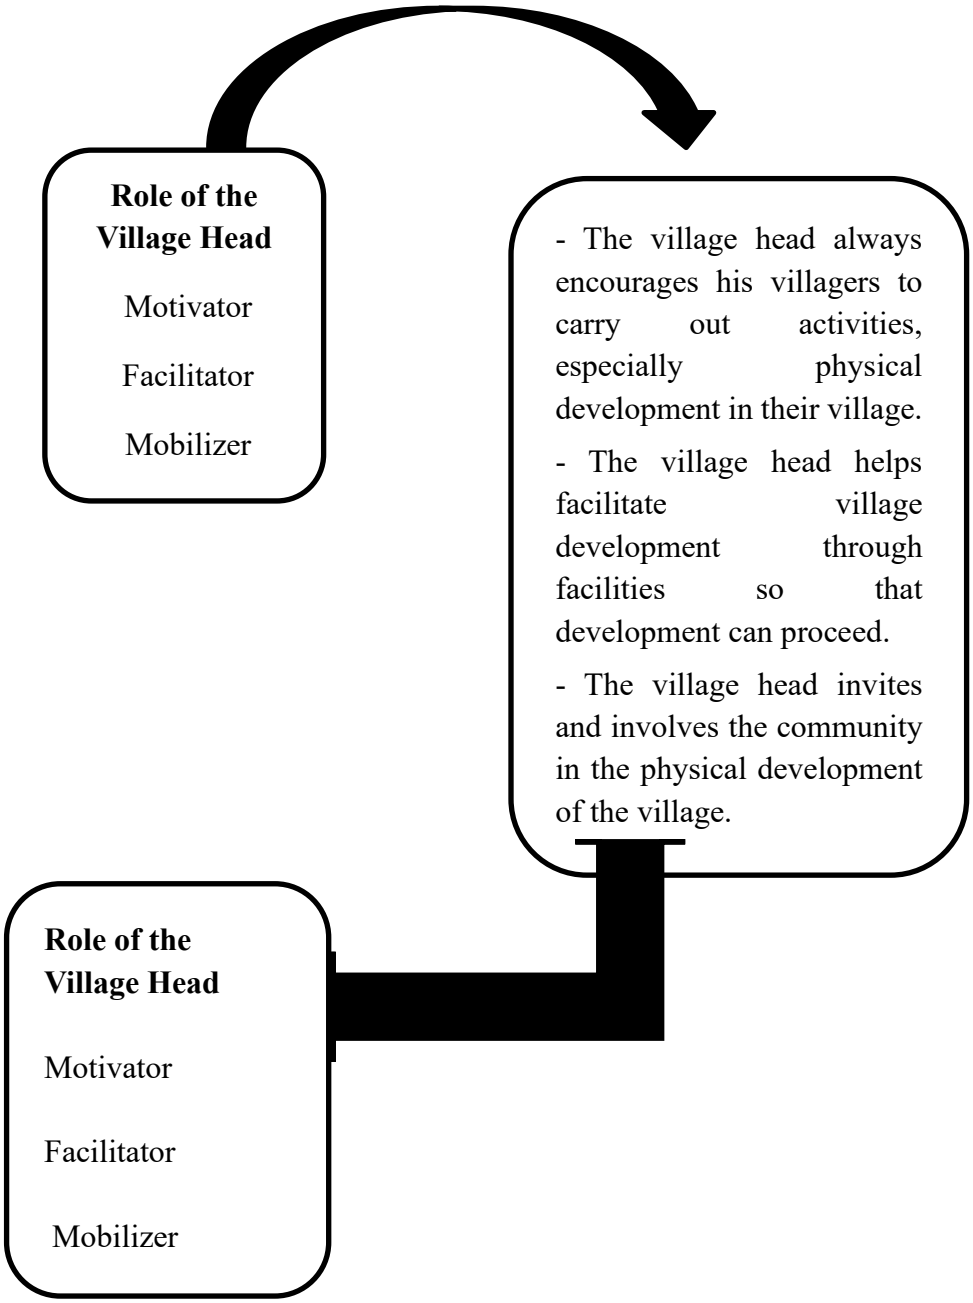
Mobilizers It can be seen that the village head always invites and involves the community in physical development, for example opening farm roads, concrete rebates, sewers, bridges and other physical developments. The community is always involved in development in the village, not only physical development but also non-physical development such as PKK activities. In making decisions, the head of untang village always discusses first, after that looking for a good solution in order to create a decision that is together not for individuals but for together. The village head has a driving role in village development activities. As a leader, the village head must be able to mobilize the community in the village development process, especially in developing community self-help to be able to carry out village programs such as development in the village. The village head always holds meetings and involves the community, which are attended by several elements that aim for the common interest. It can be seen that the village head always involves all communities in the implementation of village development, for example in the physical development of the village.

This can be seen from the statements of several residents who said that the village head always involves the community in physical development, with this development the community can get a job. To motivate the community to participate, the village head often involves the community, especially to be able to carry out meetings at the dusun and village

levels, which is done to get closer to the community. The village head also gathers with the community to meet directly to gather the necessary information by talking directly with the community so that the village head knows the needs in the village. All developments carried out are the result of deliberations held at the dusun level from the community proposing to the stage of carrying them out. The village head said that the most suitable empowerment is to involve the community directly, such as employing them in the physical development. It can be seen from Mr. Peli's statement that the village head makes decisions transparently, which means that the village head carries out his duties with honesty and responsibility.



From the results of the research that has been researched above, it shows that the leadership role of the Untang Village head in the physical development of Untang Village. The leadership role of the head of Untang Village focuses on the role of the village head as a motivator, facilitator, mobilizer. According to Caselia (2021) the role of the village head in improving physical development is very important. The village head always encourages his citizens to want to carry out activities, especially physical development in their village. It can be seen that the head of Untang Village provides motivation by starting with prayer, ice breaking, briefing before doing the task. Every briefing meeting the head of Untang Village always encourages all village officials not only during briefings but every working hour, the village head also provides direct and indirect motivation. According to Hidayati, et al., (2023) The Role of Village Head Leadership to Increase Citizen Participation in Physical Development in the Village. The village head helps facilitate village development through facilities so that development can run. We can see that before physical development in untang village, the village head formed a team to prepare the RKP APBDES in the implementation after the committee was formed and then held deliberations according to the hamlet. The village head always conducts consensus meetings with the community to make joint decisions. The head of Untang village cooperates with the village government, the community and various groups from the sub-district, village and regency. Mohulaingo (2022) the influence of transformational leadership on increasing community participation in village physical development. The village head invites and involves the community in the physical development of the village. It can be seen that the village head always invites and involves the community in physical development, for example opening farm roads because farm roads, concrete rebates, sewers, bridges, house renovations and wc because the land used belongs to the community they are also involved in every development carried out in Untang Village. The village head uses a personal approach to invite the community to be involved in physical development in the village, by employing the community directly so that the community feels more empowered. That way the community is also a supervisor and the implementation is not only village officials but involves the entire community in untang village. With these three elements being the motivator, facilitator and mobilizer, this research goes into great depth on how these three roles interrelate and support physical development. It is this approach that sets this study apart from others that may only focus on the role of the village head or a particular aspect of development.



Role of the Village Head
Motivator
Facilitator
Mobilizer
- The village head always encourages his villagers to carry out activities, especially physical development in their village.
- The village head helps facilitate village development through facilities so that development can proceed.
- The village head invites and involves the community in the physical development of the village.
Role of the Village Head
Motivator
Facilitator
Mobilizer

The chart above is a finding depicted in the form of a model that shows the leadership role of the village head plays a positive role in increasing physical development in the village. The village head always encourages his people to carry out activities, especially physical development in their village. The village head helps facilitate village development through facilities so that development can proceed. The village head invites and involves the community in the physical development of the village.

5. Conclusion

It shows that the leadership of the Untang Village Head plays an important role in improving the physical development of the village through three main aspects As a motivator, the village head encourages the work enthusiasm of village officials and the community through personal approaches, providing motivation in every meeting, and actively interacting with the community to understand their needs. As a facilitator, the village head facilitates the development process by providing space for discussion, forming a planning team (RKP APBDES), and establishing good communication with the community and government at the kecamatan and kabupaten levels. As a mobilizer, the village head not only mobilizes the community to be involved in physical development but also ensures that every development program is transparent and involves all elements of the community. This research confirms that effective leadership in village development depends not only on policies, but also on interpersonal approaches and active involvement of leaders in mobilizing existing resources. With an approach that prioritizes deliberation and mutual cooperation, physical development in Untang Village can run well and provide benefits to the community at large.

THE INFLUENCE OF SOCIAL MEDIA AND BRAND AWARENESS ON INCREASING THE NUMBER OF CONSUMERS (CASE STUDY OF MSMES GETUK TAKE TAWANGMANGU)

Lasarus Icon Sandro

Institut Teknologi Bisnis Kristen Bukit Pengharapan, Jawa Tengah

Abstract

Getuk Take MSMEs in Tawangmangu are one of the local business actors that are able to survive and develop in the midst of increasingly fierce business competition. In the digital age, the use of social media and brand awareness plays an important role in marketing strategies. This study aims to analyze the extent of the influence of social media and brand awareness on the increase in the number of consumers. This study uses a quantitative method with a survey approach, involving 96 respondents. The results of the analysis show that social media significantly affects the increase in the number of consumers, while brand awareness does not have a significant influence partially, but has a simultaneous influence with social media. This research makes an important contribution to understanding MSME marketing strategies through social media.

Keywords: Social Media, Brand Awareness, Increasing Number of Consumers, MSMEs, Getuk Take

1. Introduction

1.1 Background

Micro, Small, and Medium Enterprises (MSMEs) are the backbone of the Indonesian economy. In the face of the times and technology, MSMEs are required to innovate in marketing strategies. One approach that has proven effective in increasing product visibility is the use of social media. In addition, brand awareness is an important factor in building customer loyalty.

Getuk Take MSMEs in Tawangmangu have utilized social media such as TikTok, Instagram, and Google Review to reach a wider range of consumers. However, it is necessary to examine whether this strategy is really effective in significantly increasing the number of consumers.

1.2 Problem Formulation

1. How does social media affect the increase in the number of consumers of Getuk Take MSMEs?
2. How does awareness affect the increase in the number of consumers?
3. How do social media and brand awareness simultaneously affect the increase in the number of consumers?

1.3 Research Objectives

This research aims to:

1. Knowing the influence of social media on the increase in the number of consumers.
2. Knowing the influence of brand awareness on increasing the number of consumers.
3. Knowing the influence of social media and brand awareness simultaneously on the increase in the number of consumers.

1.4 Research Benefits

Theoretically, this research strengthens the theory of digital marketing and consumer behavior. Practically, the results of the research can be used as a reference for MSMEs in optimizing marketing strategies through social media

2. Literature Review

2.1. Grand Theory

This study uses the theory of *Social Media Marketing* developed by Philip Kotler and Chris Heuer. This theory explains that social media is not only a place to communicate, but also an important tool for building good relationships with customers and adding value to a brand. This is also supported by the opinion of Moriansyah (2015), who states that social media can increase brand *awareness*, influence purchasing decisions, and create a closer relationship between business actors and consumers.

If social media is used well—for example, through engaging content, direct interactions such as comments and discussions, endorsements from influencers, and reviews from other customers (*e-WOM)*—it can build customer trust and loyalty. The success of a marketing strategy on social media also depends on how well the business owner understands how the platform works and how they make use of the available data.

As technology advances, the goal of marketing through social media is now more emphasized on long-term relationships, not just quick sales. Therefore, this theory is very important to explain how social media can be used strategically to attract more consumers, expand market reach, and strengthen brand position, especially for MSMEs such as Getuk Take in Tawangmangu.

2.2. Social Media

Social media is a digital platform that allows people to share information and communicate with each other without time and place limits. Because it can be accessed directly and widely by anyone, social media is now not only used for communication, but also an important tool in promotional and buying and selling activities.

Research shows that social media has a great influence on people's desire to buy a product, and can even directly influence purchasing decisions. Business actors, especially MSMEs, can take advantage of social media to expand their market. One effective way is to create a compelling and convincing promotional message to attract potential buyers.

In Indonesia itself, internet usage continues to increase. In 2020, more than 175 million people were already using the internet, mostly through mobile phones. This is a great opportunity for MSMEs to market products cheaper and reach a wider range of consumers. Social media also facilitates direct communication with customers, so that business actors can quickly receive input and build good relationships.

Even so, social media is not the only factor that determines the buying decision. Many people still choose products based on quality, price, or recommendations from people they trust. In addition, there are still many MSMEs who do not have enough knowledge or skills in using social media to the fullest.

Therefore, MSMEs need to learn and improve their skills in digital marketing. If used well, social media can be a very useful tool for growing your business, attracting more customers, and competing with other businesses in the market.

2.2.1. Social Media Factors

1. Platform suitability, meaning that the platform used must be in accordance with business needs.
2. Cheaper costs, compared to promotions in traditional media such as TV or radio.
3. Ease of interaction, because social media has features such as comments and direct messages that make communication faster.
4. Internet access, which makes it easier for businesses to reach a wider market.
5. Immediate benefits, such as increased sales or quick feedback from customers.
6. Social influences, such as encouragement from consumers, competitors, or the business community.
7. Supporting facilities, such as adequate training and technology.
8. Lack of digital knowledge, which can be an obstacle for MSME actors.

2.2.2. Social Media Indicators

1. Brand awareness, seen from the number of followers, how often the brand is mentioned, and how far the content is spread.
2. Engagement rates, such as the number of likes, comments, and people sharing the content.
3. Conversions and sales, which are how many people buy after viewing content on social media.
4. Customer loyalty, seen from how often customers repurchase and leave reviews or recommend products to others.
5. Overall, social media can be a very useful tool for MSMEs if used properly. In the case of Getuk Take MSMEs in Tawangmangu, social media not only helps introduce products, but also strengthens relationships with customers, increases sales, and increases consumer loyalty.

2.3. Brand Awareness

Brand awareness is a person's ability to recognize and remember a brand in various situations. This is very important in marketing strategy, because the more a brand is known, the more likely people are to buy the product.

Brand awareness helps create a strong image and differentiate the brand from competitors. Brands that are often remembered by consumers will be easier to choose when they want to buy similar products. Therefore, business actors need to ensure that their brand is easily recognizable and always appears in the minds of consumers.

2.3.1. Brand awareness factor

1. Marketing strategies, such as advertising, promotions, content on social media, and collaborations with influencers, that help introduce the brand to more people.
2. The quality of products and services, where unique, quality, and good service products will make consumers trust and loyal.
3. Clear brand identity, such as logos, slogans, and other easily recognizable visual displays.
4. Customer experience, because a good experience will make consumers happier and may recommend to others.
5. Social media activity, with regular and engaging posts on platforms like Instagram or Facebook can expand the brand's reach.
6. Participation in events and sponsorships, which help introduce the brand to more people through the activities they attend.

2.3.2. Brand awareness indicator

1. Brand recognition, how quickly consumers can recognize the brand from its logo or packaging.
2. A reminder again, how easy it is for consumers to mention brand names without help.
3. Top of mind, when a brand immediately comes to the consumer's mind when they think of a particular product.
4. Brand aware, a condition in which consumers have never heard of or recognized the brand at all.

2.4. Increasing Number of Consumers

The increase in the number of consumers is an important sign that shows whether a business is successful or not, whether it is a large business or MSMEs such as Getuk Take. The number of consumers describes how many people buy or use a product in a given time. In the business world, the number of consumers can increase due to strategies from within the company and also due to external influences such as consumer habits and tastes.

2.4.1. Factors of Increasing the Number of Consumers

1. Product quality: A good and satisfactory product will make people happy to buy again and even recommend it to others.
2. Price: The price that matches the quality will be considered reasonable by consumers. If the price is right and competitive, then more people are interested in buying.
3. Promotions: Attractive promotions, especially through social media, can introduce the product to more people. For example, with videos, customer testimonials, or attractive discounts.
4. Quality of service: Fast, friendly, and helpful service to make consumers feel valued and more comfortable to buy again.
5. Easy location and access: Businesses that are strategically located and easily accessible will be visited more often by buyers.
6. Product innovation: Businesses that continue to make updates, whether in terms of products, packaging, or production methods, can more easily attract consumer attention and compete in the market.
7. Social and cultural factors: Most of the time, people buy products because of the influence of their family, friends, or social environment. For example, a person buys something because it is commonly used in his home since childhood.

2.4.2. Indicators of Increasing the Number of Consumers

1. Customer satisfaction: Consumers are satisfied that the product meets their expectations. This can be seen from positive reviews, repeat purchases, and comments on social media.
2. Successful promotions: Promotions are considered successful if they attract a lot of attention, increase sales, and keep people interested even after the promotion is over.
3. Good product: A product is rated good if it gets good reviews and is rarely returned due to problems.
4. Good service: Service is rated good if the customer is served quickly, their questions are answered, and they feel valued when interacting with the business

2.5. Previous Research

Several previous studies have shown mixed results related to the influence of social media

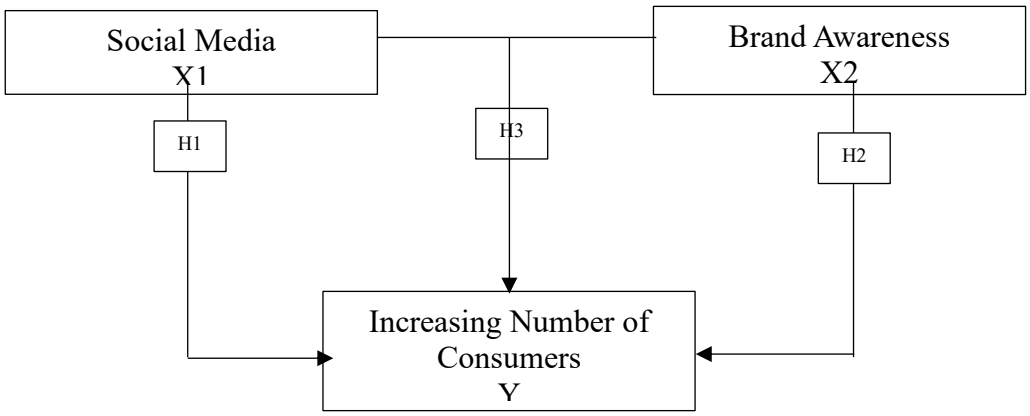
and brand awareness on purchase decisions and customer loyalty.

2.6 Hypothesis Development

1. H1: Social media has an effect on increasing the number of consumers.
2. H2: Brand awareness has an effect on increasing the number of consumers.
3. H3: Social media and brand awareness simultaneously affect the increase in the number of consumers.

2.7. Frame of mind

The framework of thought shown in the figure below illustrates the relationship between the independent variables and the dependent variables that the research focuses on



3. Research Methods

3.1. Population and Sample

The population in this study is all consumers of Getuk Take MSMEs which are recorded through social media and Google Reviews as many as 2,416. The sample was determined using the Slovin formula with an error rate of 10%, so that 96 respondents were obtained.

$$n = \frac{N}{1 + N(e)^2}$$

n = $2416/(1+2416 \times (0,1)^2)$

n = $2416/25,16$

n = $96,02$

3.2. Types and Data Sources

The data type consists of primary data (questionnaires and interviews) and secondary data (literature and documentation).

3.3. Data Collection Techniques

Data were collected through questionnaires with a Likert scale and interviews with key informants.

3.4. Data Analysis Techniques

The analysis was carried out using SPSS 26 with validity, reliability, classical assumption test, multiple linear regression analysis, t-test, F-test, and determination coefficient (R^2).

4. Results and Discussion

4.1. Characteristics of Respondents

This research was conducted in Tawangmangu District, Karanganyar Regency, Central Java, with the aim of determining the influence of social media and brand awareness on the increase in the number of consumers of Getuk Take MSMEs. To obtain the appropriate data, the researcher distributed questionnaires to 96 respondents who had bought Getuk Take products at least once in the past year.

The characteristics of the respondents help to describe who any Getuk Take consumer is. From the questionnaire data, it is known that most of the respondents are students (43 people), followed by private employees (24 people), and the rest come from other work backgrounds such as civil servants, farmers, students, and others. When viewed from gender, the number of male respondents was 62 people, and 34 women were women.

In terms of age, the majority of respondents were aged 18–29 years old with a total of 65 people. This shows that Getuk Take consumers are dominated by young people. There were 17 people aged 30–39 years, 10 people aged 40–49 years, and 4 people aged 50–59 years.

Based on how they knew Getuk Take's social media, most of the respondents knew him through Instagram (45 people), then TikTok (38 people), and the rest through Google Maps (13 people). This shows that social media, especially Instagram and TikTok, play a very important role in helping introduce Getuk Take to the public, especially young people.

4.2. Validity and Reliability Tests

All variable indicators have a correlation value above the r-table (0.2006), indicating validity. Cronbach's Alpha value > 0.7 indicates the reliability of the instrument.

Variabel Media Sosial

Pernyataan	r Hitung	r Tabel	Keterangan
X1.1	0,683	0,2006	Valid
X1.2	0,730	0,2006	Valid

4.4 Multiple Linear Regression Test

Model regresi: Y = 1.548 + 0.811X1 + 0.160X2

1. X1 (Social Media) significant (t count = 7,265 > t table = 1,985; sig = 0.000)

2. X2 (Brand Awareness) is insignificant (t count = 1.519 < t table = 1.985; sig = 0.132)
3. The F test shows F count = 160.848 and sig = 0.000 < 0.05, meaning a significant simultaneous influence.
4. The R^2 value is 0.776, meaning that 77.6% of the variation in the increase in the number of consumers is explained by social media and brand awareness.

	Standardized coefficient				
Model	B	Std Erorr	Beta	t	sig
Constant	1,548	1,423		1,088	0,279
X1	0,811	0,112	0,742	7,265	0,000

Model	R	*R Square*	*Adjusted R Square*	*Std Error of the Estimate*
1	,881[a]	0,776	0,771	1,89846

4.5. Discussion

The results of the study show that the active and appropriate use of social media has proven to have a great and real influence in increasing the number of consumers of Getuk Take MSMEs in Tawangmangu. This can be seen from the results of statistical calculations, namely *the calculated t* value of 7.265 which is greater than *the t table of 1.985*, and the significance value of 0.000 which is much smaller than 0.05. This means that social media helps introduce products to more people, make products look attractive, and open direct communication between business actors and customers. These findings are also supported by various previous studies that state that social media is very effective in marketing products and influencing consumers' decisions to buy.

Meanwhile, brand awareness or brand awareness in this study did not have a significant influence on the increase in the number of consumers. This is shown from the *calculated t* value of 1.519 which is smaller than *the t table of* 1.985 and the significance value of 0.132 which is greater than 0.05. This means that even though many people know and know the Getuk Take brand, it is not strong enough to make them immediately decide to buy the product. The findings are also in line with other research that suggests that just knowing a brand isn't always enough to encourage people to buy, especially if it's new or not yet widely known.

However, if social media and brand awareness are used together, both can have a strong impact on increasing the number of consumers. This is proven through the F test with an *F* result of 160.848 and a significance value of 0.000, which means that together these two factors do have a significant effect.

In general, this study confirms that social media is an important key to attracting more consumers, especially because social media can reach many people and deliver promotional messages quickly and engagingly. Although brand awareness has not shown a direct influence, building brand awareness is still important, because if it continues to be done well and combined with promotion on social media, this can have a positive impact on increasing the number of consumers in the future.

5. Conclusion and Suggestions

5.1. Conclusion

1. Social media has a significant effect on increasing the number of consumers.
2. Brand awareness has no significant effect partially.
3. Simultaneously, social media and brand awareness have a significant effect on increasing the number of consumers.

5.2. Suggestions

It is recommended that Getuk Take MSMEs focus more on optimizing social media content such as promotional videos and discounts. Regular evaluation of social media performance and brand awareness is also needed so that the strategies used can be adjusted to market dynamics.

AN INTEGRATIVE MODEL OF THE IMPACT OF CUSTOMER ENGAGEMENT ON SOCIAL MEDIA USAGE INTENTION: THE MEDIATING ROLE OF VALUE CO-CREATION, RELATIONSHIP QUALITY, AND CUSTOMER INVOLVEMENT

Fachmi Tamzil, Arief Kusuma AP, Lia Amalia

Universitas Esa Unggul

E-mail: ftamzil@student.esaunggul.ac.id

Abstract

Social media has evolved from a mere communication tool into a dynamic participatory space where users actively contribute to the creation of experiences, relationships, and value. In this digital landscape, concepts such as Customer Engagement, Value Co-Creation, Relationship Quality, and Customer Involvement have become increasingly critical in understanding user behavior, particularly within highly connected urban communities. Despite their relevance, limited studies have comprehensively examined the interrelationships among these constructs within a single integrative model—especially in the context of emerging digital societies such as Jakarta, Indonesia. This study seeks to fill this gap by developing an integrative model that investigates how customer engagement influences social media usage intention, mediated by value co-creation, relationship quality, and customer involvement. Using a quantitative approach and targeting active Instagram users in Jakarta, the research provides empirical evidence on how psychological, relational, and participatory factors shape continued use of social media platforms. The findings aim to advance both theoretical understanding and practical strategies for digital marketing by emphasizing user-driven, experiential, and relationship-based approaches.

Keywords: Customer Engagement, Value Co-Creation, Relationship Quality, Customer Involvement, Social Media Usage Intention

1. Introduction

Over the past two decades, digital transformation has fundamentally reshaped how individuals, organizations, and societies communicate, interact, and create value. These changes are not only technological but also sociological and behavioral in nature. Users are no longer passive recipients of information; instead, they actively co-create value within digital ecosystems (Vargo & Lusch, 2004; Ramaswamy & Ozcan, 2016).

Within this evolving context, concepts such as Customer Engagement (CE), Value Co-Creation (VCC), Customer Involvement (CI), and Relationship Quality (RQ) have become critical to understanding consumer behavior in social media environments. These constructs are intricately interconnected and contribute to shaping Social Media Usage Intention (SMUI) as a function of both social interaction and economic utility (Dessart et al., 2015; Hollebeek et al., 2014).

Indonesia provides a rich context for studying these relationships, as it ranks among the top countries globally in terms of social media use. According to We Are Social (2025), over 72% of the Indonesian population are active social media users, spending an average of over three hours per day online. Social media platforms, therefore, serve not only as communication channels but also as spaces for collaboration, community building, and digital commerce (Kemp, 2025).

The concept of Value Co-Creation, rooted in Service-Dominant Logic (S-D Logic), emphasizes that value is no longer produced solely by companies but is co-created in interaction with consumers (Vargo & Lusch, 2008). In digital contexts, value is co-produced through feedback, user-generated content, brand advocacy, and shared experiences (Prahalad & Ramaswamy, 2004).

Customer Engagement plays a pivotal role in these processes. It serves as a psychological and behavioral bridge between the user and the brand or service provider. CE is multi-dimensional encompassing cognitive, emotional, and behavioral dimensions and is often triggered by immersive digital experiences (Brodie et al., 2011; Hollebeek, 2011). These experiences foster greater user participation in value co-creation activities.

Customer Involvement extends this idea by emphasizing the active contribution of users to design, adapt, and enhance digital services. Lead users, as introduced by von Hippel (1986), often serve as innovators in shaping services and content. In social media platforms, CI includes not just feedback but direct influence over platform features, community norms, and even brand narratives (Zhang et al., 2024).

Relationship Quality, comprising elements such as trust, satisfaction, and commitment, provides the relational foundation for sustained interactions (Morgan & Hunt, 1994). High RQ enhances user loyalty and the willingness to maintain long-term digital engagement (Liang et al., 2011; Suhartanto & Dean, 2024).

Ultimately, these constructs jointly shape Social Media Usage Intention. Users' continued engagement with social platforms is driven not merely by functional benefits but also by the psychological, emotional, and social value they derive (Yang et al., 2024; Rafi et al., 2023).

This study proposes an integrative model that investigates how CE, VCC, CI, and RQ influence SMUI among active Instagram users in Jakarta. By adopting a quantitative approach, this research aims to fill empirical and contextual gaps in the literature while offering strategic insights for user-centered and relational digital marketing.

2. Literature Review

2.1 Value Co-Creation (VCC)

The concept of Value Co-Creation (VCC) has undergone a paradigmatic shift, moving from a producer-centric view to a collaborative interaction model involving customers as active co-creators of value. This transition is rooted in the Service-Dominant Logic (S-D Logic), which emphasizes that value is no longer embedded in products alone but is co-created through interactions between firms and customers (Vargo & Lusch, 2004; Lusch & Vargo, 2006).

Prahalad and Ramaswamy (2004) further advanced the notion of VCC by highlighting the role of dialogue, transparency, access, and risk assessment as pillars of co-creation experiences. In digital contexts—especially social media—VCC manifests through shared content, customer reviews, personalized feedback, and collaborative product development (Chen et al., 2023). Recent studies emphasize that VCC positively influences relationship quality and platform loyalty. Yang et al. (2024) found that co-creation strengthens users' emotional and social attachment to platforms, ultimately increasing usage intentions.

2.2 Customer Engagement (CE)

Customer Engagement (CE) is conceptualized as a multidimensional construct encompassing cognitive, emotional, and behavioral elements (Brodie et al., 2011). Engagement is triggered by value-driven, participative experiences and involves actions such as sharing content, participating in discussions, and brand advocacy (Hollebeek, 2011). In the digital age,

CE has become a key determinant of customer loyalty and brand co-creation. Dessart et al. (2015) found that emotionally engaged users are more likely to become content contributors, community advocates, and loyal consumers. Khan et al. (2023) emphasized that CE contributes significantly to the formation of Relationship Quality (RQ) and Usage Intention, particularly in social media ecosystems.

2.3 Customer Involvement (CI)

Customer Involvement (CI) refers to the extent to which users participate in decision-making and content creation, often influencing the design and delivery of products or services. Von Hippel (1986) introduced the concept of "lead users" who proactively contribute ideas and innovations. In digital platforms, CI fosters innovation and enhances user satisfaction. Li et al. (2020) suggest that CI positively moderates the link between Relationship Quality and organizational performance, especially in high-involvement industries. However, Ma et al. (2017) warn that unmanaged CI can lead to increased operational pressure and complexity.

2.4 Relationship Quality (RQ)

Relationship Quality (RQ) is a strategic component of relationship marketing and comprises trust, satisfaction, and commitment (Morgan & Hunt, 1994). High RQ leads to increased loyalty, advocacy, and voluntary participation in co-creation (Liang et al., 2011; Suhartanto et al., 2024). In social media settings, strong relationships enhance users' willingness to engage in discussions, give feedback, and co-develop brand narratives (Kamangarpoor & Shahmoradi, 2017). RQ thus serves not only as an emotional buffer but also as a driver of long-term engagement.

2.5 Social Media Usage Intention (SMUI)

Social Media Usage Intention (SMUI) refers to users' psychological tendency to continue using social platforms based on perceived utility, social connection, and value experience (Davis, 1989; Yuan et al., 2021). The Uses and Gratifications Theory (Katz et al., 1973) offers a foundational explanation, highlighting users' motivation to fulfill entertainment, information, and social interaction needs.

Recent studies (Rafi et al., 2023; Yang et al., 2024) show that both Value Co-Creation and Relationship Quality significantly predict continued use of platforms like Instagram, especially when users feel empowered and connected in community settings.

3. Methodology

3.1 Research Paradigm

This study adopts a positivist research paradigm grounded in a quantitative approach, aiming to explain the causal relationships among variables through statistical testing (Creswell, 2014). The model examines how Customer Engagement (CE) influences Social Media Usage Intention (SMUI), with Value Co-Creation (VCC), Customer Involvement (CI), and Relationship Quality (RQ) serving as mediating variables. The approach allows the researcher to test hypotheses based on empirical data collected from a specific population, thereby ensuring objectivity and generalizability.

3.2 Unit of Analysis and Observation

The unit of analysis in this research is the individual user of social media, specifically active Instagram users in Jakarta aged 18 and above. These users are considered relevant given Indonesia's high rate of social media adoption (Kemp, 2025). The unit of observation is each

respondent's perception and behavior as captured through survey responses, representing their level of engagement, co-creation, relationship quality, involvement, and intention to continue using Instagram.

3.3 Research Method

A survey research method was employed using a structured questionnaire as the primary data collection instrument. This method is appropriate for measuring attitudes, perceptions, and behavioral intentions in large populations (Malhotra, 2010). A non-probability purposive sampling technique was used to target Instagram users who had experience interacting with brands, communities, or influencers.

The sample size was determined using the rule of thumb for Structural Equation Modeling (SEM), where a minimum of 5–10 respondents per indicator is required (Hair et al., 2019). With approximately 30 indicators used in this study, a minimum sample of 300 was targeted to ensure model fit and generalizability.

3.4 Operationalization of Variables

All variables in this study were measured using validated multi-item scales adapted from previous studies and adjusted to fit the Instagram context. A **five-point Likert scale** was used for all items, ranging from 1 = "Strongly Disagree" to 5 = "Strongly Agree."

- **Customer Engagement (CE)** was measured through cognitive, emotional, and behavioral dimensions (Brodie et al., 2011).
- **Value Co-Creation (VCC)** was assessed based on interaction, feedback, co-design, and advocacy behaviors (Prahalad & Ramaswamy, 2004).
- **Customer Involvement (CI)** was measured based on user participation in content creation and service improvement (Von Hippel, 1986).
- **Relationship Quality (RQ)** included trust, satisfaction, and commitment dimensions (Morgan & Hunt, 1994).
- **Social Media Usage Intention (SMUI)** was measured using intention to continue, recommend, and intensify usage (Yuan et al., 2021).

All constructs were pretested for reliability and clarity before the full-scale data collection.

3.5 Questionnaire Design

The questionnaire was divided into three sections:

- **Demographic information**: Age, gender, occupation, education, frequency of Instagram use.
- **Screening questions**: Confirming active Instagram use and interaction with content or communities.
- **Main constructs**: Measurement items for CE, VCC, CI, RQ, and SMUI.

The survey was distributed **online using Google Forms**, targeting Instagram communities, digital marketing groups, and university student networks in Jakarta.

3.6 Data Collection Procedure

Data collection took place over a four-week period. Respondents participated voluntarily and anonymously. To ensure validity:

- Each participant could only submit the survey once (by restricting IPs).
- Responses were reviewed for completeness before inclusion in the dataset.

Ethical approval was obtained from the university's research board, and all participants provided **informed consent**.

3.7 Data Analysis Techniques

The collected data were analyzed using **Structural Equation Modeling (SEM)** with the **Partial Least Squares (PLS)** method via **Smart PLS** software. PLS-SEM is suitable for predictive modeling and complex relationships involving multiple mediating variables (Hair et al., 2019).
The analysis steps included:

- **Descriptive statistics** for demographic profiles.
- **Outer model evaluation**: Reliability (Cronbach's Alpha, Composite Reliability), Validity (AVE, Cross-loadings), Discriminant validity (Fornell-Larcker criterion).
- **Inner model evaluation**: Path coefficients, R^2, and predictive relevance (Q^2).
- **Hypothesis testing** using bootstrapping to assess significance of paths.

4. Results and Discussion

4.1 Results

This study employed **Partial Least Squares Structural Equation Modeling (PLS-SEM)** using SmartPLS 4.0. The data collected from 322 valid respondents were processed to evaluate both the measurement and structural models. The results are presented in two stages: the outer model (validity and reliability) and the inner model (hypothesis testing).

4.1.1 Measurement Model (Outer Model) Evaluation

The outer model was assessed through:

- Convergent Validity: All item loadings were above 0.7, and Average Variance Extracted (AVE) values exceeded the minimum threshold of 0.50, confirming that indicators measured the intended constructs (Hair et al., 2019).
- Composite Reliability and Cronbach's Alpha values for all constructs were above 0.70, indicating high internal consistency (Nunnally & Bernstein, 1994).

4.1.2 Structural Model (Inner Model) Evaluation

Path coefficients were tested using bootstrapping (5,000 samples). The R^2 value for Social Media Usage Intention (SMUI) was 0.693, meaning that 69.3% of the variance in SMUI could be explained by the model.

The summary of hypothesis testing is shown below:

Hypothesis	Path	Coefficient	t-value	Result
H1	VCC → RQ	0.432	8.721	Supported
H2	CE → VCC	0.378	7.462	Supported
H3	CI → VCC	0.271	5.108	Supported
H4	RQ → CI	0.294	5.355	Supported
H5	VCC → SMUI	0.349	6.709	Supported
H6	RQ → SMUI	0.326	6.132	Supported

All hypotheses were statistically significant ($t > 1.96$, $p < 0.05$), confirming the strength of the conceptual framework.

4.2 Discussion

4.2.1 Value Co-Creation Enhances Relationship Quality
The findings confirm that Value Co-Creation (VCC) significantly enhances Relationship Quality (RQ). This supports the Service-Dominant Logic, which posits that value is co-produced through interaction rather than delivered unilaterally (Vargo & Lusch, 2004). As users engage in feedback, content contribution, and brand advocacy, they feel emotionally and socially connected to the platform, thereby strengthening their perceived relationship with the brand or community (Jashari-mani et al., 2024).

4.2.2 Customer Engagement as a Driver of Co-Creation
Customer Engagement (CE) positively affects VCC, aligning with Brodie et al. (2011) who argue that CE is the foundation of participatory behavior in digital settings. Instagram users who experience emotional and cognitive engagement are more likely to collaborate in content development, discussions, and value generation (Hollebeek, 2011; Sudarti & Fachrunnisa, 2022).

4.2.3 The Role of Customer Involvement in Co-Creation
Customer Involvement (CI**)** also significantly influences VCC. Active participation in shaping service offerings reinforces users' sense of ownership and satisfaction (von Hippel, 1986). In social media contexts, CI manifests through user-generated content, idea sharing, and design feedback, all of which promote deeper involvement in co-creation activities (Ma et al., 2017; Dewarani & Alversia, 2023).

4.2.4 Relationship Quality Encourages Involvement
The study finds that high RQ encourages greater Customer Involvement. Trust and commitment enable users to engage more openly and frequently with the platform, thereby increasing their contribution to value creation (Li et al., 2020). This supports the idea that RQ acts as a psychological safety net that fosters active user participation.

4.2.5 VCC and RQ Drive Social Media Usage Intention
Both VCC and RQ significantly impact Social Media Usage Intention (SMUI). Users who experience co-creation and perceive strong relationships are more likely to continue using the platform. This aligns with findings from Yang et al. (2024), who highlight the importance of social bonding and mutual value creation in sustaining digital platform usage.
The relationship between RQ and SMUI also supports previous work by Liang et al. (2011), showing that emotional satisfaction and trust are vital determinants of continued digital engagement.

4.3 Theoretical and Practical Implications
Theoretically, this study reinforces the integration of S-D Logic, Engagement Theory, and Uses and Gratifications Theory in explaining digital behavior. It validates the multi-pathway influence of psychological and relational constructs on platform usage.
Practically, social media platforms and digital marketers should design strategies that:

- Encourage two-way communication and user-generated content.
- Build trust-based, emotionally resonant interactions.
- Involve users in brand narrative development and product innovation.

Such strategies can strengthen loyalty, extend user lifetime value, and create vibrant digital communities.

5. Conclusion

5.1 Conclusion

This study aimed to develop and empirically test an integrative model linking Customer Engagement (CE) to Social Media Usage Intention (SMUI), mediated by Value Co-Creation (VCC), Customer Involvement (CI), and Relationship Quality (RQ). Using a quantitative approach and data from 322 active Instagram users in Jakarta, the findings offer several important insights into digital user behavior.

First, the research confirms that Customer Engagement significantly enhances Value Co-Creation, supporting prior theories that emotional, cognitive, and behavioral engagement drives participatory behavior (Brodie et al., 2011; Hollebeek, 2011). Engaged users are more likely to co-create value by contributing content, providing feedback, and interacting meaningfully with brands and communities.

Second, both Customer Engagement and Customer Involvement play vital roles in enhancing Value Co-Creation. Involved users, when given space to participate in shaping digital experiences, feel more empowered and committed, aligning with findings from von Hippel (1986) and Dewarani & Alversia (2023).

Third, the study demonstrates that Value Co-Creation positively influences Relationship Quality, which in turn strengthens Customer Involvement. High levels of trust, satisfaction, and commitment act as emotional bridges that sustain long-term relationships with digital platforms (Morgan & Hunt, 1994; Liang et al., 2011).

Lastly, Value Co-Creation and Relationship Quality significantly influence Social Media Usage Intention. This confirms that digital platform usage is not merely driven by functionality, but also by the emotional and social value experienced during interaction (Yang et al., 2024; Rafi et al., 2023).

Collectively, the findings affirm that digital behavior is shaped by user-driven, relational, and participatory dynamics. The proposed integrative model thus offers a comprehensive lens for understanding the psychological and social mechanisms underlying sustained social media engagement.

5.2 Theoretical Implications

This research contributes to the literature in several ways:

- It integrates concepts from Service-Dominant Logic (Vargo & Lusch, 2004), Engagement Theory, and Relationship Marketing into a single empirical model, offering a broader framework to analyze user behavior in digital ecosystems.
- It empirically validates the mediating role of Value Co-Creation, Customer Involvement, and Relationship Quality in shaping Social Media Usage Intention, thereby addressing gaps in previous studies that examined these variables in isolation (Brodie et al., 2011; Hollebeek, 2011).
- It contributes contextually to emerging markets, particularly Indonesia, by examining user behavior in an urban, high-engagement social media environment.

5.3 Practical Recommendations

For digital marketers, platform designers, and content creators, the findings offer the following strategic implications:

- Foster Customer Engagement
  Create immersive, emotionally resonant experiences that invite user interaction—such as polls, gamified content, and real-time feedback tools.
- Encourage Value Co-Creation
  Provide opportunities for users to contribute ideas, co-design features, and co-develop brand stories. UGC (user-generated content) campaigns are one effective approach.

- Strengthen Relationship Quality
  Invest in building trust and responsiveness. Humanized communication, fast replies, and transparency in digital services help build relational equity.
- Leverage Customer Involvement
  Involve users in decisions—not just as consumers, but as collaborators. For example, letting users vote on new features or products can boost involvement and loyalty.
- Personalize and Localize Content
  Use data analytics to tailor content to users' needs and cultural contexts, as personalization drives both engagement and satisfaction.

5.4 Limitations and Future Research

While the study yields robust findings, several limitations should be acknowledged:

- The sample is limited to active Instagram users in Jakarta, which may affect generalizability to other regions or platforms.
- The cross-sectional design restricts causal inference over time.
- Cultural factors and personality traits were not examined in this model.

Future studies could:

- Use longitudinal data to analyze behavioral changes over time.
- Compare user behavior across platforms (e.g., Istagram, TikTok, YouTube).
- Integrate cultural, emotional intelligence, or digital literacy variables into the model.

UNDERSTANDING ENTREPRENEURIAL INTENTION IN EMERGING ECONOMIES: A STUDY OF MSME ACTORS IN INDONESIA.

Indra Gunawan[1], Rhian Indradewa[1], Unggul Kustiawan[1]

[1]Faculty of Economics and Business, Esa Unggul University

Abstract

This study examines the factors influencing entrepreneurial intention among Micro, Small, and Medium Enterprises (MSMEs) in Indonesia. In this emerging economy, entrepreneurship is crucial for economic advancement. This research utilizes the theory of planned behavior (TPB) to investigate the impact of entrepreneurial attitude, self-efficacy, and learning on entrepreneurial intention. Additionally, it examines the moderating influence of subjective norms to elucidate how perceived social pressure affects the link between internal factors and intention. Data were gathered via structured surveys administered to MSME participants who had completed entrepreneurial training programs. The findings, derived from structural equation modeling (SEM), indicate that entrepreneurial attitude, self-efficacy, and learning strongly affect entrepreneurial intention. Additionally, subjective norms influence the intensity of these associations, indicating that social contexts are crucial in entrepreneurial decision-making. The research enhances the comprehension of intention formation in the context of developing countries and provides practical insights for policymakers and entrepreneurship educators in Indonesia.

Keywords: *entrepreneurial learning, entrepreneurial attitude, entrepreneurial self-efficacy, subjective norms, entrepreneurial intention*

1. Introduction

Entrepreneurship is widely recognized as a key driver of economic growth, job creation, and innovation, particularly in developing countries (Acs et al., 2012; Audretsch & Keilbach, 2004). In Indonesia, micro, small, and medium enterprises (MSMEs) are the backbone of the national economy, contributing approximately 61% to the gross domestic product (GDP) and employing nearly 97% of the national workforce. Despite their significance, the entrepreneurial ratio in Indonesia remains relatively low at 3.35%, far behind countries like the United States (12%), Singapore (8.76%), and Malaysia (4.74%) (GEM, 2022). This gap highlights the urgency of fostering entrepreneurial intention, particularly among MSME actors participating in entrepreneurship training programs. However, structural challenges such as limited risk tolerance, low entrepreneurial confidence, and weak learning ecosystems hinder sustainable entrepreneurial behavior (Hofstede, 1984; Zarnadze et al., 2022).

To better understand the drivers of entrepreneurial behavior, many studies have adopted the theory of planned behavior (TPB), which posits that intention is the most proximal determinant of behavior and is shaped by attitude, perceived behavioral control (often operationalized as self-efficacy), and subjective norms (Ajzen, 1991). In the context of Indonesian MSMEs, these factors are particularly relevant given the cultural tendency toward uncertainty avoidance, which can suppress entrepreneurial risk-taking (Hofstede, 1984). While entrepreneurship training has proliferated across regions to address technical and managerial

gaps, its effectiveness in fostering long-term entrepreneurial intention remains inconsistent. Prior research suggests that entrepreneurial learning can enhance individual confidence and shape positive attitudes toward entrepreneurship (Huang et al., 2023; Yang et al., 2023). However, few studies have integrated these cognitive variables with normative social influences to explain intention among MSME actors. Therefore, this study aims to fill that gap by examining how entrepreneurial learning, attitude, and self-efficacy influence entrepreneurial intention, and how subjective norms moderate these relationships within the post-training context of Indonesian MSMEs.

2. Literature Review

2.1 Entrepreneurial learning as a foundational driver of entrepreneurial intention

Entrepreneurial learning is a crucial cognitive and experiential process through which individuals acquire, internalize, and apply knowledge to recognize and act upon business opportunities. According to Kolb (1984), learning is a cyclical process involving concrete experience, reflective observation, abstract conceptualization, and active experimentation. In the entrepreneurial context, learning is not only limited to formal education but also occurs through informal interactions, trial-and-error, and social engagement (Cope, 2005; Politis, 2005). Huang et al. (2023) emphasize three dimensions of entrepreneurial learning: school-based learning, social learning through peers and mentors, and family-based learning from exposure to entrepreneurial activities within households. These learning modalities shape entrepreneurial cognition, enabling individuals, especially MSME actors, to develop adaptive competencies, resilience, and opportunity recognition skills necessary for sustained business engagement.

In the context of MSMEs in Indonesia, entrepreneurial learning is a foundational construct that bridges knowledge acquisition and behavioral intention. As posited in the Theory of Planned Behavior (Ajzen, 1991), intention is influenced by attitudinal beliefs, perceived behavioral control (often measured as entrepreneurial self-efficacy), and normative pressures. Entrepreneurial learning strengthens attitude and efficacy by enhancing confidence, reducing uncertainty, and providing practical frameworks for action. Empirical evidence supports that learning-oriented interventions increase individuals' readiness to pursue entrepreneurial activities (Barba-Sánchez et al., 2022; Yang et al., 2023). However, despite the proliferation of entrepreneurship training programs across Indonesia, many MSME actors still operate at a subsistence level, often lacking the confidence or cognitive flexibility to scale their ventures. This underscores the need to understand how different forms of entrepreneurial learning contribute to intention formation, particularly when moderated by social and cultural factors such as subjective norms.

2.2 Entrepreneurial attitude as a key predictor of entrepreneurial intention

Entrepreneurial attitude refers to an individual’s evaluative disposition, positive or negative, toward engaging in entrepreneurial activities. Within the theory of planned behavior (Ajzen, 1991), attitude toward behavior represents the degree to which a person has a favorable or unfavorable evaluation of performing the behavior in question, in this case, starting and managing a business. A strong positive attitude typically reflects high personal value placed on autonomy, innovation, risk-taking, and self-achievement, which are crucial psychological traits

for entrepreneurs (Lüthje & Franke, 2003). Entrepreneurial attitude is thus a cognitive-affective orientation that mediates the translation of learning and experience into concrete entrepreneurial intention.

Research has consistently shown that an entrepreneurial attitude is central to predicting entrepreneurial intention across various contexts. He et al. (2024) and Kaur & Chawla (2023) found that individuals with a more positive attitude toward entrepreneurship are likelier to engage in opportunity identification and venture creation. Moreover, Karimi (2019) and Shah et al. (2020) established that an entrepreneurial attitude significantly predicts entrepreneurial intention among university students, even more than external environmental factors. In the context of MSMEs, an entrepreneurial attitude is particularly important, as it serves as a motivational driver that sustains entrepreneurial action beyond mere exposure to training or external support mechanisms.

In developing countries like Indonesia, where structural barriers and cultural constraints, such as high uncertainty avoidance, persist (Hofstede, 1984), a positive entrepreneurial attitude can serve as a psychological buffer. It empowers MSME actors to view entrepreneurship as a means of subsistence and a pathway for self-actualization and long-term value creation. Entrepreneurial training, incorporating attitude development through mentorship, self-reflection, and experiential activities, has fostered more persistent and proactive entrepreneurial behaviors (Rapina et al., 2023). Therefore, fostering a strong entrepreneurial attitude is not only a theoretical imperative but also a practical necessity for enhancing the entrepreneurial ecosystem among Indonesian MSMEs.

2.3 Entrepreneurial self-efficacy and the perception of behavioral control in entrepreneurial intention

Entrepreneurial self-efficacy (ESE) is defined as an individual's belief in their capability to successfully perform entrepreneurship-related tasks, such as identifying opportunities, mobilizing resources, managing risks, and sustaining business growth (Chen et al., 1998). Rooted in Bandura (1977) in social cognitive theory, self-efficacy influences how people think, feel, and act. Within the theory of planned behavior (Ajzen, 1991), self-efficacy aligns with the concept of perceived behavioral control, representing the degree to which individuals believe they have control over engaging in entrepreneurial actions. Individuals with high ESE are more likely to pursue entrepreneurial careers, overcome challenges, and remain resilient in uncertain environments.

In the context of MSMEs in Indonesia, entrepreneurial self-efficacy becomes a critical factor influencing entrepreneurial intention, especially amid structural and cultural challenges such as limited access to resources and high uncertainty avoidance (Hofstede, 1984). Prior empirical studies have shown a consistent positive relationship between ESE and entrepreneurial intention (Krueger & Brazeal, 1994; Shinnar et al., 2014). In particular, Huang et al. (2023) emphasize that entrepreneurial learning contributes significantly to the development of ESE through increased exposure to experiential activities and practical decision-making. The higher the individual has confidence in handling entrepreneurial tasks, the more likely they are to commit to launching or expanding a business venture.

Furthermore, self-efficacy does not operate in isolation but often interacts with other psychological and social factors. For instance, (Barba-Sánchez et al., 2022) argue that ESE can mediate between learning experiences and intention, as well as between subjective perceptions and actual behavior. In the Indonesian MSME landscape, where many entrepreneurs begin from necessity rather than opportunity, enhancing ESE is about skill-building, reframing internal beliefs, and reducing fear of failure. Consequently, entrepreneurship education and training must incorporate confidence-building mechanisms, such as mentoring, role-model exposure, and small-scale business simulations, to ensure that ESE translates into genuine entrepreneurial engagement.

2.4 Subjective norms and social influence in shaping entrepreneurial intention

Subjective norms refer to the perceived social pressure an individual feels regarding whether or not they should perform a specific behavior, in this case, the decision to become an entrepreneur (Ajzen, 1991). Within the theory of planned behavior (TPB), subjective norms represent one of the three core predictors of behavioral intention, alongside attitude and perceived behavioral control. This construct captures the influence of significant referent groups, such as family, peers, mentors, and community members, on an individual's intention to engage in entrepreneurship. In collectivist societies like Indonesia, where group approval and social conformity are culturally emphasized, the role of subjective norms is particularly salient in entrepreneurial decision-making (Hofstede, 1984).

Several empirical studies have highlighted the significance of subjective norms in shaping entrepreneurial intention. For instance, Lyu et al. (2024) and Nguyen (2020) that supportive social environments positively influence entrepreneurial attitudes and increase individuals' likelihood of pursuing entrepreneurial activities. These norms often act as external validations or deterrents, reinforcing or inhibiting the internal motivations of aspiring entrepreneurs. In the case of MSME actors who have undergone entrepreneurship training, the extent to which their immediate social circles support or discourage their entrepreneurial aspirations can critically affect whether training outcomes are translated into action.

Despite its theoretical relevance, subjective norms have shown inconsistent results in empirical research. Some studies report weak or non-significant effects on intention, especially in individualistic cultures, whereas in collectivist contexts, such as in many Asian societies, its influence tends to be more pronounced (Karimi, 2019; Shah et al., 2020). Moreover, subjective norms may not only exert a direct influence on intention. They may also function as a moderator, enhancing or diminishing the strength of relationships between internal variables (e.g., attitude, self-efficacy) and intention. This moderating role is particularly relevant when individuals face internal ambivalence; strong social support or expectation can either validate or suppress their entrepreneurial inclinations.

2.5 Entrepreneurial intention as a precursor to entrepreneurial behavior

Entrepreneurial intention refers to an individual's conscious state of mind that directs attention, experience, and action toward the initiation of a new business venture (Krueger & Brazeal, 1994). It is widely regarded as the most immediate antecedent of entrepreneurial behavior and has become a central focus in entrepreneurship research, particularly in intention-based models such as the theory of planned behavior (Ajzen, 1991) according to this theory,

intention is shaped by three key psychological constructs: attitude toward the behavior, perceived behavioral control (often operationalized as self-efficacy), and subjective norms. Thus, understanding entrepreneurial intention is critical to predicting who is likely to become an entrepreneur, especially in emerging economies like Indonesia.

Numerous studies have affirmed that entrepreneurial intention serves as a robust predictor of entrepreneurial actions, such as business registration, venture initiation, and opportunity exploitation (Barba-Sánchez et al., 2022; Zapkau et al., 2017). However, intention alone does not guarantee entrepreneurial action; appropriate capabilities, enabling environments, and motivational consistency must support it. In this regard, intention is not only a psychological orientation but also a reflection of one's readiness to undertake entrepreneurial risks and responsibilities. In the case of MSMEs in Indonesia, where structural and cultural constraints often limit entrepreneurial action, intention becomes even more critical; it represents the bridge between awareness and action.

3. Methodology

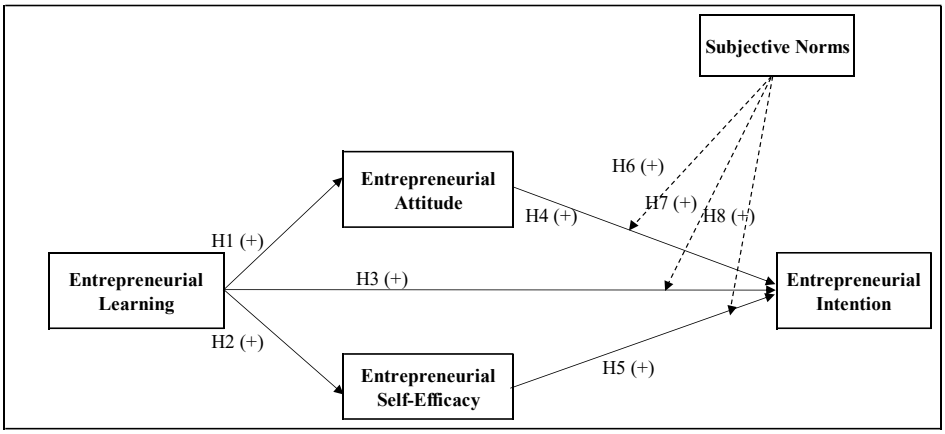
This study employed a quantitative research design using the partial least squares structural equation modeling (PLS-SEM) approach to examine the relationships among entrepreneurial learning, entrepreneurial attitude, entrepreneurial self-efficacy, subjective norms, and entrepreneurial intention. The unit of analysis comprised micro, small, and medium enterprises (MSMEs) in the greater Jakarta area (Jabodetabek), which had previously participated in formal entrepreneurship training programs. Data were collected through a structured questionnaire distributed to 380 respondents using purposive sampling. Measurement instruments were adapted from validated scales in previous literature and subjected to reliability and validity testing before full-scale analysis. The PLS-SEM method was selected for its suitability for predictive modeling and handling complex relationships among latent constructs in behavioral research.

3.1 Theoretical framework

The theoretical framework of this study draws upon social cognitive theory (Bandura, 1986), which emphasizes the reciprocal interaction between personal factors, behavior, and environmental influences in shaping human action. Within this perspective, entrepreneurial learning is viewed as a socially situated process where individuals acquire knowledge and develop beliefs about their capabilities (self-efficacy) through observation, experience, and feedback. Entrepreneurial self-efficacy, in turn, becomes a central cognitive mechanism that affects motivation and goal-setting. Entrepreneurial attitude reflects the affective and evaluative response resulting from learned experiences, while subjective norms are interpreted as perceived social reinforcement that can either facilitate or constrain entrepreneurial action. This theoretical lens is particularly relevant in the context of MSMEs in Indonesia, where cultural norms, social approval, and experiential learning through community-based training strongly influence the formation of entrepreneurial intention. By positioning self-efficacy and learning as key drivers and subjective norms as a contextual amplifier, the framework captures the dynamic interplay between cognition, affect, and social environment in entrepreneurial decision-making.

3.2 Conceptual framework

Figure 1. Conceptual Framework and Research Hypotheses



The conceptual framework of this study illustrates the hypothesized relationships among five key constructs: entrepreneurial learning, entrepreneurial attitude, entrepreneurial self-efficacy, subjective norms, and entrepreneurial intention. Drawing upon social cognitive theory (Bandura, 1986), the model positions entrepreneurial learning as a foundational variable influencing both entrepreneurial attitude (H1) and entrepreneurial self-efficacy (H2). Entrepreneurial learning is a multidimensional process; its formal, social, and experiential dimensions equip individuals with the cognitive and emotional resources necessary to shape positive attitudes and self-belief in pursuing entrepreneurship.

In turn, entrepreneurial attitude (H4) and entrepreneurial self-efficacy (H5) are hypothesized to affect entrepreneurial intention positively. This aligns with the literature suggesting that evaluative dispositions and perceived capability are critical antecedents to entrepreneurial action. Furthermore, Entrepreneurial Learning is also expected to impact Entrepreneurial Intention (H3) directly, reflecting the possibility of both direct and mediated effects through attitude and self-efficacy.

Subjective norms are integrated into the framework as independent variables and moderators. As an independent factor, subjective norms are hypothesized to influence entrepreneurial intention (H6) directly, reflecting the social and normative pressures MSME actors perceive in their entrepreneurial decisions. Additionally, subjective norms are posited to moderate the relationship between entrepreneurial attitude and entrepreneurial intention (H7) and between entrepreneurial self-efficacy and entrepreneurial intention (H8). These moderating paths aim to capture how social approval or disapproval can strengthen or weaken the internal psychological drivers of entrepreneurial behavior.

3.3 Instrumentation

The measurement instruments employed in this study were adapted from well-established and validated scales to ensure theoretical robustness and contextual relevance for MSME actors in Indonesia. Each construct was operationalized using multiple indicators rated on a four-point Likert scale ranging from “strongly disagree” (1) to “strongly agree” (4), in order to minimize neutral responses and encourage clear judgments. Entrepreneurial attitude, subjective norms, and entrepreneurial intention were measured using scale items developed by Liñán & Chen (2009), which have been widely used in studies applying the theory of planned behavior in entrepreneurial contexts. Entrepreneurial self-efficacy was measured using items

from Wilson et al. (2007), focusing on individuals' confidence in performing tasks related to opportunity recognition, innovation, and business management. Meanwhile, entrepreneurial learning was measured based on the multidimensional framework proposed by Huang et al. (2023), including school-based, social, and family learning components. Before data collection, all instruments were translated and pre-tested to ensure clarity, cultural appropriateness, and content validity, followed by reliability and validity assessments during the pilot phase.

4. Results and discussions

This section presents the results of the data analysis and discusses their implications for the research objectives and existing literature. Data were analyzed using partial least squares structural equation modeling (PLS-SEM) to test the hypothesized relationships among entrepreneurial learning, entrepreneurial attitude, entrepreneurial self-efficacy, subjective norms, and entrepreneurial intention. The analysis included evaluating the measurement model (outer model) and the structural model (inner model). The measurement model confirmed that all constructs met acceptable levels of reliability and validity, as indicated by composite reliability, average variance extracted (AVE), and outer loadings. Subsequently, the structural model analysis revealed significant and positive effects of entrepreneurial learning on both entrepreneurial attitude and self-efficacy, significantly affecting entrepreneurial intention. Furthermore, the results showed that subjective norms not only had a direct influence on entrepreneurial intention but also moderated the relationships between internal cognitive variables and intention.

Table 1. Results of reliability and convergent validity assessment for latent constructs

Variable	Cronbach's alpha	Composite reliability (rho_a)	Composite reliability (rho_c)	Average variance extracted (AVE)
EA	0.862	0.863	0.901	0.644
EI	0.908	0.909	0.929	0.685
EL	0.952	0.953	0.958	0.657
ESE	0.895	0.896	0.919	0.656
SN	0.799	0.801	0.882	0.713

Table 2. R-square result

Variable	R-square	R-square adjusted
EA	0.134	0.132
EI	0.662	0.656
ESE	0.478	0.476

As shown in Table 1, all constructs demonstrate satisfactory levels of reliability and convergent validity. The cronbach's alpha values for all latent variables exceed the acceptable threshold of 0.70 (Hair et al., 2019), indicating strong internal consistency across the measurement items. The highest alpha value is observed for entrepreneurial learning (EL = 0.952), while subjective norms (SN = 0.799) is still within the acceptable limit, suggesting adequate reliability even for constructs with relatively fewer indicators.

In addition to internal consistency, the constructs also show excellent composite reliability (rho_c) scores, all of which exceed the recommended cut-off value of 0.70, with values ranging from 0.882 (SN) to 0.958 (EL). This reinforces the robustness of the measurement items in capturing the intended constructs. Furthermore, all average variance extracted (AVE) values are well above the threshold of 0.50, confirming convergent validity; that is, each construct explains more than half of the variance of its indicators. The highest AVE is found in subjective norms (0.713), reflecting strong shared variance among its indicators.

Table 2 presents the R-square (R^2) and adjusted R-square values for the three endogenous variables: entrepreneurial attitude (EA), entrepreneurial intention (EI), and entrepreneurial self-efficacy (ESE). These values represent the proportion of variance in the dependent constructs that can be explained by their respective predictors. Entrepreneurial intention (EI) has the highest R^2 value of 0.662 (adjusted R^2 = 0.656), which indicates that 66.2% of the variance in entrepreneurial intention is explained by the model's predictors; namely, entrepreneurial attitude, entrepreneurial self-efficacy, and subjective norms. This value falls within the moderate to substantial range, suggesting a strong explanatory power of the structural model.

Meanwhile, entrepreneurial self-efficacy (ESE) yields an R^2 of 0.478 (adjusted 0.476), implying that entrepreneurial learning explains 47.8% of the variance in ESE. Entrepreneurial attitude (EA), with an R^2 of 0.134, is the least explained construct in the model, though this still reflects a small-to-moderate effect consistent with complex behavioral constructs. Overall, these results support the predictive relevance of the proposed model and validate the theoretical interconnections among entrepreneurial learning, attitude, efficacy, norms, and intention.

Figure 2. Structural Model Results with Path Coefficients and R^2 Values

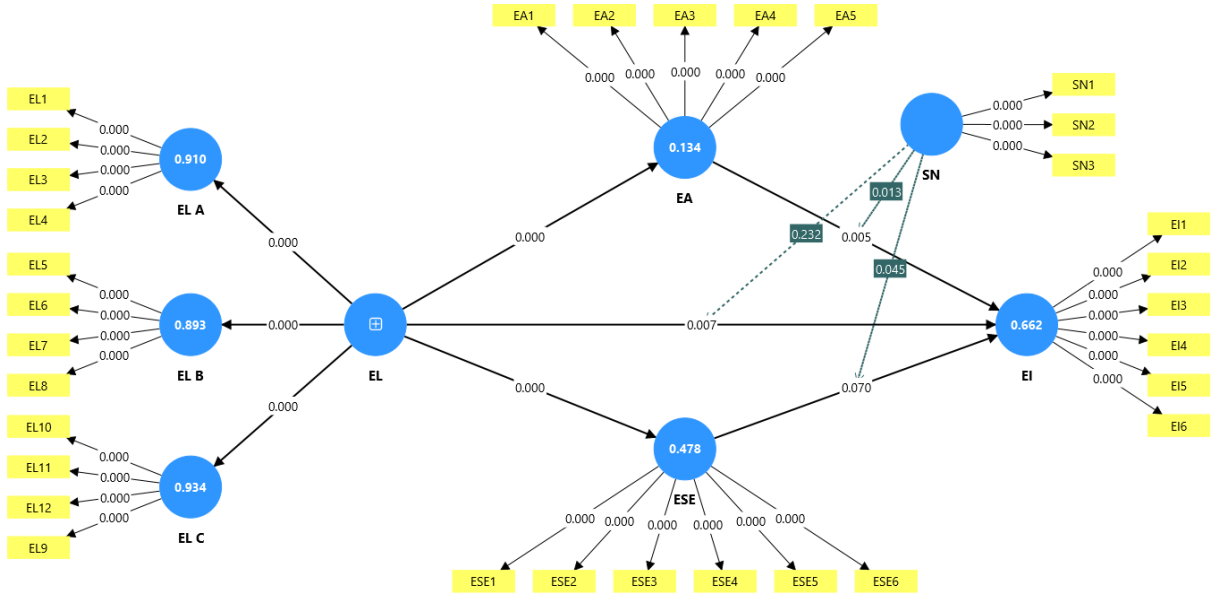


Figure 2 illustrates the final structural model estimated using partial least squares structural equation modeling (PLS-SEM), including standardized path coefficients, R^2 values for endogenous constructs, and the moderating effects of subjective norms (SN). The model demonstrates the multidimensional structure of entrepreneurial learning (EL), which is

reflected by three formative components: EL-A (school entrepreneurial learning), EL-B (social entrepreneurial learning), and EL-C (family entrepreneurial learning), with strong outer weights (0.910, 0.893, and 0.934, respectively). This confirms that entrepreneurial learning among MSME actors in this study is shaped by diverse and complementary learning experiences.

Table 3. Path Coefficients

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values
EA -> EI	0.125	0.130	0.045	2.806	0.005
EL -> EA	0.366	0.367	0.058	6.269	0.000
EL -> EI	0.191	0.189	0.070	2.707	0.007
EL -> ESE	0.691	0.691	0.042	16.604	0.000
ESE -> EI	0.144	0.145	0.079	1.813	0.070
SN -> EI	0.419	0.414	0.076	5.536	0.000

SN x EL -> EI	-0.070	-0.069	0.058	1.195	0.232
SN x ESE -> EI	0.123	0.122	0.061	2.007	0.045

Table 3 presents the results of the path coefficient analysis used to test the proposed hypotheses in the structural model. The results reveal several significant relationships among the core variables, supporting the central assumptions of the research model. First, entrepreneurial attitude (EA) has a significant positive effect on entrepreneurial intention (EI) ($\beta = 0.125$, $t = 2.806$, $p = 0.005$), indicating that individuals with a favorable attitude toward entrepreneurship are more likely to intend to start a business. This finding is consistent with previous studies such as Liñán & Chen (2009), reinforcing the notion that attitude is a strong predictor of intention.

Similarly, entrepreneurial learning (EL) shows a significant positive effect on both entrepreneurial attitude (EA) ($\beta = 0.366$, $p < 0.001$) and entrepreneurial self-efficacy (ESE) ($\beta = 0.691$, $p < 0.001$), supporting the notion that learning experiences gained through formal training and social exposure enhance both cognitive and affective drivers of entrepreneurial behavior. EL also directly influences entrepreneurial Intention (EI) ($\beta = 0.191$, $p = 0.007$), albeit with a lower magnitude, suggesting that learning can have both direct and indirect effects on intention formation.

Interestingly, the relationship between entrepreneurial self-efficacy (ESE) and entrepreneurial intention (EI) is not statistically significant at the 5% level ($\beta = 0.144$, $p = 0.070$). While the effect is positive and the t-statistic is close to the cutoff, this marginal result may indicate that self-efficacy alone is insufficient to drive intention without reinforcement from other factors such as social support or attitude. In contrast, subjective norms (SN) exert a strong and significant influence on entrepreneurial intention ($\beta = 0.419$, $p < 0.001$), confirming the importance of social expectations and normative pressure in shaping entrepreneurial behavior, particularly in collectivist societies such as Indonesia.

With regard to moderation, the interaction between subjective norms and entrepreneurial attitude (SN × EA → EI) yields a significant negative effect (β = -0.100, p = 0.013), suggesting a suppressing or offsetting effect. This result may reflect a tension between personal beliefs and perceived social expectations; when social pressure is strong, it might override individual attitude. On the other hand, the moderation effect of subjective norms on the EL–EI relationship is not significant (β = -0.070, p = 0.232), indicating that the influence of learning on intention is relatively stable across different levels of social pressure. However, the moderating effect of subjective norms on the ESE–EI relationship is significant (β = 0.123, p = 0.045), implying that perceived social support can enhance the impact of self-efficacy on entrepreneurial intention.

These findings demonstrate that while cognitive and learning-based factors are central to fostering entrepreneurial intention, their impact is often contextualized by the surrounding social environment. Thus, programs aimed at increasing entrepreneurial engagement among MSMEs must consider both individual development and social reinforcement mechanisms to achieve sustainable behavioral outcomes.

5. Conclusion

This study set out to investigate the key determinants of entrepreneurial intention among micro, small, and medium enterprises (MSMEs) in Indonesia, with a particular focus on the influence of entrepreneurial learning, attitude, self-efficacy, and subjective norms. By employing a structural equation modeling approach (PLS-SEM), the research provides robust empirical evidence supporting the interconnectedness between learning-driven cognition, personal beliefs, and social context in shaping entrepreneurial intention.

The findings confirm that entrepreneurial learning plays a foundational role in enhancing both entrepreneurial attitude and self-efficacy, which subsequently contribute to the development of entrepreneurial intention. Notably, while entrepreneurial attitude significantly predicts intention, the effect of self-efficacy, though positive, was not statistically significant at conventional levels, indicating that confidence alone may not be sufficient without supportive attitudes or environments. Furthermore, subjective norms emerged as a critical social determinant, exerting both direct and moderating effects, highlighting the importance of cultural and relational support in the entrepreneurial process.

These results underline the need for entrepreneurship training programs that go beyond skill development, by also cultivating positive attitudes and reinforcing supportive social networks. For policymakers and practitioners, fostering environments that validate entrepreneurial efforts; through mentorship, community engagement, and value recognition, can amplify the outcomes of learning-based interventions. In a broader sense, entrepreneurial intention among MSMEs should be viewed as the product of both individual agency and collective endorsement, particularly in emerging economies where social expectations significantly shape personal aspirations.

MANAGING MUSLIM-FRIENDLY TOURISM THROUGH RELIGIOUS-CULTURAL INTEGRATION: THE CASE OF KAMPUNG GELGEL, BALI

POLICY INSIGHTS FOR INCLUSIVE AND SUSTAINABLE TOURISM GOVERNANCE

Dhiya Alatas[1], B Syarifuddin Latif[1]

[1]National University, Jakarta, Indonesia

Abstract

This study examines the management of Muslim-friendly tourism in the culturally diverse setting of Kampung Gelgel, Klungkung, Bali, where a Muslim community coexists within a predominantly Hindu region. The research explores how religious and cultural integration influences tourism policy and governance, aiming to develop an inclusive and sustainable model. Using a qualitative case study approach, data were collected through interviews with community leaders, local government officials, tourism stakeholders, and visitors. Findings reveal that effective collaboration between religious communities, inclusive local policies, and cultural sensitivity are key to fostering mutual respect and sustainable tourism growth. The study proposes policy recommendations that emphasize participatory governance, interfaith dialogue, and the integration of local wisdom into tourism development. These insights contribute to the broader discourse on managing religious diversity in tourism and provide a replicable framework for Muslim-friendly tourism in other multicultural destinations.

Keywords: Muslim-friendly tourism, Religious-cultural integration, Tourism policy, Community-based tourism, Sustainable tourism

1. Introduction

Tourism in multicultural societies presents both opportunities and challenges, especially when it intersects with religious sensitivities and cultural diversity. In recent years, the demand for **Muslim-friendly tourism (MFT)** has grown significantly in response to the increasing number of Muslim travelers worldwide seeking destinations that accommodate their religious needs. While Muslim-majority countries have led this development, non-Muslim-majority destinations, including Indonesia's popular island of Bali, are also exploring inclusive strategies to attract this growing segment.

Kampung Gelgel, located in Klungkung Regency, Bali, presents a unique case for Muslim-friendly tourism development. As a historically significant Muslim enclave situated within the predominantly Hindu cultural landscape of Bali, Kampung Gelgel offers a living example of **religious and cultural coexistence**. Its heritage, shaped by centuries of interfaith interaction, provides a strong foundation for inclusive tourism practices. However, balancing the preservation of local traditions with the needs of Muslim tourists requires thoughtful policy design and participatory management.

The global MFT sector has evolved into a robust economic domain. While the increasing number of Muslim travelers remains a fundamental driver, several additional factors explain this expansion. Rising disposable income among middle-class Muslims, particularly in OIC countries like Indonesia, Malaysia, Turkey, and Gulf nations has boosted demand for religiously aligned services (Sumardi & Osman, 2025). The proliferation of low-cost airlines, easier visa regimes, and improved airport infrastructure have also contributed to higher

mobility among Muslim tourists (Rahmawati et al., 2023). Notably, the role of social media influencers, travel vlogs, and digital halal travel platforms such as Muslim Pro and HalalTrip has significantly increased destination visibility.

According to the Global Muslim Travel Index (GMTI) 2023, the MFT market was valued at USD 225 billion and is forecasted to reach USD 300 billion by 2028, reflecting sustained annual growth (CrescentRating & Mastercard, 2023). MFT is no longer a niche, but a globally recognized tourism segment with growing influence over public and private sector investment.

Historically, Bali's tourism identity has been anchored in mass tourism, shaped around spiritual landscapes, Hindu rituals, yoga retreats, beach culture, and international nightlife scenes. The primary market has been Western and East Asian tourists seeking cultural enrichment or leisure experiences (Ismail, 2021). This model, while economically successful, has led to several issues: environmental degradation, overtourism, and cultural erosion.

Recognizing these limitations, Bali's tourism authorities are exploring market diversification through niche offerings like Muslim-friendly tourism, wellness tourism, and eco-tourism. In the case of MFT, the motivation is twofold: to capture a larger share of the Southeast Asian and Middle Eastern Muslim travel market, and to promote inclusive practices that reflect Indonesia's pluralist national identity. Promoting MFT in Bali represents not only an economic strategy but also a political gesture towards tolerance and social harmony.

The Muslim community in Kampung Gelgel dates back to the 16th century, during the rule of the powerful Gelgel Kingdom. Historical records and oral traditions suggest that Muslim traders and clerics from Java, Kalimantan, and Gujarat were welcomed by the Hindu-Balinese court and were given land to settle. These early Muslims established mosques, educational institutions, and intermarried with local populations, laying the foundations for centuries of religious pluralism. This unique historical legacy distinguishes Kampung Gelgel from other Muslim settlements in Indonesia. Its interfaith traditions, dual heritage identity, and continued respect between religious communities offer a model of cultural resilience and religious diplomacy.

Developing MFT in Kampung Gelgel presents significant opportunities. The village can serve as a model for community-based interfaith tourism, showcasing how Muslim and Hindu values coexist in architecture, rituals, and everyday life. Additionally, the area's strategic location, close to Klungkung's cultural centers and Bali's southern tourism corridor, adds logistical appeal for tourism development.

However, challenges persist. These include limited halal-certified food outlets, lack of standardized Muslim-friendly facilities, and potential tensions if development is perceived as privileging one group over another. As such, the study emphasizes the importance of participatory tourism governance, where local voices from both Muslim and Hindu communities are central to planning and implementation. Interfaith dialogue and local wisdom must guide the design of tourism infrastructure, services, and narratives.

By using Kampung Gelgel as a case study, this study aims to explore **how religious-cultural integration contributes to the management of Muslim-friendly tourism in Kampung Gelgel,** and what policy insights can be drawn to support **inclusive and sustainable tourism governance** in similar multicultural settings. The research seeks to contribute to both academic discourse and policy practice by identifying best practices, community roles, and institutional strategies that support MFT in a culturally plural society.

2. Literature review

2.1 Muslim-Friendly Tourism (MFT): Concepts and Trends

Muslim-friendly tourism refers to tourism services and destinations that accommodate the religious and cultural needs of Muslim travelers, such as halal food, prayer facilities, modesty considerations, and religious holiday awareness (Battour & Ismail, 2016). With the rise of the global Muslim middle class, MFT has become a key growth area in international tourism (CrescentRating, 2023). While predominantly practiced in Muslim-majority countries, non-Muslim destinations have increasingly developed policies to attract Muslim visitors without compromising their own cultural identities.

Further clarification is needed between the terms *Halal Tourism* and *Muslim-Friendly Tourism*, which are often used interchangeably but diverge in conceptual depth. Halal tourism emphasizes strict adherence to Islamic jurisprudence in all aspects covering food, services, and behavior, while Muslim-friendly tourism adopts a more flexible and inclusive approach, especially suitable for non-Muslim destinations (Hanafiah et al., 2022). This distinction affects both policy design and destination marketing.

The key components of MFT include:

1. Halal food and beverage availability
2. Prayer spaces in public areas
3. Gender-sensitive facilities (e.g., separate swimming times or areas)
4. Awareness of Islamic holidays and prayer times
5. Marketing using culturally appropriate visuals and language (Khairuldin & Anas, 2024).

Scholars have debated issues in MFT development, particularly the tension between authenticity and commercialization. Critics argue that over-commercialization of Muslim identity risks reducing Islam to a consumer brand, undermining cultural and spiritual authenticity (Fauzi & Battour, 2025). Others emphasize bottom-up approachescommunity-driven, locally grounded models over top-down, government-imposed branding, especially in multicultural societies where religious dynamics are sensitive (Kamal, 2020).

2.2 Tourism Governance in Multicultural Societies

Effective tourism governance in multicultural environments requires policies that recognize cultural and religious pluralism. The integration of minority communities into tourism development must go beyond infrastructure provision and include meaningful participation, cultural sensitivity, and institutional inclusivity (Dredge & Jamal, 2015). In regions like Bali, where Hindu cultural heritage is dominant, crafting policies that also accommodate Muslim tourist needs presents a complex but vital task.

To advance this governance, different models have emerged, including:

1. Centralized governance, dominated by state institutions
2. Decentralized systems, where local actors take initiative
3. Collaborative governance, where government, community, and private sectors share responsibility
4. Participatory governance, emphasizing inclusivity and deliberation (Cuesta-Valiño et al., 2020)

The application of Stakeholder Theory is critical in multicultural tourism governance. This approach identifies all parties impacted by tourism from local communities and religious leaders to tourists, businesses, and policymakers, and promotes dialogue to ensure that no group is marginalized in decision-making (Hanafiah et al., 2022; Muslim & Harun, 2022).

2.3 Religious-Cultural Integration as a Policy Tool

Religious-cultural integration involves harmonizing religious practices and cultural expressions within a shared socio-political and economic framework. In tourism, this

integration can enhance destination attractiveness, community resilience, and interfaith understanding (Timothy & Olsen, 2006). Policies promoting interreligious cooperation, mutual respect, and cultural inclusiveness are essential to building tourism that reflects local values while meeting global demands.

From a theoretical perspective, this concept is informed by Cultural Pluralism Theory and Intergroup Contact Theory (Allport, 1954), which posit that structured intergroup encounters reduce prejudice and foster cooperation. Importantly, "integration" differs from assimilation, where one group absorbs into another, and segregation, where groups live separately. Integration supports equal visibility and mutual recognition, making it especially beneficial for sustainable, inclusive tourism in plural societies (Saffinee & Jamaludin, 2023).

Examples from South Korea and Japan illustrate these dynamics. Both countries, while non-Muslim-majority, have introduced Muslim-friendly services such as halal restaurants, multilingual signage, and prayer spaces yet challenges remain regarding cultural training of staff and deeper inclusion of Muslim values (Harun et al., 2024). Thailand's Andaman Coast has similarly piloted Muslim-friendly destination planning through stakeholder clustering and local engagement (Pongsakornrungsilp, 2024).

2.4 Kampung Gelgel: A Context of Historical Coexistence

Kampung Gelgel represents one of the oldest Muslim settlements in Bali, tracing its origins back to the Gelgel Kingdom period in the 16th century. The community has long practiced cultural adaptation while maintaining Islamic traditions in harmony with surrounding Hindu-Balinese customs. This social and historical context positions Kampung Gelgel as an ideal case study for exploring religious-cultural integration in tourism policy and practice.

Its legacy illustrates the potential of localized interfaith models that blend spatial proximity with religious distinctiveness. Kampung Gelgel has historically fostered coexistence rather than convergence, making it a living example of peaceful pluralism. This distinct identity offers a foundation for community-based tourism governance, where cultural heritage is both preserved and presented to visitors seeking meaningful, respectful engagement (Putri, 2021).

3. Methodology

3.1 Research Design

This study adopts a qualitative descriptive approach to explore how religious-cultural integration shapes the management of Muslim-friendly tourism in Kampung Gelgel, Klungkung, Bali. The qualitative descriptive method is well-suited for studies seeking to provide a comprehensive, context-rich understanding of real-world practices and social dynamics without imposing complex theoretical interpretations (Sandelowski, 2000). This approach allows for a clear representation of the perspectives, experiences, and actions of local stakeholders involved in tourism governance.

3.2 Study Site

The research was conducted in Kampung Gelgel, one of the oldest Muslim communities in Bali, located within a predominantly Hindu region. The village presents a living example of cultural pluralism and interreligious harmony, making it an ideal site for examining the intersection of Muslim-friendly tourism and religious-cultural integration.

3.3 Data Collection

Primary data were collected through semi-structured interviews, participant observation, and document analysis over a period of three months (specify actual months if applicable). The following methods were employed:

- Interviews: A total of 15 key informants were interviewed, including:

  - Local government officials from the tourism and religious affairs departments
  - Leaders from both the Muslim and Hindu communities
  - Local tourism actors (e.g., homestay owners, tour guides, halal food providers)
  - Muslim tourists visiting Kampung Gelgel
- Observations: The researcher engaged in direct observation of daily community interactions, tourism activities, prayer practices, and cultural ceremonies. Field notes were recorded to capture contextual details relevant to religious-cultural integration.
- Document Analysis: Relevant policy documents, tourism plans, local regulations, community archives, and promotional materials were analyzed to understand the institutional framework and narratives surrounding Muslim-friendly tourism development.

3.4 Data Analysis

Data were analyzed using **thematic analysis**, following Braun and Clarke's (2006) framework. The steps included:

- Transcribing interviews and organizing field notes
- Initial coding of textual data
- Identifying recurring patterns and key themes related to religious-cultural integration, tourism policy, and community engagement
- Reviewing and refining themes in relation to the study's objectives

Themes were interpreted in light of both academic literature and the socio-cultural context of Kampung Gelgel to maintain analytical rigor and cultural sensitivity.

3.5 Trustworthiness of Data

To enhance the credibility and reliability of findings, the study employed several strategies:

- Triangulation: Data from interviews, observations, and documents were cross-validated
- Member checking: Selected participants were consulted to confirm the accuracy of interpreted data
- Thick description: Contextual details were emphasized to allow transferability and provide insight into the unique characteristics of Kampung Gelgel

3.6 Ethical Considerations

The study received informed consent from all participants. Identities of respondents are anonymized to ensure confidentiality. The research respected local customs and religious practices, and all activities were conducted in alignment with community norms and values.

4. Results and discussions

4.1 Religious-Cultural Coexistence as a Foundation for Muslim-Friendly Tourism

The long-standing presence of a Muslim community in Kampung Gelgel has fostered deep-rooted interfaith tolerance and cooperation with the surrounding Hindu-Balinese population. Respondents described how daily life is marked by mutual respect, including shared participation in local rituals and events.

One Hindu community leader stated:

"Kami sudah hidup berdampingan sejak zaman nenek moyang. Tidak ada masalah. Kami saling menghormati saat upacara agama."("We've lived side by side since the time of our ancestors. No problem at all. We respect each other during religious ceremonies.")

Specific examples of coexistence include shared involvement in Nyepi preparations, assistance during Islamic Eid celebrations, and joint youth sports and arts programs organized through the village banjar. These events not only foster social bonds but also create an environment of trust that allows Muslim-friendly tourism (MFT) to evolve without religious conflict.

Historical narratives collected during fieldwork mention the original settlement of Muslim traders in the 16th century who were welcomed by the Gelgel royal court, a legacy still commemorated by an annual interfaith festival co-hosted by both communities. This aligns with Timothy and Olsen's (2006) assertion that interfaith social capital is a key enabler of inclusive tourism. Raya (2022) further argues that such "invented harmonies" form the basis for halal tourism experimentation in Bali, giving rise to unique hybrid practices that resonate with both locals and tourists.

Figure 1. Intercultural interaction in Kampung Gelgel
(Source: Author's own illustration)

Local religious and cultural integration can shape sustainable and inclusive Friendly Tourism governance by fostering mutual respect, reinforcing community identity, and aligning tourism development with local socio-religious values, thereby enhancing destination authenticity, stakeholder collaboration, and long-term socio-cultural resilience.

4.2 Community Participation and Informal Governance

Tourism in Kampung Gelgel is largely community-driven. Muslim and Hindu community leaders collaborate on tourism-related matters informally, ensuring that local values are respected. For example, prayer facilities for Muslim tourists have been made available in public spaces with the support of both communities.

One Muslim elder explained:

"Kami tidak punya banyak bantuan dari pemerintah, tapi kami saling bantu agar tamu Muslim bisa nyaman di sini." ("We don't get much help from the government, but we support each other so that Muslim guests feel welcome here.")

Informal tourism governance in the village relies on a council of elders (tokoh masyarakat), youth organizations (karang taruna), and mosque and temple committees who reach consensus through community meetings (musyawarah). These groups manage:

- Allocation of space for Muslim prayers in shared buildings
- Regulation of homestay decorum aligned with modesty
- Community-run halal food events

Yet, the absence of formal structures also brings challenges:

- Scalability is limited without official support
- Funding relies heavily on donations and volunteerism
- Recognition in provincial tourism strategies is lacking

These dynamics echo Dredge & Jamal's (2015) critique of top-down policy blindness and the insights of Hasaniy & Azisurrohman (2024) on how informal religious governance often substitutes for the absence of inclusive state planning in plural contexts.

4.3 Institutional Gaps in Formal Tourism Policy

Despite the strong social foundation and community initiatives, there is no formal policy framework at the district or provincial level that explicitly supports Muslim-friendly tourism in Kampung Gelgel. While general tourism policies emphasize cultural tourism and community participation, they lack specific references to religious inclusivity or halal tourism standards.

Local officials admitted that:

"Masih belum ada kebijakan spesifik tentang wisata ramah Muslim, karena fokus kami masih pada desa adat dan pariwisata budaya Bali." ("There are still no specific policies on Muslim-friendly tourism, as our focus remains on traditional villages and Balinese cultural tourism.")

The Klungkung Tourism Master Plan 2020–2025 and Bali Provincial Cultural Tourism Strategy (2022) mention community-based tourism and traditional arts, but make no provision for:

- Halal certification guidelines
- Multifaith accommodation standards
- Religious diversity indicators

Reasons for this gap include:

- A dominant focus on "Tri Hita Karana" (Balinese cosmology of three causes of well-being: harmony with God, harmony among people, and harmony with nature) as a framework for tourism
- Limited interdepartmental coordination between religious and tourism bodies
- Political sensitivities around religious categorization

The consequence is a policy vacuum that:

- Undermines scalability of Muslim-friendly services
- Reduces visibility in tourism promotion
- Limits access to funding or certification

This policy gap indicates a missed opportunity for integrating religious-cultural inclusivity into formal tourism planning echoing concerns in the literature about top-down policy blind spots in multicultural tourism settings (Dredge & Jamal, 2015). Seyfi & Rasoolimanesh (2023) note similar blind spots in other multicultural destinations where "cultural tourism orthodoxy" overshadows pluralist engagement.

4.4 Emerging Practices of Muslim-Friendly Tourism in a Hindu Cultural Context

Despite the absence of official policy, Muslim-friendly tourism practices are emerging organically, demonstrating the community's adaptive capacity and bottom-up innovation. These include:

Practice	Example
Halal Food Provision	Local warung "Mekar Rasa" now certified by MUI and offers ayam penyet, nasi padang
Prayer Facilities	Prayer rooms created in Balai Banjar and two community homestays
Heritage Walks	Islamic site visits include Gelgel Mosque (est. 1669) and interfaith heritage mural project

One tourist from Malaysia shared:

"It's rare to find such sincerity. I was surprised to see prayer mats ready at our guesthouse."

These practices demonstrate a context-sensitive adaptation of global MFT standards to the Balinese cultural environment, reinforcing the idea that religious and cultural diversity can coexist without conflict in tourism development. It also highlights the potential for developing localized Muslim-friendly tourism frameworks grounded in community values. They also align with Hasaniy & Azisurrohman's (2024) idea of "spatial integration", where religious diversity coexists peacefully through informal urban planning. This demonstrates the village's potential as a replicable model of inclusive destination governance.

5. Conclusion

This study examined how Muslim-friendly tourism (MFT) can be effectively managed through religious-cultural integration in the unique setting of Kampung Gelgel, Bali. Drawing on a qualitative descriptive approach, the research revealed that centuries-old coexistence between Muslim and Hindu communities has cultivated mutual respect and informal collaboration, conditions that have enabled community-driven MFT practices to emerge despite the absence of formal policies. Key contributions include highlighting how interfaith harmony fosters local innovations such as halal-certified eateries, shared prayer spaces, and Islamic heritage walks, which adapt global MFT principles to a Hindu-majority cultural landscape. The study also identified critical gaps in regional tourism policy frameworks, emphasizing the need for institutional recognition, standardized practices, and participatory governance models to support inclusive tourism development in multicultural societies, particularly as the scalability of these valuable community-led initiatives remains constrained without such formal support.

These findings contribute to academic discourse by demonstrating the strategic value of religious-cultural integration and bottom-up governance in shaping sustainable, inclusive tourism. Practically, they offer a replicable model for other non-Muslim-majority destinations aiming to diversify their tourism sectors. Future research should explore the economic impact of MFT in Kampung Gelgel, conduct comparative studies with similar multicultural contexts, and assess long-term sociocultural outcomes of MFT on intergroup relations. As global tourism shifts toward ethical and culturally responsive practices, the Kampung Gelgel experience affirms that religious diversity, when embraced through community leadership and integrated governance, can serve as a powerful asset in inclusive destination planning.

Nevertheless, the case of Kampung Gelgel offers valuable insights into how grassroots, culturally grounded approaches can inform more inclusive and sustainable tourism governance. It demonstrates that religious-cultural integration is not only feasible but can be a strategic asset in diversifying Bali's tourism landscape and addressing the growing demand for Muslim-friendly travel experiences in non-Muslim-majority destinations.

SUSTAINABLE TOURISM DEVELOPMENT OF PURI ANYAR HERITAGE AS ONE OF THE FIRST HOTELS IN UBUD BALI WITH THE CONCEPT OF LOCAL WISDOM

Elma Is Adiyah[1], Ramang Husin Demolingo[2]

[1]Faculty Of Economics and Business Tourism Study Program, National University,
[2]Faculty Of Economics and Business Tourism Study Program, National University.

Abstract

This research discusses the development of one of the first hotels in Ubud that carries the principles of sustainable tourism by highlighting Balinese local wisdom as the main identity. Through environmentally friendly architectural design, efficient use of natural resources, and involvement of local communities in hotel operations, the hotel aims to have a positive impact on the local environment and socio-economy. This research shows that local wisdom-based tourism development not only provides an authentic experience for tourists, but also supports cultural preservation and improves the quality of life of local communities. Thus, this hotel can be a model of sustainable tourism development in Bali, which can be adopted by other tourism entrepreneurs in creating a more environmentally and socially friendly destination. The research method used is qualitative. Qualitative method is an approach used to understand social phenomena in depth through interpretation, analysis, and description of non-numerical data. This method focuses on descriptive data collection, such as interviews, observations, and document analysis, with the aim of understanding the context, meaning, and experiences of the research subjects.

Keywords: Local Wisdom, Sustainable, Ubud Bali, Heritage, Tourism.

1. Introduction

Ubud is one of the tourist destinations in Gianyar Regency which is known as a place for the development of Balines art and culture throught the concept of local wisdom. Throught this attraction, Ubud is able to attract tourists to visit and stay. Head of Tourism Destination Division of Gianyar Regional Tourism Office, Ni Ketut Mariatni Sukadewi revealed that tourist visits to Gianyar Regency, especially Ubud, have increased every year (NusaBali.com, 2018). The growing number of tourists visiting Ubud is in line with the growth in the number of accommodation in the area. One type of accommodation that is growing rapidly in Ubud is Homestay. Homestay has different characteristics from other lodging because it is a residential building that is still inhabited by the owner, while some of the rooms are rented out to tourists. Homestay is not only a place to stay, but also a place to learn because tourists can feel new experiences related to culture and understanding of the way of life of local people in their daily lives (Wijaya et al., 2017). Besides the increasing number of homestay in Ubud, there are other interesting aspects to consider about Ubud as a tourist destination. Some news about Ubud includes congestion issues and infrastructure damage that are still a concern (Bali Express, 2017).

Along with that, one of the characteristics of buildings in the province of Bali is the presence of religiously oriented ornaments on residential buildings. Traditional village practices in Bali also contribute to Bali's unique identity in the arrangement of village patterns and forms. Traditional Balinese cultural architecture is the resulte of the implementation of

human thought and morality influenced by views of the universe, lifestyle, religious norms, beliefs, and the heritage of past civilization. Balinese local wisdom creates a harmonious patterns of social life, where good relationship with God Almighty, relationship between people, and relationship with the environment are directly related to the concept of Tri Hita Karana. This concept also affects the spatial order, providing a significant positive impact on the village and community (Widyastuty, 2018). This social and spatial state of Balinese society is a unique attraction for local and international tourists, creating a distinctive village identity that needs to be maintained and preserved in a sustainable manner (Kasuma & Suprijanto, 2010).

Through the application of the Local Wisdom concept, Puri Anyar Heritage is the first boutique hotel in Ubud that tries to preserve Bali's unique cultural identity. Puri can also be associated with a symbol of local wisdom, where puri is depicted in the preservation of noble values that exist in society both physically and non-physically (Sudiarta et al 2020). The concept emphasizes cultural preservation and environmental sustainability in Bali, by applying this principle, Puri Anyar Heritage shows its seriousness in supporting the culture and environment in Bali. In addition, the hotel also strives to provide an authentic and unique stay experience for tourists by highlighting Balinese culture and local wisdom. It is hoped that this Local Wisdom approach provides added value for travelers and differentiates Puri Anyar Heritage from other hotels in Ubud Bali.

In general, Puri has three main social roles, that is, (1) a cultural role in the preservation and conservation of arts and culture, (2) an economic role related to the welfare of the community under its auspices, and (3) a political role in directing certain figures (Sudiarta et al, 2022). Puri is a traditional Balinese architectural building that has a different function from a temple. Puri and Pura in Sanskrit mean city, king's palace, capital, kingdom, or walled settlement. But then Pura has a different meaning which is a sacred place for Balinese Hindus, while Puri means palace. Puri is not only where the King Resides, but also where the King lives with his family (Sedyawati 2010).

In addition, Puri also serves as a source of role models for the community related to Hindu religious customs and rituals in Bali. Thus, Puri is a cultural heritage that is always preserved by the community and the Royal Family. As a heritage, the castle (Puri) can be used as a heritage tour because it functions as a center for the conservation of cultural values of the Balinese people (Sudiarto et al. 2022). In addition, Puri Anyar Heritage applies the Local Wisdom concept as a whole, including efforts to preserve culture, the environment, and empower local communities (Kadek Wirawan & Dewi, 2019). This is in line with the principles of Local Wisdom and Tri Hita Karana that have been an integral part of Balinese culture for many years, which is reflected in the hotel's business practices (Ernawati, Sugianingrat, & Widhari, 2017). Puri Anyar Heritage's success in implementing the Local Wisdom concept can also serve as an example for tourism development in Bali, where the preservation of culture and natur is key to the sustainanility of tourism on the island (Ramirez, Varxis, & Ramdhony, 2019). In this context, Puri Anyar Heritage models the implementation of best practices in sustainable tourism that integrates social, cultural, economic, and environmental aspects (Yuanita, Rijanta, & Mulyanim, 2018).

This research will discuss the importance of applying the concept of local wisdom and preserving culture is very important in the development of tourism in Bali. Local wisdom itself is a way of life and knowledge as well as various life strategies in the form of activities carried out by local communities in answering various problems in fulfilling their needs (Njatrijani, 2018). This is done so that tourism in Bali can be sustainable and still maintain its cultural identity. In addition, integrating social, cultural, economic and environmental aspect is also important in the development of sustainable tourism in Bali. One of them, Puri Anyar Haritage,

is an example of the application of sustainable tourism in Bali. They apply the concept of local wisdom and preserve Balinese culture, while also paying attention to social, economic, and environmental aspects. In this research, a qualitative method will be used with data collection teachniques through interviews, observations, and documentation studies.

It is hoped that the result of this research can contribute to the development of tourism potential in Ubud, Bali, ecpecially in Puri Anyar. In addition, the result of this study can also be a reference for relevant parties in developing tourism in other regions in Indonesia. In the development of tourism to increase the tourism potential of an area, such as infrastructure development, tourism promotion, environmental preservation and sustainable tourism industry development, it also includes various approaches that focus on the tourist experience, local economic growth and preservation of culture and nature.

The objectives in this study are as follows :

1. Analyzing the potential of tourism in Ubud, Bali. Especially the potential possessed by Puri Anyar Heritage as the first hotel with the concept of local wisdom
2. Evaluate the impact of the development of Puri Anyar Heritage on the local economy and the improvement of economic activities around the area
3. Assess the effectiveness of the Local Wisdom concept in maintaining and promoting local cultural heritage, as well as strengthening the identity and sustainability of tourism in Ubud, Bali.

2. Literature review

The development of tourism in Indonesia has continued to experience significant growth in recent years. This is supported by various factors, including intensive tourism promotion, infrastructure improvement, and the diversity of natural, cultural, and culinary attractions across the archipelago. In addition, technological developments have also contributed to making access to information and booking easier for tourist. Nonetheless, challenges such as environmental stewardship and sustainablility management remain an important focus in maintaining sustainable tourism growth in the future.

Development is a strategic effort to increase, improve, and develop tourism attractions so that the number of tourists increase, which ultimately has a positive impact on society and government (Paturusi, 2001). According to Yoeti (2001) in Suwarti and Yuliamir (2017) explaians that tourism development is an effort to improve the qulity and increase the types of tourism products offered.

According to Yoeti (2006), in the development of a tourism there are 4 basic principles, which are as follows :

1. Ecological sustainability means that a development in tourism can ensure the maintenance of the tour.
2. Sustainability of life and culture means that the development of tourism makes an increase in the role of society in everyday life and culture.
3. Economic sustainability means that a tourism development that ensures the sustainability of economic activities.
4. Improving and improving the quality of life of the community means providing a forum for them to develop tourism in the area.

Planning is very important in tourism development to ensure that the development process goes according to plan and achieves the desired goals. The main reson for doing a tourism development is to improve the economy of the region or country (Santi, 2010). According to I Gusti Bagus (2017) cited in (Asmara, 2020), tourism development has the potential to expand business activities and provide positive social, cultural, and economic impacts at the national

level. When tourism development is well planned, it should be able to provide significant benefits to the community in a destination. This section includes analysis, reviews of previous research and relevant theories.

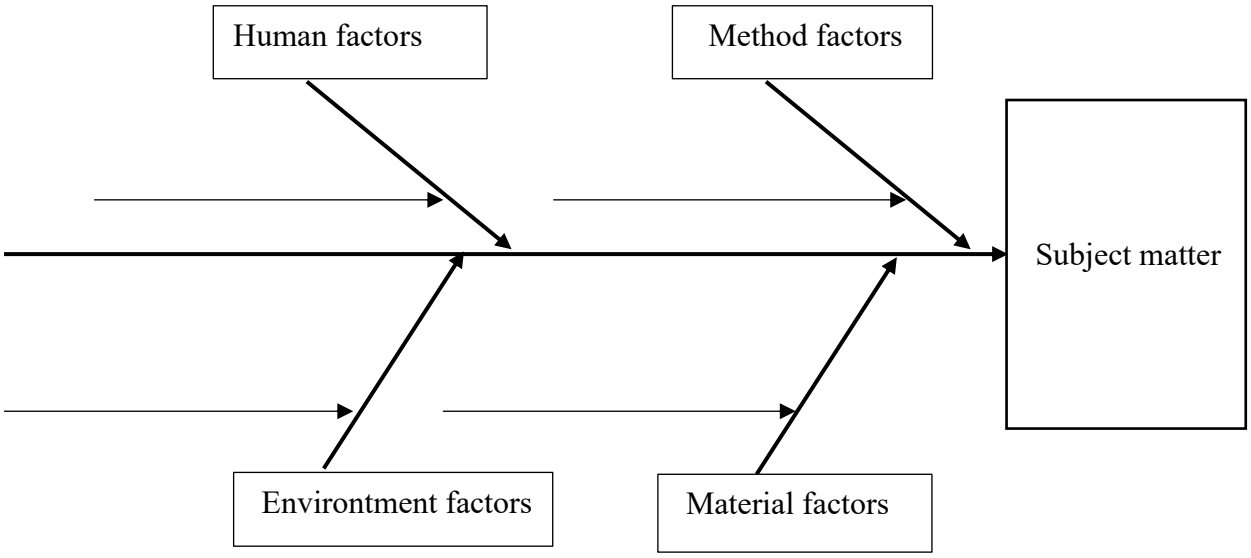
3. Methodology

The research method used is qualitative research method. Qualitative method is an approach used to understand social phenomena in depth through interpretation, analysis, and description of non-numerical data. This method focuses on descriptive data collection, such as interviews, observations, and document analysis, with the aim of understanding the context, meaning, and experience of the research subject. The data collection method used is the primary data collection method. Primary data collection methods that will be used in this research are observation, interviews and documentation studies.

The research location was at Puri Anyar Hotel, Ubud. Observation was conducted to directly observe the conditions and activities at the hotel, while the interview method was conducted directly to the research subject to gain a deeper understanding. The method used is in the form of (SWOT) analysis, namely Strengths, Weaknesses, Opportunities and Threats. Strength, Weakness, Opportunity, and Threat (SWOT). This method analyzes the strengths, weaknesses, opportunities, and threats related to tourism development, by considering aspects of local wisdom at Puri Anyar Heritage Hotel which has unique potential. This helps in formulating development strategies that are in accordance with the cultural context and local wisdom values and increase the potential for local tourism development. The SWOT matrix is used in compiling strategic factors in the development of an area. This matrix clearly illustrates how the internal opportunities and threats faced can be matched with the internal strengths and weaknesses possessed. This matrix can produce four sets of possible strategic alternatives that can be used.

IFE / **EFE**	***Strength* (S)** (Determine internal strength factors)	***Weakness* (W)** (Determine internal weakness factors)
***Opportunities* (O)** (Determine external opportunity factors)	**Strategi SO** list strengths to seize opportunities	**Strategi WO** list to minimize weaknesses by taking advantage of opportunities
***Threats* (T)** (Determine external threat factors)	**Strategi ST** list strengths to avoid threats	**Strategi WT** list to minimize weaknesses and avoid threats.

A fishbone analysis is a structural analysis that allows for a more detailed analysis of the causes of problems, discrepancies, and challenges. Fishbone analysis is usually called a fishbowl diagram or fishbone diagram which is one of the methods used to analyze the causes of a problem or condition (Suharto et al 2022).



4. Results and discussions

Ubud Village is one of the villages in the Ubud tourism area which is located in the plain area and has been developing for quite a long time until now it is still visited by many local and foreign tourists. There is one castle that is a destination and attraction for tourists, namely Puri Anyar Heritage, precisely located on Suweta Street, No.6 Ubud, Bali.

Puri Anyar Heritage is a castle located in the center of Ubud and is one of the attractions that attracts tourists both local and foreign. This castle offers rooms with traditional nuances. This castle is located in a strategic location which is close to Ngurah Rai International Airport with a distance to the airport of about 28.7 Km. By staying at Puri Anyar Heritage in Ubud Town, you are only a 5-minute drive from Ubud Monkey Forest and Puri Saren Agung. The castle is 22.1 km from Sanur Beach and 0.2 km from Ubud Traditional Art Market.

The location of this Puri is also very close to the city center which is about 300 meters. Public transportation available in Ubud includes the Loka Srana Bus terminal, and Ubung Bus Terminal. The castle offers several facilities such as restaurant, free breakfast, continental breakfast, free wi-fi, bicycle rental, free breakfast, airport transportation, laundry service, shuttle bus service, car rental, non-smoking room, spa room. The leisure activities and facilities available at this castle include ticketing services, hiking, massage, yoga room, garden, and tour services.

In addition, the castle illustrates the importance of preserving the noble values that exist in society in both physical and non-physical forms. The shape of the castle building is a form of physical heritage that can be a tourist attraction and existing values such as history and the way of life of the castle are also a concern for educational tourism and function as a conservation for the sustainability of existing values.

Puri anyar is also a performance venue, the entire Puri area is used and in response there is no boundary between the dancers and the audience, which is presented in the middle of the community all the elements around the place become part of the performance structure.

4.1. SWOT analysis as a development strategy

4.1.1. Strengths

4.1.1.1. Strategic location

The castle is strategically located near Ngurah Rai International Airport with a distance of 28.7 km to the airport. By staying at Puri Anyar Heritage in Ubud Town, you will be only a 5-minute drive from Ubud Monkey Forest and Puri Saren Agung. The castle is 22.1 km from Sanur Beach and 0.2 km from Ubud Traditional Art Market. The location of this Puri is also very close to the town center which is about 300 meters.

4.1.1.2. Strategic location

The prices offered at this inn vary greatly, starting from Rp300,000/night to Rp1,000,000/night. The price offered can be said to be quite affordable for a castle inn in a well-known tourist spot, especially Bali.

4.1.2. Weaknesess

4.1.2.1. Three star hotel

Based on the information and reviews displayed on the booking.com website (online ticket booking website) that Puri Anyar Heritage Ubud is one of the 3-star hotels in Ubud Bali. This can be a weakness for Puri because in Ubud itself quite a lot of 4 and even 5 star hotels are offered.

4.1.2.2. Child unfriendly price

Based on information on the booking.com website, children aged 6 years and over will be charged adult prices, while we know that ages 6 - 11 years are still children.

4.1.3. Opportunities

4.1.3.1. Many Travelers stay overnight

In the past, this Puri was intended for lodging for friends and relatives of high-ranking officials and respected people in Bali, but until now because of the rapid development of tourism in Bali, this Puri has also developed as a larger lodging accommodation because the demand for tourists to stay is also getting bigger, both local and foreign tourists.

4.1.3.2. Close to Bali's iconic tourist attractions

The location of this Puri is close to various tourist attractions in Bali such as Yeh Gangga Beach, Campuhan Ridge Walk, Ubud Monkey Forest, Batu Bolong Temple. This is an opportunity for Puri Anyar because it is possible that tourists who travel to these tourist attractions for a long period of time will look for lodging around it.

4.1.4. Threats

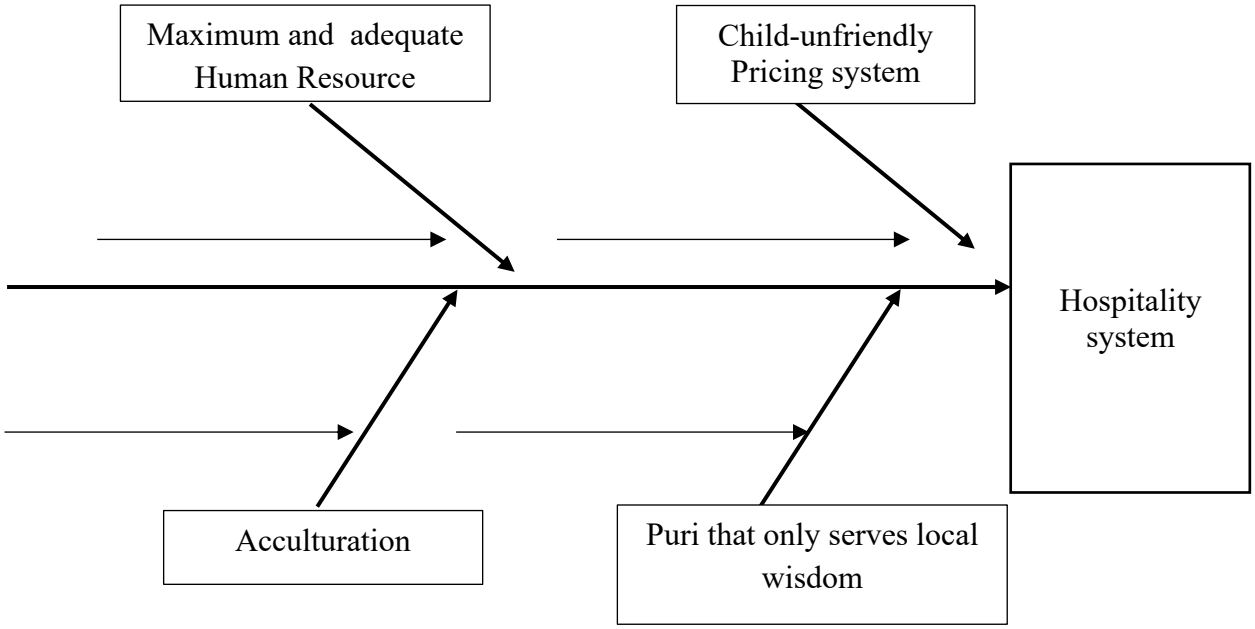
4.1.4.1. Many hotels and lodgings are more modern

Currently, many hotels in Ubud provide lodging with a more modern feel and better service. This can be a threat to the development of Puri Anyar. However, this does not apply to tourists who want to get the feel of local wisdom.

4.1.4.2. The occurrence of acculturation

As we all know that Bali is a tourist spot that is already known in the international realm. There are many foreign tourists who bring foreign cultures into Indonesia, including in Bali. This does not rule out the possibility that if the local wisdom in Ubud, especially the environment around Puri Anyar Ubud, is not well maintained, there will slowly be a very significant acculturation.

4.2. Fishbone analysis as a development strategy



This problem analysis is carried out based on weaknesses and threats based on the results of the SWOT analysis of Puri Anyar Heritage which will have an impact on the development of the castle. The problem analysis was conducted using a fishbone diagram. Based on the existing problems in the SWOT analysis, it can be seen that the main problems that exist in Puri are related to the hotel system such as the pricing system that is not child-friendly, as well as several other factors that make this hotel only classified as a 3-star hotel.

5. Conclusion

Based on the results of this research, several conclusions can be drawn which are described in accordance with the formulation of the problem and the objectives of the research with a qualitative description of "Sustainable Tourism Development of Puri Anyar Heritage as One of the First Hotels in Ubud Bali with the Concept of Local Wisdom", where Puri Anyar Hritage succeeded in becoming a pioneer in applying the concept of Local Wisdom in the Ubud hotel industry. The hotel proves that the preservation of Balinese traditional culture through the Tri Harta Karana philosophy can be juxtaposed with modern business practices to create sustainable tourism. Not only a modern hospitality industry, but also a strong differentiator in the market competition.

Puri Anyar Haritage has a competitive advantage through its strategic location and unique authentic concept. This research explains the importance of a development strategy that optimizes strengths to take advantage of opportunities, while maintaining local cultural identity. The success of this business model can be a reference for the development of sustainable tourism in other destinations in Indonesia, showing that the preservation of local wisdom and economic development can go hand in hand to create added value for all stakeholders.

Puri Anyar Heritage also faces challenges such as competition with higher star hotels and the risk of cultural acculturation, then also related to the pricing system which is currently not friendly to children. However, the existing problems can change as the times change and develop, so further research needs to be done on this matter.

THE MODERATING ROLE OF SEARCH ENGINE OPTIMIZATION ON THE INFLUENCE OF ONLINE WORD OF MOUTH, SOCIAL STATUS, AND LIFESTYLE ON THE PURCHASE DECISION OF DIGITAL PRODUCTS IN GAME

Faizil Akmal Ersyam[1,*], Suadi Sapta Putra[1]

[1]Universitas Nasional, Jakarta, Indonesia

Abstract

This study analyzes the influence of online word of mouth (eWOM), social status, and lifestyle on purchasing decisions for digital products in the Rise of Castles game, with search engine optimization (SEO) as a moderating variable. The research sample of 100 respondents was selected through purposive sampling, and the data were analyzed using PLS-SEM with WarpPLS 8.0. The results showed that social status and lifestyle have a positive and significant effect on purchasing decisions, while eWoM has no effect on purchasing decisions. SEO has a direct influence on purchasing decisions and acts as a moderating variable that strengthens the influence of social status and lifestyle but weakens the influence of social status on purchasing decisions.

Keywords: online word of mouth, social status, lifestyle, search engine optimization, purchase decision.

1. Introduction

Purchase decision is a crucial process in marketing that determines whether a consumer will buy a particular product or service. It involves selecting a brand based on various internal and external factors (Kotler & Keller, 2016). Schiffman and Kanuk (2010) state that the purchase decision includes evaluating alternatives and choosing the product that best meets consumer needs. Hawkins and Mothersbaugh (2013) add that emotional and psychological factors also play significant roles, making the purchase decision a complex and multi-dimensional variable in marketing studies.

Understanding consumer purchase decisions is essential for business performance. These decisions reflect the effectiveness of marketing strategies and directly impact a company's revenue and profitability. According to Aaker (2014), companies that understand these dynamics can better design products, set competitive prices, and select effective distribution channels. Porter (2008) emphasizes that effective purchasing decisions can foster customer loyalty, enhance market positioning, and support long-term growth.

In the context of the growing digital game industry, understanding what influences consumer purchase decisions of in-game digital products has become increasingly relevant. These digital products—such as virtual items, characters, and premium features—enhance user experience. Thus, exploring the influencing factors offers valuable insights for game developers and marketers. In-game purchase decisions are affected by online word of mouth (eWOM), lifestyle, and social status, as well as user experience and perceived value.

The fluctuating trends in in-game purchase revenue rankings over time indicate inconsistency in consumer buying behavior. One of the factors that could influence purchasing decisions is eWOM. According to Statista (2021), 70% of gamers are likely to purchase a

product based on recommendations from friends or online communities. This confirms the importance of eWOM in digital product marketing. eWOM refers to communications between consumers about products or services. Cheung and Thadani (2019) assert that eWOM significantly shapes perceptions and purchasing decisions, especially in competitive industries like gaming. Consumers tend to trust peer recommendations more than traditional advertising, making eWOM an effective promotional tool.

Research by Yulindasari & Fikriyah (2022) and Prasad et al. (2017) supports a significant positive influence of eWOM on purchase decisions. In contrast, Wijaya et al. (2022) found no significant effect of eWOM. Social status within online gaming communities also influences purchasing behavior. Players who own exclusive digital items are often perceived as having higher status. Kim et al. (2018) note that social status plays a vital role in shaping consumer preferences and purchase behavior. However, research results regarding this influence have been inconsistent.

Lifestyle also plays an important role in shaping consumer purchasing decisions. Lifestyle reflects how individuals spend their time and money, which influences their preferences for digital products. Solomon et al. (2020) highlight that gamers' lifestyles are often associated with community, social interaction, and immersive experiences. Some studies (Philip, 2019; Aini & Andjarwati, 2020) found lifestyle has a positive influence on purchase decisions, while others (Zaezatun, 2022) report no significant effect.

The inconsistency in previous findings presents a research gap, suggesting the need to develop a more comprehensive empirical model. This study introduces Search Engine Optimization (SEO) as a moderating variable. SEO is a vital digital marketing strategy that enhances the visibility of digital products in search results. Chaffey and Smith (2021) and Moz (2022) found that SEO improves product accessibility and influences consumer purchasing behavior.

Accordingly, this study examines the moderating role of SEO on the influence of eWOM, social status, and lifestyle on digital product purchase decisions in games.

2. Literature review

2.1 Marketing Management

Marketing management is a systematic approach to planning, executing, and controlling marketing strategies that align with an organization’s objectives. According to Kotler and Keller (2021), marketing management involves the design, pricing, promotion, and distribution of products or services to facilitate transactions that satisfy both customer needs and organizational goals. Haryanto (2022) defines it as a process of organizing, directing, and supervising marketing activities effectively and efficiently. The primary goals of marketing management include long-term business growth, profitability, employment generation, and sustainability (Purnomo, 2023).

2.2 TheoryofPlannedBehavior(TPB)

The Theory of Planned Behavior (Ajzen, 1991) explains the relationship between individual attitudes, subjective norms, and perceived behavioral control in shaping behavioral intentions. It is a development of the Theory of Reasoned Action (TRA) and is particularly useful in contexts where behavior is influenced by internal beliefs and external factors. TPB asserts that individuals are more likely to perform a behavior if they have a positive attitude toward it, believe that important others think they should perform it, and feel capable of performing it.

2.3 Purchase Decision

Purchase decision is defined as the consumer's action to buy or not to buy a product, involving several stages such as need recognition, information search, evaluation of alternatives, and final decision. Kotler, Armstrong, and Balasubramanian (2023) state that the process is influenced by cultural, social, personal, and psychological factors. These include age, lifestyle, economic conditions, motivation, perception, and social status. Nugroho (2010) emphasized that understanding these variables allows marketers to design more effective strategies.

2.4 Online Word of Mouth (eWOM)

eWOM is the process of spreading consumer opinions and recommendations via digital platforms. It is characterized by permanence, rapid accessibility, platform dispersion, and anonymity (King et al., 2014). According to Kotler and Keller (2016), eWOM can influence consumer behavior both positively and negatively based on their online experiences. Goyette et al. (2012) identify key indicators such as reading online reviews, collecting review information, consulting online, concern over not reading reviews, and increased confidence after reading reviews.

2.5 Social Status

Social status refers to one's position in the social hierarchy, often expressed through ownership of prestigious goods. In digital contexts, social status may be linked to exclusive virtual items or community recognition. Kim et al. (2018) and Bourdieu (1984) argue that symbolic assets—such as premium features—reinforce one's status. Indicators of social status include use of products as status symbols, preference for premium brands, desire to stand out, group influence, and purchase for recognition (Tung et al., 2020).

2.6 Lifestyle

Lifestyle represents a person's pattern of living, shaped by values, interests, and activities. Solomon (2009) notes that lifestyle is reflected in consumption behavior, while Kotler (2002) describes it as manifested in one's daily activities and opinions. According to Arnould et al. (2019), lifestyle is affected by demographic and social factors. Key indicators include hedonistic consumption, social value influence, preference for experiential consumption, engagement in digital consumption, and use of consumption to signal social image (Fitzgerald et al., 2018).

2.7 Search Engine Optimization (SEO)

SEO refers to strategies and techniques aimed at increasing a website's visibility on search engine results. Lee et al. (2020) and Kotler (2021) highlight the role of SEO in enhancing digital marketing effectiveness and influencing consumer discovery and purchase behavior. Important SEO components include on-page and off-page optimization, technical SEO, and

user experience. Key indicators include search ranking, site speed, mobile optimization, content quality, and simple URL structure.

2.8 Prior Studies and Research Gap

Previous studies on eWOM, social status, lifestyle, and SEO show inconsistent results regarding their influence on purchase decisions. For example, some studies found that eWOM significantly influences purchase behavior (Hardiansyah & Khuzaini, 2023; Murti et al., 2024), while others reported no significant effect (Wijaya et al., 2022). Similar inconsistencies appear in studies related to social status (Yulianti, 2023; Susanti, 2020) and lifestyle (Kusuma, 2023; Suryani, 2022). Meanwhile, research on SEO (Hasugian, 2024; Devano et al., 2023) consistently shows a positive effect.

3. Methodology

3.1 Research Design

This study employs a quantitative research design using a descriptive and causal approach. The research was conducted to identify causal relationships between independent variables (online word of mouth, social status, lifestyle), the dependent variable (purchasing decision), and the moderating variable (SEO).

3.2 Population and Sample

The population in this study consisted of individuals who had played the game and made in-game purchases. A purposive sampling technique was used to collect data from 100 respondents who met these criteria.

3.3 Data Collection Methods

Primary data were collected through questionnaires distributed online via Google Forms. Each item was measured using a five-point Likert scale ranging from "strongly disagree" to "strongly agree."

3.4 Data Analysis Technique

Structural Equation Modeling (SEM) was used through WarpPLS 8.0 software. The analysis included outer model and inner model.

3.5 Research Model

The research model developed in this research can be seen in Figure 1.

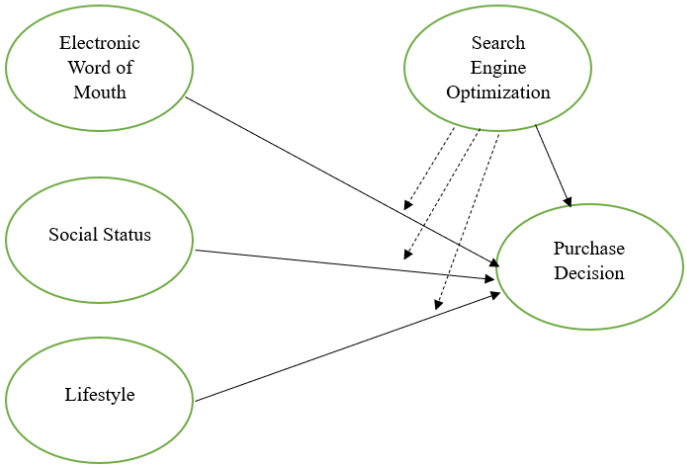

Figure 8

4. Results and discussions

The research findings indicate that social status and lifestyle have a positive and significant influence on purchase decisions, while eWOM does not affect purchase decisions. SEO has a direct influence on purchase decisions and also acts as a moderating variable that strengthens the influence of social status and lifestyle, but weakens the influence of eWOM on purchase decisions

4.1 Measurement Model Analysis (Outer Model)

a. Convergent Validity

Convergent validity is assessed based on the loading factor value of each indicator in the study. An indicator is considered valid if its loading factor reaches or exceeds 0.7. The calculated loading factor values for each indicator are presented in Figure 2 below.

Indicator	eWOM	Social Status	Lifestyle	SEO	Purchase Decision	Description
WOM1	0.743	0.549	0.344	0.578	0.444	Valid
WOM2	0.793	0.440	0.131	0.550	0.273	Valid
WOM3	0.733	0.523	0.425	0.489	0.414	Valid
WOM4	0.726	0.455	0.406	0.510	0.370	Valid
WOM5	0.743	0.451	0.309	0.533	0.412	Valid
SS1	0.580	0.717	0.422	0.363	0.498	Valid
SS2	0.422	0.719	0.407	0.628	0.552	Valid
SS3	0.507	0.828	0.441	0.592	0.537	Valid
SS4	0.376	0.610	0.518	0.362	0.511	Valid
SS5	0.492	0.801	0.570	0.541	0.618	Valid
GH1	0.263	0.497	0.729	0.440	0.590	Valid
GH2	0.383	0.579	0.748	0.458	0.609	Valid
GH3	0.502	0.525	0.803	0.522	0.571	Valid
GH4	0.155	0.397	0.752	0.183	0.462	Valid
GH5	0.316	0.407	0.715	0.229	0.540	Valid
SEO1	0.519	0.604	0.602	0.534	0.620	Valid
SEO2	0.508	0.521	0.372	0.840	0.463	Valid
SEO3	0.509	0.460	0.308	0.814	0.384	Valid
SEO4	0.607	0.541	0.289	0.865	0.475	Valid
SEO5	0.565	0.449	0.288	0.752	0.420	Valid
KP1	0.265	0.437	0.585	0.304	0.708	Valid
KP2	0.261	0.602	0.610	0.418	0.775	Valid
KP3	0.561	0.655	0.594	0.597	0.866	Valid
KP4	0.568	0.696	0.601	0.688	0.885	Valid

Figure 9

Based on Figure 2, it can be seen that all indicators have loading factor values above 0.7, indicating that each indicator meets the requirements for convergent validity. The indicator with the highest value is KP4 with a loading factor of 0.885, meaning this indicator has the strongest contribution in representing the latent variable Purchase Decision. Meanwhile, the

indicator with the lowest value that is still considered valid is SEO1 with a loading factor of 0.534.

b. Discriminant Validity

Discriminant validity is tested by examining the Average Variance Extracted (AVE) values. The AVE calculation results are presented in Figure 3 below.

Latent Variable	AVE	Description
Online Word of Mouth (eWoM)	**0.748**	Valid
Social Status	**0.739**	Valid
Lifestyle	**0.750**	Valid
Search Engine Optimization (SEO)	**0.770**	Valid
Purchase Decision	**0.812**	Valid

Figure 10

Based on Figure 3, it can be seen that all latent variables have AVE values above 0.5, indicating that each variable meets the requirements for discriminant validity. The variable with the highest AVE value is Purchase Decision (0.812), which means this variable has the highest clarity of indicators in explaining its construct. Meanwhile, the variable with the lowest AVE value that is still valid is Social Status (0.739), which still demonstrates a good ability to explain its indicators.

These results indicate that all latent variables in this study have met the criteria for discriminant validity and can be used for further analysis.

c. Reliability Test

The reliability test is used to assess the accuracy, consistency, and precision of the measurement tool in measuring a construct. Reliability testing consists of two methods: Cronbach's Alpha and Composite Reliability. A construct is considered reliable if the Cronbach's Alpha value is greater than 0.5, while the Composite Reliability value must be greater than 0.7. The Cronbach's Alpha and Composite Reliability values for each variable in this study are presented in Table Figure 4 below.

Variabel Laten	Cronbach's Alpha (CA)	Composite Reliability (CR)	Description
Online Word of Mouth (eWOM)	**0.803**	**0.864**	Reliable
Social Status	**0.787**	**0.856**	Reliable
Lifestyle	**0.805**	**0.865**	Reliable
Search Engine Optimization (SEO)	**0.818**	**0.877**	Reliable
Purchase Decision	**0.823**	**0.884**	Reliable

Figure 11

Based on Figure 4, all latent variables in this study have Cronbach's Alpha values greater than 0.5 and Composite Reliability values greater than 0.7, indicating that each construct has a good level of accuracy, consistency, and precision in measuring its respective variable.

4.2 Structural Model Analysis (Inner Model)

a. Model Fit Test

The evaluation of the inner model is conducted by analyzing the Model Fit and Quality Indices values. In the analysis using WarpPLS 8, several indicators are used to assess the quality of the model. The values of the Model Fit and Quality Indices are presented in Figure 5 below.

Model Fit and Quality Indices	Model Fit	Score	Description
Average Path Coefficient (APC)	P < 0,05	P = 0,002	Good
Average R-squared (ARS)	P < 0,05	P < 0,001	Good
Average Adjusted R-Squared (AARS)	P < 0,05	P < 0,001	Good
Average Block VIF (AVIF)	Acceptable if <= 5, ideally <= 3,3	3,198	Acceptable
Tenenhaus GoF (GoF)	Small >= 0,1; Medium >= 0,25; Large >= 0,36	0,743	Large

Figure 12

The results of the model fit test indicate that the research model has a good fit with the data. The values of the Average Path Coefficient (APC) = 0.207 (p = 0.002) and Average R-squared (ARS) = 0.746 (p < 0.001) show that the relationships between variables are significant and that the model has high predictive power. Additionally, the Goodness of Fit (GoF) = 0.743 falls into the large category (> 0.36), indicating that the model is very effective in explaining the dependent variable.

In terms of multicollinearity, the Average Block Variance Inflation Factor (AVIF) = 3.198 is still within the acceptable threshold (≤ 5), suggesting that there is no strong indication of multicollinearity among latent variables. Therefore, this research model has a high degree of fit and can be reliably used to analyze the factors influencing digital product purchasing decisions in games.

b. Path Coefficient

Path coefficient evaluation aims to measure the strength of the influence of independent variables on the dependent variable. Based on the relationships between electronic word of mouth (eWOM), social status, and lifestyle on purchase decisions with search engine optimization (SEO) as a moderating variable, the resulting path relationships can be seen in the following figure.

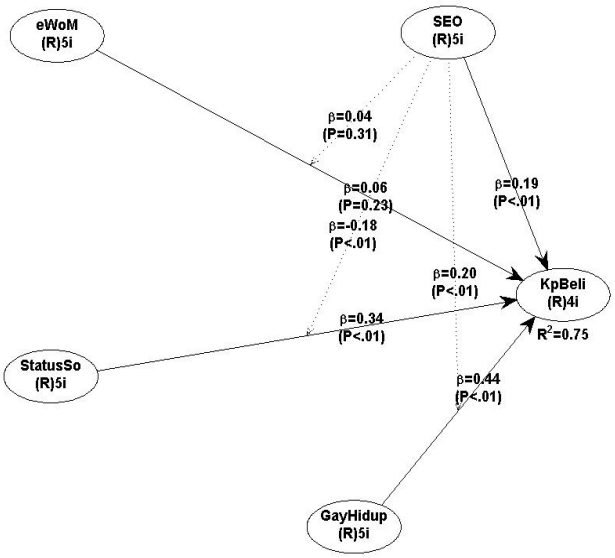

Figure 13

c. Hypotheses and Analysis

Hypothesis testing is determined based on the p-value. If the p-value ≤ 0.05, then H0 is rejected and H1 is accepted, indicating a significant effect. Conversely, if the p-value > 0.05, then H0 is accepted and H1 is rejected, meaning there is no significant effect. To measure the strength of the relationships between variables, path coefficients are used. The following table presents the path coefficient values along with the corresponding p-values as indicators of significance.

Based on the analysis results, the hypothesis testing in this study yielded the following findings:

Hypotheses	Path Coefficient	P-Value	Conclusion	Description
H1: eWOM → Purchase Decision	0,056	0,231	Not Significant	Rejected
H2: Social Status → Purchase Decision	0,344	< 0,001	Significant Positive	Accepted
H3: Lifestyle → Purchase Decision	0,442	< 0,001	Significant Positive	Accepted
H4: SEO → Purchase Decision	0,187	0,008	Significant Positive	Accepted
H5: SEO * eWOM → Purchase Decision	0,038	0,309	Not Significant	Rejected
H6: SEO * Social Status → Purchase Decision	-0,181	0,010	Significant Negative	Accepted
H7: SEO * Lifestyle → Purchase Decision	0,203	0,005	Significant Positive	Accepted

Figure 14

a. *Hypothesis Testing 1*

Based on Figure 7, the hypothesis test results show that the path coefficient value for eWOM on purchase decision is 0.056 with a p-value of 0.231. Since the p-value > 0.05, H1 is rejected, which means that electronic word of mouth (eWOM) does not have a significant influence on purchase decisions. This indicates that recommendations and reviews from other players in the *Rise of Castles* game do not directly drive the decision to purchase digital products in the game.

b. *Hypothesis Testing 2*

The hypothesis test results show that the path coefficient value for social status on purchase decision is 0.344 with a p-value < 0.001. Since the p-value < 0.05, H2 is accepted, which means that social status has a positive and significant influence on purchase decisions. This suggests that players with higher social status in the gaming community are more likely to purchase digital products to maintain or enhance their image in the game.

c. *Hypothesis Testing 3*

The hypothesis test results show that the path coefficient value for lifestyle on purchase decision is 0.442 with a p-value < 0.001. Since the p-value < 0.05, H3 is accepted, which means that lifestyle has a positive and significant influence on purchase decisions. Players with a consumptive lifestyle are more likely to purchase exclusive items to enhance their gaming experience.

d. *Hypothesis Testing 4*

The hypothesis test results show that the path coefficient value for SEO on purchase decision is 0.187 with a p-value of 0.008. Since the p-value < 0.05, H4 is accepted, indicating that SEO has a positive and significant influence on purchase decisions. This suggests that effective search optimization can increase the likelihood of players finding and purchasing digital products in the game.

e. *Hypothesis Testing 5*

The hypothesis test results show that the path coefficient value for the interaction between SEO and eWOM on purchase decision is 0.038 with a p-value of 0.309. Since the p-value > 0.05, H5 is rejected, which means that SEO does not moderate the effect of eWOM on purchase decisions. This indicates that the presence of SEO neither strengthens nor weakens the relationship between player recommendations and purchase decisions.

f. *Hypothesis Testing 6*

The hypothesis test results show that the path coefficient value for the interaction between SEO and social status on purchase decision is -0.181 with a p-value of 0.010. Since the p-value < 0.05, H6 is accepted, but with a negative effect, meaning that SEO weakens the influence of social status on purchase decisions. In other words, the higher the level of search optimization, the lesser the impact of social status on players' purchasing decisions.

g. *Hypothesis Testing 7*

The hypothesis test results show that the path coefficient value for the interaction between SEO and lifestyle on purchase decision is 0.203 with a p-value of 0.005. Since the p-value < 0.05, H7 is accepted, which means that SEO strengthens the influence of lifestyle on purchase decisions. In other words, the better the search optimization, the greater the impact of a consumptive lifestyle on the purchase of digital products in the game.

5. Conclusion

5.1 Conclusion

Based on the analysis conducted, this study presents several key findings regarding the influence of online word of mouth (eWOM), social status, lifestyle, and search engine optimization (SEO) on purchasing decisions for digital products in the game. The main conclusions of this research are as follows:

a. eWOM has no significant effect on digital product purchasing decisions in the game, indicating that reviews and recommendations from other players are not the main factors driving purchases.

b. Social status has a positive and significant influence on purchasing decisions, meaning that the higher a player's social status in the game community, the more likely they are to buy digital items to enhance their in-game image.

c. Lifestyle has the most dominant influence on purchasing decisions, showing that players with a consumptive lifestyle are more inclined to buy digital products in-game to enhance their gaming experience.

d. SEO has a direct effect on purchasing decisions, meaning that search optimization can increase the likelihood of players finding and purchasing digital products in the game.

e. SEO does not moderate the relationship between eWOM and purchasing decisions, indicating that the effectiveness of player recommendations on purchasing decisions is not influenced by the level of search optimization.

f. SEO moderates the relationship between social status and purchasing decisions negatively, meaning that the higher the search optimization, the lower the influence of social status on purchasing decisions.

g. SEO moderates the relationship between lifestyle and purchasing decisions positively, indicating that SEO strengthens the relationship between a consumptive lifestyle and in-game purchase decisions.

Overall, the results of this study affirm that social status and lifestyle are the main factors influencing digital product purchasing decisions in games, with SEO acting as a moderating variable that can either strengthen or weaken the relationships among these variables.

SKINTIFIC ATTRACTIVENESS: ANALYSIS OF FACTORS AFFECTING MOISTURIZER PURCHASING DECISIONS BY UNISMA 2021 STUDENTS

Devina Anggraini Putri[1],Abd Qodir Djailani[2], Alfian Budi Primanto[3]

Email : devinaangrainidap@gmail.com

Universitas Islam Malang

Abstract

This study aims to determine and analyze the relationship between the influence of digital marketing, brand awareness and brand image on purchasing decisions on skintific skincare. This study uses a case study on Unisma students where data is obtained by distributing questionnaires via g-form to Unisma students selected by purposive sampling. Determination of the number of samples in this study using the Slovin formula and the results obtained were 96 respondents. The analysis methods used in this study are instrument testing, (validity testing, reliability testing), normality testing, classical assumption testing (multicollinearity testing, heteroscedasticity testing), multiple linear regression analysis, hypothesis testing (F test and t test), determination coefficient testing (Adjusted R2) data processing using the IBM SPSS 26 program. The results of this study indicate that the influence of digital marketing, brand awareness, brand image simultaneously influences purchasing decisions. Digital Marketing partially influences purchasing decisions, Brand Awareness partially influences purchasing decisions, Brand Image partially influences purchasing decisions.

Keywords: Digital Marketing, Brand Awareness, Brand Image, Purchase Decision

1. Introduction

The skincare industry in Indonesia is experiencing significant growth, especially among teenagers. New brands are emerging with a variety of innovative products, and Skintific is one that is known for its technology-driven approach to product development. Amidst this fierce competition, marketing strategies are successful and crucial to attract customers' attention. To increase brand awareness and brand image, digital marketing is one of the key strategies. Purchasing decisions can be influenced by these two important factors. The way companies market their goods has changed due to the rapid advancement in information and communication technology.

Skintific is a skincare brand that emphasizes products with formulations based on scientific and dermatological research, aiming to provide skincare solutions that are effective, safe, and tailored to various skin needs. One of its flagship products is moisturizer, which is designed to provide optimal and deep moisture to the skin, while improving texture and maintaining overall skin health.

A study by Nielsen shows that 59% of consumers are more likely to buy products from brands they are familiar with. In the context of college students, high brand awareness of skincare brands such as skintific increases the likelihood of making a purchase. The purchase decisions made by consumers provide valuable insights for marketers regarding effective strategies in utilizing digital marketing. This aims to increase their awareness and brand image and drive better purchase decisions.

In the opinion of Kotler, (2019) digital marketing includes various strategies to reach target audiences through digital media, including the internet, mobile devices, social media, and various other digital platforms. Basically, digital marketing emphasizes how important it is to use digital technology to interact personally and effectively with customers. Dafid's opinion, (2018) argues that the ability of consumers to identify that a particular brand is one of the characteristics of the product offered, and this is recognized by a particular brand. And a measure of how far a brand is known and remembered by consumers. This involves a process from the initial stage when consumers are not yet aware of the existence of the brand to the final stage where the brand is the first to come to mind when talking about a particular product or service.

In the opinion of Keller, (2020) argues that brand image, or better known as brand image, is one of the crucial components in brand management that explains how consumers perceive a product or service based on its quality and appearance, in this definition, brand image can create consumer memories that are certainly formed by consumers about a brand. As stated by Mangkunegara, (2019) reveals that purchasing decisions are a framework related to work or something that consumers do when they make purchases. The behavior of others and unexpected situations are the two main components that influence this type of work. Consumers tend to be dissatisfied if performance is below expectations, on the other hand they will be happy and satisfied if performance exceeds expectations.

This, this research provides benefits not only from an academic perspective, but also practically for the skincare industry. So that researchers conducted a study with the title "The Influence of Digital Marketing, Brand Awareness and Brand Image on Purchasing Decisions for Moisturizer Products at Skintific Skincare (Study on Islamic University of Malang students class of 2021)".

2. Literature Review

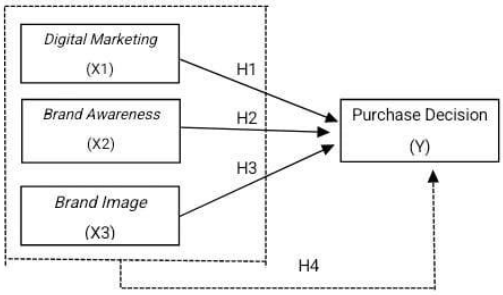
According to Mangkunegara (2019) purchasing decisions can be considered as a framework that influences performance, which shows customer beliefs when they make purchasing decisions. This structure is influenced by two main components, namely perceptions of others and expected circumstances. If the perceived performance is below expectations, consumers will feel dissatisfied. Conversely, if the performance is in accordance with consumer expectations, there will be a feeling of satisfaction and happiness.

According to Daengs, Achmad (2016) states that the digital marketing understanding of an entrepreneur or businessman focuses more on the marketing system through internet media, this definitely includes cell phones and various social networking sites. However, for this technique to be more effective, it seems that promotional techniques are less prioritized and more focused on communication. Building personalized relationships with consumers through listening to their complaints or suggestions can make customers feel more valued.

Brand Awareness according to Harjadi, (2024), the level of consumer recognition and awareness of a brand is an important aspect in the world of marketing and branding. This concept has a direct impact on purchasing decisions made by consumers. Brand awareness not only includes how much consumers are familiar with a brand, but also how deeply they understand the characteristics, quality and value offered by the brand.

Brand Image according to Leksono, (2023) that brand image is needed by a company, especially in facing increasingly competitive business competition. With a positive product

image, the company will be able to make its products different from its competitors who have other similar products.



Gambar 1. Research Model

Hypothesis

H1 : It is suspected that digital marketing has a significant impact on purchasing decisions.

H2 : It is suspected that brand awareness has a significant influence on purchasing decisions.

H3 : It is suspected that brand image has a significant influence on purchasing decisions.

H4 : It is suspected that Digital Marketing, Brand Awareness and Brand Image simultaneously have a significant influence on purchasing decisions.

3. Methodology

A quantitative approach with an associative research type is used in this study. Where, associative research is conducted to understand how two or more variables interact with each other (Sugiono, 2013). In this context, they will be able to observe the effect of digital marketing, brand awareness, and brand image on purchasing decisions. Research on a specific population or sample is called a quantitative approach and is conducted randomly using instruments, analysis, and statistics Sugiyono, (2015).

The research population is a generalization area consisting of subjects and objects with certain characteristics and qualities Sugiyono, (2017). These characteristics have been determined by the researcher to be the object of study, in the hope of drawing relevant conclusions. As a result, the population in this study is college students at the Islamic University of Malang Class of 2021.

Sugiyono, (2017) suggests that the sample is a part taken from the entire population that represents the various characteristics possessed by the population. In this study, the sampling method applied was purposive sampling, or what is often referred to as judgmental sampling. The purposive sampling technique is a nonprobability sampling method, in which the researcher sets certain criteria that must be met by individuals or objects in order to be included in the sample, and it is known that the population is 2,201 female students, with calculations using the slovin formula, the sample size is 96 female students.

$$n = \frac{N}{1 + N(e)^2}$$

Gambar 2 Slovin's formula

$n = N / (1 + N e^2)$

$= 2.201 / (1 + 2.201 \times 0{,}1^2)$

$= 95{,}6$ = rounded to 96

4. Result And Discussion

Tabel 1 Validity Test Result

Variabel	Item	R hitung	R tabel 5% (96)	Sig.	Kriteria
X1	X1.1	0,578	0,204	0,000	Valid
	X1.2	0,645	0,204	0,000	Valid
	X1.3	0,696	0,204	0,000	Valid
	X1.4	0,606	0,204	0,000	Valid
	X1.5	0,613	0,204	0,000	Valid
	X1.6	0,674	0,204	0,000	Valid
X2	X2.1	0,758	0,204	0,000	Valid
	X2.2	0,593	0,204	0,000	Valid
	X2.3	0,757	0,204	0,000	Valid
	X2.4	0,683	0,204	0,000	Valid
X3	X3.1	0,646	0,204	0,000	Valid
	X3.2	0,538	0,204	0,000	Valid
	X3.3	0,515	0,204	0,000	Valid
	X3.4	0,735	0,204	0,000	Valid
	X3.5	0,544	0,204	0,000	Valid
	X3.6	0,634	0,204	0,000	Valid
	X3.7	0,619	0,204	0,000	Valid
	X3.8	0,710	0,204	0,000	Valid
Y	Y.1	0,694	0,204	0,000	Valid
	Y.2	0,606	0,204	0,000	Valid
	Y.3	0,696	0,204	0,000	Valid
	Y.4	0,770	0,204	0,000	Valid
	Y.5	0,632	0,204	0,000	Valid

Source: Primary data processed 2025

Based on the table, it can be seen that the calculated r values of all variables are positive and exceed the r table value. Consequently, all indicators of this research pass the validity test and are verified as valid.

Tabel 2 Reliability Test Result

No.	Variabel	*Cronbach Alpha*	Standar Reliabilitas	Keterangan
1.	*Digital Marketing* (X1)	0,704	0,60	Reliabel
2.	*Brand Awareness* (X2)	0,652	0,60	Reliabel
3.	*Brand Image* (X3)	0,772	0,60	Reliabel
4.	Purchase Decision (Y)	0,711	0,60	Reliabel

Source: Primary data processed 2025

The reliability test results listed in the table show the Cronbach Alpha value for each variable. For the Digital Marketing variable, the value obtained is 0.704, while for Brand Awareness it is 0.652. The Brand Image variable recorded a value of 0.772, and the Purchasing Decision received a value of 0.711. From the data obtained, it appears that all variables have a Cronbach Alpha coefficient of more than 0.60. This shows that each measurement concept in these variables can be considered as reliable. Thus, the questionnaire used in this study can be trusted. This means that if the questionnaire is used again at a different time, the results obtained in this study.

Tabel 3 Normality Test Result

One – Sample Kolmogorov – Smirnov Test			
			Untandardised Residual
N			96
Normal Parameters[a,b]	Mean		.0005194
	Std. Deviation		1.46360686
Most Extreme Differences	Absolute		.056
	Positive		.056
	Negative		-.046
Test Statistic			.056
Asymp. Sig. (2-tailed)			.200[c,d]
Monte Carlo Sig (2-tailed)	Sig		.905[e]
	99% Confidence Interval	Lower Bound	.897
		Upper Bound	.912

Source: Primary data processed 2025

Based on the table of Kolmogorov-Smirnov OnSample test results with Asymp. Sig. (2-tailed) of 200. Based on the Kolmogorov-Smirnov normality test decision-making criteria, the data is declared normally distributed if the Asymp. Sig. (2-tailed) is greater than 0.05 or 5%. The Monte Carlo Sig (2-tailed) value was also found to exceed 0.05. Therefore, it can be concluded that the residual data is normally distributed because the value of 200 is greater than 0.05, which indicates that the residuals follow a normal distribution.

Tabel 4 Multicollinearity Test Result

Coefficients								
Model		Unstandardzed Coefficients		Standardzed Coefficients	T	Sig	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	.733	1.473		.498	.620		
	Digital Marketing	.247	.088	.276	2.797	.006	.373	2.684
	Brand Awareness	.285	.114	.230	2.501	.014	.427	2.340
	Brand Image	.279	.072	.393	3.881	.000	.353	2.833

Source: Primary data processed 2025

Based on the table above, the tolerance value for all variables analyzed is greater than 0.10, while the VIF value is less than 10, as shown in the table. Therefore, the results of this study indicate that there is no multicollinearity problem.

Tabel 5 Heteroscedasticity Test Result

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig
		B	Std. Error	Beta		
1	(Constant)	.439	.952		.462	.645
	Digital Marketing	.050	.057	.150	.885	.378
	Brand Awareness	-.007	.074	-.016	-.102	.919
	Brand Image	-.014	.046	-.052	-.300	.765

Source: Primary data processed 2025

Based on the table above the results of the heteroscedasticity test, the researchers conducted the Glejser test. In accordance with the existing provisions, if the significance value between the dependent variable and the absolute residual exceeds 0.05, it is concluded that there are no symptoms of heteroscedasticity. Based on the table provided, it can be seen that all variables show a significance value greater than 0.05.

Tabel 6 Multiple Linear Analysis

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig
		B	Std. Error	Beta		
1	(Constant)	.733	1.473		.498	.620
	Digital Marketing	.247	.088	.276	2.797	.006
	Brand Awareness	.285	.114	.230	2.501	.014
	Brand Image	.279	.072	.393	3.881	.000

Source: Primary data processed 2025

From the values contained in the table above, a linear equation can be made as follows:

$Y = a + b1.X1 + b2.X2 + b3.X3 + e$

$Y = 0.733 + 0.247.X1 + 0.285.X2 + 0.279.X3 + e$

Description:

Y = Purchase Decision

a = Constant

β = Regression Coefficient

X1 = Digital Marketing

X2 = Brand Awareness

X3 = Brand Image

a. The value of 0.733 as a constant indicates that the value of digital marketing, brand awareness, and brand image variables has a significant correlation, which is 0.733.

b. Purchasing decisions are positively influenced by the implementation of digital marketing, with a regression coefficient of 0.247. This indicates that each one unit increase in digital marketing contributes to a 0.247 unit increase in the value of purchasing decisions. Thus, it can be concluded that the better the implementation of digital marketing, the greater the opportunity for consumers to make purchasing decisions.

c. The regression coefficient obtained shows that the purchase decision has a value of 0.285. This shows that every one unit increase in brand awareness will have an impact on increasing the value in the purchasing decision-making process by 0.285. This positive coefficient position confirms the existence of a favorable relationship between brand awareness and purchasing decisions.

d. Purchasing decisions are increased by 0.279 by every one unit increase in brand image, with a regression coefficient of 0.279 recorded for the brand image variable on purchasing decisions. This increase in purchasing decisions is indicated by the positive coefficient value, which indicates that the compatibility of brand image with consumer expectations and abilities plays an important role in increasing it.

Tabel 7 F Test Result

Anova					
Model	Sum of Squares	Df	Mean Square	F	Sig
Regression	407.653	3	135.884	61.431	.000[b]
Residual	203.504	92	2.212		
Total	611.156	95			

Source: Primary data processed 2025

Based on the results of the F test, the calculated F value is 61.431 and the F table value is 3.10. It can be concluded that the calculated F value is greater than the F table value (61.431> 3.10). Furthermore, the significance value obtained is 0.000, which is also smaller than 0.05 (0.000 < 0.05). Therefore, it can be stated that digital marketing, brand awareness, and brand image together affect purchasing decisions.

Tabel 8 Result of the t-test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig
		B	Std. Error	Beta		
1	(Constant)	.733	1.473		.498	.620
	Digital Marketing	.247	.088	.276	2.797	.006
	Brand Awareness	.285	.114	.230	2.501	.014
	Brand Image	.279	.072	.393	3.881	.000

Source: Primary data processed 2025

a. Purchasing decisions are positively and significantly influenced by digital marketing. This is supported by the calculated t value of 2.797, exceeding the t table value of 1.662. The recorded significance of 0.006 also indicates that H1 is accepted because it is below 0.05.

b. Purchasing decisions are positively and significantly influenced by brand understanding. This is supported by the results of the data analysis, where the calculated t value (2.501) of Brand Awareness is found to be higher than the table t value (1.662). The significance of less than 0.05 (i.e. 0.014) further strengthens this conclusion, thus H2 can be accepted.

c. Purchasing decisions are proven to be positively and significantly influenced by brand image. This is supported by statistical data with a calculated t value of 3.881 which is greater than the t table of 1.662 and a significance level below 0.05, namely 0.000. Therefore, H3 is accepted.

Tabel 9 Coefficient of Determination Test Result (Adjusted R^2)

Model	R	R Square	Adjusted R Squajre	Std. Error of the Estimajte
1	.817[a]	.667	.656	1.487

Source: Primary data processed 2025

Based on the table above, it is known that the Adjusted R Square value is 0.656 or 65.6%, meaning that the independent variables, namely Digital Marketing (X1), Brand Awareness (X2), and Brand Image (X3), provide 65.6% of purchasing decisions.

Based on the results of the research that has been conducted, it is found that the Digital Marketing variable (X1) has a significant influence on Purchasing Decisions (Y) on Skintific skincare products, especially among female students at the Islamic University of Malang. This finding highlights the crucial role of digital marketing (X1) in influencing consumers in the purchasing decision-making process (Y). The results of this study are in line with the findings

obtained by Rika, (2020), Dwiputri et al., (2024), and Hubbina, (2023) which state that digital marketing variables have a positive and significant effect on purchasing decisions.

Based on the research results, it is known that brand awareness is accepted, which means that the brand awareness variable (X2) has a positive and significant effect on the purchasing decision variable (Y) of Skintific products for female students at the Islamic University of Malang. The results of this study show similarities with research revealed by Adriyanto et al., (2023), Sari et al., (2021), Vevi, (2015) which states that the brand awareness variable has a positive and significant effect on purchasing decisions.

Based on the research results, it is known that the brand image variable is accepted, which means that the brand image variable (X3) has a positive and significant effect on the purchasing decision variable (Y) of Skintific products for female students at the Islamic University of Malang. The results of this study are in line with the findings obtained by Putri & Selviana, (2023), Kusuma et al., (2022), and Widjaja & Wijayadne, (2023) which show that the brand image variable has a positive and significant influence on purchasing decisions.

5. Conclusion

After analyzing the data with various series of statistical tests and hypotheses, the results of the discussion can be concluded as follows: Digital marketing, brand awareness, and brand image have a significant influence on purchasing decisions. These three variables are interrelated and contribute, therefore companies need to integrate marketing strategies that include digital marketing, increasing brand awareness, and strengthening brand image to achieve greater success in the market. The results of the analysis show that digital marketing has a significant influence on purchasing decisions. This indicates that an effective digital marketing strategy can increase consumer interest and desire to buy products.

Brand awareness has a significant influence on purchasing decisions. High brand awareness among consumers can increase their likelihood of choosing that product, indicating the importance of marketing efforts in building brand recognition. Brand image has a significant influence on purchasing decisions. A positive brand image can increase consumer trust and loyalty, which in turn encourages them to make purchases. In this study, there are a number of limitations that cannot be avoided, because every research must have limitations. Nevertheless, it is hoped that this research will still provide meaningful benefits. The limitations in this study are that it only uses 3 independent variables, namely digital marketing, brand awareness, and brand image. This can limit understanding of other factors that may also affect purchasing decisions. There are still many other variables, such as price, product quality, and customer service, which can provide deeper insight into consumer behavior. The researcher has reached some conclusions from this research and hopes that it can help the development of science, related institutions, and everyone involved in this research. The following are some suggestions that can be taken from the research findings:

For future researchers, it is recommended to consider adding variables that have not been listed in this study. The goal is that the next research can be more comprehensive and provide deep insight. For the Islamic University of Malang, the results of this study can be a valuable reference archive for lecture materials, especially those related to marketing. Academics can also document these findings to make it easier for future researchers to find references, especially related to the various factors that influence purchasing decisions among female students.

The Skintific company is expected to continue to strive to improve the quality of its products to suit consumer needs. In other ways, they will be able to build a positive brand image and maintain consumer loyalty to all products offered. Given the increasingly fierce competition, Skintific needs to maintain the quality of the products they have in order to remain competitive in the market.

THE IMPACT OF DIGITAL TAX SYSTEM IMPLEMENTATION ON TAXPAYER COMPLIANCE MODERATED BY DIGITAL LITERACY

Dwi Ifani[1], Eny Zuhrotin Nasyi'ah[2], Naimatul Hasanah[3]

[1,2,3] University of Islam Malang, Indonesian

Abstract

This study aims to analyze the impact of implementing a digital taxation system on taxpayer compliance moderated by digital literacy on individual taxpayers registered at KPP Pratama Tegal in the Brebes Regency area. This type of research uses a quantitative approach method with a type of cause-and-effect relationship. This study uses primary data obtained from questionnaires. The population in this study were individual taxpayers registered at KPP Pratama Tegal in the Brebes Regency area with a sample size of 100 respondents. The method used in this research is moderation regression analysis using SPSS software version 27. The results of this study indicate that the application of the digital taxation system has a positive effect on taxpayer compliance and digital literacy moderates, but has a weakening effect on the application of the digital taxation system on taxpayer compliance. The implications of this study contribute to the literature in the fields of taxation and technology, and can assist the Directorate General of Taxes in designing policies for implementing an effective and easy-to-use digital taxation system.

Keywords: Digital tax system, taxpayer compliance, and digital literacy

1. Introduction

Taxes are mandatory contributions paid by individuals or entities to the state, which are compelling and regulated by law. Tax revenue is one of the largest sources of revenue for state revenue (Putri, 2022). Taxes have a crucial role in the country's economy, as the main source of revenue used to finance government spending. According to Lado & Budiantara (2018) in Djo (2022) research, tax revenue is used to finance government spending, regulate economic growth, maintain a balance between prices and inflation rates, and implement development in various fields evenly. Although taxes are the main source of state revenue, the level of tax compliance in Indonesia is still a complex problem. According to Yuliati & Huda (2022), people are still not familiar with taxes and many still do not understand the importance of paying taxes so that people's willingness to pay taxes is still relatively low.

Based on statistical data from the ministry of finance as of December 31, 2023, tax revenue in Indonesia in 2022 reached IDR 1,716.77 trillion, growing significantly compared to 2021. However, in 2023, it experienced a slight slowdown with tax growth of 8.9%, but this still reflects a stable and sustainable level of compliance from the community in fulfilling their tax obligations. According to Richard & Lastanti (2024), government efforts and public awareness of the importance of tax compliance continue to grow, contributing to the stability and sustainable economic growth in Indonesia. However, this slowdown shows that there is a need to evaluate and improve the tax system so that in the following year this tax growth will increase again. The use of technology is a must for every government agency, especially within the Ministry of Finance (Fitrianti et al., 2024). Therefore, the Directorate General of Taxes (DGT) has made efforts to innovate and reform, including the development of a tax digitalization system to simplify the process of reporting and paying taxes.

The Directorate General of Taxes created DGT Online to facilitate taxpayers in fulfilling their obligations. This system utilizes information and communication technology to manage the entire taxation process, from taxpayer registration, to tax reporting and tax

payment. This system is expected to increase accountability, transparency, and public participation in tax compliance. Digitalization in tax management not only accelerates the service process, but also digital technology allows tax authorities to collect data in real time. With the development of technology, DGT also needs to educate the public on the use of information technology in taxation to increase public awareness and understanding of taxation. However, in its implementation, there are challenges that must be faced, such as limited infrastructure, low digital literacy, and system security that still needs to be improved (Vientiany et al., 2024).

Digital literacy plays an important role in increasing taxpayers' awareness and understanding of taxation. According to Yuliati & Huda (2022), digital literacy makes it easy for readers to access information anytime and anywhere using devices connected to the internet network. Good digital skills can make it easier for taxpayers to access tax-related information through various online platforms such as the official website of the Directorate General of Taxes, tax applications, and social media. Digital literacy has great potential to improve tax compliance, but there are still challenges that need to be overcome. Not everyone has equal access to technology and information. Therefore, it is important for the government and related institutions to make efforts to improve digital literacy, especially in underserved areas. Digital-based tax training and education programs can be a solution to increase public understanding of tax obligations.

This study examines how the implementation of the digital tax system affects taxpayer compliance, moderated by digital literacy. The purpose of this study was to analyze and determine the effect of the application of the digital tax system on taxpayer compliance, moderated by the level of digital literacy. The results of this study are expected to contribute to the development of accounting science, especially the fields of taxation and technology, and can be used as a reference or guide for future researchers in understanding digital tax systems, taxpayer compliance, and digital literacy. In addition, this study also aims to assist the Directorate General of Taxes in designing the implementation of the digital tax system, as well as increasing taxpayer awareness of the importance of taxpayer compliance and encouraging taxpayers to utilize technology in their taxation process.

2. Literature Review

2.1 Technology Acceptance Model

The Technology Acceptance Model is a framework used to understand how users accept and adopt technology (Wicaksono, 2022). The Technology Acceptance Model aims to describe users' acceptance of new information technology, such as management information systems and software. In the technology acceptance model theory, this model emphasizes two main factors that influence technology acceptance: perceived usefulness and perceived ease of use.

2.2 Tax Definition

Taxes are a source of state revenue that must be paid by the public which is regulated by law as a legal basis (Habib, 2022). Taxes have a clear legal basis in the form of laws that regulate the tax obligations of citizens. The main purpose of tax collection is to improve the welfare of society so that the government can create conditions that support the welfare of society as a whole.

2.3 Taxpayer Compliance

Taxpayer compliance is the attitude and actions taken by individuals or entities in carrying out tax obligations in accordance with applicable regulations. According to Agun et al. (2022), tax compliance can be defined as a situation where taxpayers fulfill all tax

obligations and exercise their rights. Compliance is measured not only based on the amount of tax paid, but also on the extent to which taxpayers comply with the provisions of tax legislation (Husaini et al., 2024). According to Wicaksari & Wulandari (2021), tax compliance can be seen from several aspects, such as taxpayer awareness in registering themselves, compliance in submitting tax returns correctly, compliance in calculating and paying taxes owed correctly, and compliance in paying arrears. Compliance with taxation not only contributes to state revenue, but also reflects social responsibility and active participation in economic development.

2.4 Digital Tax System

A digital tax system is a system that uses information and communication technology to manage taxation processes such as reporting, payment, and tax monitoring. According to Vientiany et al. (2024), online tax services can provide many benefits, both for taxpayers and DGT. E-filing is one of the electronic systems used by the Directorate General of Taxes (DGT) of the Ministry of Finance of the Republic of Indonesia for tax reporting (Amin et al., 2024). This system can increase efficiency and transparency in tax administration.

2.5 Digital Literacy

Digital literacy is an important ability to obtain, understand, and utilize information that comes from various digital sources (Naufal, 2021). Digital literacy is a key skill to adapt to a world that is increasingly filled with digital technology and information. According to Naufal (2021), he existence of digital literacy skills allows people to access, sort, select, and understand a variety of information that can be used to improve the quality of life.

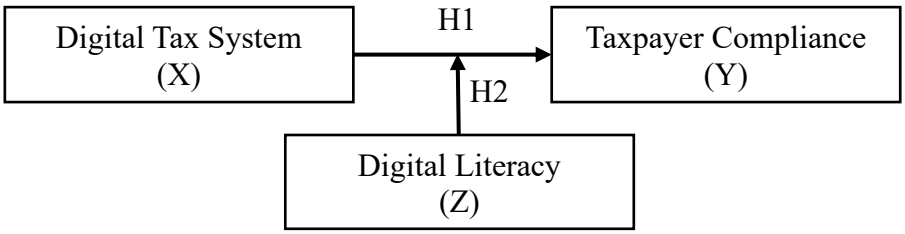
2.6 The Relationship Between the Implementation of the Digital Tax System and Taxpayer Compliance

The digital tax system makes the tax administration process more efficient and transparent. Taxpayers can access information related to tax obligations more easily through an online platform. This system also has a real-time transaction monitoring feature, which allows tax authorities to more quickly detect any non-compliance. According to Rachmawati et al. (2022), the application of the e-filing system can affect taxpayer compliance. When a digital tax system is implemented, taxpayers can easily access the taxation process and can increase the convenience of reporting, so as to increase the level of taxpayer compliance. From this explanation, the hypothesis formulated is H1 = The digital tax system affects taxpayer compliance.

2.7 The Relationship Between Digital Literacy Moderating the Effect of Digital Tax System Implementation on Taxpayer Compliance

Digital literacy has an important role in the implementation of the digital tax system. When a digital tax system is implemented, taxpayers who have good high digital literacy tend to be better able to use existing technology. According to Widjiadha & Damayanti (2024), digital literacy can strengthen the effect of implementing a digital tax system on taxpayer compliance. When taxpayers have an understanding of digital literacy, taxpayers can more easily access information, perform their tax obligations online, and can use the platform provided by the tax authority. Good digital literacy can make taxpayers better prepared to understand and use the digital tax system, thereby increasing taxpayer compliance. From this explanation, the hypothesis formulated is H2 = Digital literacy moderates the effect of the digital tax system on taxpayer compliance.

2.8 Kerangka Konseptual



3. Research Methodology

3.1 Type, Location and Time of Research

This research uses a quantitative approach method with the type of research used is a causal relationship or cause-and-effect relationship. This research was conducted at the Office of Taxation Services, Counseling and Consultation (Kp2Kp) Bumiayu Jl. Yos Sudarso No. 8, Pangembon, Brebes, Kec. Brebes, Kab, Brebes, Central Java 52212. This research was conducted from November 2024 to January 2025.

3.2 Population and Sample

The population in this study were individual taxpayers registered at the Tegal Primary Tax Service Office (KPP Pratama Tegal) in the Brebes Regency area, with a population of 408,563 based on data recorded at KPP Pratama Tegal as of December 17, 2024. The sample is a part that reflects the number and characteristics of a population (Sugiyono, 2022). The method used for sampling in this study is the Simple Random Sampling method. To determine the sample, this study used the Slovin formula, namely:

$$n = \frac{N}{1 + N\,(e)^2}$$

Description:
n : Number of samples required
N : Total population
e : Minimum sample error rate of 10%
Then the number of samples in this study are:

$$n = \frac{408.563}{1 + 408.563\,(0{,}1)^2}$$

$$n = 99{,}97$$

Based on the calculations carried out, the number of samples required for this study was 99.97, which was rounded up to 100 samples.

3.3 Variable Definitions and Operations

1. Taxpayer Compliance (Y)

   Taxpayer compliance is an action taken by an individual or entity to fulfill tax obligations in accordance with applicable regulations. Tax compliance can be measured through various aspects such as tax registration, reporting, calculation, and payment. This compliance not only contributes to state revenue but also reflects social responsibility and active participation in economic development.
2. Digital Tax System (X)

   The digital tax system is an electronic system provided by the Directorate General of Taxes (DGT) to facilitate interaction between the DGT and taxpayers. This system uses information and communication technology to manage taxation processes such as tax reporting, payment, and monitoring.

3. Digital Literacy (Z)

   Digital literacy is the ability to acquire, understand and utilize information from a variety of digital sources. Digital literacy is not just about skills in using devices and the internet, but also the important ability to analyze and use information wisely. Good digital skills enable people to access and select information that helps to improve quality of life.

3.4 Data Collection Sources and Methods

This research uses primary data as the data source. In this study, data was collected using a survey method that was randomly distributed to respondents. There are five points in the choice of scale, namely: Strongly Agree (5 Points), Agree (4 Points), Neutral (3 Points), Disagree (2 Points), and Strongly Disagree (1 Point).

3.5 Data Analysis Method

This study uses Moderated Regression Analysis (MRA) as the main analysis method. Moderated regression analysis is a regression analysis method that takes into account moderating variables in developing a model of the relationship between variables. According to Ghozali (2021), moderating variables are independent variables that can strengthen or weaken the relationship between the independent variable and the dependent variable. The following is the moderation regression analysis equation:

$$Y = \alpha + \beta 1X + \beta 2Z + \beta 3(X * Z) + \varepsilon$$

Keterangan:

Y : Taxpayer compliance (Dependent Variable)
α : Constant
β1-β3 : Regression coefficient
X : Digital tax system (Independent Variable)
Z : Digital Literacy (Moderating Variable)
ε : Error

4. Results and Discussion

This research was conducted on individual taxpayers registered at KPP Pratama Tegal in the Brebes Regency area with a total of 408,563 taxpayers. To determine the sample in this study using the Slovin formula with a final result of 100 samples. This research was processed using SPSS version 27.

4.1 Descriptive Statistical Analysis

Table 1. Descriptive Statistics

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
Digital Tax System	100	1	5	4.14	.602
Digital Literacy	100	2	5	4.28	.386
Taxpayer Compliance	100	2	5	4.38	.515
Valid N (listwise)	100				

Source: Primary data processed by SPSS version 27, 2025

Based on the table above, it is known that in the Digital Tax System (X) variable, the lowest value is 1, while the highest value reaches 5. The average value for this variable is 4.14 with a standard deviation of 0.602. The Digital Literacy variable (Z) shows the lowest value of

2 and the highest value of 5, with an average value of 4.28 and a standard deviation of 0.386. Meanwhile, the Taxpayer Compliance variable also has the lowest value of 2 and the highest value of 5, with an average value of 4.38 and a standard deviation of 0.515. It can be seen that the average value for the three variables is quite high, namely the Digital Tax System variable of 4.14, the Digital Literacy variable of 4.28, and the Taxpayer Compliance variable of 4.38. This shows that respondents tend to agree or have a positive view of the three variables measured.

4.2 Instrument Test

1. Validity Test

   Based on the results of the validity test, it can be concluded that all statement items on the digital tax system variable, digital literacy and taxpayer compliance each have a value of r count> r table, namely 0.195, so that all statement items from each variable are said to be valid.

2. Reliability Test

Table 2. Reliability Test

Variable	Cronbach's Alpha	Description
Digital Tax System	0,885	Reliabel
Digital Literacy	0,755	Reliabel
Taxpayer Compliance	0,887	Reliabel

Source: Primary data processed by SPSS version 27, 2025

Based on the reliability test results in the table above, it explains that the Cronbach's Alpha value on the Digital Tax System (X) variable is 0.885 which means that the data is reliable because the Cronbach's Alpha value is> 0.7. Then the Digital Literacy variable (Z) is 0.755 which means that the data is reliable because the Cronbach's Alpha value is> 0.7. Finally, the Taxpayer Compliance (Y) variable is 0.887 which means that the data is reliable because the Cronbach's Alpha value is> 0.7.

4.3 Normality Test

To test normality in this study using the Kolmogorov Smirnov test.

Table 3. Normality Test

One-Sample Kolmogorov-Smirnov Test			
			Unstandardized Residual
N			100
Normal Parameters[a.b]	Mean		,0000000
	Std. Deviation		2,41341781
Most Extreme Differences	Absolute		,072
	Positive		,068
	Negative		-,072
Test Statistic			,072
Asymp. Sig. (2-tailed)[c]			,200[d]
Monte Carlo Sig. 92-tailed)[e]	Sig		,227
	99% Confidence Interval	Lower Bound	,216
		Upper Bound	,238

Source: Primary data processed by SPSS version 27, 2025

Based on the results in the table above, this study obtained an Asymp. Sig. (2-tailed) value is greater than the significant level of 0.05, which is 0.200. This shows that the normality assumption is met and the data used in this study are normally distributed.

4.4 Classical Assumption Test

1. Multicollinearity Test

The multicollinearity test aims to test whether there is a correlation between the independent variables in the regression model.

Table 4. Multicollinearity Test

Coefficients[a]								
Model		Unstandardized Coefficients		Standardized Coefficient	t	Sig.	Collinearity Statistic	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	12,945	2,778		4,660	,000		
	Digital Tax System	,458	,065	,624	7,007	,000	,793	1,262
	Digital Literacy	,002	,143	,002	,017	0,17	,793	1,262

Source: Primary data processed by SPSS version 27, 2025

Based on the table above, each variable has a Tolerance value greater than 0.10 and the VIF value on each variable is less than 10, which means there is no multicollinearity.

2. Heteroscedasticity Test

The heteroscedasticity test aims to test the regression model whether there is an inequality of variance from the residuals in one observation to another.

Table 5. Heteroscedasticity Test

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	5,336	1,441		3,703	,000
	Digital Tax System	-,010	,034	-,032	-,289	,774
	Digital Literacy	-,141	,074	-,212	-1,905	,060
a. Dependent Variable: Abs RES						

Source: Primary data processed by SPSS version 27, 2025

From the results of the table above, it can be seen that the Sig. value of the Digital Tax System variable is 0.774 and Digital Literacy is 0.060. So it can be concluded that there is no heteroscedasticity in the regression model.

4.5 Moderated Regression Analysis

Table 6. Moderated Regression Analysis

Coefficients[a]					
Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		

1	(Constant)	-30,586	20,716		-1,476	,143
	Sistem Pajak Digital	1,872	,670	2,551	2.793	,006
	Digital Literacy	2,065	,983	1,289	2.101	,038
	Digital Tax System * Digital Literacy	-,067	,031	-2,767	-2,120	0,037
a. Dependent Variable: Taxpayer Compliance						

Source: Primary data processed by SPSS version 27, 2025

$$KWP = -30,586 + 1,872SPD + 2,065LD – 0,067SPD*LD + \varepsilon$$

From the moderation regression analysis equation above, it can be explained as follows:

1. The coefficient value of the Digital Tax System variable regression model is 1.872 so it can be concluded that if the Digital Tax System increases by 1%, then taxpayer compliance also increases by 187.2%.
2. The coefficient value of the interaction regression model between the Digital Literacy variable and the Digital Tax System is -0.067 so it can be concluded that if the interaction between Digital Literacy and the Digital Tax System increases by 1%, then Taxpayer Compliance decreases by 6.7%.

4.6 Uji Hipotesis

1. Test Coefficient of Determination (R2)

Table 7. Determination Coefficient Test

Model Summary[b]				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,646[a]	,418	,399	2,395

Source: Primary data processed by SPSS version 27, 2025

It can be seen from the Model Summary test results in the table above, the Adjusted R Square value is 0.399 = 39.9%. So it can be concluded that the independent variables, namely the Digital Tax System and Digital Literacy, in explaining the dependent variable, namely Taxpayer Compliance in this model, are only 39.9%. Meanwhile, 60.1% is explained by other independent variables not discussed in this study.

2. T-test (partial)

Table 8. Test t (Partial)

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	-30,586	20,716		-1,476	,143
	Digital Tax System	1,872	,670	2,551	2.793	,006
	Digital Literacy	2,065	,983	1,289	2.101	,038
	Digital Tax System * Digital Literacy	-,067	,031	-2,767	-2,120	0,037
a. Dependent Variable: Taxpayer Compliance						

Source: Primary data processed by SPSS version 27, 2025

Based on the data in the table above, it can be concluded that:

1. It is known that the Digital Tax System has a significant value of 0.006 less than 0.05, so H1 is accepted.
2. It is known that the interaction of Digital Literacy with the Digital Tax System has a significant value of 0.037 less than 0.05, then H2 is accepted.

4.7 Discussion

1. The Effect of the Digital Tax System on Taxpayer Compliance

The first hypothesis (H1) states that the Digital Tax System has an effect on Taxpayer Compliance is accepted. This finding is in line with research conducted by Rachmawati et al. (2022), Habib (2022), Hama (2023), Widjiadha & Damayanti (2024), and Agusetiawati et al. (2024) which underline that the digital tax system has a positive effect on taxpayer compliance. This shows that the existence of a digital tax system can make it easier for taxpayers to access tax services, so the better the implementation of the digital tax system, the higher the taxpayer compliance in carrying out their obligations. Based on the demographics of the respondents, the majority of respondents who use the digital tax system are female, aged between 20-40 years, have a Bachelor's degree, and work as self-employed or in other flexible job categories. These factors indicate that these groups are more adaptable to technology and can take advantage of the conveniences offered by the digital tax system, which in turn helps increase taxpayer compliance in fulfilling tax obligations. This finding is in accordance with the Technology Acceptance Model (TAM) theory which states that perceived usefulness and ease of use can influence a person's decision to adopt technology. The theoretical implications of this research are useful for scientific development and further researchers to enrich the literature on technology acceptance in the context of taxation. Practically, this research is useful for the government to design better policies in implementing a more effective digital tax system and for taxpayers to improve compliance through a system that is easier to access and use. So that the implementation of an effective and efficient digital tax system can create a more transparent and accountable environment in tax management and simplify the taxation process for taxpayers.

2. The Interaction Effect of Digital Literacy with the Digital Tax System on Taxpayer Compliance

The second hypothesis (H2) states that Digital Literacy moderates the effect of the Digital Tax System on taxpayer compliance is accepted, but has a weakening impact. This finding is in line with research conducted by Widjiadha & Damayanti (2024), which reveals that digital literacy can moderate the relationship between the use of digital tax systems and taxpayer compliance, but in this study it has a weakening impact. This shows that although high digital literacy should help taxpayers in utilizing the digital tax system, other factors can weaken its influence on taxpayer compliance. Based on the demographics of respondents, although the majority of respondents have higher education and good digital literacy, most of the taxpayers work in the self-employed sector or jobs with irregular income which is often below the Non-Taxable Income (PTKP) limit. This causes taxpayers to feel that they do not need to report taxes. While the 20-40 age group is more adaptive to technology, lack of understanding of tax obligations and low income remain key barriers to improving taxpayer compliance, although the use of digital tax systems can help. Based on the Technology Acceptance Model (TAM) theory, which states that perceived usefulness and ease of use can influence a person's decision to adopt technology. Digital literacy can affect the ease of use of the digital tax system, but if taxpayers feel that the system is not useful, especially because income is below the PTKP limit, taxpayers tend to be non-compliant even though the system is easy to use. The factors of low income and irregular employment weaken the effect of digital literacy on tax compliance. The theoretical implications of this research for scientific development and further researchers contribute to the development of TAM theory in the context of taxation. Practically, this research is useful for the government to conduct training and provide an easily accessible

platform, while for taxpayers, increasing digital literacy will increase the ease and convenience of fulfilling tax obligations.

5. Conclusions and Suggestions

5.1 Conclusion

Based on the results of the tests carried out, it can be concluded that the application of the digital tax system can have a positive influence on the compliance of individual taxpayers registered at KPP Pratama Tegal in the Brebes Regency area. Digital literacy moderates, but has a weakening effect on the application of the digital tax system on the compliance of individual taxpayers registered at KPP Pratama Tegal in the Brebes Regency area.

5.2 Limitations

Based on the results of research and discussion in this study there are still limitations, namely:

1. The population in this study only includes individual taxpayers registered at KPP Pratama Tegal in the Brebes Regency area.
2. The independent variable used in this study is limited to one variable, namely the digital tax system.

5.2 Suggestion

Based on the findings and discussion, there are still limitations, so there are suggestions given as follows:

1. For future researchers, it is hoped that it will not only focus on individual taxpayers, but also involve corporate taxpayers, so that the results can provide a more comprehensive picture more broadly.
2. Future researchers can add other independent variables, such as tax socialization and tax literacy to expand research and gain deeper insight.

INFLUENCE OF KNOWLEDGE, EASE AND RISK ON INTEREST IN INVESTING IN THE SYARIAH CAPITAL MARKET (Case Study of UNISMA Faculty of Economics and Business Students in 2021-2023)

Elfa Putri Rahmadanti, M. Cholid Mawardi, Siti Aminah Anwar

Universitas Islam Malang

Email: 22101083013@unisma.ac.id

Abstract

This study aims to analyse the effect of knowledge, convenience and risk on student interest in investing in the Islamic capital market. The subjects of this research are students of the Faculty of Economics and Business, Islamic University of Malang, class of 2021-2023. The method used is a quantitative method with a correlational approach. The sampling technique used purposive sampling with a total of 95 respondents. Data collection was carried out through a questionnaire that had been tested for validity and reliability. Data analysis using multiple linear regression tests with the help of SPSS software. The results showed that knowledge does not have a positive effect on student interest in investing in the Islamic capital market. In contrast, convenience and risk have a positive and significant effect on students' interest in investing in the Islamic capital market. This finding confirms that although knowledge is an important aspect, well-managed convenience and risk factors have a more dominant role in encouraging student interest.

Keywords: Knowledge, Convenience, Risk, Investment Interest, Islamic Capital Market.

1. Introduction

In Islamic teachings, investment is a form of muamalah that is highly recommended. By investing, the assets owned can be utilised productively and provide benefits to others. To realise this recommendation, facilities that support investment activities are needed. One form of investment that can be done is by investing in the Islamic capital market (Hasibuan, 2019).

The Islamic Capital Market is a muamalah economic activity that involves trading securities that are in accordance with Islamic investment principles, such as stocks, bonds, and Islamic mutual funds. The existence of the Islamic capital market aims to fulfil the needs of Muslims in Indonesia who want to invest in capital market products that are in line with sharia principles. Sharia principles in capital market investment are applied so that investors can transact in compliance with Islamic values.

Sharia principles in investment refer to rules derived from Islamic law, which emphasises the value of divinity, justice, equality, and honesty in transactions. In addition, this principle also prioritises business ethics, the spirit of togetherness, and brotherhood in economic activities, as well as (Kharisma et al., 2023). In the Qur'an, Allah SWT expressly prohibits hoarding wealth without good use, as stated in (QS. Al-Hasyr verse 18):

يَٰٓأَيُّهَا ٱلَّذِينَ ءَامَنُوا۟ ٱتَّقُوا۟ ٱللَّهَ وَلْتَنظُرْ نَفْسٌ مَّا قَدَّمَتْ لِغَدٍ ۖ وَٱتَّقُوا۟
ٱللَّهَ ۚ إِنَّ ٱللَّهَ خَبِيرٌۢ بِمَا تَعْمَلُونَ ﴿١٨﴾

Meaning: "O you who believe, fear Allah and let everyone consider what he has done for tomorrow (hereafter) and fear Allah. Verily, Allah knows best what you do."

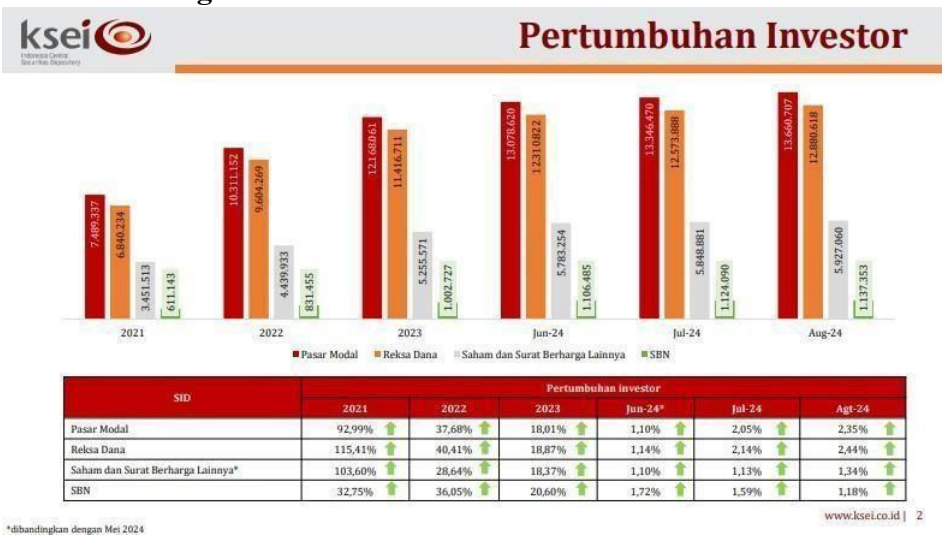
The above verse implies that humans are always prepared for everything that might happen in the future. In terms of the economy, Prophet Yusuf a.s set an example by preparing

sufficient food reserves to face the famine season. Thanks to careful planning, the reserves were able to meet the needs of the Egyptian people for seven years.

The capital market is one of the important pillars in today's world economy. Many industries and companies use capital market institutions as a medium to absorb investment and a medium to strengthen their financial position. In Indonesia, the development of the Islamic Capital Market began in 1997 with the launch of Islamic mutual funds by PT Danareksa Invesment Management on 3 July 1997. Then, on 3 July 2000. The Indonesia Stock Exchange in collaboration with PT Danareksa Investment Management launched the Jakarta Islamic Index which aims to assist investors in investing according to sharia principles (Ojk.go.id, 2020).

The difference between the conventional Islamic capital market comes from the company that will be invested, in the Islamic capital market is not contrary to sharia principles. According to William Strauss and Neil Howe, Generation Z is a group of teenagers born between 1996 and 2010. They are also known as the IGeneration or internet generation. They are similar to generation Y, but they cannot do many things at once with technology. The Islamic capital market has experienced an increase in the number of investors over the past four years from 2020 to January 2024 according to KSEI data (Ksei.co.id, n.d.).

Figure 1. 1 Investor Growth Chart 2020-2024



SID	Pertumbuhan investor					
	2021	2022	2023	Jun-24*	Jul-24	Agt-24

www.ksei.co.id | 2

Source:https://www.ksei.co.id/files/Statistik_Publik_Januari_2024_v3.pdf

Based on investor demographic data, the growth in the number of investors is currently dominated by Millennial investors under the age of 30 which reached 55.07% in August 2024 then followed by the number of investors aged 31-40 years which reached 24.27% then followed by the number of investors aged 41-60 years which reached 11.96% then followed by the number of investors aged 51-60 years with 5.72% and finally the age group above 60 years reached 2.98% of investors. The demographic data is the total number of investors registered at KSEI (Ksei.co.id, n.d.).

In fact, the Islamic financial system has provided a place for the public to invest in Islamic investments that can be profitable. The guarantor refers to the Financial Services Authority Law, which includes:

POJK Nomor 15/POJK.04/2015	Sharia principles in the capital market
POJK Nomor 16/POJK.04/2015	Sharia experts
POJK Nomor 17/POJK.04/2015	Issuance and requirements of sharia securities in the form of shares by sharia issuers

POJK Nomor 18/POJK.04/2015	or sharia public companies
POJK Nomor 19/POJK.04/20150	Issuance and requirements of sukuk
POJK Nomor 20/POJK.04/2015	Issuance and requirements of sharia mutual funds

Table 1.2 of Financial Services Authority Regulations

In addition, it is supported by DSN-MUI regulation Number 20/DSN- MUI/IV/2021 concerning investment implementation guidelines for Islamic mutual funds, which is also enhanced by Bapepam-LK regulations Number IX/A/13 concerning the issuance of Islamic securities and II.K.I concerning criteria and issuance of Islamic securities lists (Ojk.go.id, 2016).

The Indonesia Stock Exchange introduced the 'Yuk Nabung Saham' programme with the aim of changing the mindset of the public, from initially only saving in banks to realising that saving can also be done through the Islamic capital market. The concept of saving stocks is similar to saving at a bank, where the initial investment capital for students to open a Customer Fund Account is now more affordable, which is IDR 100,000 (Idxchannel.com, 2019). In investing, one of the obstacles that is often faced, especially for students, is the perception that investment requires a large initial capital. In fact, the lower the capital required, the higher a person's interest in investing.

The Indonesia Stock Exchange also organises education and socialisation programmes on investing in the capital market, especially for university students. In addition, the IDX held a campaign called 'Yuk Nabung Saham.'. During this programme, students are given special attention. Capital market education from the IDX, because students are assets in the future that will fill the financial industry in the capital market. In order to support the socialisation programme of sharia or sharia-based public businesses by launching investment galleries in several universities, the IDX hopes to attract new issuers and investors to the capital market through the issuance of POJK regulation Number 18/POJK.04/2015, sharia mutual funds, sharia asset-building securities and education. With the IDX investment gallery, which is a collaboration between the IDX, universities and securities companies, it is hoped that it will not only introduce the capital market from a practical and theoretical point of view (Idxchannel.com, 2018). One of the main objectives of the Indonesia Stock Exchange is to attract young investors by establishing Investment Galleries in each University. This cooperation with the University of Islam Malang aims to make students of the University of Islam Malang more interested in investing in the Islamic capital market.

Universitas Islam Malang is one of the private institutions that has an investment gallery (stock exchange corner). This investment gallery was opened through the cooperation of the Faculty of Economics and Business, Islamic University of Malang with the Indonesia Stock Exchange and PT Indo Premier Online Trading (IPOT). Dean of the Faculty of Economics and Business, Islamic University of Malang, Mrs Nur Diana SE, MSi, in the inauguration of the investment gallery (2/3/2016), hopes that the IDX investment gallery can encourage students of the Faculty of Economics and Business to develop their talents by utilising the investment gallery as a learning centre Until now, the Investment Gallery of Islamic University of Malang is the best and second most active investment gallery (Jatimtimes.com, 2016).

Students of the Faculty of Economics and Business, Islamic University of Malang have great potential to become investors. They get courses on investment management, portfolios and capital markets. In addition, the existence of investment galleries around campus is a good suggestion to deepen their understanding of investing in Islamic capital markets. In addition to academic support, PT Indo Premier Online Trading (IPOT), is also always open in providing more in-depth information about investing in the Islamic capital market. This is believed to increase students' interest in starting to invest. The Indonesia Stock Exchange Investment

Gallery at FEB UNISMA continues to grow from year to year. Based on the official website of FEB UNISMA (14/08/2020), the investment gallery has won the following awards

Students of the Faculty of Economics and Business, Islamic University of Malang also receive education about investing in the capital market. Guidance on investment is very important for students so that they can understand the concept of investment early on, so as not to be consumptive and start planning for financial stability in the future. This investment education is provided through courses that focus on the Islamic capital market. Thus, students not only understand the theory, but can also apply it in investment practices in the Islamic capital market. This course covers various aspects of investment, ranging from the level of profit, types of investment, benefits and ease of investment, to the risks that must be taken into account. In addition, the campus also provides supporting facilities, such as an investment gallery, which serves as a direct learning tool for students who want to enter the world of investment in the capital market. The campus also regularly holds motivational seminars to increase students' enthusiasm for investing and provide a deeper understanding of investment in the Islamic capital market.

Knowledge of the ease of investment in the Islamic capital market has a perception that is supported by several factors, namely easy to understand, easy to use, no effort is needed and doing it easily (Hikmah & Rustam, 2020). In investing, apart from the convenience and benefits that can be obtained, investors must also understand that the risks that may occur and always follow the investment benefits, because investment risk is directly proportional to the benefits obtained. Because the level of risk associated with investment is positively correlated with the level of profit earned by investors. Conversely, the level of risk that investors will face is negatively correlated with the level of profit they can get (Yunia et al., 2021).

To generate this interest, students must know what the Islamic capital market is. In addition, as students we must also know the benefits and risks of an investment. By investing and knowing the capital market, we can learn various knowledge, such as reading financial statements, how to analyse a company that has good prospects. In addition, we can get (capital gain) or profit from the difference between the selling price and the purchase price and can also get dividends. In addition, investment can not only be done by people who have jobs or have sufficient assets, students also have the opportunity to get to know the world of investment and invest in the Islamic capital market. It is hoped that they will also be interested in getting to know the capital market. Because as students, they also have a role in building the country's economy (Latifah, 2019).

This study found that the knowledge variable does not have a significant influence on student investment interest in the Islamic capital market. Students of the Faculty of Economics and Business, Islamic University of Malang consider that knowledge does not play an important role in encouraging investment interest, they are more dominant on the ease and risk of investment. This result is different from research conducted by (Latifah, 2019), which found that knowledge has a positive influence on student interest in investing. This difference can be caused by several factors such as different respondent characteristics, varying levels of financial literacy or the analytical methods used.

In a study (Diansyah & Hidayati, 2023) entitled 'The Effect of Financial Literacy, Motivation, Perception of Ease, Investment Risk on Interest in Investing in the Islamic Capital Market (Case Study of Islamic Financial Management Study Program Students in East Java)' the results showed that the convenience variable had a significant effect on interest in investing in the Islamic capital market. This is because the easier an investment system or service is to use, the more likely individuals are interested in investing. Conversely, other research conducted by (Masrina, 2020) shows that convenience does not always affect investment decisions, due to other factors such as financial literacy and investment experience. So, it can

be seen that the difference in the results of the above research requires an empirical review of the effect of convenience on investment interest in the Islamic capital market in this study.

In research (Yunia et al., 2021) entitled 'Motivation, Knowledge, Investment Risk Preferences and Investment Interest in the Islamic Capital Market in FEB IAIN Pekalongan Students' the results showed that the risk variable has an understanding of risk tends to be more interested in investing in the Islamic capital market. However, in contrast to research (Hikmah & Rustam, 2020), which states that risk has a negative impact on investment interest, because the higher the risk a person feels, the less likely they are to invest. Therefore, given the differences in the above research, this study aims to re-examine the relationship between risk and investment interest, in order to gain a clearer understanding of the role of risk in investment decisions in the Islamic capital market.

By considering the background of the problem above, this research is used to determine how much influence knowledge, convenience and assessed risk have on students' decisions to invest in the Islamic capital market. Based on the explanation above, the authors are interested in conducting further research on "The Effect of Knowledge, Ease and Risk on Interest in Investing in the Islamic Capital Market (Case Study of Students of the Faculty of Economics and Business, Islamic University of Malang 2021-2023)."

1.1 Problem Formulation

Based on the above context, the problems in this study are formulated as follows:

1. How does knowledge, convenience and risk affect the interest in investing in Islamic capital markets?
2. How does knowledge affect interest in investing in Islamic capital markets?
3. How does convenience affect interest in investing in the Islamic capital market?
4. How does risk affect the interest in investing in the Islamic capital market?

1.2 Research Objectives

1. To find out how knowledge, convenience and risk affect the desire to invest in the Islamic capital market.
2. To find out how investment knowledge affects the desire to invest in the Islamic capital market.
3. To find out how the ease of investment has an impact on the desire to invest in the Islamic capital market.
4. To find out how risk knowledge impacts the desire to invest in the Islamic capital market.

2. Theoretical Basis and Hypothesis Development

2.1 Theory of Planned Behavior (TPB)

Theory of Planned Behavior, as stated by Ajzen (2011: 131), is intended to predict and explain human behaviour in a particular setting. This idea tries to predict and The Theory of Reasoned Action, which claims that attitudes and subjective norms predict behavioural interest, is the foundation for the Theory of Planned Behavior, which explains human behaviour.

2.2 Technology Acceptance Model (TAM)

When using an information system, users consider several factors, such as the benefits and usability of the system. The Technology Acceptance Model (TAM) is a framework used to analyse how users adopt and utilise technology. This theory was first introduced by Davis M. (1986: 10) and then developed by researchers such as Adam et al. (1992:227), Szajna (1994:91), Igbaria et al. (1995:369), Venkatesh & Morris (2000:186), and Venkatesh & Davis (2000:186). The main purpose of TAM is to explain the factors that influence technology adoption and

analyse user behaviour regarding information technology. The model provides insight into how users accept technology based on two main factors: perceived usefulness (the extent to which a person believes the technology will improve performance) and perceived ease of use (the extent to which a person finds the technology easy to use) (Davis, 1989:10).

2.3 Islamic Capital Market Investment

Investment is the result of an individual's assessment of how well investing in the capital market can help them achieve their financial goals. The stronger a person's knowledge, ease of access, and understanding of risk, the more likely they are to develop a strong interest in investing. In short, investment interest is influenced by internal factors such as knowledge, accessibility, and risk perception, as well as external factors such as global economic events and market fluctuations (Abdullah, 2023).

2.4 Knowledge

Investment knowledge is an understanding of various aspects of investment, including the basics of valuation, risk levels, and potential returns (Latifah, 2019). Adequate knowledge of the capital market is very important in making investment decisions. Investors who have in-depth knowledge of investment instruction, market analysis, and potential risks and returns can have a competitive advantage and make more informed decisions.

2.5 Ease

According to Davis et al. (1989), ease of use is the extent to which a person believes that information technology is easy and does not require much effort. This means that a person feels that the technology used is uncomplicated and free from obstacles.

2.6 Risk

The definition of investment risk is a condition of uncertainty that can lead to losses or a negative impact on a decision or activity. Risk can come from various sources such as fluctuations in stock prices, changes in economic conditions, or unexpected events. In investment, risk always involves trading between risk and return. The perception of risk can vary between investors with some having a high risk tolerance and ready to take big risks, while others are more conservative (Abdullah, 2023).

2.7 Conceptual Framework

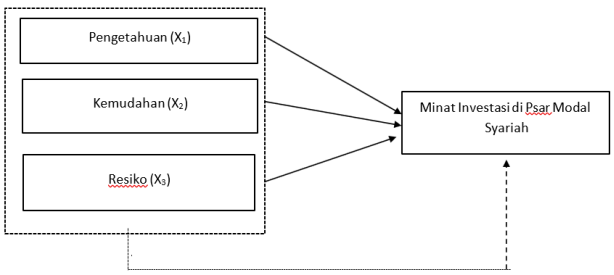

Figure 1 Conceptual Framework

H1: There is an influence of knowledge, convenience and investment risk on investment interest in the Islamic capital market of FEB UNISMA students class 2021-2023.

H2: There is an influence of knowledge on student interest in investing in the Islamic capital market of FEB UNISMA students class of 2021-2023.

H3: There is an influence of convenience on student interest in investing in the Islamic capital market of FEB UNISMA students class of 2021-2023.

H4: There is an influence of risk on student interest in investing in the Islamic capital market of FEB UNISMA students class of 2021-2023.

3. Methodology

3.1 Population and Sample

The population of this study were students of the Faculty of Economics and Business, UNISMA, batch 2021-2023 with a total of 150 respondents. Determination of the research sample was calculated using the Slovin formula which resulted in 95 respondents. The sampling technique used is purposive sampling with several predetermined criteria, namely:

a. Active students of the Faculty of Economics and Business, Islamic University of Malang, class of 2021-2023.
b. Students of the Faculty of Economics and Business, Islamic University of Malang who are currently studying or taking Islamic capital market courses.
c. Students of the Faculty of Economics and Business, Islamic University of Malang who have attended investment training or Islamic capital market investment seminars.

3.2 Data Source

The data source in this study is the type of primary data distributed directly to students of the Faculty of Economics and Business, UNISMA directly through questionnaires.

3.3 Data Collection Methods

This research uses data collection methods through questionnaires. Researchers used a Likert measurement scale with 5 levels of respondents' answers aimed at understanding the influence of knowledge, convenience and risk of Islamic capital market investment.

4. Results and Discussion

4.1 Validity Test

Table 1.1 Validity Test

Variabel	Item	r hitung	r tabel	Keterangan
Pengetahuan	$X1._1$	0,716	0,202	VALID
	$X1._2$	0,709	0,202	VALID
	$X1._3$	0,730	0,202	VALID
	$X1._4$	0,795	0,202	VALID
	$X1._5$	0,726	0,202	VALID
Kemudahan	$X2._1$	0,866	0,202	VALID
	$X2._2$	0,826	0,202	VALID
	$X2._3$	0,802	0,202	VALID
Risiko	$X3._1$	0,836	0,202	VALID
	$X3._2$	0,783	0,202	VALID

	$X3_{.3}$	0,842	0,202	VALID
Minat	Y_1	0,758	0,202	VALID
	Y_2	0,813	0,202	VALID
	Y_3	0,879	0,202	VALID
	Y_4	0,887	0,202	VALID

Source of primary data processed by SPPS 2025

The results of data processing and validity testing of the four variables show r count> r table. Therefore, it can be concluded that each statement is valid.

4.2 Reliability Test

Table 1.2 Reliability Test

No	Variabel	Cronbach's Alpha	Keterangan
1	Pengetahuan (X1)	0,787	Reliabel
2	Kemudahan (X2)	0,776	Reliabel
3	Resiko (X3)	0,757	Reliabel
4	Minat (Y)	0,856	Reliabel

Primary data sources processed by SPPS 2025

The results of the reliability test in this study resulted in a Cronbach Alpha value of each variable> 0.60. So that one variable used is declared reliable.

4.3 Normality Test

Table 1.3 Normality Test

One-Sample Kolmogorov-Smirnov Test			
			Standardized Residual
N			95
Normal Parametersa,b	Mean		.0000000
	Std. Deviation		.98391316
Most Extreme Differences	Absolute		.068
	Positive		.061
	Negative		-.068
Test Statistic			.068
Asymp. Sig. (2-tailed)c			.200d
Monte Carlo Sig. (2-tailed)e	Sig.		.325
	99% Confidence Interval	Lower Bound	.313
		Upper Bound	.337

Source of processed primary data spps 2025

In the table above, the normality test uses Kolmogorov -Smirnov which shows a significance value> 0.05. Based on the results of the normality test above, a significance value of 0.200 is obtained which exceeds 0.05. Therefore, it can be concluded that the data in this study are normally distributed.

4.4 Classical Assumption Test

4.4.1 Multicollinearity Test

Table 1.4 Multicollinearity Test

Variabel	Tolerance	VIF	Keterangan
Pengetahuan (X1)	0,845	1.171	bebas multikolinearitas.
Kemudahan (X2)	0,889	1.124	bebas multikolinearitas.
Resiko (X3)	0,936	1.069	bebas multikolinearitas.

Based on Table 1.4, it can be seen that the X1 tolerance value, namely Investment Knowledge, is 0.854 and VIF 1.171, then the X2 tolerance value, namely the Ease of Investment, is 0.889 and VIF 1.124, then the X3 tolerance value, namely risk, is 0.936 and VIF 1.069. The results in the multicollinearity test show tolerance results of more than 0.1 and VIF of the three variables are less than 10. So it can be said that there is no multicollinearity problem or free of multicollinearity.

4.4.2 Heteroscedasticity Test

Table 1.5 Heteroscedasticity Test

Variabel	T	Sig.	Keterangan
Pengetahuan (X1)	0,322	0.748	Bebas heteroskedastisitas
Kemudahan (X2)	1.107	0,271	Bebas heteroskedastisitas
Resiko (X3)	-0.142	0.888	Bebas heteroskedastisitas

Based on table 1.5 above, it can be seen that the significance of the investment knowledge variable is 0.748, the ease of investment is 0.271, and the investment risk is 0.888 has a significance value of more than 0.05. So it can be concluded that there is no heteroscedasticity in the regression model.

4.4.3 Multiple Linear Analysis

Table 1.6 Multiple Linear Analysis Test Results

Coefficientsa						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.079	2.119		.981	.329
	Pengetahuan	.080	.080	.090	.996	.322
	Kemudahan	.695	.119	.507	5.824	<,001
	Resiko	.294	.127	.202	2.318	.023
a Dependent Variable: Minat						

Source of processed primary data spps 2025

Based on the results of multiple linear regression, this study shows that the constant value (a) is 2,079, which indicates the influence of the variable influence of knowledge (X1), convenience (X2), risk (X3). Each variable has a regression coefficient value of 0.080 for knowledge, 0.695 for convenience, 0.294 for risk, which indicates the level of contribution of each variable to the research model.

4.4.4 F test

Table 1.7 F Test (Simultaneous Test)

ANOVA						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	197.437	3	65.812	18.066	<,001[b]
	Residual	331.510	91	3.643		
	Total	528.947	94			
a Dependent Variable: Minat						
b Predictors: (Constant), Resiko, Kemudahan, Pengetahuan						

Source of processed primary data spps 2025

Based on the table above, the simultaneous results (F test) show that the Fcount value of 18,066> compared to the Ftable of 2,073, and the significance value of 0.001 is smaller than 0.005. Thus, the variables of knowledge, convenience and risk together have an effect on student investment interest.

4.4.5 Coefficient of Determination Analysis Test

Table 1.8 Test Analysis of the Coefficient of Determination

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.611a	.373	.353	1.909
a Predictors: (Constant), Resiko, Kemudahan, Pengetahuan				

Source of processed primary data SPPS 2025

The results of the table above show that the Adjusted R Square value is 0.353 or 35.3%. The coefficient of determination shows that the variables of Knowledge (X1), Ease (X2), and Risk (X3) are able to explain the investment interest variable (Y) by 35.3% while the remaining 64.7% is explained by other variables.

4.4.6 t test

Table 1.8 t test (Partial Test)

Coefficientsa						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.079	2.119		.981	.329
	Pengetahuan	.080	.080	.090	.996	.322
	Kemudahan	.695	.119	.507	5.824	<,001
	Resiko	.294	.127	.202	2.318	.023
a Dependent Variable: Minat						

Source of primary data processed by SPPS 2025

Based on the results obtained, each variable, namely knowledge (X1), convenience (X2) and risk (X3), is proven to have an individual influence on investment interest (Y).

4.5 Discussion Implications

4.5.1 The Influence of Knowledge on Interest in Investing in the Sharia Capital Market among

Students of the Faculty of Economics and Business UNISMA

This study examines the effect of knowledge on student investment interest in the Islamic capital market. The t-test results show that knowledge has no significant effect on investment interest, with a significance value of 0.332> 0.05. External factors such as the lack of understanding of investment and the rise of fraudulent investments make students hesitate to invest. This finding contradicts the research of Siti Latifah (2019) which states that knowledge has a positive effect on investment interest. Therefore, increasing investment literacy is needed to build student confidence in investing in the Islamic capital market.

4.5.2 The Effect of Ease on Interest in Investing in the Islamic Capital Market on Students of the Faculty of Economics and Business UNISMA

The t test results show that the ease of investment has a significant effect on investment interest in the Islamic capital market, the higher the student's interest in investing. This finding is in line with Viki Rahmat's research (2023) and supports the Theory of Planned Behaviour (TPB) which states that the ease of using technology increases a person's interest in investing.

4.5.3 The Effect of Risk on Interest in Investing in the Islamic Capital Market Among Students of the Faculty of Economics and Business UNISMA

This study found that risk has a significant effect on student interest in investing in the Islamic capital market with a significance value of 0.023 less than 0.05. The main influencing factor is the belief in transparent and careful sharia principles, as well as the availability of clear information for novice investors. These results are in line with research by Putri Sheilla (2020), which shows that risk preferences fulfil student investment interest.

5. Conclusions

Based on the results of the data analysis, this research resulted in the following main conclusions:

1. Knowledge, convenience and risk together affect the interest in investing in Islamic capital markets.
2. Knowledge has no effect on students' interest in investing in the Islamic capital market.
3. Ease affects student interest in investing in the Islamic capital market.
4. Risk affects student interest in investing in the Islamic capital market.

THE EFFECT OF ENVIRONMENTAL, SOCIAL, AND GOVERNANCE (ESG) ON FIRM VALUE IN GREEN AND NON-GREEN INDUSTRY COMPANIES

Elly Lutfiana1*, Noor Shodiq Askandar2, Erfan Efendi3

1,2,3 University of Islam Malang
*E-mail: 22101082085@unisma.ac.id

Abstract

This study analyzes the effect of ESG Disclosure on firm value and compares its impact between companies which are related and not related to the green industry. This study uses secondary data from annual reports of companies listed in the IDXINDUST Index for the 2021–2023 period. The analysis method applied is multiple linear regression using software IBM SPSS Statistics 27. The results show that ESG Disclosure significantly affects firm value, with a more dominant impact on companies related to the green industry. Environmental disclosure has a significant positive effect on green industry companies, while in non-green industry companies, it has a significant negative effect. However, social and governance variables do not significantly influence firm value in either green or non-green industry companies. These findings indicate that transparency and compliance with environmental practices enhance investor confidence in green industry companies, whereas in non-green industries, ESG compliance costs may be perceived as a financial burden that reduces firm value. The implications of this study provide insights for companies to improve ESG transparency and for investors to consider sustainability factors in investment decision-making.

Keywords: Environmental, Social, Governance, Firm Value

1. Introduction

Industries in Indonesia contribute significantly to the economy, but they also have a substantial environmental impact, such as air, water, and soil pollution caused by industrial waste and carbon emissions (Kaplale et al., 2023). In 2021, Indonesia generated 60 million tons of hazardous and toxic waste (B3 waste), with the manufacturing sector as the main contributor. In addition, Indonesia's carbon emissions reached 620 $MtCO_2$, accounting for 1.72% of total global emissions, making Indonesia one of the largest emitters in the world. (Global Carbon Atlas, 2024). This situation necessitates the implementation of green industry to balance economic growth with environmental sustainability.

The implementation of green industry can improve a company's competitiveness through resource efficiency and reduced environmental impact. By adopting green industry practices, companies can play an active role in reducing negative impacts on the environment and improving the quality of life of the community. (Hutahuruk et al., 2023).

The concept of Environmental, Social, and Governance (ESG) has become an important instrument in assessing a company's sustainability performance, which affects firm value and investor trust. ESG plays a crucial role in evaluating a company’s contribution to sustainability, where environmental disclosure reflects transparency in managing ecological impacts, the social aspect indicates responsibility toward stakeholders, and the governance aspect reflects the implementation of Good Corporate Governance (GCG) principles. Companies with a high level of ESG disclosure tend to have higher firm value, as reflected by Tobin’s Q, which serves as a market-based indicator of company valuation (Sugiarto et al., 2023).

Therefore, it is important to explore how ESG disclosure affects firm value in the industrial sector, which significantly contributes to the economy but also faces considerable environmental risks. This study aims to analyze the effect of ESG disclosure on the firm value of companies listed in the IDXINDUST Index for the 2021–2023 period. Furthermore, due to the limited number of studies comparing the impact of ESG disclosure across companies, this research also compares the differences in ESG's influence between companies related to the green industry and those that are not. This comparison seeks to provide deeper insights into the effectiveness of ESG disclosure in enhancing firm value, particularly among companies included in the IDXINDUST Index.

2. Literature Review

2.1 Stakeholder Theory

According to Freeman, R. E. (1984), stakeholder theory states that an organization must consider the interests of all parties connected to or affected by its business activities, such as employees, customers, suppliers, communities, and the environment. Stakeholder theory emphasizes that firm value has a significant influence on sustaining relationships with investors. The higher the firm value, the greater the investor interest in participating in the company. Thus, the primary objective of stakeholder theory is to assist company management in managing relationships with stakeholders to support long-term sustainability and growth (Dhani & Utama, 2017). In this study, stakeholder theory is used to analyze how the implementation of ESG influences firm value through the interaction and relationship with various stakeholders.

2.2 Legitimacy Theory

Legitimacy theory is used to explain how companies develop frameworks for disclosing social and environmental responsibility in order to maintain harmonious relationships with society and the environment. According to this theory, companies hold a social contract to operate based on prevailing values of fairness and accepted norms (Badjuri et al., 2021). The legitimacy theory is highly relevant and necessary for this study, as ESG disclosure serves as a mechanism for companies to strengthen their legitimacy in the eyes of stakeholders. In the context of firm value, ESG disclosure reflects the company's efforts to meet social expectations, enhance transparency, and demonstrate a commitment to sustainability. This is important because legitimacy gained through ESG disclosure can contribute to an improved corporate reputation, which ultimately has a positive impact on market perception and firm value.

2.3 Signalling Theory

Signaling theory refers to the information provided by a company to investors regarding the projected future development of the firm (Agus & Sutanto, 2024). The signal in this context is the information communicated by the company to external parties such as investors. Therefore, the signals conveyed must possess sufficient informational value to influence external perceptions of the company (Mirfaqoh et al., 2023). In the context of this study, ESG disclosure functions as a positive signal that reflects the company's commitment to sustainable social, environmental, and governance practices. This can enhance investor and stakeholder confidence in the company's long-term performance. Such positive signals also encourage investors to evaluate the company more favorably, increase investment interest, and ultimately contribute to higher stock prices and improved firm value.

2.4 Firm Value

Firm value is generally reflected in the company's stock price in the market, which is determined by market mechanisms through the interaction of supply and demand from market participants. Firm value represents the market's assessment of the company and can be enhanced through strong performance. Positive performance attracts investor interest, triggers favorable responses, and increases investment, ultimately leading to a rise in firm value (Twincond, 2023). To measure the firm value variable, this study uses Tobin's Q, calculated using the following formula:

$$TOBIN'S\ Q\ = \frac{Market\ Value\ of\ Equity + total\ liabilities}{Total\ Assets}$$

2.5 ESG Disclosure

Environmental, Social, and Governance (ESG) refers to a series of activities that encompass environmental and social responsibility, as well as the application of ethical principles in business operations under effective oversight (Kim & Li, 2021). The ESG aspect is a critical element that must be fulfilled to support economic, social, and environmental performance in achieving business sustainability goals (Shakil, 2021). ESG encompasses various components that influence long-term sustainability and corporate social responsibility. The following is an explanation of each ESG component:

2.5.1 Environmental

The environmental component of ESG reflects how business activities affect ecosystems and natural resources. Through sustainable strategies, companies not only seek to reduce their ecological impact but also contribute to the preservation of biodiversity and valuable natural resources (Putra & Asfiah, 2024). To determine the value of environmental disclosure, the following formula is used:

$$\text{ENV} = \frac{\Sigma\ item\ ENV}{total\ ENV}$$

2.5.2 Social

The social component of ESG focuses on a company's interaction with employees, communities, and society at large. By fostering strong social relationships, companies can build closer and more positive connections with stakeholders (Putra & Asfiah, 2024). To determine the value of social disclosure, the following formula is used:

$$\text{SOC} = \frac{\Sigma\ item\ SOC}{total\ SOC}$$

2.5.3 Governance

The governance aspect of ESG refers to the mechanisms of corporate management, regulation, and oversight. Good governance serves as a fundamental pillar for achieving long-term corporate success. Through transparent, ethical, and efficient governance practices, companies can ensure regulatory compliance, operational optimization, and the creation of added value for all stakeholders. (Putra & Asfiah, 2024). To determine the value of governance disclosure, the following formula Is used:

$$\text{GOV} = \frac{\Sigma\ item\ GOV}{total\ GOV}$$

2.6 Conceptual Framework

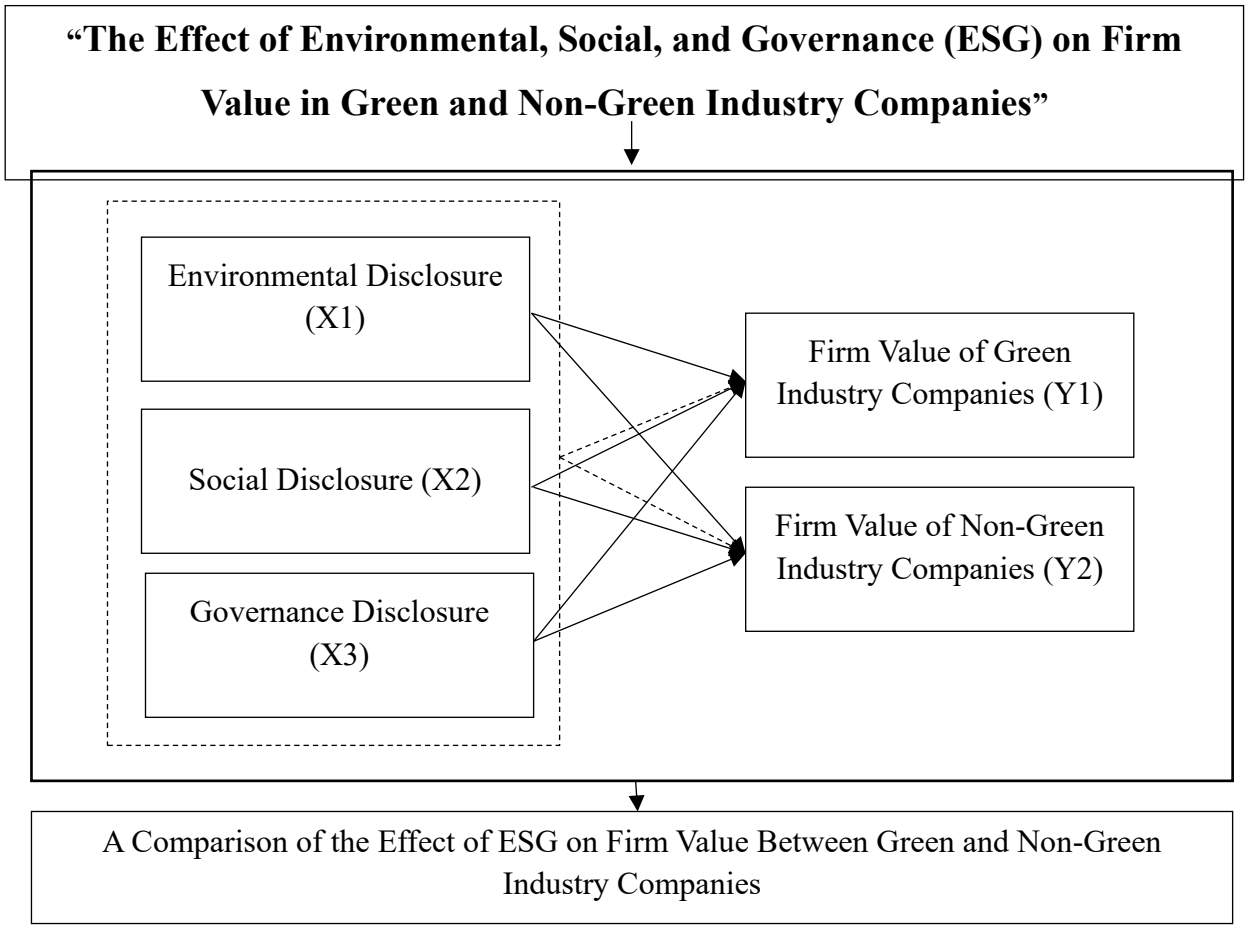

Figure 1. **Conceptual Framework**

Based on the conceptual framework above, the following hypotheses are proposed:

H1: Environmental, Social, and Governance (ESG) disclosure simultaneously has a significant effect on the firm value of companies related to the green industry.

H1a: Environmental disclosure has a significant effect on the firm value of companies related to the green industry.

H1b: Social disclosure has a significant effect on the firm value of companies related to the green industry.

H1c: Governance disclosure has a significant effect on the firm value of companies related to the green industry.

H2: Environmental, Social, and Governance (ESG) disclosure simultaneously has a significant effect on the firm value of companies not related to the green industry.

H2a: Environmental disclosure has a significant effect on the firm value of companies not related to the green industry.

H2b: Social disclosure has a significant effect on the firm value of companies not related to the green industry.

H2c: Governance disclosure has a significant effect on the firm value of companies not related to the green industry.

H3: The "Environmental" component of ESG disclosure has a more dominant effect on firm value in companies related to the green industry compared to those not related to the green industry.

H4: There is a difference in the effect of Environmental, Social, and Governance (ESG) disclosure on firm value between companies related to the green industry and those not related to it.

3. Research Methodology

3.1 Type of Research and Data Sources

This study employs a quantitative research design with a correlational and comparative approach. The objective is to examine the relationship between ESG disclosure and firm value, as well as to compare firm value between companies related to and not related to the green industry. This research utilizes secondary data obtained from financial reports, annual reports, and sustainability reports of companies listed on the Indonesia Stock Exchange (IDX) under the IDXINDUST Index during the 2021–2023 period. The 2021–2023 period was selected because the IDXINDUST Index was first launched in 2021, and data related to the companies in this index have only been available since then.

3.2 Population and Sample

The population of this study consists of all industrial sector companies listed in the IDXINDUST Index on the IDX during the 2021–2023 period. These companies were selected due to their relevance to the research topic, namely ESG disclosure and its relationship to firm value. The sample was determined using purposive sampling with specific criteria, resulting in 57 data points from 19 green industry-related companies and 42 data points from 14 non-green industry-related companies.

3.3 Data Analysis Method

In this study, multiple linear regression analysis is used to examine the effect of Environmental, Social, and Governance (ESG) disclosure on firm value. Meanwhile, to test the difference in the effect of ESG disclosure on firm value between companies related to and not related to the green industry, an independent sample t-test (difference test) is employed. The following is the multiple linear regression equation used in this research:

$$\text{Tobinsq1} = \alpha_1 + \beta_1 Env1 + \beta_2 Soc1 + \beta_3 \text{Gov1} + \beta_4 Size1 + \beta_5 ROA1 + \in_1$$

$$\text{Tobinsq2} = \alpha_2 + \beta_6 Env2 + \beta_7 Soc2 + \beta_8 \text{Gov2} + \beta_9 SIZE2 + \beta_{10}\ \text{ROA2} + \in_2$$

Explanation:

Tobinsq1	= Firm value of companies related to the green industry
Tobinsq2	= Firm value of companies not related to the green industry
Env1, Env2	= Environmental Disclosure
Soc1, Soc2	= Social Disclosure
Gov1, Gov2	= Governance Disclosure
SIZE1, SIZE2	= Firm Size
ROA1, ROA2	= Profitability
α_1, α_2	= Constant
$\beta_1 - \beta_{10}$	= Regression coefficients
$\in_1, \in_2$	= Error term

4. Research Results and Discussion

4.1 Descriptive Statistical Analysis

Table 1. Descriptive Statistical Analysis of Companies Related to the Green Industry

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
ENV1	57	,094	,742	,28086	,172389
SOC1	57	,056	,833	,26067	,194987
GOV1	57	,045	1,000	,32593	,360634
TOBINSQ1	57	,356	4,098	1,12735	,758358
SIZE1	57	26,609	33,731	28,74653	1,757471
ROA1	57	-,073	,364	,05577	,078551
Valid N (listwise)	57				

Source: Output of IBM SPSS Statistics 27, (2025)

Table 2. Descriptive Statistical Analysis of Companies not Related to the Green Industry

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
ENV2	42	,031	,375	,19131	,107437
SOC2	42	,100	,611	,23348	,096661
GOV2	42	,045	1,000	,20448	,200932
TOBINSQ2	42	,473	2,878	1,29690	,628831
SIZE2	42	24,678	31,885	27,81757	1,637002
ROA2	42	-,241	,125	,00157	,078110
Valid N (listwise)	42				

Source: Output of IBM SPSS Statistics 27, (2025)

Based on the descriptive analysis results, firm value (Tobin's Q) for green companies has an average of 1.127 with a standard deviation of 0.758, while non-green companies have an average of 1.297 with a standard deviation of 0.629, indicating that green companies tend to have higher market valuation. ESG disclosure shows that green companies have higher average scores than non-green companies across all aspects (environmental, social, and governance), with the environmental aspect showing the greatest variation. In terms of firm size (SIZE), green companies have a larger average size (28.75) compared to non-green companies (27.82), while profitability (ROA) is also higher in green companies (0.056) than in non-green companies (0.00157).

Overall, these results indicate that green companies exhibit better ESG disclosure, larger firm size, and higher profitability compared to non-green companies.

4.2 Normality Test Results

a. Normality Test Results for Companies Related to the Green Industry

Table 3. Results of the Normality Test

One-Sample Kolmogorov-Smirnov Test

	Unstandardized Residual
N	57

Normal Parameters[a,b]	Mean		,0000000
	Std. Deviation		,37053453
Most Extreme Differences	Absolute		,082
	Positive		,082
	Negative		-,074
Test Statistic			,082
Asymp. Sig. (2-tailed)[c]			,200[d]
Monte Carlo Sig. (2-tailed)[e]	Sig.		,433
	99% Confidence Interval	Lower Bound	,421
		Upper Bound	,446

Source: Output of IBM SPSS Statistics 27, (2025)

The test results in Table 3 show that the Asymp. Sig. (2-tailed) value is 0.200, which is greater than 0.05. Therefore, it can be concluded that the residuals are normally distributed.

b. Normality Test Resulrs for Companies Related to the Green Industry

Table 4. Results of the Normality Test

One-Sample Kolmogorov-Smirnov Test

			Unstandardized Residual
N			42
Normal Parameters[a,b]	Mean		,0000000
	Std. Deviation		,51532489
Most Extreme Differences	Absolute		,071
	Positive		,071
	Negative		-,057
Test Statistic			,071
Asymp. Sig. (2-tailed)[c]			,200[d]
Monte Carlo Sig. (2-tailed)[e]	Sig.		,857
	99% Confidence Interval	Lower Bound	,848
		Upper Bound	,866

Source: Output of IBM SPSS Statistics 27, (2025)

Based on the results of the normality test conducted using the One-Sample Kolmogorov-Smirnov method, the Asymp. Sig. (2-tailed) value obtained is 0.200, which exceeds the alpha level of 0.05. Therefore, it can be concluded that the data for companies not related to the green industry are normally distributed.

4.3 Classical Assumption Test Results

a. Multicollinearity Test

The basis for decision-making in the multicollinearity test is based on the tolerance and VIF values. Multicollinearity is considered not to occur if the tolerance value is ≥ 0.10 and the VIF value is ≤ 10. The following are the multicollinearity test results for companies related to and not related to the green industry

Tabel 5. Multicollinearity Test Results for Companies Related to the Green Industry

Variable	Tolerance	VIF	Explanation
ENV1	0,305	3,272	No multicollinearity is detected
SOC1	0,269	3,714	No multicollinearity is detected
GOV1	0,434	2,304	No multicollinearity is detected

SIZE1	0,625	1,599	No multicollinearity is detected
ROA1	0,892	1,121	No multicollinearity is detected

Source: Output of IBM SPSS Statistics 27, (2025)

Tabel 6. Multicollinearity Test Results for Companies not related to the Green Industry

Variable	Tolerance	VIF	Explanation
ENV2	0,797	1,255	No multicollinearity is detected
SOC2	0,449	2,228	No multicollinearity is detected
GOV2	0,661	1,513	No multicollinearity is detected
SIZE2	0,678	1,475	No multicollinearity is detected
ROA2	0,858	1,166	No multicollinearity is detected

Source: Output of IBM SPSS Statistics 27, (2025)

b. Heteroscedasticity Test

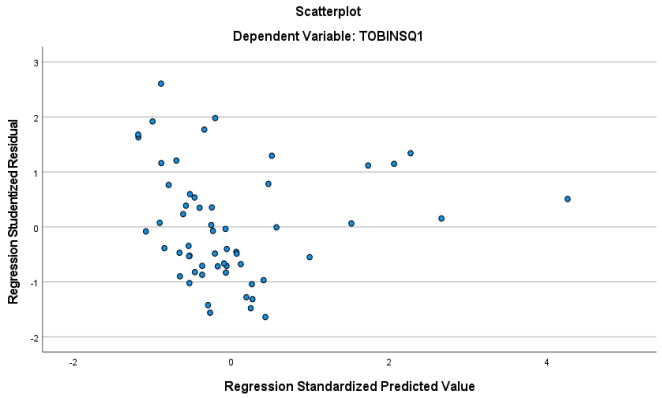

Figure 2. Heteroscedasticity Test Results for Companies Related to the Green Industry

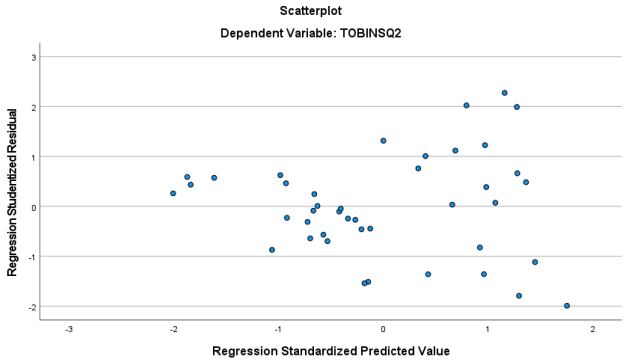

Figure 3. Heteroscedasticity Test Results for Companies not Related to the Green Industry

Based on the figure above, the heteroscedasticity test was conducted using a scatterplot. In Figures 2 and 3, the residual points are randomly scattered, indicating the likelihood of no significant heteroscedasticity.

c. Autocorrelation Test

Table 7. Autocorrelation Test Results for Companies Related to the Green Industry

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	,869[a]	,755	,731	,393648	1,436

a. Predictors: (Constant), ROA1, GOV1, SIZE1, ENV1, SOC1

b. Dependent Variable: TOBINSQ1

Source: Output of IBM SPSS Statistics 27, (2025)

Table 8. Autocorrelation Test Results for Companies Not Related to the Green Industry

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	,573[a]	,328	,235	,549948	,911

a. Predictors: (Constant), ROA2, GOV2, ENV2, SIZE2, SOC2
b. Dependent Variable: TOBINSQ2

Source: Output of IBM SPSS Statistics 27, (2025)

To detect the absence of negative or positive autocorrelation, the Durbin-Watson (DW) value should ideally fall between -2 and +2 (Nasution et al., 2024). Based on the results, the DW value is 1.436 for companies related to the green industry and 0.911 for companies not related to the green industry. Therefore, it can be concluded that the regression models are free from autocorrelation.

4.4 Multiple Linear Regression Analysis

a Results of Multiple Linear Regression Analysis for Companies Related to the Green Industry

b Table 9. Results of Multiple Linear Regression Analysis

Coefficients[a]

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	4,578	1,026		4,464	,000
	ENV1	1,163	,552	,264	2,108	,040
	SOC1	,189	,520	,049	,363	,718
	GOV1	-,372	,221	-,177	-1,679	,099
	SIZE1	-,146	,038	-,338	-3,852	,000
	ROA1	8,715	,709	,903	12,292	,000

a. Dependent Variable: TOBINSQ1

Source: Output of IBM SPSS Statistics 27, (2025)

Based on Table 9, the multiple linear regression equation for companies related to the green industry is as follows:

$$\text{Tobinsq1} = 4{,}578 + 1{,}163\, ENV1_{(Sig:0{,}040)} + 0{,}189\, SOC1_{(Sig:0{,}718)} - 0{,}372\, GOV1_{(Sig:0{,}099)} - 0{,}146\, SIZE1_{(Sig:<0{,}001)} + 8{,}715\, ROA1_{(Sig:<0{,}001)} + \in_1$$

b. Results of Multiple Linear Regression Analysis for Companies not Related to the Green Industry

Table 10. Results of Multiple Linear Regression Analysis

Coefficients[a]

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	4,967	1,686		2,946	,006
	ENV2	-3,121	,896	-,533	-3,485	,001
	SOC2	,193	1,326	,030	,145	,885
	GOV2	,345	,526	,110	,656	,516
	SIZE2	-,115	,064	-,299	-1,800	,080
	ROA2	1,265	1,187	,157	1,065	,294

a. Dependent Variable: TOBINSQ2

Source: Output of IBM SPSS Statistics 27, (2025)

Based on Table 10, the multiple linear regression equation for companies not related to the green industry is as follows:

$$\text{Tobinsq2} = 4{,}967 - 3{,}121\, ENV2_{(Sig:0{,}001)} + 0{,}193\, SOC2_{(Sig:0{,}885)} + 0{,}345\, GOV2_{(Sig:0{,}516)} - 0{,}115\, SIZE2_{(Sig:0{,}080)} + 1{,}265\, ROA2_{(Sig:0{,}294)} + \in_2$$

4.5 Hypothesis Testing Results

a. F-Test

Hypothesis testing is conducted based on the significance value. If the significance value (Sig.) is ≤ 0.05, then H_0 is rejected, indicating that the independent variables simultaneously have a significant effect on the dependent variable. Conversely, if the significance value (Sig.) is > 0.05, then H_0 is accepted, indicating that there is no significant simultaneous effect.

Table 11. F-Test Results for Companies Related to the Green Industry

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	24,303	5	4,861	31,367	,000[b]
	Residual	7,903	51	,155		
	Total	32,206	56			

a. Dependent Variable: TOBINSQ1

b. Predictors: (Constant), ROA1, GOV1, SIZE1, ENV1, SOC1

Source: Output of IBM SPSS Statistics 27, (2025)

Table 12. F-Test Results for Companies not Related to the Green Industry

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	5,325	5	1,065	3,521	,011[b]
	Residual	10,888	36	,302		
	Total	16,213	41			

a. Dependent Variable: TOBINSQ2

b. Predictors: (Constant), ROA2, GOV2, ENV2, SIZE2, SOC2

Source: Output of IBM SPSS Statistics 27, (2025)

Table 11 shows that the regression model is significant in explaining firm value (TOBINSQ1) for companies related to the green industry ($F = 31.367$; $p < 0.001$), indicating that the variables ENV1, SOC1, GOV1, SIZE1, and ROA1 simultaneously have a significant effect. Therefore, H1 is accepted. Meanwhile, Table 12 shows that the regression model for non-green companies is also significant ($F = 3.521$; $p = 0.011$), thus H2 is accepted, although with a lower predictive strength.

b. Coefficient of Determination (R^2)

Table 13. Coefficient of Determination (R^2) Results for Companies Related to the Green Industry

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,869[a]	,755	,731	,393648

a. Predictors: (Constant), ROA1, GOV1, SIZE1, ENV1, SOC1
b. Dependent Variable: TOBINSQ1

Source: Output of IBM SPSS Statistics 27, (2025)

Source: Output of IBM SPSS Statistics 27, (2025)

Table 14. Coefficient of Determination (R^2) Results for Companies not Related to the Green Industry

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,573[a]	,328	,235	,549948

a. Predictors: (Constant), ROA2, GOV2, ENV2, SIZE2, SOC2
b. Dependent Variable: TOBINSQ2

Source: Output of IBM SPSS Statistics 27, (2025)

Source: Output of IBM SPSS Statistics 27, (2025)

Table 13 shows that ESG variables can explain 75.5% of the variation in firm value for companies related to the green industry (R Square = 0.755), while the remaining 24.5% is influenced by other factors. Table 14 indicates that, for non-green companies, ESG variables explain only 32.8% of the variation in firm value (R Square = 0.328), with the remaining 67.2% influenced by other factors outside the research model.

c. t-Test

Table 15. t-Test Results for Companies Related to the Green Industry

Coefficients[a]

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	4,578	1,026		4,464	,000
	ENV1	1,163	,552	,264	2,108	,040
	SOC1	,189	,520	,049	,363	,718
	GOV1	-,372	,221	-,177	-1,679	,099
	SIZE1	-,146	,038	-,338	-3,852	,000
	ROA1	8,715	,709	,903	12,292	,000

a. Dependent Variable: TOBINSQ1

Source: Output of IBM SPSS Statistics 27, (2025)

The partial test results for companies not related to the green industry indicate the influence of Environmental, Social, Governance, Size, and Profitability variables on firm value as follows:

1. Environmental disclosure has a significant positive effect on firm value (t-test = 2.108; sig = 0.040), thus H1a is accepted, indicating that environmental transparency increases investor trust and enhances firm value. This finding supports Legitimacy Theory and Stakeholder Theory, where green-oriented companies actively engaged in environmental practices are more attractive to investors. In line with Legitimacy

Theory, one way for companies to gain legitimacy is by disclosing their social performance in sustainability reports as evidence of corporate social responsibility (Mudzakir & Pangestuti, 2023).

2. Social and Governance disclosures do not have a significant effect (sig > 0.05), therefore H1b and H1c are rejected, indicating that social and governance factors are not yet major concerns for investors in green-related industries. Their focus remains on profitability and environmental compliance, with profitability (ROA) and environmental disclosure showing significant positive effects.
3. Firm size (Size) has a significant negative effect (t-test = -3.852; sig < 0.001), suggesting that the larger the company, the more complex its management becomes, potentially reducing operational efficiency. Profitability (ROA) has a significant positive effect (t-test = 12.292; sig < 0.001), indicating that high earnings remain a key factor considered by investors.

Table 16. t-Test Results for Companies not Related to the Green Industry

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	4,967	1,686		2,946	,006
	ENV2	-3,121	,896	-,533	-3,485	,001
	SOC2	,193	1,326	,030	,145	,885
	GOV2	,345	,526	,110	,656	,516
	SIZE2	-,115	,064	-,299	-1,800	,080
	ROA2	1,265	1,187	,157	1,065	,294

a. Dependent Variable: TOBINSQ2

Source: Output of IBM SPSS Statistics 27, (2025)

The partial test results for companies not related to the green industry reveal the influence of Environmental, Social, Governance, Size, and Profitability variables on firm value as follows:

1. Environmental disclosure has a significant negative effect (t-test = -3.485; sig = 0.001), thus H2a is accepted. Environmental disclosure has a significantly negative impact on non-green companies because it is perceived as an additional cost burden without clear financial benefits. This is consistent with Signaling Theory, where investors interpret such disclosure as a reduction in profitability.
2. Social and Governance disclosures do not have a significant effect (sig > 0.05), therefore H2b and H2c are rejected, indicating that employee welfare and corporate governance are not the main considerations in investment decisions.
3. Firm size and profitability also do not show significant effects (sig > 0.05), suggesting that in non-green sectors, investors may consider other factors not included in this study.

The results of the partial tests for both groups of companies indicate that Environmental disclosure significantly affects firm value in both green and non-green companies, but in opposite directions. In green industry-related companies, the effect is significantly positive, while in non-green companies, the effect is significantly negative. This confirms that the Environmental component has a more dominant influence on firm value in green companies compared to non-green companies, thus supporting Hypothesis H3.

4.6 Independent Sample T-Test Results

Table 17. Results of Independent Sample T-Test

Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
									95% Confidence Interval of the Difference	
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Environmental Dosclosure	Equal variances assumed	3,871	,052	2,967	97	,004	,089550	,030187	,029638	,149463
	Equal variances not assumed			3,174	94,670	,002	,089550	,028217	,033530	,145570
Social Disclosure	Equal variances assumed	11,382	,001	,831	97	,408	,027190	,032726	-,037762	,092143
	Equal variances not assumed			,912	86,449	,364	,027190	,029824	-,032093	,086474
Governance Disclosure	Equal variances assumed	19,556	,000	1,967	97	,052	,121454	,061731	-,001065	,243972
	Equal variances not assumed			2,133	91,052	,036	,121454	,056947	,008336	,234571

Source: Output of IBM SPSS Statistics 27, (2025)

The independent t-test results show significant differences in Environmental and Governance disclosures between companies related and not related to the green industry, with green companies exhibiting higher average disclosure levels.

1. Environmental Disclosure: A significant difference is observed (Sig. 0.004 < 0.05), with green industry-related companies showing higher levels of environmental disclosure.
2. Social Disclosure: No significant difference is found (Sig. 0.364 > 0.05), indicating that social disclosure is relatively similar between the two groups.
3. Governance Disclosure: A significant difference is observed (Sig. 0.036 < 0.05), with green companies demonstrating a higher level of governance disclosure.

These findings support Hypothesis H4, as green industry-related companies tend to be more transparent in disclosing environmental and governance information compared to companies not related to the green industry.

5. Conclusion and Suggestions

5.1 Conclusion

1. Environmental disclosure has a significant positive effect on firm value in companies related to the green industry, while the social and governance aspects have no significant effect.
2. In companies not related to the green industry, environmental disclosure has a significant negative effect on firm value, whereas the social and governance aspects do not show significant effects.
3. The influence of the environmental aspect is more dominant on firm value in companies related to the green industry compared to those not related.
4. The results of the Independent Sample T-Test show significant differences in environmental and governance disclosures between companies related and not related to the green industry, while the social aspect shows no significant difference and is relatively similar between the two groups.

5.2 Limitations

1. This study only covers companies listed in the IDXINDUST index over a three-year period (2021–2023).

2. It only considers three independent variables (Environmental, Social, and Governance), excluding other potential factors that may influence firm value.
3. The measurement of control variables (Size and ROA) has limitations in fully representing company scale and profitability.

5.3 Suggestions

1. Future research may expand the scope to other sectors listed on the IDX and extend the observation period to capture long-term trends.
2. Additional variables related to ESG and firm value, such as Green Innovation, Eco-Efficiency, Environmental Management Accounting, and Good Corporate Governance, can be included to enhance model accuracy.
3. Employing more comprehensive measures of firm size (e.g., market capitalization) and adding other control variables such as ROE or NPM may improve the relevance and robustness of the research findings.

THE EFFECT OF FINANCIAL TECHNOLOGY, DIGITALIZATION OF TAX SERVICES, DIGITAL-BASED TAX LITERACY ON TAXPAYER COMPLIANCE IN MALANG CITY

Umi Ratna Zuliyanti*, Jeni Susyanti,**, Ahsani Taqwiem***

University Islam Of Malang

Abstract

Indication this study focused on at the level of awareness and compliance of the Indonesian people with taxes still tends to be low. The purpose of this study is to determine the effect of Financial Technology, digitization of Tax Services, digital-based tax literacy on tax compliance. Research location in Malang City. The time used was December 2024 to February 2025. The number of samples was 90 respondents. the data was analyzed with SPSS 27. The results of this study indicate that the use of financial technolohy has no effect on taxpayer compliance, while the digitization of tax services and digial-based tax literacy has an effect on taxpayer compliance. Future researchers are advised to expand the research area outside Malang City, it is hoped that it will increase corporate taxpayer research respondents. and further researchers can add other variables.

Keywords: Tax compliance, Financial technology, digitalization of tax services, digital-based tax literacy

1. Introduction

According to Law No. 7 of 2021 concerning Harmonization of Tax Regulations, taxes are compelling with no direct reward for state purposes. This definition shows tax as an instrument of state revenue collection to fund development programs and public services. In this context, taxes are one of the main sources of state revenue needed to support the state budget.

The Directorate General of Taxes (DGT), source of the 2023 State Budget, reported that taxes are the source of state revenue in the period 2021 to 2024. This is evidenced by the very significant proportion of tax revenue, reaching 73.9% of total state revenue in 2021. The proportion of tax revenue continues to increase until it reaches 83.2% in 2023. The consistent increase in tax revenue every year indicates that taxes have become the mainstay for the state in financing the State Budget.

Tax revenue has also shown a significant upward trend since 2021 after experiencing a decline in 2020 due to the COVID-19 pandemic. Tax realization in 2021 reached IDR1,278.63 trillion with an annual growth of 19.3%, followed by an increase in 2022 of IDR1,716.77 trillion with a growth of 34.3%. In 2023, tax revenue increased again to IDR1,869.23 trillion or 102.8% of the target, with annual growth of 8.9%. This data shows the success of the government's strategy in improving taxpayer compliance.

Many factors affect taxpayer compliance, one of which is financial technology. tax is one of the largest state revenues, so it should emphasize the utilization of fintech where taxpayer actors increase their understanding of certain features or services from fintech such as financial management so that state revenues can be increased as a result of increasing taxpayer tax compliance. Apart from financial technology, Digitalization of Tax Services is also a factor that can affect taxpayer compliance. Digitalization of tax services can reduce administrative barriers and increase transparency, so that taxpayers are more motivated to fulfill their obligations on time. Therefore, increasing the digitalization of tax services will make taxpayer compliance increase.

The next factor is digital-based tax literacy can also affect taxpayer compliance. a more effective way of delivering digital-based tax information can increase public understanding. Digital-based tax literacy helps taxpayers operate online tax applications or platforms, thereby reducing technical barriers that can lead to non-compliance.

There have been many previous studies on taxpayer compliance. This research expands the understanding of the determinants of tax compliance by integrating the three main variables of financial technology, digitalization of tax services, and digital-based tax literacy in one model, in contrast to previous studies that tend to focus only on one or two independent variables. The focus on the local context of Malang City provides a unique and specific perspective, adding geographical and social dimensions that have not been studied much before. The emphasis on digitalization reflects recent developments in technology and government services, making it relevant to Davis' (1986) adoption theory, the Technology Acceptance Model or TAM, which explains how factors such as perceived ease of use and perceived usefulness influence the acceptance and use of new technologies.

2. Literature Review

2.1 Technology Acceptance Model (TAM)

The Technology Acceptance Model (TAM) is a theoretical framework developed by Davis in 1989 to understand and predict user acceptance of technology. TAM emphasizes two main variables, namely Perceived Usefulness and Perceived Ease of Use, which have a significant effect on users' behavioral intentions to use technology.

2.2 Tax Compliance

Tax compliance, according to Nurmantu (2005: 148-149), is defined as the ability of taxpayers to comply with tax provisions and exercise taxation rights. Ristanti et al., (2022) added that taxpayer compliance includes awareness and actions of taxpayers in fulfilling tax obligations, including registration, reporting, and payment of taxes in accordance with applicable regulations. Indicators of compliance in registering themselves as taxpayers, compliance in submitting tax returns on time, and calculation of tax payments owed, and settlement of tax arrears.

2.3 Financial Technology

According to Nuria Soviatun, (2024) financial Technology (Fintech) includes improving and simplifying financial services, including personal and business financial management. Fintech creates new products, services and business models that can increase efficiency, security and accessibility in financial transactions. This certainly helps in financial management so that it can increase tax compliance. Financial technology indicators include the level of utilization of financial technology, the level of understanding of financial technology, managing finances with financial technology, the level of ease of use and barriers to the use of financial technology (Hakim, 2022).

2.4 Digital-based Tax Literacy

According to Andinata (2015) the ability of a taxpayer to know tax regulations both about the tax rates they will pay, and the benefits of taxes that will be useful for their lives. Indicators of digital-based tax literacy include Knowing tax subjects and tax objects, Tax rates, Knowledge of financial concepts, Ability to compile and file tax reports, Ability regarding financial budgeting) and the concept of saving (saving, insurance, and investment).

Conceptual Framework

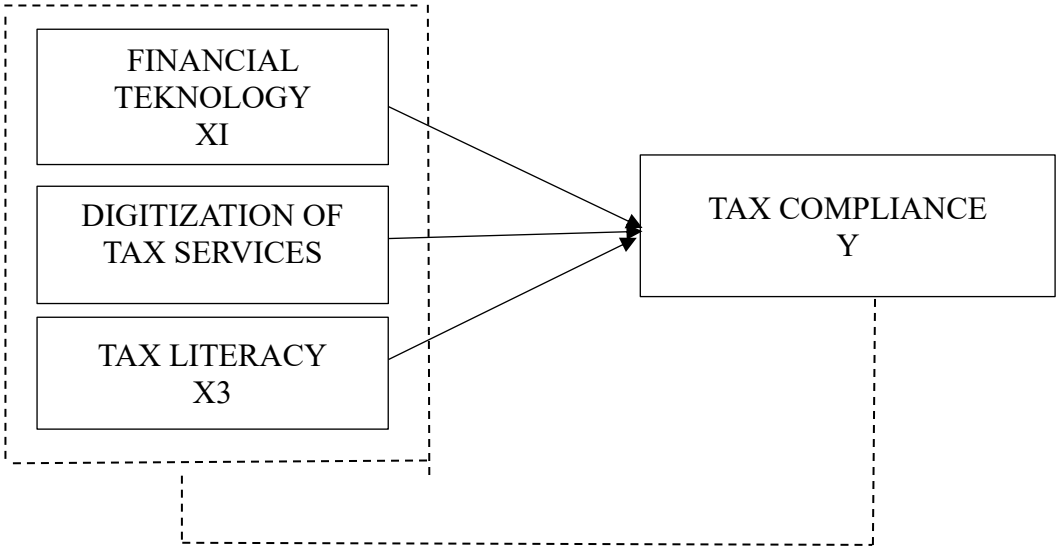

Figure 2.1 Conceptual Framework

Research Hypotheses

1. H1: Financial Technology (Fintech) has a positive and significant effect on taxpayer compliance in Malang City.
2. H2: Digitalization of tax services has a positive and significant effect on taxpayer compliance in Malang City.
3. H3: Digital-based tax literacy has a positive and significant effect on taxpayer compliance in Malang City.
4. H4: Financial Technology (Fintech), digitalization of tax services, and digital-based tax literacy simultaneously have a positive and significant effect on taxpayer compliance in Malang City.

3. Methodology

This research is included in quantitative research In this quantitative research uses the method of translating data into numerical form to conduct analysis. This research uses a causal method that aims to explain the cause-and-effect relationship between the variables studied which aims to test the hypothesis that has been formulated. This research was conducted in the districts of Kedungkandang, Klojen, Sukun, Blimbing, Lowokwaru, Malang City. The time used was December 2024 to February 2025.

The population in this study were individual taxpayers in Malang City. The research sample was obtained from the calculation of the slovin formula with a total of 90 respondents. The research sample was obtained from the calculation The sampling method used in this study is purposive sampling method, explained by Sugiyono (2018: 133) that Purposive Sampling is a sampling technique with certain considerations. The sample criteria selected in this study are as follows: 1) Formal workers (civil servants and private sector) in the Malang City area who have NPWP. 2) Domiciled in Malang City, 3) Age, 4) Total PTKP (non-taxable income), and 5) Length of status as a taxpayer calculation of the slovin formula with a total of 90 respondents. The research sample was obtained from the calculation The sampling method used in this study is purposive sampling method, explained by Sugiyono (2018: 133) that Purposive Sampling is a sampling technique with certain considerations. The sample criteria selected in this study are as follows: 1) Formal workers (civil servants and private sector) in the Malang City area who

have NPWP. 2) Domiciled in Malang City, 3) Age, 4) Total PTKP (non-taxable income), and 5) Length of status as a taxpayer

The data source in this study is using primary data with data collection methods using a questionnaire. This research analysis was carried out with several stages, namely instrument test, normality test, classical assumption test, multiple linear regression, moderated regression analysis, and hypothesis testing.

4. Research Results and Discussion

4.1 Research Results

Characteristics of Respondents

Description of Research Variables

In this study, there are four variables analyzed: Financial technology, Digitalization of Tax Services, Digital-based Tax Literacy, and Tax Compliance. The analysis results show that:

Financial Technology: the average answer for the Financial Technology variable is 4.14, indicating that respondents generally agree with the statements contained in this variable. The item with the highest average is "I feel information about FinTech is easy to access as well as understand." with an average of 4.41.

Digitalization of Tax Services: the average answer for the Tax Service Digitalization variable is 3.80, indicating that respondents are capable of using digital reporting. The item with the highest average is "Digitalization of taxation is easy to understand and learn" with an average of 3.87.

Digital-based Tax Literacy: the average answer for the Digital-based Tax Literacy variable is 3.80, indicating that respondents are literate in digital-based literacy so that it has a good impact on reporting. The item with the highest average is "I can submit my tax return online" with an average of 3.84.

Tax Compliance: the average answer for the Tax Compliance variable is 4.08, indicating that respondents can carry out tax compliance well. The item with the highest average is "I always submit my tax return on time" with an average of 4.60.

4.2 Analysis Results and Discussion

4.2.1 Descriptive Statistical Analysis

Descriptive statistical analysis shows an overview of the characteristics of the variables studied, namely Financial technology (X1), Digitalization of Tax Services (X2), and Digital-based Tax Literacy (X3).

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
X1	90	2.67	5.00	3.8723	0.43214
X2	90	2.86	5.00	3.9746	0.44254
X3	90	3.00	5.00	3.9976	0.38476
Y	90	3.00	5.00	4.0161	0.45034
Valid N (listwise)	90				

Source: Data Processed, 2025

Based on the descriptive statistical test table, it can be concluded

1. Financial technology variable obtained a minimum of 16, a maximum value of 30. The average value is 23.23 with a standard deviation of 2.592.

2. The Tax Service Digitalization variable obtained a minimum of 20, a maximum value of 35, an average value of 27.82 with a standard deviation of 3,092.

3. The digital-based tax literacy variable obtained a minimum of 24, a maximum value of 40. The average value is 31.97 with a standard deviation of 3,077.

4. The Tax Compliance variable obtained a minimum of 24, a maximum value of 40, an average value of 32.11 with a standard deviation of 3,602.

4.2.2 Validity and Reliability Test

Validity and reliability testing are crucial stages in this research to ensure that the data collection instruments are reliable and actually measure the intended variables. Validity relates to the extent to which a measuring instrument is able to represent the concept to be measured, while reliability refers to the level of consistency of the results produced by the measuring instrument.

Variabel	Item	r Hitung	r Tabel	Description
Financial Tecnology (X1)	X1.1	0.657	0.207	Valid
	X1.2	0.772	0.207	Valid
	X1.3	0.653	0.207	Valid
	X1.4	0.73	0.207	Valid
	X1.5	0.665	0.207	Valid
	X1.6	0.396	0.207	Valid
Digitalization of Tax Services(X2)	X2.1	0.656	0.207	Valid
	X2.2	0.794	0.207	Valid
	X2.3	0.708	0.207	Valid
	X2.4	0.784	0.207	Valid
	X2.5	0.739	0.207	Valid
	X2.6	0.681	0.207	Valid
	X2.7	0.753	0.207	Valid
Digital-based Tax Literacy(X3)	X3.1	0.672	0.207	Valid
	X3.2	0.706	0.207	Valid
	X3.3	0.636	0.207	Valid
	X3.4	0.494	0.207	Valid
	X3.5	0.765	0.207	Valid
	X3.6	0.771	0.207	Valid
	X3.7	0.764	0.207	Valid
	X3.8	0.741	0.207	Valid
Tax Compliance (Y)	Y1.1	0.292	0.207	Valid
	Y1..2	0.685	0.207	Valid
	Y1.3	0.689	0.207	Valid

	Y1.4	0.799	0.207	Valid
	Y1.5	0.807	0.207	Valid
	Y1.6	0.757	0.207	Valid
	Y1.7	0.747	0.207	Valid
	Y1.8	0.759	0.207	Valid

All items in the variables studied have a value of r count higher than r table, so it can be concluded that all items are valid. In addition, the Cronbach's Alpha value that exceeds 0.6 for each variable indicates that the measurement instruments in this study have a good level of internal consistency.

No.	**Variabel**	**Koefisien Reliabilitas**	**Keterangan**
1	*Financial Tecnology (X1)*	0.705	Reliabel
2	Digitalization of Tax Services(X2)	0.852	Reliabel
3	Digital-based Tax Literacy(X3)	0.832	Reliabel
4	Tax Compliance (Y)	0.844	Reliabel

The reliability test results indicate that all variables have a good level of internal consistency. Financial Technology (X1) obtained a Cronbach's Alpha value of 0.705, indicating excellent reliability. Digitalization of Tax Services (X2) also has good reliability with a value of 0.852. Digital-based Tax Literacy (X3) obtained a value of 0.832, which reflects good consistency. Meanwhile, Tax Compliance (Y) has a value of 0.844, which also shows a good level of reliability. Overall, all variables have Cronbach's Alpha values above 0.6, indicating that the measurement instruments in this study are reliable and suitable for further analysis. This high reliability plays an important role in ensuring the accuracy and reliability of the data collected, thus increasing the overall validity of the study.

4.2.3 Normality Test

The normality test in this study aims to determine whether the data used is normally distributed. If the test results show that the residual data is normally distributed, then the regression model used fulfills the normality assumption and can be used for further analysis.

Parameter	**Nilai**
Asymp. Sig. (2-tailed)	.200[d]

The results of the normality test, it is known that the p-value of 0.200> 0.05 indicates that the data is normally distributed. This is a strong foundation for the statistical analysis that will be carried out next.

4.2.4 Classical Assumption Tes

The Classical Assumption Test is carried out in regression analysis to ensure that the regression model used meets the basic assumptions and produces valid estimates. In this study, the classical assumption tests carried out include: Multicollinearity Test aims to determine

whether there is a strong relationship between independent variables and Heteroscedasticity Test To test whether there is an inequality of residual variances.

Table 6 Multicollinearity Test

Variabel	Tolerance	VIF	Keterangan
X1	0.833	1.201	non multikolinearitas
X2	0.589	1.698	non multikolinearitas
X3	0.590	1.695	non multikolinearitas

Table 7 Heteroscedasticity Test

Variabel	Sig.	Keterangan
Financial Tecnology (X1)	0.989	non heteroskedastisitas
Digitalisasi Layanan Pajak (X2)	0.802	non heteroskedastisitas
Literasi Pajak Berbasis Digital (X3)	0.523	non heteroskedastisitas

The multicollinearity test results indicate that there is no multicollinearity problem, indicated by tolerance and VIF values that are within appropriate limits. In addition, the heteroscedasticity test indicates that the regression model does not experience significant heteroscedasticity problems.

4.2.5 Multiple Linear Regression Analysis
Table 8 Multiple Linear Regression Analysis

Coefficientsa								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	6.214	3.597		1.728	0.088		
	X1	0.140	0.127	0.101	1.105	0.272	0.833	1.201
	X2	0.416	0.126	0.357	3.299	0.001	0.589	1.698
	X3	0.347	0.127	0.296	2.736	0.008	0.590	1.695
a. Dependent Variable: Y								

Based on table 4.20 above, the regression equation can be written as follows:

$$Y = 6.214 + 0.140X_{1(sig.0.272)} + 0.416X_{2(sig.0.001)} + 0.347X_{3(sig.0.008)} + e$$

The variable Financial Tecnology (X1), Digitalization of Tax Services (X2), Digital-based Tax Literacy (X3) has a positive value.

5. Conclusion, Limitations and Suggestions

5.1 Conclusion

In the study analyzing the effect of financial technology, digitization of tax services and digital-based tax literacy on tax compliance in Malang city taxpayers, it can be concluded (A) Financial Technology is not significant to tax compliance, advances in financial technology have not directly increased tax compliance. (B) Digitalization of tax services has a positive and significant effect. Users have various benefits in terms of access, reporting to administrative barriers. (C) Digital-based tax literacy has a positive and significant effect. Good understanding can increase high compliance. (D) Simultaneously, these three variables have a positive and significant effect on tax compliance. The combination of Financial technology, Digitalization of tax services, digital-based tax literacy contributes positively to increasing tax compliance.

5.2 Limitations

In this study, there are data limitations, namely on individual taxpayers in Malang City, there are only 90 respondents in this study, Respondents in this study only used individual taxpayers and the research focus was only three variables so that the findings show that there are still more factors that influence tax compliance.

5.3 Suggestions

Further researchers are advised to expand the research area outside Malang City, it is hoped that it will increase research respondents because in this study only uses individual taxpayer compliance so that further researchers can add corporate taxpayer compliance respondents. and further researchers can add other variables.

THE EFFECT OF *GOOD CORPORATE GOVERNANCE* AND PROFITABILITY ON PROFIT MANAGEMENT (CASE STUDY ON PHARMACEUTICAL SECTOR COMPANIES LISTED ON THE IDX FOR THE PERIOD 2019 - 2023)

[1.] Imelda Yuliana, [2] Usman Sastradipraja

Ahmad Yani University
[1] Email: imeldayul.21@gmail.com
[2] Email: usmansastradipraja@ak.unjani.ac.id

Abstract

This study aims to analyze the effect of Good Corporate Governance (GCG) and profitability on earnings management in pharmaceutical companies listed on the Indonesia Stock Exchange (IDX) during the period 2019–2023. GCG is measured by institutional ownership, profitability by Return on Assets (ROA), and earnings management by the distribution of earnings changes (ΔE). This study uses a quantitative approach with descriptive and verification methods. The sample was selected by purposive sampling from four companies: KLBF, KAEF, MERK, and PEHA. Data analysis was carried out using multiple linear regression, correlation, coefficient of determination, and t-test and F-test with the help of SPSS version 27. The results of the study indicate that both partially and simultaneously, GCG and profitability do not have a significant effect on earnings management. This is likely due to the company's focus on long-term investment and the impact of the COVID-19 pandemic on the effectiveness of GCG implementation. In addition, profitability does not directly reflect earnings management practices. This finding suggests that other factors may play a more dominant role in influencing earnings management practices. Further research is suggested to extend the observation period, increase the sample size, and include additional variables such as leverage and intellectual capital to obtain more comprehensive results .

Keywords: Good Corporate Governance, Profitability, Earnings Management, Indonesia Stock Exchange and Pharmaceutical Sector.

1. Introduction

The pharmaceutical industry in Indonesia plays a vital role in supporting public health needs, especially during and after the COVID-19 pandemic. The sector has seen significant growth, with the Ministry of Industry reporting an annual market value increase of 2.5% in Q1 2024, largely driven by domestic pharmaceutical companies that control more than 80% of the market share. However, this growth also brings challenges in maintaining financial stability, transparency, and reputation amidst increasing competition.

As healthcare providers, pharmaceutical companies are expected to not only demonstrate strong operational performance but also ensure the reliability of their financial statements. Financial statements serve as a key indicator for investors and stakeholders. However, the pressure to meet market expectations and maintain profits often leads to earnings management practices, where managers may manipulate accruals or real activities to present profitable financial results. While such actions may follow accounting standards, they risk distorting the quality of financial information and reducing investor confidence.

To overcome this, the implementation of Good Corporate Governance (GCG) becomes important. GCG mechanisms such as independent boards, audit committees, and internal controls can limit earnings manipulation and increase the credibility of financial reporting. In

addition, profitability is a potential driver of earnings management. Companies with high profits may seek to maintain a stable image, while companies with low profits may be pressured to manipulate reports to appear more profitable.

Given the unique characteristics of the pharmaceutical sector such as high R&D costs, strict regulation, and public scrutiny, these companies are highly susceptible to earnings management practices. Previous studies have mostly focused on the banking or general manufacturing sectors. Thus, this study focuses on pharmaceutical companies listed on the Indonesia Stock Exchange (IDX) during 2019 - 2023, with the aim of analyzing the effect of GCG and profitability on earnings management.

This research is also relevant for regulators such as OJK and BEI, which support efforts to improve corporate governance and financial reporting standards in public companies. Through this research, it is expected to provide academic and practical contributions by providing insights for companies, investors, and regulators in maintaining the integrity of financial reports and corporate sustainability in sector pharmacy .

Table 1 Good Corporate Governance Data, Profitability , and Practices Earnings Management in Pharmaceutical Sector Companies Listed on the Indonesia Stock Exchange (IDX), 2019–2023

NO	CODE	COMPANY NAME	YEAR	KI	Net profit	ΔE
1	KLBF	PT. Kalbe Farma Tbk .	2019	57%	24.26%	0.57
			2020	57%	30.99%	3.68
			2021	58%	27.07%	5.69
			2022	58%	24.43%	3.14
			2023	58%	12.52%	-8.87
2	KAEF	PT .	2019	95%	12.41%	-0.36
			2020	95%	12.59%	0.00
			2021	95%	12.66%	0.39
			2022	95%	10.27%	-0.31
			2023	94%	0.09%	-2.81
3	BRAND	PT. Merck Indonesia Tbk .	2019	87%	0.11%	-0.02
			2020	87%	1.68%	0.00
			2021	87%	-0.64%	40.81
			2022	87%	-10.36%	32.79
			2023	87%	8.68%	-0.97
4	PEHA	PT. Phapros Tbk .	2019	6%	7.73%	-0.01
			2020	6%	12.83%	-0.02
			2021	6%	17.33%	-0.04
			2022	6%	18.61%	0.01
			2023	6%	4.88%	-0.02

This study uses earnings management indications as dependent variables measured through changes in earnings (ΔE). The identification method follows Nurani & Dillak (2019) who compare the coefficients of variation of earnings and sales (CVΔI and CVΔS). If CVΔI < CVΔS, the company is categorized as performing income smoothing.

Data from four pharmaceutical companies during 2019–2023 show fluctuating profit distribution, indicating potential earnings management practices. This is important, given that the pharmaceutical sector faces tight regulation, high costs, and public expectations for accountability.

In this context, the implementation of Good Corporate Governance (GCG) and profitability play a key role in maintaining the integrity of financial reporting and building investor and public trust.

This finding is in line with research conducted by (Braindies & Fuad, 2019) and (Sarra, 2020) which states that Good Corporate Governance and Profitability do not have a positive effect on Earnings Management. On the other hand, research conducted by (Sholikah et al., 2024) and (Fitriyah, 2021) shows a significant effect. In other studies conducted by (Tamara et al., 2022) and (Paramitha & Idayati, 2020) showed a significant effect. Likewise with independence, the results of the study still show differences.

2. Literature Revies

2.1 Agency Theory

Agency theory (Jensen & Meckling, 2014) explains the relationship between principals (owners/shareholders) and agents (managers) where the principal delegates tasks to the agent to manage the company. The principal's main goal is to maximize the value of the company, but conflicts of interest often occur because agents have personal interests. This causes agency problems such as conflicts and costs that are detrimental to the principal.

2.2 Financial statements

Financial statements are important documents prepared by companies to provide a comprehensive picture of the financial condition, performance, and changes in financial position in a period. According to (Thian, 2022a) , this report is useful for economic decision makers, especially if the information can be used to predict the future. PSAK No. 1 (2018) emphasizes that financial statements include balance sheets, income statements, cash flows, and other notes and explanations. (Kasmir, 2019) refers to financial statements as a picture of the company's financial condition in a certain period.

In general, financial reports function as a communication tool between companies and stakeholders, as well as being a reflection of business activities that can be analyzed to assess performance and plan future strategies.

2.3 Management Accounting

Management accounting is an accounting system that presents financial information for internal parties of the company, such as financial, production, and marketing managers (Suharlina., Fajariani, 2023) . According to the Institute of Management Accountants (IMA), management accounting is an ongoing process to add value through planning, measuring, and managing financial and non-financial information to support the achievement of strategic and operational goals.

Experts such as Hlmim & Supomo and Mulyadi emphasize that management accounting aims to present financial information as a basis for decision making by management. Meanwhile, Charles T. Horngren highlights the role of management accounting in identifying, analyzing, and communicating information to help executives achieve organizational goals.

Thus, management accounting becomes an important tool in supporting the planning process, cost control, performance evaluation, and effective and efficient decision making in an

organization.

2.4 Profit Management

Earnings management is the action of managers to influence information in financial reports, either by increasing or decreasing profits, for personal or corporate interests. Agency theory explains that this practice arises due to differences in goals between managers and owners. Watts and Zimmerman (1986) through Positive Accounting Theory formulated three main hypotheses that explain the motivation for earnings management:

- Bonus Plan Hypothesis: Managers will increase profits to earn larger bonuses.
- Debt Covenant Hypothesis: Managers increase profits so that the firm does not violate debt covenants.
- Political Cost Hypothesis: Profits are lowered to avoid political burdens such as taxes and government regulations .

The profit distribution approach formula according to Philips et al. (2003) in (Aditama Ferry, 2019) is:

$$\Delta \mathbf{E} = \frac{\boldsymbol{Eit - Eit - 1}}{\boldsymbol{MVEit - 1}}$$

Information :

ΔE = Change in profit
Eit = Profit of company i in year t
Eit-1 = Profit of company i in year t-1.
MVEit-1 = Market Value of Equity of Company I at year t-1

2.5 Good Corporate Governance

GCG is a mechanism supervision and control in the company For minimize conflict between principal and agent . In theory agency , GCG functions as monitoring tools that can reduce cost agency and inhibit behavior opportunistic managers. GCG elements such as commissioners independent , audit committee , ownership institutional , and ownership managerial viewed capable limit room managers' movements in manipulating financial reports.

The formula for Good Corporate Governance (GCG) according to Suriyani et al. 2015 in (Elindika, 2019) that is:

$INST = \frac{Jumlah\ saham\ yang\ dimiliki\ institusional}{Jumlah\ saham\ beredar}\ x\ 100$
$MAN = \frac{Jumlah\ saham\ yang\ dimiliki\ manajer}{Jumlah\ saham\ beredar}\ x\ 100$
KA = Number of audit committee members in the company
DK = Number of members of the board of commissioners in the company

Information :

INST = Ownership Institutional
MAN = Ownership Managerial

KA = Audit Committee
DK = Board of commissioners

2.6 Profitability

Profitability , which is usually measured using Return on Assets (ROA), reflects manager efficiency in managing asset company . In theory agency , high profitability can create pressure For maintain profits consistently , so managers tend to carry out profit management to make it look capable maintain performance . (Thian, 2022b)

According to Abd'rachim (2021, p. 17), ROA can be calculated using the formula:

$$ROA = \frac{Laba\ Bersih\ Setelah\ Pajak\ (EAT)}{Total\ Aktiva}\ x\ 100$$

3. Research Method

This research was conducted at Pharmaceutical Companies listed on the Indonesia Stock Exchange. (BEI) For That 2019-2023 period. This research is A quantitative Study with Secondary data were obtained from www.idx.co.id and company websites. Sampling using purposive sampling method with a sample size of 8 companies during the 5-year observation period. That data analysis used in the This Study used English: IBM SPSS 27 For window statistics software, with the classical assumption tests used, namely the normality test, multicollinearity test, heteroscedasticity test and autocorrelation test, then multiple linear regression, correlation coefficient, determination coefficient and finally hypothesis testing, namely partial test (t test) and simultaneous test (f test).

4. Results and Discussion

Normality Test

The normality test is carried out to determine and test whether the residual values are distributed. usually or No use That Kolmogorov-Smirnov statistics test with decision making if the significance value has a value above 0.05 then the data stated has been normally distributed and vice versa. The results of the normality test are as follows:

Table 2 Results from Kolmogorov owned by Smrinov Normality Test Before Outlier

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		15
Normal Parameters[a,b]	Mean	.0000000
	Std. Deviation	3.44628843
Most Extreme Differences	Absolute	.125
	Positive	.125
	Negative	-.113
Test Statistic		.125
Asymp. Sig. (2-tailed)[c]		.200[d]
a. Test distribution is Normal.		
b. Calculated from data.		
c. Lilliefors Significance Correction.		

Source : Data process the results use SPSS

Based on table 2 above, it shows the results of the Kolmogorov-Smirnov test as seen from the Asymp.Sig (2-tailed) results in a value of 000. This number is smaller than A = 0.05, Which method That That remainder data is No usually distributed. So, he is needed to correct or handle

data by eliminating extreme data (outliers).

Table 3 Results from Kolmogorov owned by Smrinov Normality Test After Outlier

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		15
Normal Parameters[a,b]	Mean	.0000000
	Std. Deviation	3.44628843
Most Extreme Differences	Absolute	.125
	Positive	.125
	Negative	-.113
Test Statistic		.125
Asymp. Sig. (2-tailed)[c]		.200[d]
a. Test distribution is Normal.		
b. Calculated from data.		
c. Lilliefors Significance Correction.		

Source : Data process the results use SPSS

Based on on table 3 .7 on, he show That That Kolmogorov-Smirnov test results seen from Asymp. Sig. (2-tailed) has a value of 200 or the value is greater than α = 0.05. so that the residual data in this study is normally distributed.

Multicollinearity Test

The next classical assumption test is the multicollinearity test. This test aims to test whether the regression model finds a correlation between independent variables. A Good regression model is A regression model in the Which there is There is no correlation between independent variables. To find out whether or not there is multicollinearity in regression model, he Can become Finished by evaluate That amount from English: VIF (Difference Inflation Factor) and tolerance value. If the tolerance value > 0.10 or VIF value < 10 then there is no multicollinearity and if the tolerance value < 0.10 or VIF value > 10 then there is multicollinearity. regression model. The results of the multicollinearity test in this study are as follows:

Table 4 Multicollinearity Test Results

Coefficients[a]			
Model		Collinearity Statistics	
		Tolerance	VIF
1	KI	.960	1.042
	ROA	.960	1.042
a. Dependent Variable: ΔE			

Source : Data processing results use SPSS

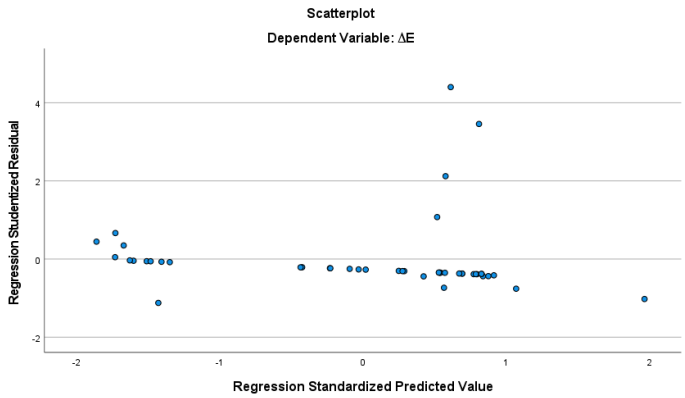
Based on table 4 above, it is known that the tolerance value at variable Ownership Institutional (KI) or GCG and Return on Assets (ROA) or Profitability is 0.9 60 . Then the results of the Tolerance value show > 0.1. In addition, the Variance Inflation Factor (VIF) value on the Ownership variable Institutional (KI) or GCG and Return on Assets (ROA) or Profitability of 1.0 42 . So the whole thing he show VIF < 10 of every from This variable. Can concluded that Ownership Institutional (KI) or GCG and Return on Assets (ROA) or Profitability in this study there is no multicollinearity.

Heteroscedasticity Test

The third classical assumption test is the heteroscedasticity test. The heteroscedasticity test is an explanatory variable in the regression equation that has a non-constant error variance and causes the estimator to be inefficient. In this test, it can be observed by looking at the results of the scatterlot test if the points on the scatterlot graph are spread above and below the number 0, then this indicates that there is no heteroscedasticity. The following are the results of the heteroscedasticity test using IBM SPSS 27 which can be seen as follows:

Figure 1

Heteroscedasticity Test Results



Source : Data process the results use SPSS

Automatic correlation Test

Autocorrelation test is the final step testing that is carried out with the aim of to test the nuisance error in period t with the nuisance error in period t-1 which arises due to consecutive observations to determine whether or not there is autocorrelation which is carried out using the Durbin-Watson test (WD-test) using IBM SPSS 27 software.

Table 5 Autocorrelation Test Results

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.144[a]	.021	-.026	8.7115698	1.527

a. Predictors: (Constant), ROA, KI

b. Dependent Variable: ΔE

Source : Data processing results use SPSS

Based on the results of the autocorrelation test in table 4.9 above, show mark Durbin-Watson as big as 1,527 . Mark This is then compared with the DU and 4-DU values. Based on table Durbin-Watson, mark DU For k= 2 (number of variables) independent) And n= 45 (amount data) is 1 , 61 48 and the 4-DU value is 2.473 . Then the Durbin-Watson value is obtained which is explained as follows:

= DW < DU < 4-DU

= 1.527 < 1.6148 < (4 – 1.527)

= 1,527 < 1,6148 < 2,473

The above calculation concludes that this study can reject (H0) which states that there is no positive and negative autocorrelation between all independent variables, so there are no symptoms of autocorrelation.

Many Linear Regression Analysis

This study uses multiple linear regression tests which aim to test the independent variables, namely carbon emission disclosure, green innovation, and intellectual capital against That depends variable, that is firm mark. That data processing used to analyze This use IBM SPSS 27 software, the following are the results of the processed data:

Table 6 Many Linear Regression Test Results

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-3.589	7.831		-.458	.649
	KI	7.654	9.713	.123	.788	.435
	ROA	-2.510	7.233	-.054	-.347	.730

a. Dependent Variable: ΔE

Source : Data processing results use SPSS

Based on on table 6 on, he Can become conclude That That Lots linear regression equality in the This research is as follows:

Y = -3,589 + 7,654X1 – 2,510X2

1. That constant mark from -3,589 Which show That mark from Ownership Institutional or GCG (X1), and Return on Assets or Profitability (X2) is 0, then the Distribution value Change in Profit or Earnings Management (Y) is -3.589 .

2. That regression coefficient mark from Ownership Institutional or GCG (X1) is 7,645 Which show That Ownership Variable Institutional or GCG (X1) has a positive influence on Distribution Change in Profit or Profit Management (Y). If Ownership Institutional (X1) increases by 1%, this will be followed by an increase in Distribution Change in Profit (Y) is 7.645 .

3. The regression coefficient value of Return on Assets or Profitability (X2) is -2.510 , which

shows that Return on Assets (X2) has a fairly large influence on the dependent variable, namely -2.510 . (X2) variable own A positive influence on Firm Mark (Y). If Return on Assets (X2) increases by 1%, which will be followed by an increase in Company Value (Y) of -1.602.

Correlation Coefficient Analysis

Correlation analysis is used to determine how close the relationship is between two independent variables. is together (simultaneously) And One depends variable. That correlation number range from - 1 to 1. That closer to That number 1 year That higher That connection between That independent variable together and the dependent variable. Positive and negative values indicate the direction of the relationship, if the value is positive then the relationship is unidirectional and vice versa if the value is negative then the relationship is not unidirectional. The following are the results of the correlation test as follows:

Table 7 Results from Correlation Coefficient Analysis Test

Correlations

		KI	ROA	ΔE
KI	Pearson Correlation	1	-.201	.134
	Sig. (2-tailed)		.186	.381
	N	45	45	45
ROA	Pearson Correlation	-.201	1	-.079
	Sig. (2-tailed)	.186		.607
	N	45	45	45
ΔE	Pearson Correlation	.134	-.079	1
	Sig. (2-tailed)	.381	.607	
	N	45	45	45

Source : Data processing results use SPSS

Based on the results of the interpretation of the partial correlation test in table 4.13 above, it is known that the relationship between the variables can be seen that the level of relationship between GCG and profit management is very low in that direction positive , It means if mark GCG go on so will followed with decreasing earnings management . Furthermore, the level of relationship between the Profitability variables t on earnings management is very low with a negative direction, meaning if the profitability value go on then it will be followed by a decrease in earnings management.

Determination Coefficient Analysis

The determination coefficient test is used to assess the extent to which the independent variable influences the dependent variable as a whole, the measurement refers to the Adjusted R Square value. results from Lots linear regression analysis. That follow is That results from That The coefficient of determination test can be seen in the following table:

Table 8 Results from Determination Coefficient Analysis Test

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.544[a]	.021	-.026	8.7115698

a. Predictors: (Constant), ROA, KI

Source : Data processing results use SPSS

Kd = R ^{2} X 100%

= (0, 544) ^{2} X 100%
= 29.5%

Based on the results of the determination coefficient analysis in the table 8 in on, known mark coefficient determination by 29.5 %. Mark This show that *Good Corporate Governance* (GCG), and Profitability can explain about profit management amounting to 29.5 %. While the remaining 70.5 % is explained by the variables others that were not examined in this study.

Draw a conclusion

Drawing conclusions Drawing conclusions is done to find out whether the proposed hypothesis is accepted or not, by conducting hypothesis testing, namely partial tests (t-tests) and simultaneous tests (f-tests).

Part Test (t-test)

Part test or T test is has brought go out to draw conclusion about whether That submitted Hypothesis is accepted or rejected. The t-test describes the extent to which the influence of each independent variable can explain the dependent variable. The t-test is done by comparing Tcount with Ttable. H0 is rejected and Ha is accepted if Tcount > Ttable or - Tcount < Ttable and the significance level < 0.05, this means that H0 is rejected and Ha is accepted. show That That independent variable own A part And important influence on That depends variables. On the other hand, If Ha is rejected And H0 If Count < Table or - Count > - Table And A important level>0.05, this show that That partial independent variable does not affect the dependent variable. The following are the results of the partial test (t-test) as follows:

Table 9 Part Test Results (T- Test)

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-3.589	7.831		-.458	.649
	KI	7.654	9.713	.123	.788	.435
	ROA	-2.510	7.233	-.054	-.347	.730

a. Dependent Variable: ΔE

Source : Data processing results use SPSS

Based on table 9 above , it is known that that mark t count more small from t table namely - 0.458 < 2.018 and the significance value is greater than 0.05, namely 0.435 > 0.05. It can be concluded that partially the GCG variable does not have a significant effect on earnings management on sector pharmacy Which listed on the Indonesia Stock Exchange (IDX) for the period 2019–2023. And the value t count more small from t table that is 0.788 < 2.018 and the significance value is greater than 0.05, namely 0.730 > 0.05. It can be concluded that partially the *intellectual capital variable* does not have a significant effect on profit management sector pharmacy listed on the Indonesia Stock Exchange (IDX) for the period 2019–2023.

Simultaneously Test (F- Test)

That Statistics Test F is has brought go out to find go out whether independent variable together can influence That depends variable. That decision make is That If That meaning mark < 0.05 And That If the value of fCalculate > FTable, then it can be stated that H0 is rejected and Ha is accepted. The following are the results of the F test.

Table 10 Simultan Test Results (F- Test)

ANOVA[a]

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	67.301	2	33.651	.443	.645[b]
Residual	3187.441	42	75.891		
Total	3254.742	44			

a. Dependent Variable: ΔE

b. Predictors: (Constant), ROA, KI

Source : Data processing results use SPSS

Based on table 4.16 above, it is known that the significance value of the model simultaneous regression smaller than 0.05 , namely 0.645 > 0.05. In addition, the calculated F value is greater than the F table which is 0.443 < 3.22 So it can be concluded that simultaneously the GCG and Profitability variables does not have a significant effect on earnings management on sector pharmacy Which registered in Exchange Effect Indonesia (BEI) period 2019–2023.

That Influence from Good Corporate Governance on Partial Earnings Management

Testing data show the result is that *Good Corporate Governance (GCG)* does not has a significant influence on earnings management, this is indicated by the GCG variable which has a significance value greater than 0.05, namely 0.435 > 0.05 and the calculated t value is smaller than the t table which is 0.458 < 2.018 , so that H a1 rejected and H 01 accepted, which means that GCG does not have a significant effect on earnings management.

That Influence from Profitability in Partial Earnings Management

Data testing shows that *profitability* does not have a significant effect on earnings management, this is indicated by *Return on Assets.* (ROA) which has a significance value greater than 0.05, namely 0.730 > 0.05 and a calculated t value that is smaller than the t table which is 0.788 < 2.018 so that H a 1 rejected and H 0 1 accepted which means profitability does not have a significant positive effect on earnings management.

That Influence from Good Corporate Governance and Profitability in Simultaneous Earnings Management

Data testing shows that Good Corporate Governance (GCG) and Profitability simultaneously do not have a significant effect on Earnings Management. This is indicated by the significance value Which more small from 0.05 that is as big as 0.645 > 0.05 and mark F count Which more big from F table that is of 0.443 < 3.22, so it can be concluded that H a2 rejected and H 02 accepted, which means that Corporate Governance (GCG) and Profitability do not have a significant influence to Earnings Management on sector pharmaceuticals listed on the IDX for the 2019–2023 period.

4. Conclusion and Suggestions

Conclusion

Based on the results of data analysis through hypothesis testing that has been carried out by researchers entitled That Influence from Carbon Emission Disclosure, Green Innovation, And Intellectual Active capital Firm Mark in the Energy Company Registered on That Indonesia Share Exchange (BEI) For That Period 2019-2023, it can be concluded that this research is as follows:

4. Carbon Emission Disclosure part own A important positive influence on Firm Mark.
5. Green Innovation part own A important negative influence on Company Mark.

Intellectual Capital part own NO influence And is No important to That Company Mark .

Suggestion

This research is expected to provide an overview of the influence of Good Corporate Governance and Profitability. on Profit Management in Pharmaceutical Companies Listed on the Indonesia Stock Exchange for the 2019-2023 Period . Based on several research limitations, the researcher intends to provide suggestions for further researchers, that is as as follows: a). It is expected to increase the observation period of the research, expand the population and sample, and add other factors or variables that can affect earnings management. b). It is expected to use moderating variables in order to analyze the factors that affect the independent variables on the dependent variables. c). It is expected to add variables that can strengthen the influence of the independent variables on the dependent variables. d). It is expected to expand the sectors studied so that the range of information produced is greater. e). It is expected to help companies in making decisions related to Earnings Management and companies should pay attention to the level of Profit Management by managing and utilizing funding from debt or loans properly in order to increase profits for the company .

Thank-you note

This research would not have happened without the support of my parents and my own hard work. I would like to thank my parents and my self, for being able to fight hard so far and continue to try until finally being able to complete this research

THE INFLUENCE OF *ENVIRONMENTAL SOCIAL GOVERNANCE* AND *ECO-EFFICIENCY* ON FIRM VALUE MEDIATED BY FINANCIAL PERFORMANCE IN MINING SECTOR COMPANIES LISTED ON THE INDONESIA STOCK EXCHANGE FOR THE PERIOD 2019-2023

Indri Kurnia Ardiyanti[1], Veronika Santi Paramita[2]

[12]Universitas Jenderal Achmad Yani,
Cimahi, Indonesia

Abstract

The mining sector remains a favorite among investors because it contributes significantly to the economy. However, mining activities are a major contributor to carbon emissions and deforestation in Indonesia, requiring companies to implement sustainable business practices through ESG and improved environmental efficiency. This study aimed to determine the effect of environmental social governance and eco-efficiency on firm value with financial performance as a mediating variable. The research method used is a quantitative method descriptive causality approach. The population consists of 71 mining companies listed on the Indonesia Stock Exchange. The sampling technique using purposive sampling resulted in 11 companies—statistical analysis using the panel data regression method and the sobel test. The results showed that: 1) ESG and Eco-efficiency have a positive effect on ROA; 2) ESG has a negative effect on firm value; 3) Eco-efficiency has no effect on firm value; 4) ROA has a positive effect on firm value; 5) Financial performance is not able to mediate the effect of ESG on firm value; 6) Financial performance can mediate the effect of Eco-efficiency on firm value; and 7) ESG, Eco-efficiency, and financial performance simultaneously affect firm value.

Keywords: *Environmental, Social, Governance (ESG); Eco-efficiency; ROA; Firm Value*

1. Introduction

The ESG concept is an assessment standard based on three main criteria: environmental, social, and governance. Research by Rahelliamelinda & Handoko (2024), Adhi & Cahyonowati (2023), Mudzakir et al. (2023), and Mauliddin & Subardjo (2022) shows that the application of ESG as a form of environmental responsibility for environmental damage problems can increase the trust and good image of the company in front of investors and stakeholders, so that it becomes a positive signal for investors to buy company shares and increase company value. Contrary to research by Xaviera & Rahman (2023), Romli & Abdurohim (2024), and Prayogo et al. (2023), the application of ESG has not become a significant factor in investment decisions because the practice is considered only a formality and requires a significant cost, which will reduce the dividends received by investors.

Eco-efficiency focuses on resource efficiency and environmental impact to increase the added value of products. Research by Anjarsari et al. (2023), Dewi & Rahmianingsih (2020), Kurnianta & Dianawati (2020), and Rais et al. (2020) shows that the application of *eco-efficiency* makes business activities effective because it can save costs and reduce waste and

pollution, thus becoming a competitive advantage and a positive signal for investors. After all, the company has the potential to achieve high profitability and provide a good image in the eyes of the public and investors. In contrast to the research results of Kurniasari & Cahyono (2025) and Yuliandhari et al. (2023), the application of *eco-efficiency* to reduce environmental impacts is still not the primary focus of investors when investing. Because many investors do not know in detail the application of environmental performance and the effect of financial benefits if they support the application of *eco-efficiency*, investment decisions are still based on how much profit investors will receive.

Financial performance is a significant factor for investors and shows the company's ability to generate profits from utilizing its assets. Investors still tend to see financial performance as the main factor in investment decisions because if the company's financial performance is increasing, it will impact the distribution of larger dividends. Research from Putra & Budastra (2023) and Sumarno et al. (2023) shows that implementing ESG is a wise step for companies in running a sustainable business as a form of responsibility to society, the social environment, and the government. Exemplary ESG implementation will help improve profitability, corporate image, and investor confidence. Thus, investors will consider ESG an indicator of investment decision-making and encourage stock purchases to increase company value. However, implementing ESG is costly and will pressure the company's finances if not managed properly. Based on research by Ajizah (2025) and Utami & Falah (2023), ESG implementation requires a long time and significant costs, so in the short term, it will affect the company's profitability. In addition, the frequent misalignment between ESG disclosure and real action will reduce investor confidence in the company. Financial performance can also be an indication of the success or failure of the implementation of *eco-efficiency*. According to research by Rais et al. (2020) and Savitri & Abdullah (2023), environmental and economic efficiency will reduce production costs and compliance costs to increase company profitability. This increase in profitability is a good signal for investors that by implementing *eco-efficiency*, the company's operating costs do not swell and will not reduce the profits distributed to investors, so that investors respond by buying company shares, which impacts increasing company value.

Based on the description above, the authors are interested in examining the effect of *environmental, social, governance,* and *eco-efficiency* on firm value mediated by financial performance in mining sector companies listed on the IDX for the 2019-2023 period.

2. Literature Review

2.1 Signaling Theory

Signaling Theory reveals an imbalance of information between two parties. According to this theory, there are three main elements in *signaling theory*: the signal giver, the signal itself, and the signal receiver. The information conveyed is an important element that investors need to describe the company's past, present, and future conditions (Kurnianta & Dianawati, 2020; Panggau & Septiani, 2017; Spence, 1973).

2.2 Stakeholder Theory

Based on the *Stakeholder theory*, company management needs to formulate and implement strategic steps to understand the needs and concerns of all stakeholders. This theory focuses on expanding the responsibility of companies that not only maximize profits for shareholders but must also meet the needs of other stakeholders (Freeman & McVea, 2006; Hariyanto & Ghozali, 2024).

ESG disclosure is a form of corporate transparency to stakeholders and supports business sustainability. Good ESG practices, such as resource efficiency, waste management, and transparent governance, can reduce operational costs and increase profitability, particularly *return on* assets (ROA). A high ROA reflects a company's effectiveness in managing assets into profit. A high ESG score also improves the company's reputation and attracts investors and business partners, facilitating access to funding. Previous research shows that ESG has a positive impact on profitability, supporting the theory that attention to stakeholder interests strengthens corporate profitability (Azkiya et al., 2024; Brigham & Houston, 2019; Masditok et al., 2024; Nisa et al., 2023; Putra & Budastra, 2023).
H_1: ESG has a positive effect on ROA

The application of *eco-efficiency* emphasizes environmental responsibility and economic efficiency by minimizing the negative impact of production while maintaining product value. This concept encourages companies to increase productivity while reducing operational costs through environmentally friendly practices. Reduced environmental impacts contribute to cost efficiency and increased profits (Atiningsih & Setiyono, 2023; Lorenza & Sudrajat, 2024; WBCSD, 2006). Research conducted by Daud et al (2023), Meutia et al (2019), and Rais et al. (2020) shows that *eco-efficiency* has a positive effect on ROA, because good environmental practices can increase company profitability.
H_2: *Eco-efficiency* has a positive effect on ROA

ESG is a sustainable business practice that includes environmental, social, and governance aspects, and serves as a means of corporate transparency to stakeholders and consideration for investors. Based on *stakeholder theory*, the implementation of ESG reflects the company's responsibility to stakeholders and supports sustainable relationships (Romli & Abdurohim, 2024). Firm value reflects investors' perception of the company's performance and is closely related to the stock price. An increase in ESG score will improve the company's image, increase share demand, and drive up the company's value. Previous research conducted by Mudzakir et al. (2023), Pramisti & Istiqomah (2024), and Rahelliamelinda & Handoko (2024) shows that ESG has a positive effect on firm value.
H_3: ESG has a positive effect on firm value

Eco-efficiency is a concept that combines economic and environmental efficiency to increase productivity while reducing costs and environmental impacts. This strategy strengthens the company's competitiveness through production efficiency, waste reduction, and using environmentally friendly resources. Based on *stakeholder theory*, environmental responsibility will build stakeholder trust, which impacts increasing company value. Previous research conducted by Anjarsari et al. (2023), Dewi & Rahmianingsih (2020), Kurnianta & Dianawati

(2020), and Savitri & Abdullah (2023) shows that *eco-efficiency* has a positive effect on firm value.
H_4: *Eco-efficiency* has a positive effect on firm value

Return on assets (ROA) reflects the effectiveness of the company in managing assets to generate profits. A high ROA indicates good managerial performance, improves the company's reputation, and impacts increasing stock demand and company value. ROA is an important signal for investors in assessing company efficiency, and research shows that ROA has a positive effect on firm value (Kumala & Priantilianingtiasari, 2024; Pramisti & Istiqomah, 2024; Putra & Budastra, 2023; Rais et al., 2020; Setiawati et al., 2023; Udjaili et al., 2021).
H_5: ROA has a positive effect on firm value

Companies implementing ESG practices have good growth prospects because they are committed to sustainability and social, environmental, and governance responsibilities. ESG implementation contributes to the company's financial efficiency by reducing production costs and increasing profitability. Based on *signaling theory* and *stakeholder theory*, good ESG disclosure provides positive signals to stakeholders, increases *return on* assets, and strengthens the company's image and reputation. An increase in ROA drives up the demand for shares and their selling price, increasing the company's value. In addition, high profitability allows companies to fund ESG activities more easily. Previous research conducted by Putra & Budastra (2023) and Sumarno et al. (2023) shows that ROA can mediate the influence of ESG on firm value.
H_6: ROA can mediate ESG on firm value.

Eco-efficiency encourages companies to produce high-value products by minimizing environmental impacts, resource use, and operational costs. This practice strengthens production efficiency, provides positive signals to the public, and improves stakeholders' perception of the company. A good reputation makes the company more attractive to investors, increasing demand and share prices, and impacting company value. Research conducted by Rais et al. (2020) and Savitri & Abdullah (2023) shows that *return on assets* (ROA) can mediate the effect of *eco-efficiency* on firm value, because environmental efficiency contributes to increasing profitability, so that it can attract investment and maintain its long-term value.
H_7: ROA can mediate *Eco-efficiency* on firm value.

Based on the literature review above, the paradigm of this study is as follows.

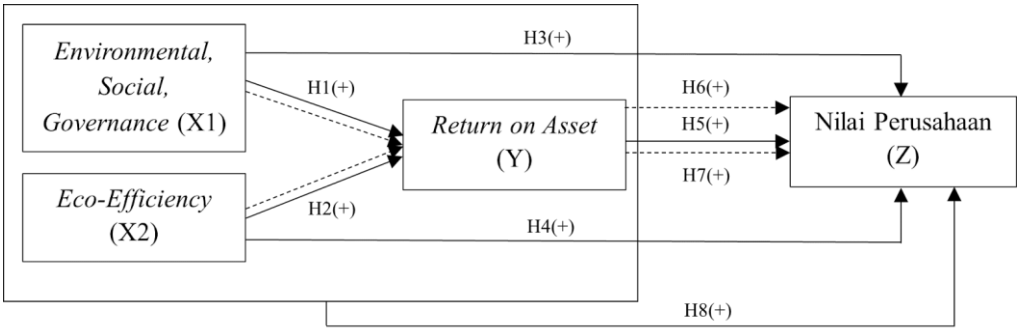

Figure 1. Research Model

3. Research Methodology

This study uses a quantitative method with a descriptive causality approach. The population of this study was all companies included in the mining sector and listed on the IDX during the 2019-2023 period, a total of 71 companies. The sampling technique for this study was *purposive sampling,* and a sample of 11 companies was selected. The data analysis technique uses the panel data regression method and the sobel test. This study uses E-views 10 software to perform statistical analysis. The statistical model equation is as follows:

$$Z = \alpha + \beta_{(1)}\, X_{(1)} + \beta_{(2)}\, X_{(2)} + e$$

$$Y = \alpha + \beta_{(1)}\, X_{(1)} + \beta_{(2)}\, X_{(2)} + \beta_3 Z + e$$

The operationalization of variables is as follows:

Table 1. Variable Operationalization

Variable	Measurement Method	Scale
Environmental, Social, and Governance (ESG) (X1)	ESG=Nilai Pengungkapan ESG Total Pengungkapan Maksimal	Ratio
Eco-efficiency (X2)	The criteria for dummy variables are as follows: • Value 1 = the company has an ISO 14001 certificate • Value 0 = the company does not have an ISO 14001 certificate	Nominal
Company Value (Y)	Tobin's Q= Total Market Value+Hutang Total Aktiva	Ratio
Financial Performance (ROA) (Z)	ROA=Laba BersihTotal Aktivax100%	Ratio

4. Research Results

4.1 Classical Assumption Test

Table 2. Classical Assumption Test Results

Classical Assumption Test	Method	Criteria	P Value	Conclusion
		Model 1		
Normality Test	*Jarque-Bera*	> 0,05	0,2197	Normal Distribution
Multicollinearity Test	VIF	< 10	• ESG: 6,9879 • ECO: 8,4252	No Multicollinearity
Heteroscedasticity Test	*Glejser* Test	> 0,05	- ESG: 0,0817 - ECO: 0,4714	No Heteroscedasticity

Autocorrelation Test	*Durbin Watson*	-2>DW<+2	1,0263	No Autocorrelation
Model 2				
Normality Test	*Jarque-Bera*	> 0,05	0,1737	Normal Distribution
Multicollinearity Test	VIF	< 10	• ESG: 2,1655 • ECO: 4,4121 • ROA: 2,0150	No Multicollinearity Occurs
Heteroscedasticity Test	*Glejser* Test	> 0,05	- ESG: 0,0518 - ECO: 0,4756 - ROA : 0,9011	No Heteroscedasticity
Autocorrelation Test	*Durbin Watson*	-2>DW <+2	1,7445	No Autocorrelation

Source: Data processing results with Eviews 10, 2025

Based on Table 3, the regression model has passed the classical assumption test.

4.2 Panel Data Regression

Table 3. Regression Model Selection

	Model 1 ***P-value***	**Model 2** ***P-value***
Chow Test Results	0,0000	0,0000
Hausman Test Results	0,3479	0,7912
Lagrange Multiplier Test Results	0,0002	0,0000

Source: Data processing results with Eviews 10, 2025

The Chow Test *p-value* of equations 1 and 2 is smaller than 0.05, so the model chosen is the *fixed effect model* (FEM). Followed by the Hausman Test, the *p-value* of models 1 and 2 is greater than 0.05, so the model chosen is the *random effect model* (REM). Followed by the LM Test, the *p-value* of models 1 and 2 is less than 0.05. Therefore, the model chosen is the *random effect model* (REM).

Table 4. Panel Data Regression Results Model 1 and 2

Dependent variable: Z_ROA					
Variable	**Coefficient**	**Std. Error**	**t-Statistic**	**Prob.**	**Conclusion**
C	-5.313931	0.782092	-6.794513	0	
ESG	1.576834	0.759254	2.07682	0.0436	Accepted
ECO	1.400548	0.641928	2.181785	0.0344	Accepted
Dependent variable: Y_TOBIN'S Q					
Variable	**Coefficient**	**Std. Error**	**t-Statistic**	**Prob.**	**Conclusion**
C	0.323992	0.285185	1.136076	0.2621	
ESG	-0.386109	0.1607	-2.402675	0.0206	Accepted

ECO	0.365396	0.215701	1.693994	0.0973	Rejected
ROA	0.067249	0.032449	2.072445	0.0441	Accepted
F test				**0,0108**	
Adj R^2				**0,1691**	

Source: Data processing results with Eviews 10, 2025

Based on the results of the panel data regression analysis above, the regression equation models one and two are as follows:

$$Z = -5.3140 + 1.5768X1 + 1.4005X2$$
$$Y = 0.3240 - 0.3861X1 + 0.3654X2 + 0.0672Z$$

4.3 T test

1. The ESG regression coefficient value of 1.5768, *probability* 0.0436, is smaller than 0.05, meaning that ESG affects ROA in a positive relationship direction.
2. The ECO regression coefficient value of 1.4005, *probability* 0.0344, is smaller than 0.05, meaning that ECO affects ROA with a positive relationship direction.
3. The ESG regression coefficient value is -0.3861, and the *probability of* X1 on Y is 0.0206, which is smaller than 0.05, meaning that ESG affects the company's value in the direction of a negative relationship.
4. The ECO regression coefficient value of 0.3654, the *probability* X2 to Y of 0.0973 is greater than 0.05, meaning that ECO has no effect on firm value with a positive direction of relationship.
5. The ROA regression coefficient value is 0.0672, and the *probability of* Z against Y is 0.0441, which is smaller than 0.05. This means that ROA has an effect on firm value with a positive relationship direction.

4.4 F test

The *probability* value of the F test is 0.0108< 0.05, then H0 is rejected, meaning that the ESG, ECO, and ROA variables jointly affect firm value.

4.5 Coefficient of Determination

The *Adjusted R-Square* value is 0.1691. This value indicates that the ESG, ECO, and ROA variables can explain 16.91% of the variation in endogenous variables.

4.6 Sobel Test

Table 5. Sobel Test Results

Variable	T-count	T-table	Decision
X1_ESG	1,467	2,007	Does not mediate
X2_ECO	2,072	2,007	Mediate

Source: Data processing results with Eviews 10, 2025

Based on the table above, the t-table value is 2.007. The t-count result of the ESG variable is obtained at 1.467 < 2.007, so *return on assets* cannot mediate the effect of ESG on firm value. While the t-count result of the ECO variable is obtained at 2.072 > 2.007, meaning that *return on assets* can mediate the effect of ECO on firm value.

5. Discussion

5.1 Effect of Environmental Social Governance on Return on Assets

The test results show that ESG has a positive effect on ROA. These results indicate that sustainable business practices with attention to environmental, social, and governance issues directly contribute to increasing company profitability. In line with signal theory, an increase in the average ESG performance of mining sector companies is a positive signal to investors that the company is concerned with non-financial aspects by continuing to increase revenue and profit without neglecting its responsibility to the broader community. In addition, ESG is a means of communication between companies and stakeholders (Putra & Budastra, 2023; Pramisti & Istiqomah, 2024). The results of this study are in line with research conducted by Pramisti & Istiqomah (2024), Putra & Budastra (2023), and Aydogmus et al. (2022), which shows that commitment to sustainability can encourage more optimal profitability.

5.2 Effect of Eco-efficiency on Return on Assets

The test results show that *eco-efficiency* has a positive effect on ROA. This result aligns with stakeholder theory that, in its strategic plan, the company must understand its responsibilities and create value for stakeholders. Reducing negative environmental impacts due to production activities will reduce production costs and compliance costs, so that it does not significantly affect the company's profitability and can maximize its profits for the welfare of investors and stakeholders (Daud et al., 2023; Meutia et al., 2019). The results of this study are in line with research conducted by Daud et al. (2023), Meutia et al. (2019), Rais et al. (2020), and Savitri & Abdullah (2023)

5.3 The Effect of Environmental Social Governance on Company Value

The test results show that ESG has a negative effect on firm value. According to Prabawati & Rahmawati (2022), the application of ESG in developing countries has not been fully implemented, considering that its application is expensive and not profitable, so in the short term, it will reduce the company's operating costs. In addition, ESG activities have likely not been communicated to stakeholders, so they do not consider ESG activities to be a positive signal that will encourage the purchase of company shares. The lack of investors who buy shares will cause the stock price to fall and decrease the company's value. Prayogo et al. (2023) and Finrely (2024) also revealed the same results, stating that ESG shows significant results but has a negative relationship direction, so that ESG implementation will affect the decline in firm value.

5.4 The Effect of Eco-efficiency on Firm Value

The test results show that *eco-efficiency* does not affect firm value. Although the ISO 14001 certificate indicates the implementation of an environmental management system according to international standards, research shows that *eco-efficiency* has not had a direct impact on increasing the market value of the company, so it is not in line with the initial hypothesis (Yuliandhari et al., 2023). Investors consider financial factors rather than environmental aspects when making investment decisions (Kurniasari & Cahyono, 2025). In addition, the

wider community has not understood the benefits of implementing *eco-efficiency, so it has not impacted* the company's reputation to increase its market value. This is in line with research conducted by Apriandi & Lastanti (2023), Damas et al. (2021), Kurniasari & Cahyono (2025), and Yuliandhari et al. (2023), which states that *eco-efficiency* has no direct effect on firm value.

5.5 Effect of Return on assets on Firm value

The test results show that ROA has a positive effect on firm value. ROA is an indicator that measures the company's ability to generate profits from its total assets (Kumala & Priantilianingtiasari, 2024). If the company achieves a high level of profit and healthy financial prospects, it will provide benefits through dividends or an increase in share prices (Badollah, 2024; Rais et al., 2020) This is in line with research conducted by Badollah (2024), Kumala & Priantilianingtiasari (2024), Rais et al. (2020), and Savitri & Abdullah (2023) that good financial performance characterized by a high level of profitability affects the increase in firm value.

5.6 The effect of Environmental Social Governance on Firm Value mediated by Return on Assets

Based on the sobel test results, ROA cannot mediate the effect of ESG on firm value. This result illustrates that ESG cannot affect firm value despite increased *return on assets*. The increase in corporate profits is thought to be reallocated to invest in ESG activities, which in its implementation often requires high costs, so that corporate profits have no impact on shareholders (Ajizah, 2025). In other words, the amount of retained earnings allocated for ESG investment is greater than the earnings distributed to shareholders, so that investors catch the signal and there is a decrease in stock purchases, not an increase in company value. Therefore, in line with research conducted by Ajizah (2025) and Utami & Falah (2023), it shows that financial performance reflected by *return on assets* cannot mediate the influence of ESG on firm value.

5.7 The effect of Eco-efficiency on Firm Value mediated by Return on Assets

Based on the sobel test results, ROA can mediate the effect of *eco-efficiency* on firm value. These results illustrate that *eco-efficiency* will affect firm value by improving the company's financial performance, as reflected in the *return on assets.* Implementing *eco-efficiency* is a company strategy to optimize the welfare of shareholders and stakeholders. Positive responses from investors, the environment, and society to companies with good reputations and healthy financial conditions can strengthen the company's position (Savitri & Abdullah, 2023; Rais et al., 2020). Applying *eco-efficiency* can reduce production and compliance costs, which affects the increase in profitability and attracts investors to buy company shares because it provides optimal benefits in the form of dividends. Thus, the more investors buy the company's shares, the more the company's reputation and market value will increase. These results are reinforced by the results of research conducted by Rais et al. (2020) and Savitri & Abdullah (2023) that *eco-efficiency* cannot affect firm value directly, but requires an intervention variable, namely, financial performance, to be able to increase firm value.

5.8 The Effect of ESG, Eco-efficiency, and Return on Assets Simultaneously on Firm Value

Based on the F test, ESG, *eco-efficiency*, and *return on assets* simultaneously affect firm value. The *adjusted R-square* value is 16.91%, indicating that the company value can be explained by ESG, *eco-efficiency, and return on assets* by 16.91%. The remaining 83.09% is explained by other variables not examined.

6. Conclusion

Environmental, Social, and Governance (ESG) and Eco-efficiency positively affect financial performance as proxied by Return on Assets. ESG has a negative effect on company value. Eco-efficiency does not affect company value. Return on assets (ROA) has a positive effect on company value. ROA is unable to mediate the effect of ESG on company value. However, ROA can mediate the effect of eco-efficiency on company value. Simultaneously, ESG, eco-efficiency, and ROA significantly affect company value, with an effect size of 16.91%.Based on the discussion above, this study still has limitations in the sample size that cannot describe the overall condition of the mining sector, so that further research is expected to expand the sample coverage or replace it with other industrial sectors in order to find out the condition of the research results more accurately and thoroughly.

Abstract

The purpose of this study is to evaluate various aspects of audit quality in Indonesia, with a particular emphasis on auditor competence, independence, and audit costs at public accounting firms in Bandung.A quantitative approach is applied using descriptive, associative, and causal methods. To collect data, auditors from 17 randomly selected public accounting firms were used as respondents in a closed-ended questionnaire based on a Likert scale. The data were analyzed using SEM-PLS techniques together with the SmartPLS 4 tool. The results of the analysis showed that auditor competence and independence greatly influence audit quality. Conversely, audit fees do not significantly affect audit quality, but they weaken the relationship between competence and audit quality. Meanwhile, audit fees do not moderate the relationship between independence and audit quality.These findings highlight the crucial role of auditor competence and objectivity in maintaining high audit quality, in line with Attribution Theory. Practically, companies should invest in improving auditor skills, ensure auditor independence, and establish audit fees that are fair and proportional. Future studies are encouraged to adopt a mixed-method approach.
Keywords: Audit Quality, Competence, Independence, Audit Fee and Public Accounting Firm.

1. Introduction

Indonesia faces pressing challenges in audit quality deterioration, highlighted by recurrent breaches involving accounting firms and professionals. For instance, the Financial Services Authority (OJK) penalized Anderson Public Accounting Firm and its auditor, Anderson Supari, in early 2024 for non-compliance with Article 21 of POJK No. 9/2023 on audit quality control. A similar case occurred at PT Wanaartha Life, where data manipulation amounting to IDR 12.1 trillion was discovered. Auditor Nunu Nurdiyaman and KAP KNMT received severe sanctions for violating POJK No. 13 of 2017, and auditor Jenly Hendrawan was deemed unqualified under OJK regulations.

The audit of PT Garuda Indonesia's financial statements conducted by KAP Tanubrata Sutanto Fahmi Bambang & Partners experienced a similar case. The investigation revealed that the auditors made mistakes by recognizing revenue prematurely, violating SA 315, SA 500, and SA 560. As a result, the KAP's practice license was revoked by the Ministry of Finance in 2019.Several factors contribute to the declining audit quality, including insufficient auditor competence and independence, as well as inappropriate audit fees. Fees that are too low can reduce the quality of the audit, while excessively high fees may compromise auditor independence (Indahsari et al., 2023).

Auditors with adequate competence and independence are capable of performing audits professionally and producing reliable reports (Maulana, 2020). However, in reality, there are still auditors who fail to detect errors or fraud in financial statements.

Table 1. Sanctioned Public Accounting Firms

No.	Public Accounting Firm	Sanction	Source
1.	Andersen Subri & Partners Public Accounting Firm	Sanctioned by OJK for non-compliance with regulations and lack of quality control in audits. Firm was suspended and prohibited from offering audit services during the sanction period	*OJK Jatuhkan Sanksi ke KAP Andersen Subri, Larang Audit Laporan Keuangan* www.cnbcindonesia.com
2.	Kosasih, Nurdiyaman, Mulyadi Tjahjo & Partners (KNMT)	Sanctioned for audit violations related to WAL's financial reports (2014–2019), failing to disclose high-risk insurance products. Violated POJK No. 13/2017.	*OJK Jatuhkan Sanksi ke KAP KNMT Gara-gara Laporan Keuangan WAL 2014-2019* www.cnbcindonesia.com
3.	Tanubrata, Sutanto, Fahmi, Bambang & Partners is part of the BDO International network, reflecting its connection to a global auditing standard.	Sanctioned for recognizing unearned revenue in Garuda's audit. Violated SA 315, 500, and 560. Received a one-year suspension from both MoF and OJK.	*Pelanggaran SA 315-560: KAP Tanubrata Sutanto Dibekukan Setahun Akibat Pendapatan Fiktif* www.cnbcindonesia.com
4.	Satrio, Bing, Eny & Partners	Sanctioned for issuing WTP opinion on misleading financial statements of PT SNP. Registration revoked; firm was banned from taking new clients.	*OJK Cabut Izin KAP Satrio Bing Eny Kasus Laporan Keuangan PT SNP* www.cnbcindonesia.com

Source: www.cnbcindonesia.com 2024

The table of sanctions imposed on Public Accounting Firms reveals that professional standard violations remain widespread. These include inaccurate revenue recognition, misleading audit opinions, and non-compliance with standards such as SA 315, SA 500, and SA 560. This indicates poor audit quality, mainly due to the auditors' lack of competence and independence.(Mahendra & Soedibyo, 2023).

The PPPK inspection results from the third quarter of 2022 showed that 61% of the 926 findings were violations of professional standards, most commonly found in SA 500, SA 315, and SA 530. Despite the increasing number of public accountants, most are over 50 years old, and serious violations continued to rise in 2023—one of which is linked to low audit fees.

These findings align with the research by (Septiana & Jaeni, 2021) and (Noormansyah, 2024), which shows that audit quality is improved by competence. Conversely, the research by (Lele Biri, 2019) and (Hasan Farid,2023.) shows no significant impact. Similarly, regarding independence, research results still show differences.

2. Literature Review

2.1 AttributionTheory

In 1958, Fritz Heider developed attribution theory, explaining that people interpret the reasons behind their own and others' actions by considering two main categories: internal (personal traits) and external (environmental influences) factors. Internal factors include an individual's personal characteristics such as ability, effort, personality, and motivation. External factors, on the other hand, relate to situations or conditions outside the individual, such as social pressure, rules, or the environment (Weiner et al., 2015,Utama & Rohman, 2023).

In the auditing context, attribution theory explains the way auditors link their judgments and behaviors to both internal and external elements. Factors like professional competence and independence significantly influence the decisions auditors make during an engagement. Auditors with strong competencies possess the technical abilities needed for precise evaluations, while those who uphold independence are more likely to remain objective and resist external pressures that could undermine the reliability of audit outcomes. (Murdiansyah et al., 2021).

However, attribution theory also recognizes that external factors such as audit fees can influence auditor behavior. Audit fees serve as a situational factor that can change the way auditors act. For example, if audit fees are low, auditors may feel that they are not adequately rewarded and may be less committed to performing the audit to its full potential. This shows how audit fees can reduce auditors' motivation even though they have good competence and independence (Murdiansyah et al., 2021).

Attribution theory helps explain how auditors seek causation from the events they observe during an audit. Auditors tend to try to understand what factors led to a particular outcome or decision, either from within themselves (competence and independence) or from external conditions (such as management pressure or audit fees). This explains how auditors evaluate their audit results based on an assessment of the causes they deem relevant - whether it is due to personal ability (competence) or external pressures they face (Weiner et al., 2015).

Auditors' interpretation of why events occur during an audit process (such as mistakes made or problems successfully identified) is fundamentally shaped by whether they assign responsibility to personal capabilities or outside influences. When examining audit deficiencies, professionals might attribute these either to their own skill gaps and knowledge limitations (internal attribution) or to organizational constraints and client pressures that compromise their impartiality (external attribution). These causal judgments subsequently influence both how auditors rationalize their findings and what corrective measures they implement in subsequent engagements (Weiner et al., 2015).

Attribution theory provides an important framework in explaining how auditors respond to various factors that influence their decisions and behavior in the audit process. By separating internal (competence and independence) and external (audit fees and environmental pressures) factors, the theory helps to understand why auditors act in certain ways. Auditors attribute their audit results to internal factors such as their ability and integrity, or to external factors that influence their behavior, such as audit fees (Utama & Rohman, 2023; Weiner et al., 2015).

Attribution theory has been extensively applied in auditing research to understand how auditors form judgments, evaluate performance, and make decisions. The theory focuses on the cognitive processes underlying auditors' assessments and behavioral responses, with particular emphasis on how intrinsic factors predominantly influence their professional capabilities (Ali Zaputra & Marlina, 2022)

3. Methodology

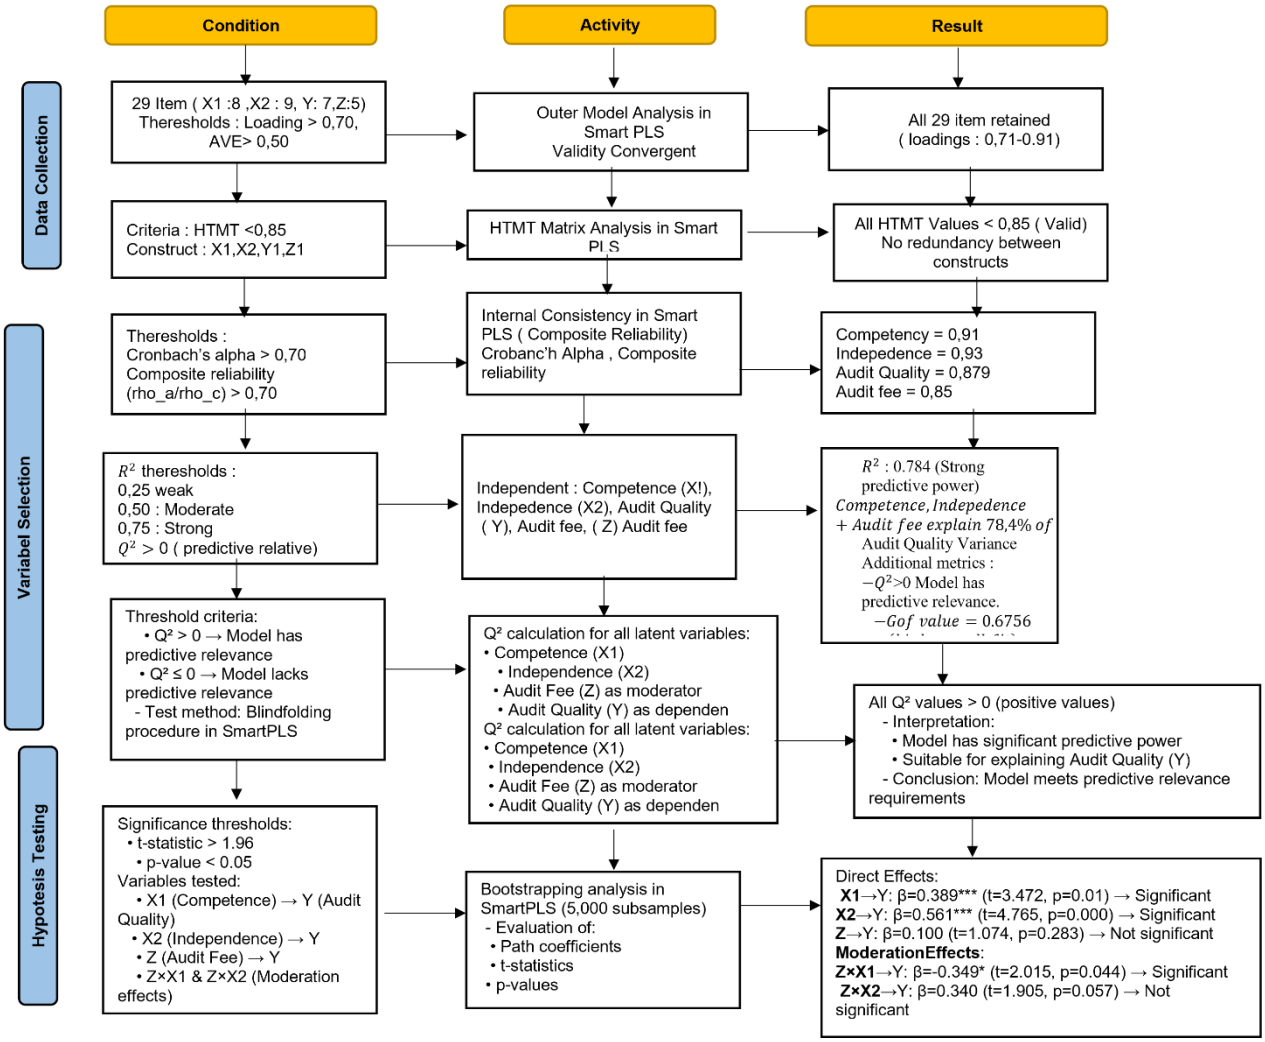
This study is a quantitative research that applies a descriptive and associative approach to evaluate how auditor competence and independence affect audit quality, where audit costs serve as a moderating variable. The main data source was obtained through the distribution of questionnaires directly to research respondents.

This study involved all 35 public accounting firms registered with IAPI Bandung. The sample was selected using simple random sampling, which means that everyone in the population had an equal chance of being selected. For this study, Google Forms and physical questionnaires were used to collect data.

The instrument used in this study is a Likert scale questionnaire, which measures the respondents perceptions of the research variables. The instrument is tested for validity (convergent and discriminant validity) and reliability (Cronbach's Alpha and Composite Reliability) to ensure data quality.

Inferential statistical analysis (SEM) was used to analyze the data, and SmartPLS 4 software was used to perform the analysis (Ghozali, 2024). Figure 1 shows the procedure used to process and analyze the data.

Figure 1.Diagram Condition-Activity-Result Methodology



Source: Processed (2025)

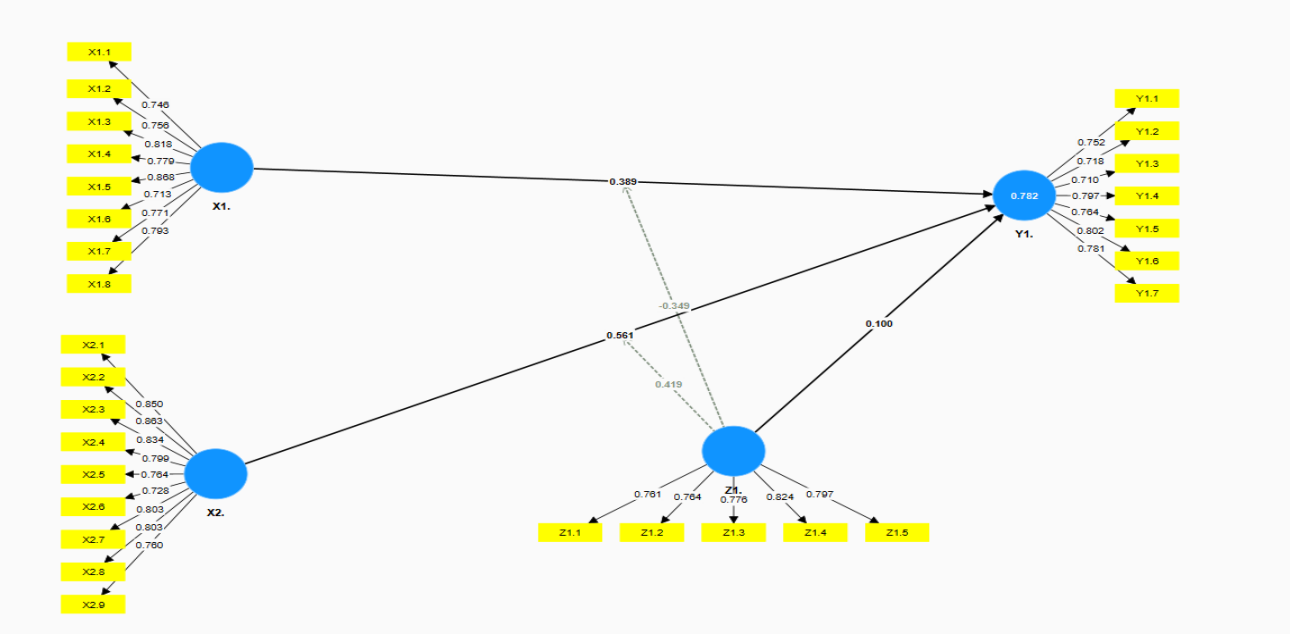
4. Result and Discussion

Validity Test Results

4.1 Convergent Validity Test Results

Convergent validity testing was conducted to measure the consistency of indicators with the constructed construct. Indicators were considered valid if they showed an outer loading value >0.70, although in scale development research, a minimum limit of 0.50 was still tolerable(Ghozali, 2024).

Figure 2. PLS Algorithm Final Evaluation Result



Source: SmartPLS 4 Output, processed (2025)

Discriminant Validity Test Results

Discriminant validity was assessed using the HTMT (Heterotrait-Monotrait Ratio) criterion, which is among the most recommended and up-to-date methods in PLS-SEM.

- HTMT value < 0.85 (or < 0.90 in some literature) → Discriminant validity is satisfied; constructs are empirically distinct.
- HTMT value ≥ 0.85 (or ≥ 0.90) → Discriminant validity is not satisfied; constructs may not be truly different.

Figure 3. Discriminant Validity Test Results

Discriminant validity - Heterotrait-monotrait ratio (HTMT) - Matrix

	X1.	X2.	Y1.	Z1.	Z1. x X2.	Z1. x X1.
X1.						
X2.	0.573					
Y1.	0.806	0.796				
Z1.	0.386	0.346	0.431			
Z1. x X2.	0.052	0.190	0.099	0.165		
Z1. x X1.	0.078	0.066	0.097	0.244	0.733	

Source: SmartPLS 4 Output, 2024

Based on Figure 2, all HTMT values are below 0.85, which means all constructsCompetence, Independence, Audit Quality, and Audit Fee—are empirically distinct. This indicates the model is valid in terms of construct separations.

4.2 Reliability Test (Cronbach's Alpha)

Internal consistency of constructs was measured through reliability testing using Cronbach's Alpha and Composite Reliability. According to (Ghozali, 2024), a construct is considered reliable when it meets the following conditions:

- Cronbach's Alpha > 0.70
- Composite Reliability > 0.70

Table 6. Reliability Test Results

Variable	Cronbach's Alpha	rho_A	Composite Reliability
Competence	0.91	0.917	**0.926**
Independence	0.93	0.933	**0.942**
Audit Quality	0.879	0.882	**0.906**
Audit Fee	0.85	0.861	**0.892**

Source: Processed SmartPLS 5 Output, 2025

From the table above, all variables have high reliability, with values > 0.85. This indicates the instruments used are internally consistent and reliable.

4.3 Structural Model Test (Inner Model)

The structural model test evaluates the causal relationship between latent variables using the following criteria:

- R-Square (R^2)
- Q-Square (Q^2)
- Goodness of Fit (GoF)

4.4 R-Square Test Result

Table 7. R-Square Test Result

Variabel	R-square
Kualitas Audit (Y)	0.784

Source: SmartPLS 4 Output, 2025

The R-Square value = 0.784, which means that 78.4% of the variance in Audit Quality can be explained by the independent variables Competence, Independence, and the moderating variable Audit Fee.

4.5 Q-Square Test Result

Table 8. Q-Square Test Result

Construct cross-validated redundancy - Total			
	SSO	SSE	Q^2 (=1-SSE/SSO)
X1.	488.000	455.285	0.067
X2.	549.000	517.671	0.057
Y1.	427.000	250.818	0.413
Z1.	305.000	305.000	0.000

Source: Processed SmartPLS 5 Output, 2025

This model is considered to have good predictive ability, as seen from all latent variable Q^2 values greater than 0.
This means the constructs used are relevant in explaining the variation in the dependent variable (Audit Quality).

4.6 Goodness of Fit (GoF) Test Result

GoF is used to assess the overall model fit and its capability to explain empirical data (Ghozali, 2015).
The value is calculated using the formula:

GoF=Average AVE×R2GoF

GoF=Average AVE×R2

- AVE Values:
  - Competence = 0.612
  - Independence = 0.642
  - Audit Quality = 0.580
  - Audit Fee = 0.622
  - Moderation (Z*X1) = 1
  - Moderation (Z*X2) = 1
- R^2 = 0.784
- Average AVE = (0.612 + 0.642 + 0.580 + 0.622 + 1 + 1) / 6 = 0.7427
- Gof = $\sqrt{Com\ x\ R^2}$

- $= \sqrt{\frac{0{,}612 + 0{,}642 + 0.58 + 0.622 + 1 + 1}{6}}$ x 0.78

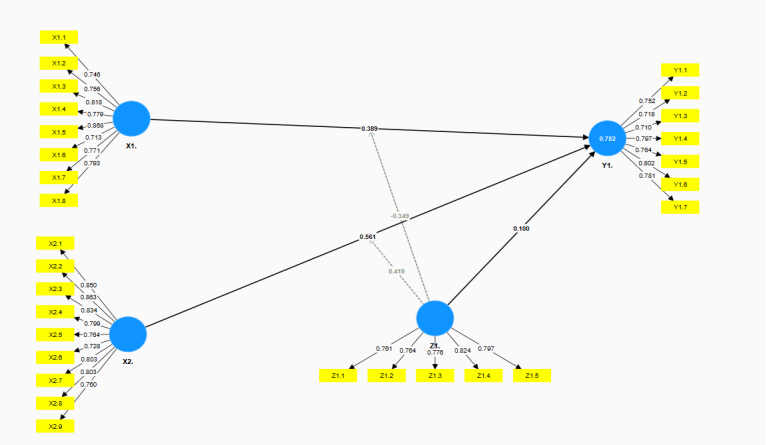
  = 0,6756

Interpretation: GoF = 0.6756 → indicates high overall model fit (above 0.36 threshold).

4.7 Hypothesis Testing Results

This study used the bootstrapping method in SmartPLS to evaluate the influence between constructs. This was done by looking at the coefficient of determination and t-statistic values; the hypothesis was accepted if the p-value was less than 0.05. The SmartPLS bootstrapping results are shown in the following figure.

Figure 4. Bootstrapping Test Results



Source: SmartPLS Output 4, 2025

P-values and T-statistics are used in the bootstrapping process with path coefficient output to determine whether independent variables significantly influence dependent variables or whether moderator variables strengthen or weaken the relationship between the two. The bootstrapping results with T-statistics and P-values are shown in the following table.

Table 9. Path Coefficient Test Results

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values
X1. -> Y1.	0.389	0.396	0.112	3.472	0.001
X2. -> Y1.	0.561	0.54	0.118	4.765	0
Z1. -> Y1.	0.1	0.121	0.094	1.074	0.283

Source: SmartPLS Output 4, 2025

Based on Table 9 , the results of hypothesis testing on the direct influence using bootstrapping can be explained as follows:

1.The analysis results show that the Competence variable (X1) has a positive effect on Audit Quality (Y) with a path coefficient of 0.389. The T-statistic value of 3.472 (>1.96) and significance of 0.01 (<0.05) confirm a statistically significant effect.

2.The research findings reveal that Independence (X2) has a strong positive influence on Audit Quality (Y) with a coefficient of 0.561. This is supported by a T-statistic value of 4.765 (>1.96) and a significance level of 0.000 (<0.05), indicating a highly significant relationship.

3.For the Audit Cost (Z) variable, although it shows a positive path coefficient of 0.100 on Audit Quality (Y), the T-statistic value of 1.074 (<1.96) and significance level of 0.283 (>0.05) indicate that the influence is not statistically significant.

4.8 Moderation Test Results

Table 10. Moderation Path Coefficient Test Results

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values
Z1. x X2. -> Y1.	0.419	0.34	0.22	1.905	0.057
Z1. x X1. -> Y1.	-0.349	-0.277	0.173	2.015	0.044

Source: SmartPLS Output 4, 2025

1.The results of the moderation analysis revealed that Audit Costs (Z) significantly moderated the effect of Competence (X1) on Audit Quality (Y), with an interaction coefficient of -0.349 (T=2.015 > 1.96; p=0.044 < 0.05). These findings indicate that Audit Costs play a significant moderating role in this relationship.

2.In contrast to the previous finding, the moderating effect of Audit Costs (Z) on the relationship between Independence (X2) and Audit Quality (Y) is not statistically significant, although it shows a positive coefficient of 0.340 (T=1.905 < 1.96; p=0.057 > 0.05). Thus, Audit Costs were not found to moderate the relationship between Independence and Audit Quality.

4.9 Disscusion

Competence as a Determinant of Audit Quality

Statistical analysis proves a significant positive influence between auditor competence and audit quality. The T-statistic value exceeds the threshold of 1.96, and the P-value is below 0.05, indicating that the hypothesis is accepted. This finding not only supports the proposed hypothesis but also confirms the theoretical proposition that an increase in auditor competence is directly proportional to an increase in audit quality through three main mechanisms: risk identification ability, proper execution of audit procedures, and reliability of audit results.

Independence as a Determinant of Audit Quality

The analysis indicates that auditor independence has a significant positive effect on audit quality. The statistical test results show that independence meets the requirements for hypothesis acceptance. This suggests that independent auditors are more likely to maintain objectivity, perform their duties fairly, and produce accurate audit reports. Independence is essential to ensure that auditors are not influenced by external parties during the audit process.

Audit Fee Impact on the Quality of Audit Services

Statistical analysis revealed no significant effect of audit fees on audit quality.The T-statistic value is below 1.96 and the P-value is greater than 0.05, meaning the hypothesis is rejected. This finding rejects the initial hypothesis and implies that non-monetary variables such as professional integrity and compliance with auditing standards may play a greater role in ensuring audit quality than the amount of audit fees.

The Moderating Role of Audit Fees Between Auditor Competence and Audit Quality

The moderation analysis indicates that audit fees (Z) significantly moderate the relationship between auditor competence (X1) and audit quality (Y), with an interaction coefficient of -0.349. This is evidenced by a T-statistic of 2.015 (exceeding the 1.96 threshold) and P-value of 0.044 (below α=0.05), statistically confirming the moderating effect. These findings demonstrate that audit fees serve as a significant moderator variable influencing the competence-audit quality association.

The Moderating Role of Audit Fees Between Independence and Audit Quality

The moderation test results indicate that audit fees (Z) do not significantly moderate the relationship between auditor independence (X2) and audit quality (Y). This is evidenced by a non-significant moderation coefficient of 0.34 (T-Statistic = 1.905 < 1.96; P-Value = 0.057 > 0.05). Therefore, it can be concluded that audit fees do not play a relevant moderating role in the independence-audit quality relationship, neither strengthening nor weakening its effect.

5. Conclussion

Using a case study at a public accounting firm in Bandung, this study aims to examine the relationship between competence and independence on audit quality, with audit costs as a moderating variable. The respondents consisted of 61, junior auditors, senior auditors, supervisors, managers, and partners. The data were analyzed using SmartPLS 4. The hypothesis testing results led to the following conclusions:

1. Auditor competence markedly influences audit quality, as heightened expertise correlates with superior outcomes. This underscores the pivotal role of technical proficiency and experiential knowledge in ensuring audit reliability.
2. Effect of Independence on Audit Quality
   The analysis confirms that auditor independence significantly affects audit quality. Professionals who maintain independence demonstrate superior capability in conducting objective and unbiased assessments, thereby positively enhancing audit outcomes.

3. Non-Significance of Audit Fees
   The study reveals no significant impact of audit fees on audit quality. This implies that financial compensation levels do not determine audit quality, as auditors consistently apply professional standards and ethical principles unaffected by monetary factors.
4. Moderating Role of Audit Fees
   Audit fees serve as a statistically significant moderator in the competence-audit quality relationship. The analysis demonstrates that fee structures can amplify or attenuate the effect of auditor competence on audit quality, with the moderating effect being statistically significant in this study context.
5. Audit fee does not moderate the effect of independence on audit quality.
   The audit fee received does not influence the relationship between independence and audit quality. Independence remains an internal factor that consistently contributes to audit outcomes regardless of fee levels.

THE INFLUENCE OF *FLASH SALES* AND FEAR OF MISSING OUT ON IMPULSIVE BUYING BEHAVIOR OF LAZADA USERS (A STUDY ON GENERATION Z IN BOGOR CITY)

Wulan Maudi Rahmadani[1], Oktori Kiswati Zaini[2,*] and Arie Wibowo Irawan[3]

[1]Pakuan University, Indonesia
[2] Pakuan University, Indonesia
[3]Pakuan University, Indonesia

Abstract

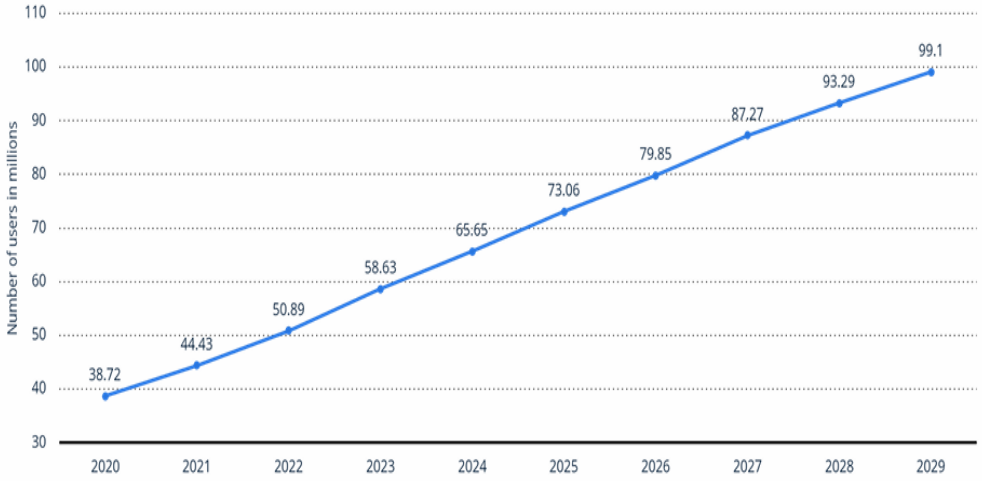
This research aims to analyze the influence of flash sales and fear of missing out on impulsive buying behavior among Lazada application users within Generation Z in Bogor City. This is a quantitative study. Data collection was conducted through a questionnaire using a Likert scale of 1-4, with a sample of 100 respondents from Generation Z who use the Lazada application in Bogor City. The data were analyzed using Structural Equation Modeling-Partial Least Squares (SEM-PLS) with the assistance of SmartPLS 4.0 software. The results show that flash sales have a positive and significant effect on impulsive buying behavior, with a T-statistic value of 2.896, while fear of missing out has a stronger and significant effect, with a T-statistic value of 9.444. These findings indicate that promotional factors and emotional factors significantly drive impulsive purchases among Generation Z Lazada user.

Keywords: Flash Sale, Fear of Missing Out, Impulsive Buying, Lazada

1. Introduction

Technological developments have affected many aspects of life, including in the world of business and marketing. Digitalization has driven significant growth in internet users, which then opens up new opportunities in buying and selling activities through social media and online shopping applications (*apps shop*). This has led to the formation of an online shopping trend that is now increasingly popular, especially in Indonesia.

Figure 1: Number of E-commerce users in Indonesia for the period 2020-2029



Source: Trade, 2024

Based on data from the (Ministry of Trade, 2024), the number of *e-commerce* users in Indonesia has continued to increase since 2020. In 2024, there were 65,65 million users and is expected

to reach 99,1 million users in 2029. This growth shows that *e-commerce* has great potential to influence consumer behavior, especially generation Z who are very familiar with the digital world.

Based on data from (Datanesia 2022) , presents data related to the statistics of the 10 regions with the highest e-commerce transaction growth in Indonesia. The city of Bogor has the highest e-commerce growth, reaching 113,5%. This indicates that Bogor City experienced a significant increase in online buying and selling activities during that period. However, the percentage of transactions conducted online relative to the total population was only 21,1%, the lowest among the nine other cities. Bekasi City and Depok City ranked second and third, with growth rates of 103,2% and 82,7%, respectively. Other major cities followed, including Central Jakarta, East Jakarta, and Yogyakarta, which ranked at the bottom with a growth rate of 16,3%.

Figure 2: E-commerce with the most visitors in Indonesia throughout 2023

Source: Databoks, 2024

Based on data from (Databoks 2024) on Figure 2, it can be seen that Lazada has not been able to achieve the highest number of visits. During January-December 2023, the Lazada e-commerce site cumulatively achieved around 762,4 million visits, which is significantly lower than Shopee, which achieved around 2,3 billion visits, and Tokopedia, which achieved around 1,2 billion visits. Meanwhile, Blibli's website recorded 337,4 million visits, and Bukalapak's website recorded 168,2 million visits. Lazada's performance still lags behind competitors such as Shopee and Tokopedia. In fact, the number of visits to Lazada's website has decreased by 46,72% (*year-to-date*).

One of the strategies used by *e-commerce* to attract consumers is flash sales. According to (Darwipat et al., 2020), a flash sale is a promotional technique that offers lower prices for a limited time, creating a sense of urgency and increasing traffic and purchases. Data from (Goodstats.id, 2023) states that 64% of respondents claimed to like flash sale promotions, making it one of the favorite types of promotions for consumers. It is known that flash sales held by Lazada are more frequent, namely as many as 4x every day, but still unable to attract consumer interest to be able to increase visits to this Lazada *e-commerce* application.

Table 1: Table Pre Survey on Generation Z in Bogor City Regarding Flash sale

Question	Answer		Total Sample
	Yes	No	
I feel that the discounts offered during	20	10	30

Lazada flash sales are very attractive and make me want to buy products	(66,7%)	(33,3)	
The amount of discount on products during Lazada's flash sales is enough to make me buy products that I don't really need	16 (53,3%)	14 (46,7%)	30
I feel that the duration of the flash sale that is currently taking place is long enough for me to decide to buy products at Lazada.	20 (66,7%)	10 (33,3)	30

Source: Primary Data, 2024

The results of a pre-survey conducted on 30 Generation Z respondents in Bogor City showed that 66,7% of respondents felt that the discounts offered during the Lazada flash sale were very attractive and encouraged them to buy products, while 53,3% of respondents stated that the size of the discount was enough to influence their decision to buy products that were not really needed. In addition, 66,7% of respondents also claimed that the duration of the *flash sale* was long enough to make a product purchase decision at Lazada.

In flash sales conducted by Lazada, generally every 4 hours and only 1 minute for big sale products, during harbonas for products that are very much in demand or are often contested and the prices offered are very cheap such as, Rp. 1, Rp. 99, Rp.100,000 for electronic goods and gadgets worth tens of millions. On the other hand, the fear of missing out (FoMO) phenomenon is also an important factor in online shopping behavior. Based on data from (Blibli, 2023), the level of FoMOs increases to 80% when promos are accompanied by " today for only" information, (Wisernotify, 2024) reported that 69% of consumers experienced FoMO and contributed to a 60% increase in sales.

Table 2: Table Pre Survey on Generation Z in Bogor City Regarding Fear of misisng out

Question	Answer		Total Sample
	Yes	NO	
I feel afraid of missing out on the great deals that Lazada offers if I don't buy the items I want right away.	22 (73,3%)	8 (26,7)	30
I worry if I miss the opportunity to get a gift or purchase bonus that Lazada offers.	19 (63,3%)	11 (36,7%)	30
I feel anxious if I don't keep up with the latest product trends offered by Lazada.	23 (76,7%)	7 (23,3)	30

Source: Primary Data, 2024

A pre-survey conducted to 30 generation Z respondents in Bogor City showed that 73,3% were afraid of missing out on great deals, 76,7% were anxious about not keeping up with the latest trends, and 66,7% admitted to often buying products without planning. This shows that FoMO has a real influence on impulsive buying behavior. The pre-survey results show that the *Fear of missing out* in generation Z tends to be high and this *Fear of missing out* phenomenon is even more pronounced in generation Z, who grew up in the digital age with unlimited access to social media and can be an opportunity to increase traffic and encourage impulse purchases on *E-commerce*. This is in line with the results of research conducted by (Putri *et al*. 2024) namely, there is a significant influence between the *Fear of missing out* variable on impulse buying behavior. The high development of *e-commerce* users makes it easier for users to obtain information and conduct electronic transactions. This ultimately triggers a consumer behavior

called *impulsive buying* (Widodo, 2024). According to (Tarigan *et al*., 2020) *impulsive* buying is consumer purchasing behavior that spontaneously buys a product without planning and has no prior purchase intention.

Table 3: Table Pre Survey on Generation Z in Bogor City Regarding impulsive buying

Question	Answer		Total Sample
	Yes	No	
I often buy products without prior planning.	20 (66,7%)	10 (33,3)	30
I find it difficult to refrain from buying a product that I want, even if I don't need it.	17 (56,7%)	13 (43,3%)	30
I tend to buy products without thinking about the consequences.	19 (63,3%)	11 (36,7%)	30

Source: Primary Data, 2024

Based on table 3, the majority of respondents (66,7%) admitted that they often buy products without prior planning, (56,7%) find it difficult to refrain from buying a product they want, even though they don't need it and (63,3%) respondents tend to buy products without thinking about the consequences. This shows that although on average 62,2% of respondents tend to impulsive buying. This percentage can be increased and is an opportunity for Lazada to encourage impulsive purchases which can be supported by factors such as promotions and emotions.

2. Literature review and hypotheses development

2.1 Flash Sale

A flash sale is a promotion that gives consumers the opportunity to purchase goods at a lower cost compared to the regular price, within a specified period of time. Usually, the duration of the flash sale is short, and the start time is publicized in advance to a wide audience (Rahmawati, 2022). According to (Ariska et al., 2022) flash Sale is a promotion that gives consumers a tendency to think, to decide on offers that they feel will not happen the next time. the indicators of flash sales in this study include:

1. Promotion time
2. Flash sale attractiveness
3. Discount

2.2 Fear OF Missing Out

According to (Imaddudin, 2020), fear of missing out is a type of anxiety commonly felt by generation Z, fear of missing out is a person's condition of fear of being said not to be updated, not slang, and fear of missing out on current trends. According to (Elviana *et al*., 2024) fear of missing out is a consumer attitude that often occurs in the field of psychology, but this fear of missing out can also occur in the field of marketing, because in marketing it is no stranger to promotional factors so that someone who has this fear of missing out trait has a fear of missing a moment such as discounts given by sellers. The indicators of FoMO in this study include:

1. Fear
2. Worry

3. Missed Experience.

2.3 Impulsive Buying

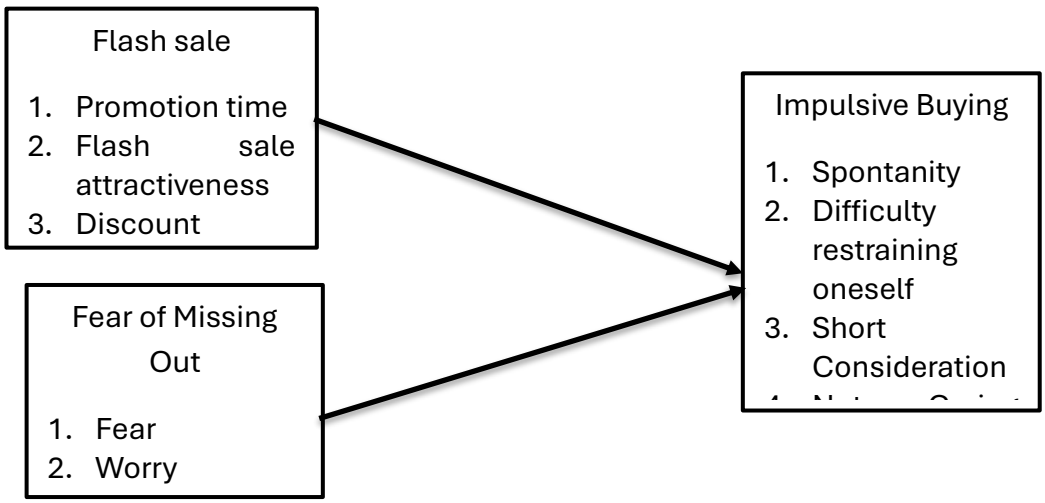
According to (Tarigan *et al*., 2020) impulsive buying is the purchasing behavior of consumers in shopping spontaneously without planning because of the emergence of interest in the product beforehand, the act of buying by consumers where there was no plan to buy before. According to (Ariska et al., 2022), Impulsive buying is the tendency of a consumer to make purchases automatically, without considering needs or prices quickly. The indicator of impulsive buying in this study include:

1. Spontanity
2. Difficulty restraining oneself
3. Short Consideration
4. Not Caring about the Consequences.

2.4 Research Constelation

Promotional strategies such as flash sales are marketing methods by providing large discounts in a very limited time. According to (Syauqi *et al*., 2022) this strategy is designed to create a sense of urgency and attract consumers' attention to make purchases immediately, even without prior planning. Time pressure and exclusivity of offers encourage consumers to make decisions quickly. Previous research results by (Darwipat et al., 2020) and (Setiawati, 2022)show that flash sales have a significant influence on impulsive buying behavior. Fear of missing out (FoMO) is a psychological condition characterized by anxiety, worry, or fear of missing an experience or opportunity. According to (Imaddudin, 2020), FoMO is a type of anxiety that is common in generation Z, who tend not to want to miss trends or be considered out of date. FoMO encourages consumers to make impulse purchases to fulfill social and emotional needs. Research by (Irza, 2024) and (Maula, 2024) shows that FoMO has a positive and significant effect on impulsive buying behavior. Based on the framework above, the researcher can make a research constellation as follows:

Figure 3: Thinking Framework



Source: Primary Data, 2024

2.5 Hypotheses development

A hypothesis is an assumption that needs to be verified, which may be true or false, by seeking

answers through research. Based on this explanation, the hypothesis in this research is:

H1 : Flash sales are thought to have an effect on impulsive buying behavior Lazada users

H2 : Fear of missing out is thought to have an effect on impulsive buying behavior Lazada users

3. Research Methods

This research uses a type of quantitative research with an associative approach. The object of research consists of two independent variables, namely flash sale and fear of missing out, and one dependent variable, namely impulsive buying. The unit of analysis is an individual, who is active or has made purchases through the Lazada application. The research location is focused on Bogor City with the distribution of questionnaires conducted online using Google Form. The type of data used in this research is quantified qualitative data. Data sources consist of primary and secondary data. The sampling method in this study was NonProbability sampling with a sample size of 100 respondents, using purposive sampling technique.

4. Results and discussion

4.1 Validity test

This validity test can be done by looking at the correlation between the score of each item in the questionnaire and the total score to be measured, namely using the Correlation Coefficient. If the Correlation Coefficient value is> 0.361 (R Table) then the question is said to be valid and if the Correlation Coefficient value is below 0.361 then the question is said to be invalid. The results of the data validity test can be seen in the following tables 4:

Table 4. Validity Test Result

No	Item	R-table	R-count	Criteria
1	XI.1	0,361	0,812	Valid
2	X1.2	0,361	0,675	Valid
3	X1.3	0,361	0,850	Valid
4	X1.4	0,361	0,699	Valid
5	X1.5	0,361	0,885	Valid
6	X1.6	0,361	0,662	Valid
7	X1.7	0,361	0,775	Valid
8	X1.8	0,361	0,855	Valid
9	X1.9	0,361	0,771	Valid
10	X2.1	0,361	0,782	Valid
11	X2.2	0,361	0,850	Valid
12	X2.3	0,361	0,838	Valid
13	X2.4	0,361	0,895	Valid

No	Item	R-table	R-count	Criteria
14	X2.5	0,361	0,846	Valid
15	X2.6	0,361	0,849	Valid
16	X3.1	0,361	0,778	Valid
17	X3.2	0,361	0,777	Valid
18	X3.3	0,361	0,743	Valid
19	X3.4	0,361	0,777	Valid
20	X3.5	0,361	0,839	Valid
21	X3.6	0,361	0,795	Valid
22	X3.7	0,361	0,861	Valid
23	X3.8	0,361	0,851	Valid
24	X3.9	0,361	0,796	Valid

Source: Primary Data, 2025

Based on Table 4, it can be seen that all instruments or items of questions from each variable are valid because the calculated r value is greater than the table r value. Based on Table 4.1, it is known that the instrument with the highest validity value is X2.4 with a calculated r value of 0.895, while X1.6 has the lowest validity value with a calculated r value of 0.662 and all instruments or question items from each variable are valid because the calculated r value is greater than the r table value.

4.2 Reliability test

This reliability test uses the SPSS program with the Cronbach Alpha (α) statistical test. A construct or variable is said to be reliable if it provides a Cronbach Alpha (α) value> 0.70. The results of the reliability test of each and all variables in the research instrument are in tables 5.

Table 5. Reliability Test Result

No.	Variabel	Cronbach's Alpha	Description
1	Flash sale	0,913	Reliabel
2	Fear Of Missing Out	0,918	Reliabel
3	Impulsive Buying	0,929	Reliabel

Source: Primary Data, 2025

Based on the reliability test results in Table 5, the Cronbach's alpha value for each variable has results greater than 0.70. These results can lead to the conclusion that all research instruments are declared reliable.

4.3 Structural Equation Modeling-Partial Least Square (outer Model)

4.3.1 Convergent Validity

Convergent validity, evaluation is obtained through the loading factor and average variance extracted (AVE) obtained through SmartPLS. The loading factor value is expected to reach more than 0,7.

Table 6: Loading Factor Results

Variabele	Item	Loading Factor	Description
Flash sale	X1.1	0,837	Valid
	X1.2	0,790	Valid
	X1.3	0,859	Valid
	X1.4	0,869	Valid
	X1.5	0,800	Valid
	X1.6	0,794	Valid
	X1.7	0,826	Valid
	X1.8	0,797	Valid
	X1.9	0,846	Valid
Fear of missing out	X2.1	0,827	Valid
	X2.2	0,859	Valid
	X2.3	0,811	Valid
	X2.4	0,775	Valid
	X2.5	0,706	Valid
	X2.6	0,759	Valid
Impulsive buying	Y.1	0,741	Valid
	Y.2	0,823	Valid
	Y.3	0,809	Valid
	Y.4	0,787	Valid
	Y.5	0,863	Valid
	Y.6	0,765	Valid
	Y.7	0,807	Valid
	Y.8	0,803	Valid
	Y.9	0,733	Valid

Source: Primary Data, 2025

From the results of data processing with SmartPLS shown in the table above, variable indicators that have a loading factor value greater than 0,70 and meet convergent validity. The next stage evaluates AVE which has an AVE value requirement> 0,5.

Table 7: Results of AVE Value

Variabele	*Average Variance Extracted* (AVE)
Flash sale	0,680

Fear Of Missing Out	0,626
Impulsive Buying	0,629

Source: Primary Data, 2025

Based on the display of table 10 output above, it shows that all constructs or latent variables, namely flash sales, fear of missing out and impulsive buying, have met the convergent validity test, namely the AVE value of more than 0,5.

4.3.2 Discriminant validity,

Discriminant Validity is done by looking at the cross loading value of construct measurements. The cross loading value shows the magnitude of the correlation between each construct with its indicators and indicators from other block constructs. the cross loading results can be shown in the following table.

Table 8: Cross LoadingtResults

Indicator Item Code	***Flash sale***	***Fear of missing out***	***Impulsive buying***
X1.1	0,837	0,531	0,519
X1.2	0,790	0,397	0,358
X1.3	0,859	0,453	0,426
X1.4	0,869	0,482	0,453
X1.5	0,800	0,386	0,403
X1.6	0,794	0,491	0,574
X1.7	0,826	0,493	0,482
X1.8	0,797	0,517	0,484
X1.9	0,846	0,452	0,409
X2.1	0,445	0,827	0,669
X2.2	0,422	0,859	0,629
X2.3	0,382	0,811	0,554
X2.4	0,540	0,775	0,587
X2.5	0,389	0,706	0,559
X2.6	0,550	0,759	0,536
Y.1	0,493	0,601	0,741
Y.2	0,384	0,619	0,823
Y.3	0,573	0,611	0,809
Y.4	0,541	0,680	0,787
Y.5	0,422	0,647	0,863
Y.6	0,418	0,473	0,765
Y.7	0,448	0,663	0,807
Y.8	0,391	0,501	0,803
Y.9	0,289	0,467	0,733

Source: Primary Data, 2025

Based on table 8 above, it can be concluded that each indicator item in the variable shows a difference with indicators in other variables, which is indicated by a loading value that is higher than other constructs.

4.3.3 Composite Reliability

The construct is declared reliable if the composite reliability and Cronbarch's alpha have a value> 0,7, then the construct is declared reliable.

Table 9: Composite Reliability Value

	Cronbach's Alpha	***Composite Reliability***
***Flash sale* (X1)**	0,941	0,950
***Fear Of Missing Out* (X2)**	0,879	0,909
***Impulsive Buying* (Y)**	0,926	0,938

Source: Primary Data, 2025

Based on the table above, the majority of constructs show the composite reliability value and Cronbarch's alpha have shown complementary results. It can be seen in the table above that each variable has a composite reliability value and Cronbarch's alpha, which is> 0,7

4.4 Structural Equation Modeling-Partial Least Square (Inner Model)

4.4.1 R-Square

Table 10: R-Square Value

R-Square Value	**Description**	**Variabele *R-Square* Value** ***Impulsive Buying***
0,25	Weak	
0,50	**Medium**	**0,587**
0,75	Strong	

Source: Primary Data, 2025

Based on table 10, the R-Square value shows that the flash sale and fear of missing out variables can explain the construction of Impulsive Buying by 58,7% and the remaining 41,3% is explained by other variables not included in the variables in this study.

4.4.2 Path Coefficient

Table 11: Path coefficient value

Endogenous Variable	***Impulsive Buying***	**Relationship**
Flash sale	0,202	Positif
Fear Of Missing Out	0,633	Positif

Source: Primary Data, 2025

Based on Table 11 above, it can be explained that the flash sale variable (X1) has a coefficient

value of 0,202, this value indicates a positive relationship to the impulsive buying variable (Y). Meanwhile, the fear of missing out (X2) variable has a coefficient value of 0,633, this value indicates a positive relationship to impulsive buying behavior (Y). Based on the path coefficient table, FoMO (coefficient 0,633) has a stronger influence than flash fale (coefficient 0,202), indicating that the fear of missing out plays a greater role in driving consumers' impulsive purchasing behavior.

4.4.3 F-Square

Table 12: F-Square value

Kriteria nilai *F-Square*	**Keterangan**	**Nilai *F-Square* Variabel *Flash Sale***	**Nilai *F-Square* Variabel *Fear of Missing Out***
0,02	**Kecil**	**0,066**	
0,15	Sedang		
0,35	**Besar**		**0,652**

Source: Primary Data, 2025

Based on Table 12 above, it is known that the results of the F-Square analysis show that the Flash sale variable has a small effect on Impulsive Buying (F^2 = 0,066), while the fear of missing out (FoMO) variable has a large effect (F^2 = 0,652). This indicates that FoMO makes a much more significant contribution in explaining consumer impulsive buying behavior than the flash sale variable

4.4.4 Predictive Relevance (Q-Square)

Table 13: Predictive Relevance (Q-Square)Value

Nilai *Q-Square*	**Keterangan**	**Nilai *Q-Square* Variabel *Impulsive Buying***
0,02 to < 0,15	Weak	
0,15 to < 0,35	Medium	
> 0,35	**Large**	**0,556**

Source: Primary Data, 2025

Based on Table 13, it can be seen that the Q-square value on the dependent variable or Impulsive buying variable is 0,556 and is classified as large, the Q-Square value of 0,556 indicates that the model has a large predictive power on the Impulsive Buying variable. This means that the model in this study has good predictive quality and is able to explain the dependent variable strongly.

4.4.5 Hypothesis Test (Bootstraping)

Table 14:. Bootstrapping Value

Influence	***Original sampel***	***t-statistic***	**P-value**	**Effect of**
Flash sale on *impulsive buying*	0,202	2,896	0,004	Signifikan

Fear of missing out on *impulsive buying*	0,633	9,444	0,000	Signifikan

Source: Primary Data, 2025

Based on the results of the bootstrapping test using a two-tailed test in Table 14 above shows the significant influence of both variables in this reaserch on impulsive buying. Thus, it is known that flash sales have a positive influence on impulsive buying of 0,202 with a t-statistic value of 2,896 and a p-value of 0,004, indicating a significant influence. Additionally, fear of missing out also has a stronger effect of 0,633 with a t-statistic value of 9,444 and a p-value of 0,000, indicating a highly significant effect on impulsive buying.
The results of this bootstrapping test show that flash sales and fear of missing out (FoMO) have a positive and significant effect on impulsive buying, with a p-value below 0,05, but FoMO has a stronger influence than flash sales in encouraging impulsive buying behavior.

4.4.6 Model Fit

The NFI value which is getting closer to 1 indicates that the model used has a higher level of fit. The NFI value of 0,774 indicates that the model has a good level of fit of 77,4%. In addition, the SRMR value of 0,078 is below the threshold limit of 0,1 which indicates that the overall fit model is good and feasible to use.

Table 15: Model Fit Value

	Estimated model
SRMR	0,078
d_ULS	1,818
d_G	0,904
Chi-square	454,641
NFI	**0,774**

Source: Primary Data, 2025

4.5 Hypothesis Test Result

The significance value of the relationship between constructs, the t-statistic value, and the p-value determine whether a hypothesis can be accepted or not. The output path coefficients are used to test the hypotheses of this study and have been discussed in previous hypothesis tests using the bootstrapping method. In the bootstrapping method used in this study, the hypothesis is accepted if the significance value of the t-statistic is greater than 1,99 (t-table) and/or the p-value is less than 0,05, then H1 and H2 are accepted. Conversely, if these conditions are not met, H0 is accepted, and H1 and H2 are rejected. Based on the results of the data analysis conducted previously, the respective t-statistic values, p-values, and F-calculations for flash sales and fear of missing out on impulsive buying can be seen in Table 4.16 below

Table 16: Hypothesis Test Results

Hypothesis	**Analysis**	**Decision**

There is a positive and significant effect of Flash sale variables on impulsive buying behavior.	The results of the bootsraping test on the flash sale variable on impulsive buying with a value of 0.202 and has been significant because it has a t-statistic value above 1,99, which is 2,896.	Accepted
There is a positive and significant effect of the Fear of misisng out variable on impulsive buying behavior.	The results of the bootsraping test on the Fear of misisng out variable on impulsive buying with a value of 0,633 and has been significant because it has a t-statistic value above 1,99, which is 9.444.	Accepted

Source: Primary Data, 2025

Based on table 15 above, it shows that the t-statistic value for flash sale is 2,896 and fear of missing out is 9,444, both of which exceed the t table value of 1,99. Therefore, both hypotheses (H1 and H2) are acceptable.

4.6 Discussion and Interpretation of Results

4.6.1 The effect of Flash sale on Impulsive buying

Based on the results of the descriptive analysis that has been carried out previously, it is known that the results of descriptive analysis show that flash sales are a factor that is considered good and approved by respondents in increasing impulsive buying behavior. The path coefficient results also show that flash sales have a coefficient value of 0,202, which indicates a positive relationship to impulsive buying. In addition, the bootstrapping results show that flash sales have a significant effect on Impulsive buying. This can be seen based on the t-statistic value which exceeds the significance limit, namely (2,866> 1,96) and the P-value which is smaller than the specified significance level (0,004 < 0,05). This means that the greater the encouragement of generation Z consumers to make purchases during flash sales, the stronger the influence in encouraging their impulse buying behavior on the Lazada application. The results of this study indicate conformity with the findings in previous studies conducted by (Rahmawati, 2023) and (Setiawati, 2022) show that flash sales have a positive and significant effect on impulsive buying.

4.6.2 The effect of Fear of missing out on Impulsive buying

Based on the results of the descriptive analysis that has been done previously, it is known that the results of descriptive analysis show that the Fear of missing out variable is a factor that is considered good and approved by respondents in increasing impulsive buying behavior. The path coefficient results also show that Fear of missing out has a coefficient value of 0,633, which indicates a positive relationship to Impulsive buying. In addition, the bootstrapping results show that Fear of missing out has a significant influence on Impulsive buying. This can be seen based on the t-statistic value which exceeds the significance limit, namely (9,444> 1,96) and the P-value which is smaller than the specified significant level (0,000 < 0,05). This means that the greater the encouragement of generation Z consumers to make purchases when they feel fear of missing out or FoMO alone, the stronger the influence in encouraging their impulsive buying behavior on the Lazada application. The results of this study show conformity with the findings in previous studies conducted by (Irza, 2024) and (Maula, 2024) found that the fear of missing out variable has a positive and significant effect on Implusive buying

5. Conclusion

1. The results of the analysis show that flash sales have a positive and significant effect on impulsive buying in generation Z consumers, with a coefficient value of 0,202. The more often consumers shop during flash sales to get discounts, the greater their tendency to make impulsive purchases. This is supported by the bootstrapping results which show a t-statistic value of 2,866 (>1,96) and a P-value of 0,004 (<0,05), which confirms that flash sales significantly drive the impulsive behavior of generation Z consumers on the Lazada application.
2. Fear of missing out (FoMO) has a greater positive and significant influence on impulsive buying in generation Z consumers, with a coefficient value of 0,633. The stronger the fear of missing out on trends or offers, the greater their tendency to make impulsive purchases. Bootstrapping results support this with a t-statistic value of 9,444 (>1,96) and a P-value of 0,000 (<0,05), indicating that FoMO significantly drives generation Z's impulsive behavior on the Lazada app

THE EVOLUTION OF EQUALITY IN THE WORKPLACE: A SYSTEMATIC ANALYSIS OF FACTORS AFFECTING FAIR AND INCLUSIVE EMPLOYMENT OPPORTUNITIES

Fatimah[1,*], Muhammad Aditya Kamandanu[1], Mochammad Setio Nugroho[1], Helmi Buyung Aulia Safrizal[1]

[1]Universitas Trunojoyo Madura, Indonesia

Abstract

This Systematic Literature Review (SLR) research aims to explore the factors that affect fair and inclusive employment opportunities through a comprehensive analysis of scientific literature for the 2019-2024 period. The research method uses the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) protocol with systematic searches on various reputable academic databases. Selection criteria include peer-reviewed publications in English, focusing on the context of work equity, with a time span of 2019-2024. Qualitative meta-synthesis analysis identifies five fundamental dimensions: regulation, organizational strategy, interactional approach, digital technology intervention, and human resource development. The findings reveal that work equality is a complex ecosystem that requires a multidimensional approach, where diversity is seen as an organizational strategic asset. The research produces practical recommendations for creating an inclusive work environment, which includes the development of progressive policies, responsive training programs, the adoption of digital technologies, and an accommodating management model to differences. The main contribution of the research is a comprehensive mapping of the factors that affect fair employment opportunities and their implications for organizational transformation

Keywords: *Equality In The Workplace, Organizational Inclusion, Diversity of the Workforce*

1. Introduction

The dynamics of the contemporary work environment are undergoing a fundamental transformation in the context of equality and inclusion, reflecting a significant social and organizational paradigm shift.(Farhani, 2024). Equality in the workplace is no longer just a normative concept, but has become a strategic imperative that determines the sustainability and competitiveness of organizations in the global era.(Anik Iftitah et al., 2023). The complexity of the equality challenge requires a comprehensive approach that goes beyond demographic representation, to systemic implementation that encourages full and meaningful participation across the entire spectrum of the workforce.

The historical context shows that discrimination and inequality in employment opportunities have been persistent issues that undermine human resource potential and hinder organizational innovation. Although progress has been made, structural inequalities still color the employment landscape, especially for traditionally marginalized groups, such as women, people with disabilities, and ethnic minorities.(Efendi, 2018). This phenomenon is not only detrimental to the individuals concerned, but also has a negative impact on the productivity and creativity of the work ecosystem as a whole. Recent research indicates that equality is not just an ethical challenge, but a fundamental prerequisite for organizational sustainability. Empirical studies show a positive correlation between comprehensive inclusion practices and increased organizational performance, innovation, and job satisfaction.(Tuasikal & Safitri, 2024). This underlines the importance of a holistic approach that takes into account the multidimensionality of factors influencing equal employment opportunities.

The complexity of equality issues requires in-depth systematic analysis to identify effective intervention mechanisms.(Fitriani & Sokhivah, 2024). The Systematic Literature Review (SLR) approach is a highly relevant methodological instrument in dismantling the knowledge structure, identifying research gaps, and mapping the conceptual evolution trajectory of equality in the workplace. By conducting a critical synthesis of various academic contributions, this study aims to explore and analyze the fundamental factors that influence the creation of an inclusive work ecosystem. The main focus of this study is to explore the complex dimensions of equal employment opportunities, taking into account the interactional aspects including gender, ethnicity, disability, sexual orientation, and socio-economic background. Through a systematic approach, this study aims to produce a comprehensive map that not only diagnoses challenges but also offers a practical framework for sustainable organizational transformation.

The academic and practical significance of this research lies in its ability to bridge the gap between theory and practice, and provide an empirical basis for policy makers and human resource practitioners. By synergizing multidisciplinary perspectives, this research is expected to provide substantive contributions in redefining the paradigm of equality in the workplace.

2. Literature review

Equality and inclusion in the workplace have become critical areas of focus in human resource management (HRM) due to globalization, demographic shifts, and increasing recognition of their impact on organizational success. Equality ensures that all employees have fair access to opportunities, resources, and treatment, regardless of gender, race, age, disability, sexual orientation, or other characteristics. Inclusion, however, goes beyond mere representation by fostering a work environment where diverse individuals feel valued, respected, and integrated into decision-making processes (Shore et al., 2011). Workplace equality is rooted in principles of fairness and justice. According to Armstrong (2020), equality in HRM involves ensuring that policies, practices, and organizational culture do not discriminate against any group. Key theories include: Social Identity Theory (Tajfel & Turner, 1979). This theory explains how individuals categorize themselves and others into social groups, leading to in-group favoritism and out-group discrimination. In workplaces, this can manifest as biases in hiring, promotions, and team dynamics. Equity Theory (Adams, 1963): Employees assess fairness by comparing their inputs (effort, skills) to outcomes (salary, recognition). Perceived inequities can lead to disengagement, turnover, and conflict. Institutional Theory (DiMaggio & Powell, 1983): Organizations adopt equality policies not just for efficiency but also to gain legitimacy in the eyes of stakeholders.

Inclusion is an active process that ensures diverse employees feel a sense of belonging and empowerment. Roberson (2006) defines inclusion as the degree to which employees feel their contributions are valued and they have access to opportunities. The Deloitte Inclusion Model (Bourke & Dillon, 2018) identifies three key dimensions: belonging, uniqueness and psychological safety. Belonging relate to employees feel accepted as part of the organization. Uniqueness relate to individual differences are respected rather than suppressed. Psychological Safety relate to employees feel safe to express ideas without fear of retaliation.

3. Methodology

This study uses a systematic literature review method. The Systematic Literature Review (SLR) methodology was chosen as a comprehensive research framework to systematically and in-depth explore the evolution of equality in the workplace. This methodological approach allows for a critical and comprehensive synthesis of relevant scientific publications, with the aim of identifying, evaluating, and integrating research

findings related to factors that influence fair and inclusive employment opportunities. The Systematic Literature Review process will be carried out through structured and rigorous methodological stages, referring to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) protocol.

The literature search strategy will be conducted systematically using various reputable academic databases, including but not limited to Web of Science, Scopus, EBSCO, ProQuest, and Google Scholar. A combination of complex keywords will be used to extract relevant literature, including terms such as "workplace equality", "organizational inclusion", "fair employment opportunities", "diversity management", and "intersectional workplace dynamics". The inclusion and exclusion criteria of the literature will be strictly determined to ensure the quality and relevance of the sources used. The inclusion criteria include: (1) peer-reviewed journal publications, (2) English-language articles, (3) publications between 2019-2024, (4) focus on the context of equality in the workplace, and (5) comprehensive empirical or conceptual research methodology. Meanwhile, the exclusion criteria include: (1) duplicate articles, (2) non-academic publications, (3) articles outside the specified time frame, and (4) publications with low methodological quality.

The literature selection process will be conducted through three main stages: (1) initial screening based on title and abstract, (2) full-text review to assess comprehensive relevance, and (3) in-depth analysis of articles that pass the previous stage. Each article will be assessed using a systematically developed critical appraisal instrument, considering methodological aspects, validity of findings, and significance of scientific contribution. Data analysis will use a qualitative meta-synthesis approach, which allows for narrative integration of research findings across studies. This method allows for the identification of patterns, themes, and conceptual constructs that emerge from the literature analyzed. The coding process will be conducted independently by two researchers to minimize bias and increase the validity of the findings.

The analytical framework will focus on several key dimensions: (1) organizational structural factors, (2) socio-cultural dynamics, (3) policy and regulatory frameworks, (4) human resource management practices, and (5) interactional perspectives on equal employment opportunities. Each dimension will be analyzed in depth to explore the complexity and interconnections of factors that influence inclusion in the workplace. The validity and reliability of the research will be ensured through several mechanisms. First, the research protocol will be documented transparently, allowing for reproducibility. Second, the selection and analysis process will involve consensus among researchers. Third, cross-checking of various sources will be carried out to ensure the credibility of the findings. An ethical approach is a fundamental consideration in the methodology of this research. The entire process will pay attention to academic integrity, avoid plagiarism, and comprehensively document each stage of the research. Transparency and methodological accuracy are the main principles in the construction of responsible scientific knowledge.

4. Results and discussions

The findings of the systematic literature review research reveal the complexity of the dynamics of equality in the workplace that requires a multidimensional and comprehensive approach. An in-depth analysis of ten recent studies identified a number of fundamental factors that significantly influence the creation of an inclusive and equitable work ecosystem. The Policy and Regulation dimension plays a crucial role in promoting equal employment opportunities. The study (Blanck, 2022) specifically highlights the transformative role of the Americans with Disabilities Act (ADA) in minimizing discrimination. The research findings indicate that a comprehensive regulatory framework serves not merely as a legal instrument,

but as a fundamental mechanism for dismantling structural barriers that have historically hindered the participation of marginalized groups in the employment ecosystem.

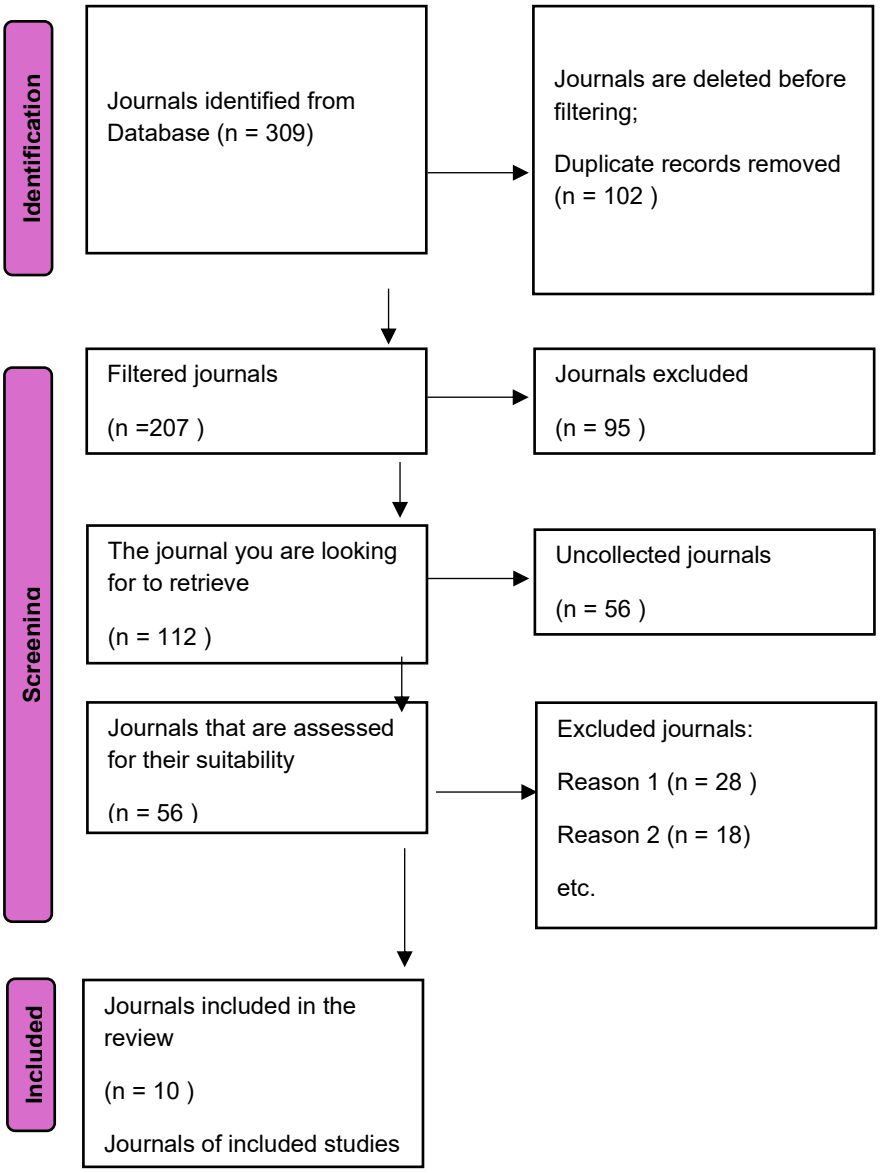

Figure 01.*Prisma Flowchart*

The interactional perspective is a central theme that emerges from various literature.(Ryan et al., 2020)insightfully explores the complexity of barriers to equality, identifying that discrimination is multidimensional and affects a range of social groups, including LGBTQ+ communities, pregnant women and people with disabilities. The findings highlight that a single approach cannot accommodate the complex diversity of contemporary employment contexts. Sectoral contexts also make a significant contribution to understanding equality dynamics.(Ni Luasa et al., 2023)in its comprehensive study on the healthcare sector revealed that equality and inclusion practices are positively correlated with increased creativity,

productivity, staff retention, and workforce integration. This shows that equality is not just an ethical imperative, but a substantive organizational strategy for creating a sustainable work environment.

Innovative approaches to promoting inclusion are an interesting finding from the literature.(Corvino et al., 2023)explores the potential of sport as an instrument of social development, offering an alternative perspective in promoting inclusive employment opportunities. The study underlines the importance of creative interventions that go beyond conventional frameworks in creating a diversity-responsive work ecosystem. The organizational development aspect receives special attention in the literature.(Aaby et al., 2020)introduced the innovative Organizational Health Literacy Responsiveness (Org-HLR) framework, identifying 62 improvement ideas and 11 action plan items to enhance organizational responsiveness. These findings affirm that equity transformation requires a systemic approach integrated into organizational architecture.

Digital technologies emerge as a significant factor in driving work inclusion. Study(Wang et al., 2024)reveals how digital inclusive finance can increase non-farm employment opportunities in rural areas, particularly through mechanisms that reduce financing constraints and improve risk appetite. This indicates the transformative role of technology in dismantling structural barriers. Demographic diversity is identified as an important predictor of organizational performance.(Turi et al., 2022)through comprehensive quantitative analysis proves the significant impact of diversity in age, beliefs, and leadership skills on organizational performance. These findings confirm that equality is not just a moral consideration, but a fundamental competitive strategy.

The literature also highlights the importance of specific intervention strategies. Studies(Tomczak et al., 2021)developed an inclusive communication model for individuals on the autism spectrum, demonstrating that targeted interventions can effectively support workforce inclusion with special needs.(Silvaggi et al., 2020) (Silvaggi et al., 2019), contributed by developing a toolbox and training tools to support the inclusion of workers with chronic conditions. The conclusions of this systematic analysis confirm that equality in the workplace is a complex phenomenon that requires a holistic, interactional and sustainable approach. Factors that influence equal employment opportunities include progressive regulatory frameworks, innovative organisational strategies, technology-based interventions, human resource capacity development and a commitment to celebrating diversity

Age diversity, diversity beliefs, and leadership skills have a significant impact on organizational performance.	Provides insight into the positive impact of diversity on organizational performance, relevant to research on the benefits of equality and inclusion.

5. Conclusion

The Systematic Literature Review (SLR) on the evolution of equality in the workplace yields comprehensive findings that underscore the complexity of the transformation of the contemporary employment ecosystem. The study reveals that equality is not merely a normative concept, but rather a fundamental prerequisite for organizational sustainability and competitiveness in the global era. The systematic review identifies five key dimensions that influence fair and inclusive employment opportunities: (1) progressive regulatory frameworks, (2) innovative organizational strategies, (3) interactional approaches, (4) digital technology-based interventions, and (5) commitment to human resource development. Each dimension has a unique contribution in dismantling the structural barriers that have historically hindered the participation of marginalized groups. The theoretical implications of this study lie in the assertion that equality is a complex ecosystem that requires a multidimensional approach. Diversity is no longer seen as a challenge, but rather a strategic asset that can drive innovation, creativity, and organizational performance. The practical recommendations produced include: (1) developing an inclusive policy framework, (2) implementing diversity-responsive training programs, (3) adopting digital technologies that support inclusion, (4) creating accommodating communication mechanisms, and (5) developing a management model that celebrates differences.

THE EFFECTIVENESS OF STOCK SPLITS IN INVESTOR SIGNALING: AN EVENT STUDY ANALYSIS BEFORE AND DURING COVID-19

Hafidz Nurhuda[1], Tito IM. Rahman Hakim [1,*], Hendra Sanjaya Kusno[2], Rahmat Hidayat[1]

[1]Universitas Trunojoyo Madura, Bangkalan, Indonesia
[2]Politeknik Negeri Balikpapan, Balikpapan, Indonesia

Abstract

This study aims to examine the differences in trading volume, firm value, bid-ask spread and abnormal return before and after a stock split. This research is a comparative study with an event study using 10 days before and after the stock split. The data used is secondary data with the data collection technique used is documentation. The population of this study is 30 companies that carry out stock splits in 2018-2021. Through purposive sampling used as a sample selection technique, there were 8 samples used in the study. The data analysis tool used in this study is SPSS 26. The results of this study indicate that there are significant differences in trading volume, firm value, and abnormal returns before and after a stock split, while there is no significant difference in the bid-ask spread before and after stock splits. Additional tests also provide empirical findings that none of the four variables tested experienced significant differences before and during Covid-19. Investors need to be more sensitive in reading the signals given by the company, especially through stock split activities. Signals from stock splits can be used by investors to see prospects for stock trading volume, company value and abnormal returns in the future.

Keywords: *abnormal return, event study, firm value, stock split*

1. Introduction

On March 2, 2020, the Indonesian government officially announced the first confirmed COVID-19 case in the country (Arnani, 2022). According to Kusuma (2020), Finance Minister Sri Mulyani Indrawati stated that Indonesia's economic growth experienced a significant decline, contracting to -0.4% by the end of 2020. The impact of the COVID-19 pandemic proved highly significant for Indonesia's economy, as evidenced by the substantial economic growth deceleration (Murdhaningsih et al., 2022). Fernando (2021) noted that since 2020, several companies achieved successful outcomes from their stock split decisions, including PT Bank Central Asia Tbk (BBCA) and PT MNC Studio International Tbk (MISN), while PT Elang Mahkota Teknologi Tbk (EMTK) and PT Unilever Indonesia Tbk (UNVR) experienced share price declines following their stock split implementations. This economic challenge was previously documented by Nasution et al. (2020), who reported that the COVID-19 pandemic significantly impacted Indonesia's economy. Within this context, stock splits were employed as a strategic mechanism by various companies to communicate their financial information to stakeholders.

Stock splits conducted by corporations can significantly influence share prices (Wahyudi & Putra, 2020). The stock split mechanism represents a corporate strategy to divide outstanding shares without actual buy-sell transactions, primarily aimed at attracting investors (Afriyenti & Kurniawan, 2019). Stock splits enable investors to purchase shares at relatively lower prices, which is expected to enhance share liquidity and increase trading volume (Lestari & Sudaryono, 2008). Based on these observations, stock splits constitute share divisions that

affect only the market price without altering the proportional ownership of existing investors. Currently, stock split events represent an intriguing phenomenon for academic investigation, particularly within the field of economics. Stock splits are also referred to as "stock cosmetics," signifying corporate actions designed to enhance share attractiveness without substantively improving investor wealth (Muharam & Sakti, 2008). This phenomenon can be examined from both theoretical and practical perspectives: theoretically, stock splits increase the number of outstanding shares without enhancing investor welfare, while practically, stock splits can trigger market reactions (Janiantari & Badera, 2014). This study is also grounded in signaling theory, which serves to communicate signals to investors and explains that companies conduct stock splits to restore optimal and more affordable share prices.

Stock demand and purchasing activity occasionally decline due to excessively high share prices, necessitating stock splits to reduce share prices and enhance market accessibility (Putra & Suaryana, 2019). While corporations generally view rising stock prices as beneficial, excessive price appreciation can adversely affect trading volume and investor participation (Handayani & Yasa, 2017). Situmorang & Mahfud (2016) identify two primary motivations for implementing stock splits: signaling positive future prospects to the market and directing share prices to an optimal trading range that facilitates broader market participation. According to Wareza (2021), PT Bank Central Asia Tbk (BBCA) executed a stock split at a 1:5 ratio. The company's decision to implement this stock split was attributed to robust capital market development and increasing retail investor interest in equity investments.

Financial information represents a critical factor required by investors as a decision-making tool for determining whether to hold, purchase, or sell securities (Muharam & Sakti, 2008). Such information serves as the foundation for investment decision-making and uncertainty reduction to achieve desired investment objectives (Lestari & Sudaryono, 2008). Munthe (2016) elucidates that investor perceptions regarding the fairness of stock prices can determine supply-demand equilibrium. Consequently, excessively high stock prices diminish investor interest in purchasing securities, necessitating price stability within reasonable and optimal ranges. To assess market efficiency, publicly available information is essential for examining market reactions to specific events through what is termed event study methodology (Hartono, 2014:585). According to Nadig (2015), event studies constitute empirical analyses designed to evaluate the impact of specific events on stock returns. The event study examined in this research focuses on stock split announcements. The primary function of event study methodology is to assess the informational content of stock split announcements (Wahyudi & Putra, 2020). Several factors may be influenced by stock split events, including trading volume, firm value, bid-ask spreads, and abnormal returns, which can be theoretically explained through signaling theory.

This study extends the research conducted by Anwar & Asandimitra (2018) by incorporating firm value as an additional independent variable. The study also examines the COVID-19 pandemic that began in 2020 to analyze market reactions to this unprecedented event. Consequently, this research includes supplementary analysis to investigate corporate responses to stock splits both before and during the COVID-19 pandemic. Four factors are identified as being influenced following stock split events: trading volume (Afriyenti & Kurniawan, 2019; Ambarwati, 2008), firm value (Sriyono & Alam, 2021; Widiastuti & Usmara, 2005), bid-ask spread (Afriyenti & Kurniawan, 2019; Janiantari & Badera, 2014), and abnormal return (Munthe, 2016; Puspita & Yuliari, 2019). This study utilizes data from companies that conducted stock splits between 2018 and 2021 and are listed on the Indonesia Stock Exchange (IDX).

Based on the conducted research, this study provides empirical evidence and contributes to the literature on stock splits. This study employs an event study methodology to better capture the effects of corporate actions, specifically stock splits. Following statistical testing, the results indicate that three out of four variables examined demonstrate statistically significant differences. Trading volume, firm value, and abnormal returns exhibit significant differences, while no significant difference is observed for the bid-ask spread variable. Regarding the additional analysis conducted on companies that implemented stock splits before and during the COVID-19 pandemic, no significant differences were found across the four tested variables, suggesting that COVID-19 did not differentially impact companies undertaking stock splits. This research also provides insights for investors, indicating that stock splits serve as corporate signals regarding future company prospects. Investors can interpret these signals through observable changes in trading volume, firm value, and abnormal returns following stock split announcements.

2. Literature review

2.1 Signalling theory

Signaling theory describes the dynamics that occur when two parties have access to different information, typically involving a sender who provides signals or information and a receiver who must interpret these signals (Connelly et al., 2011). When announced information carries positive value during the observation period, the market responds by sending positive or negative signals depending on whether investors receive favorable or unfavorable information (Afriyenti & Kurniawan, 2019). Signaling theory plays a crucial role in stock split announcements by providing information to prospective investors about the company's future prospects. Wahyudi & Putra (2020) explain that information asymmetry enables stakeholders to assess corporate prospects, allowing managers to send positive signals to investors, thereby generating favorable responses to stock split announcements. When communicating potential high returns to investors, companies can enhance their attractiveness for investment decisions (Putra & Suaryana, 2019). Consequently, stock split announcements serve as indicators that the company's financial condition remains sound (Febrianti, 2018).

2.2 Trading volume activity before and after stock split

Stock trading volume represents one of the key parameters indicating increased stock trading activity in the exchange (Indrayani et al., 2020). Changes in trading volume are measured using trading volume activity (Munthe, 2016). Khajar (2016) explains that there is a specific ratio used to measure trading volume, namely trading volume activity, which represents the ratio of traded shares to outstanding shares. The magnitude of stock split effects on stock trading volume is reflected in the volume of shares traded (Copeland, 1988). Stock splits result in increased trading volume due to lower offered share prices, thereby enhancing investor interest and trading volume (Indrayani et al., 2020). Research conducted by Indrayani et al. (2020) on 30 manufacturing companies listed on the Indonesia Stock Exchange from 2014-2016 demonstrates significant differences in stock trading volume before and after stock splits.

H1: There is a significant difference in trading volume before and after stock splits.

2.3 Firm value before and after stock split

Firm value serves as a financial performance indicator for publicly listed companies (Putra & Lestari, 2016). Generally, publicly listed companies maximize their firm value through strategic policies known as corporate actions (Maulana & Yuliana, 2022), such as stock splits.

Widiastuti & Usmara (2005) explain that higher stock prices correspond to higher firm value, while conversely, declining stock prices may indicate poor corporate performance. The study by Sriyono & Alam (2021) provides empirical evidence demonstrating significant differences in firm value before and after stock split events. Signaling theory plays a crucial role in providing investors with essential information regarding firm value assessment. Based on this premise, signaling theory can be concluded to serve as a measurement tool for investors in determining their desired investment choices. High firm value can generate positive impacts for investors by providing additional benefits in the form of capital gains from their shareholdings (Putra & Lestari, 2016).
H2: There are significant differences in firm value before and after stock split.

2.4 Bid-ask spread before and after stock split

The bid-ask spread represents the difference between the bid price and the ask price, reflecting the bargaining power of a stock (Afriyenti & Kurniawan, 2019). Higher trading activity or trading volume of a stock leads to lower ownership costs, which subsequently results in a smaller bid-ask spread (Ambarwati, 2008). According to Anwar & Asandimitra (2018), the bid-ask spread can be utilized to observe market reactions to specific events. Signaling theory explains that companies conducting stock splits signal healthy financial conditions (Fahmi, 2012). This indicates that there should be differences in bid-ask spreads before and after stock split announcements as a form of market reaction. Research findings by Pujiharjanto (2001) and Rusliati & Farida (2010) successfully identified significant differences in bid-ask spreads between the periods before and after stock split announcements.
H3: There is a significant difference in bid-ask spreads before and after stock splits.

2.5 Abnormal return before and after stock split

A stock split is a corporate action undertaken by companies with the objective of restoring share price liquidity and signaling positive information to investors (Anwar & Asandimitra, 2018). Abnormal return represents the difference between actual returns and expected returns (Doryab & Salehi, 2018; Zakiyah & Nurweni, 2020). Generally, abnormal returns yield positive values when actual returns exceed expected returns, but generate negative values when the rate of return falls below expectations (Yustisia, 2018). In the context of stock split events, positive abnormal returns can provide above-normal gains to investors, while negative abnormal returns indicate below-normal returns (Munthe, 2016). Positive abnormal returns following stock split announcements may attract investors to securities with greater certainty and transparency (Mardiyaningsih & Andhitiyara, 2020). Puspita & Yuliari (2019) explain that abnormal returns are frequently employed as the focal point for examining price reactions and market efficiency. The presence of differential abnormal returns before and after stock split announcements can serve as an indicator of positive signalling effects, as supported by empirical research (Ahn et al., 2005).
H4: There is a significant difference in abnormal returns before and after stock split.

3. Methodology

This study employs a comparative research design, which involves comparing the presence of one or more variables across two or more different samples (Sugiyono, 2021:36). The research provides a descriptive analysis of stock split events. To analyze these events, this study utilizes an event study methodology to measure capital market reactions to the publication of information required by investors, employing a specific time period to determine the research window. This study uses a 20-day event window, comprising 10 days before and 10 days after the stock split announcement. The research focuses on companies listed on the Indonesia Stock Exchange (IDX) during the period 2018-2021. The population consists of 30

companies that conducted stock splits during this period without engaging in other corporate actions. The research objects are publicly traded companies listed on the Jakarta Composite Index (JCI) of the Indonesia Stock Exchange (IDX) that executed stock split corporate actions between 2018-2021. During the 2018-2021 period, 30 companies listed on the JCI conducted stock split corporate actions. Table 1 presents a summary of the variables examined in this study.

Table 1
Operational Variable Definition

Variable	Concept	Measurement	Scale
Trading Volume Activity	Stock trading volume represents the ratio of the number of shares traded to the total number of shares outstanding during a relevant time period (Husnan, 2005).	$\text{TVA} = \frac{\text{Number of shares of company i traded in period t}}{\text{Number of shares of i outstanding at time t}}$ (Khajar, 2016).	Ratio
Firm Value	Firm value is defined as the total market value including debt divided by total assets (Putra & Lestari, 2016).	$Q = \frac{MVS + D}{TA}$ (Suranta & Merdistusi, 2004)	Ratio
Bid-Ask Spread	The difference between the bid price and the ask price is known as the bid-ask spread (Afriyenti & Kurniawan, 2019).	$\text{Spread}_{i,t} = \frac{\text{Ask}_{i,t} - \text{Bid}_{i,t}}{(\text{Ask}_{i,t} + \text{Bid}_{i,t})/2}$ (Anwar & Asandimitra, 2018)	Ratio
Abnormal Return	Abnormal return refers to the dependent variable calculated by subtracting the expected return from the actual return (Doryab & Salehi, 2018).	$\text{IHSG}_t = \frac{\text{Market Value}}{\text{Par Value}} \text{x } 100$ (Hartono, 2014:125)	Ratio

Source: Data Processed

The data analysis procedure in this study comprised descriptive statistical analysis, normality testing, paired t-test, Wilcoxon signed-rank test, and supplemental analysis, following the methodological guidelines established by Sugiyono (2021) and Ghozali (2021). This study employed the Kolmogorov-Smirnov normality test and paired-sample t-test.. Anwar & Asandimitra (2018) demonstrated that data normality can be detected using SPSS 26 through the Kolmogorov-Smirnov test. Since the t-test requires normally distributed data, non-parametric statistical estimation equivalent to the paired-sample t-test, specifically the Wilcoxon signed-rank test, was implemented when normality assumptions were violated (Zakiyah & Nurweni, 2020). The Mann-Whitney U test was selected as the analytical tool for supplemental analysis to examine and provide comparative information between pre- and post-COVID-19 periods. This supplemental analysis was conducted following the completion of

descriptive statistical analysis, normality testing, paired t-test, and Wilcoxon signed-rank test. The purpose of this additional analysis was to determine whether significant differences existed in the conditions of companies conducting stock splits before and during the COVID-19 pandemic.

4. Results and discussions

Table 2
Descriptive Statistical Test Results

Variable	Min	Max	Mean	Std. Deviation
Trading Volume Activity	13,691.00	1,246,035,397.00	22,924,133.6813	106,846,519.56887
Firm Value	39,139,101.00	972,862,000,000,000,000.00	61,294,778,211,014,300.0000	193,677,687,811,817,000.00
Bid-Ask Spread	-104,562,738.00	-7.00	-15,057,767.0875	16,191,486.02347
Abnormal Return	-241,649,293.00	316,392,132.00	-368969.3017	57,386,611.65361

Source: Data Processed SPSS 26

Referring to Table 4.2, the mean values for each variable tested are as follows:

1. The mean trading volume is 22,924,133.68 with a standard deviation of 106,846,519.57.
2. The mean firm value is 61,294,778,211,014,300.00 with a standard deviation of 193,677,687,811,817,000.00.
3. The bid-ask spread exhibits a mean value of -15,057,767.09 with a standard deviation of 16,191,486.02.
4. Abnormal return demonstrates a mean value of -368,969.30 with a standard deviation of 57,386,611.65.

Each tested variable exhibits a mean value lower than its corresponding standard deviation, indicating relatively high data variability and dispersion within the dataset.

Normality Test Results

Parametric Skewness and Kurtosis tests, along with the one-sample Kolmogorov-Smirnov test, were employed to assess data normality. Data are considered normally distributed when Skewness and Kurtosis values fall within the range of -2 to +2, while for the one-sample Kolmogorov-Smirnov test, normality is indicated when the significance value exceeds 0.05. The normality tests utilized are presented as follows:

Table 3
Skewness and Kurtosis Normality Test Results

Variable	N	Skewness Value	Kurtosis Value
Trading Volume Activity	160	52,083.33	290,561.68
Firm Value	160	18,072.92	28,199.48
Bid-Ask Spread	160	-13,885.42	23,359.58
Abnormal Return	160	3.95	27,879.27

Source: Data Processed SPSS 26

Table 4
Kolmogorov-Smirnov Normality Test Results

Variable	N	Asymp. Sig. (2-tailed)	Keterangan
Trading Volume Activity "Before"	80	0,000	Not Normal
Trading Volume Activity "After"	80	0,000	Not Normal
Firm Value "Before"	80	0,000	Not Normal
Firm Value "After"	80	0,000	Not Normal
Bid-Ask Spread "Before"	80	0,000	Not Normal
Bid-Ask Spread "After"	80	0,000	Not Normal
Abnormal Return "Before"	80	0,000	Not Normal
Abnormal Return "After"	80	0,000	Not Normal

Source: Data Processed SPSS 26

Based on Table 3 and Table 4, the normality test results indicate that all variables are not normally distributed, as demonstrated by the Skewness and Kurtosis and Kolmogorov-Smirnov test results. All four variables, both before and after the stock split, exhibit values that do not meet the significance level requirements following these tests. Therefore, this study requires a non-parametric test using the Wilcoxon Signed Rank Test due to the non-normal distribution of the data.

Hypothesis Test Results

Table 5
Wilcoxon Signed Rank Test Results

Variable	N	Asymp. Sig. (2-tailed)	Description
Trading Volume Activity	80	0.000	Accepted
Firm Value	80	0.000	Accepted
Bid-Ask Spread	80	0.108	Rejected
Abnormal Return	80	0.027	Accepted

Source: Data Processed SPSS 26

The results of hypothesis testing in this study are as follows:

1. Trading volume activity demonstrated statistical significance ($p < 0.001$), providing support for H1.
2. Firm value demonstrated statistical significance ($p < 0.001$), providing support for H2.
3. Bid-ask spread was not statistically significant ($p = 0.108$), failing to support H3.
4. Abnormal return demonstrated statistical significance ($p = 0.027$), providing support for H4.

Supplemental Analysis

Table 6
Supplemental Analysis Test Results

Variable	Asymp. Sig. (2-tailed)	Conclusion
Trading Volume Activity	0.055	There is No Significant Difference
Firm Value	0.683	There is No Significant Difference
Bid-Ask Spread	0.789	There is No Significant Difference
Abnormal Return	0.825	There is No Significant Difference

Source: Data Processed SPSS 26

Table 6 presents the comparative analysis of stock split effects between the pre-COVID-19 and COVID-19 periods, revealing the following findings:

1. Trading volume demonstrates a significance level of 0.055, which exceeds 0.05, indicating no statistically significant difference.
2. Firm value exhibits a significance level of 0.683, which is greater than 0.05, leading to the conclusion that no significant difference exists.
3. Bid-ask spread shows a significance level of $0.789 > 0.05$, indicating that no significant difference is present.
4. Abnormal return displays a significance level of $0.825 > 0.05$, thus it can be concluded that no significant difference exists.

Discussion

Trading Volume Activity on Stock Split

The hypothesis testing results for trading volume (H1) indicate that the hypothesis is accepted. These findings are consistent with studies conducted by Indrayani et al. (2020), Khajar (2016), and Mardiyaningsih & Andhitiyara (2020), which demonstrated significant differences in trading volume before and after stock splits. However, these results contradict the findings of Azhar et al. (2013), Satria & Adnan (2018), and Zakiyah & Nurweni (2020), who reported no significant differences in trading volume before and after stock splits. The results suggest that significant differences exist in trading volume before and after stock split announcements, although this study cannot definitively conclude whether companies experience an increase or decrease in trading volume.

These findings indicate that investors continue to receive signals when stock splits occur. This study supports signalling theory, whereby companies can provide signals about future prospects, enabling investors to make more informed investment decisions. Investors obtain additional information that is not available in companies' financial statements. Therefore, it can be concluded that the first hypothesis, which states that investors react when companies announce stock splits, is supported by signalling theory as an information source.

Firm Value on Stock Split

The second hypothesis states that firm value exhibits significant differences before and after stock split implementation. Statistical testing results provide evidence of significant differences, thereby supporting the acceptance of the second hypothesis. For investors, these significant differences serve as valuable signals for decision-making processes, enabling them to recognize the distinct performance patterns before and after stock splits. These findings also support signalling theory, demonstrating that stock splits contain informational content that can be utilized to observe immediate market reactions.

The results of this study are consistent with research conducted by Sriyono & Alam (2021) and Khajar (2016), which documented significant differences before and after stock split execution. However, these findings contradict the research by Mardiyaningsih & Andhitiyara (2020), who found no significant differences before and after stock split implementation. Based on the obtained results, it can be concluded that firm value increases when investor interest in stock prices also rises. The more actively the market reacts to stocks, the greater the enhancement in firm value.

Bid-Ask Spread on Stock Split

Statistical testing of the bid-ask spread variable indicates that the third hypothesis is rejected. This result is supported by the absence of significant differences before and after the stock split implementation. Moreover, information serves as a benchmark for companies to attract investors through signalling mechanisms. These findings suggest that stock split information is insufficient to influence the magnitude of stock offerings. This phenomenon can be attributed to asymmetric information distribution, resulting in investors' inability to receive signals effectively.

The analysis demonstrates that the results show no significant differences before and after stock split execution. These findings are inconsistent with studies conducted by Febrianti (2018), Janiantari & Badera (2014), and Zakiyah & Nurweni (2020), which documented significant differences before and after stock split implementation. Based on the empirical results, it can be concluded that the level of stock purchasing and selling activities can be assessed through bid-ask spread analysis; therefore, adequate information disclosure is essential to enable investors to make more informed investment decisions.

Abnormal Return on Stock Split

The hypothesis testing results for the abnormal return variable demonstrate a statistically significant difference between the pre- and post-stock split periods. These findings indicate that the fourth hypothesis is accepted. The results are consistent with previous studies by Zakiyah & Nurweni (2020) and Ahn et al. (2005), which similarly found significant differences in abnormal returns before and after stock split announcements. However, these findings contradict the results reported by Mardiyaningsih & Andhitiyara (2020) and Satria & Adnan (2018), who found no significant differences in the pre- and post-stock split periods.

These findings support signalling theory, which posits that stock splits serve as corporate actions that signal management's expectations regarding future prospects. This theory suggests that stock splits function as a mechanism to restore share prices to more accessible trading ranges for investors. Within this theoretical framework, abnormal returns serve as a focal point for examining market reactions and efficiency. In relation to signalling, the information asymmetry between management and external stakeholders enables companies to convey positive signals about future expectations. The results demonstrate that abnormal returns generate positive values when actual returns exceed market expectations, and negative values when returns fall short of expectations.

5. Conclusion

This study aims to examine and provide empirical evidence regarding whether significant differences exist before and after stock split announcements. Four variables were tested for differences pre- and post-stock split: trading volume, firm value, bid-ask spread, and abnormal returns. Based on the statistical testing results, it can be concluded that trading volume, firm value, and abnormal returns demonstrate statistically significant differences before and after stock splits. However, bid-ask spread shows no significant difference before and after stock splits. Additional testing results indicate no significant differences among the four variables tested. These findings suggest that the majority of samples examined before and during COVID-19 exhibit no significant differences. Therefore, it can be concluded that COVID-19 did not substantially influence the differential effects of stock splits on firms.

This research provides valuable insights for companies and investors in equity investment decisions. For companies, stock splits may serve as a viable alternative when firms perform well but share prices become excessively high; however, this signaling mechanism appears ineffective during periods of market stagnation. The research findings can also serve as considerations for investors in making equity investment decisions. Stock splits undertaken by companies and the accompanying signals can serve as benchmarks for investment decision-making. Through stock splits supported by signaling theory, investors can formulate future expectations, particularly regarding firm prospects and anticipated abnormal returns.

THE INFLUENCE OF LOCUS OF CONTROL, RISK TAKING PROPENSITY, NEED OF ACHIEVEMENT, PERSONALITY, ENTREPRENEURIAL EDUCATION, AND SOCIAL SUPPORT ON ENTREPRENEURIAL DECISIONS IN THE RETAIL SECTOR

Isyak Islam Udin[1], Gia Rizky[2]

[1]Yogyakarta of Technology, Indonesia
[2]Yogyakarta of Technology, Indonesia

Abstract

This study aimed to analyze the influence of locus of control, risk-taking propensity, need for achievement, personality, entrepreneurial education, and social support on the decision to engage in entrepreneurship in the retail sector in Indonesia. The respondents in this study consisted of individuals who decided to pursue entrepreneurship in the retail industry, totaling 459 respondents. The research method employed was quantitative, and the sampling technique used was random sampling. The software utilized for analysis was SPSS 22 with logistic regression analysis.The results of this study indicate that, partially, locus of control, need for achievement, personality, and social support had positive and significant influence, while risk-taking propensity and entrepreneurial education had negative and significant influence. Simultaneously, locus of control, risk-taking propensity, need for achievement, personality, entrepreneurial education, and social support collectively influence the decision to engage in entrepreneurship. Based on the coefficient of determination test, the independent variables consisting of locus of control, risk-taking propensity, need for achievement, personality, entrepreneurial education, and social support accounted for 62.7% of the variation in the dependent variable (the decision to engage in entrepreneurship), while the remaining 37.3% was influenced by other variables outside this study.

Keywords: entrepreneurial education, entrepreneurial decision, locus of control, need of achievement, personality, risk taking propensity, social support

1. Introduction

The Indonesian government is actively promoting entrepreneurship to stimulate economic growth. However, the entrepreneurial activity rate remains low at 3.47%, below the target of 3.95% (Limanseto, 2022). Compared to neighboring countries like Malaysia (4.74%) and Singapore (8.76%), Indonesia lags behind in entrepreneurial capacity (Adhi, 2024). According to the Global Entrepreneurship Index (GEI), Indonesia ranks 5th among 11 Southeast Asian countries with a score of 25 (Azkiya, 2023).

In addition to low entrepreneurship rates, Indonesia faces a significant unemployment issue. As of August 2023, the unemployment rate stood at 5.32%, affecting 7.89 million people (BPS, 2023). Entrepreneurship is seen as a solution to both economic growth and unemployment Ahmed et al. (2021), particularly through the development of Micro, Small, and Medium Enterprises (MSMEs) and the retail sector, which is accessible and labor-intensive (Heriawan 2018; Zulfiyandi et al., 2023).

Retail absorbs 26.1 million workers, second only to agriculture (38.7 million), and has shown growth in the Real Sales Index (IPR), indicating increased consumer purchasing power (Adi, 2023). Successful entrepreneurship requires traits such as resilience, creativity, and risk-taking (Alifah et al., 2019). Internal factors like locus of control positively influence

entrepreneurial intentions Ekawarna et al. (2020), although some studies find no significant effect (Othman, 2023).

Risk-taking propensity is crucial for entrepreneurial decision-making Shukla & Kumar (2024), though its influence is debated (Luc et al., 2021). The need for achievement drives individuals to overcome challenges and pursue goals (Susanto, 2018; Dzmonda 2020; Fatika et al., 2022). Personality traits also significantly affect entrepreneurial intentions (Ahmed et al., 2021; Bazkiaei et al., 2020; Ratnamiasih, 2016).

External factors such as entrepreneurial education and social support play a role. While some studies show a positive impact (Yung, 2022; Yesmin et al., 2024; Huang et al., 2024), others report no significant effect (Nabi et al., 2017). Importantly, entrepreneurial intention must translate into actual decisions and actions (Neneh & Dzomonda, 2024). This study differs from previous research by focusing on entrepreneurial decision-making rather than intention, using retail entrepreneurs as the sample. It aims to address inconsistencies in prior findings and expand the understanding of influencing variables.

2. Literature Review And Hypothesis Development

This study is grounded in Ajzen's Theory of Planned Behavior (TPB), which explains entrepreneurial decisions through three key components: attitudes (behavioral beliefs), subjective norms (normative beliefs), and perceived behavioral control (control beliefs). These elements are reflected in both internal and external factors that shape an individual's intention to pursue entrepreneurship. Internal factors include locus of control—belief in one's ability to influence outcomes (Rahmawati et al., 2023; Caliendo et al., 2024), risk-taking propensity—confidence in facing uncertainty (Ndofirepi, 2020; Shahzad et al., 2021), need for achievement—a drive to overcome challenges (Ekawarna et al. (2020); Kerr et al., 2017), and personality traits such as extraversion, conscientiousness, and openness, which support innovation and leadership (Tewel et al., 2017; Baumert et al., 2017).

External factors also play a crucial role. Entrepreneurial education provides structured learning that fosters skills, confidence, and a business mindset (Virk & Gambhir, 2024; Rakicevic et al., 2022). Social support, including emotional and practical assistance from family and peers, enhances self-esteem and reduces psychological barriers to entrepreneurship (Uchino et al., 2016; Acoba, 2024). Together, these internal and external influences align with TPB's framework, offering a comprehensive understanding of entrepreneurial intention and behavior.

Previous studies (Sze et al. 2021; Ekawarna et al. 2020; Tentama & Abdussalam, 2020; Agyemang et al. 2022); Asante & Affum-Osei, 2019; Rayawan, 2017) consistently demonstrate that individuals with a strong internal locus of control are more likely to engage in entrepreneurial activities. Such individuals are typically more motivated, proactive, and resilient, which enhances their likelihood of entrepreneurial success.

H1: The locus of control has a positive effect on entrepreneurial decisions.

Research by Antoncic et al. (2018), Setiawan et al. (2023), Ilevbare et al. (2022), and Zhuang & Sun (2024) confirms that individuals with a high propensity for risk-taking are more inclined to pursue entrepreneurship. This trait not only fosters entrepreneurial intention but also readiness to face business challenges.

H2: Risk taking propensity has a positive effect on entrepreneurial decisions.

Studies by Akhtar et al. (2020), Untu & Widjaja (2019), Shahzad et al. (2021), Saif & Ghania (2020), and Zahroh et al. (2023), reveal that a high need for achievement significantly influences entrepreneurial intention and behavior. Individuals with this trait are driven to overcome challenges and achieve business success.

H3: Need of achievement has a positive effect on entrepreneurial decisions.

Empirical evidence from Haider & Shah (2022), Mathushan (2023), Bazkiaei et al. (2020), Juhari et al. (2023), and Kathayat et al. (2023) indicates that personality traits significantly affect entrepreneurial intention and sustainability. Traits such as extraversion, conscientiousness, and openness are particularly influential.

H4: Personality has a positive effect on entrepreneurial decisions.

Findings from ArdaBily & Rizky (2024), Pebriyanti & Rizky (2024), Khoirunisa & Rizky (2025), Serefina & Kurjono (2021), and Sari et al. (2021) suggest that entrepreneurial education positively shapes entrepreneurial mindset, motivation, and readiness to start a business.

H5: Entrepreneurial education has a positive effect on entrepreneurial decisions.

Research by Yesmin et al. (2024), Shehryar & Ahsen (2022), Khusna & Ulya (2024), and Cai et al. (2021) shows that social support—particularly from family and peers—enhances entrepreneurial intention and behavior by boosting confidence and emotional well-being.

H6: Social support has a positive effect on entrepreneurial decisions.

Studies by Agustina & Fauzia (2021), Ratnamiasih et al. (2024), Annisa et al. (2023) Annisa (2022), and Shaddiq (2023) support the hypothesis that locus of control, risk taking propensity, need for achievement, personality, entrepreneurial education, and social support collectively influence entrepreneurial decision-making. These factors form a comprehensive foundation for entrepreneurial readiness and success.

H7: Independent variables have a positive effect on entrepreneurial decisions.

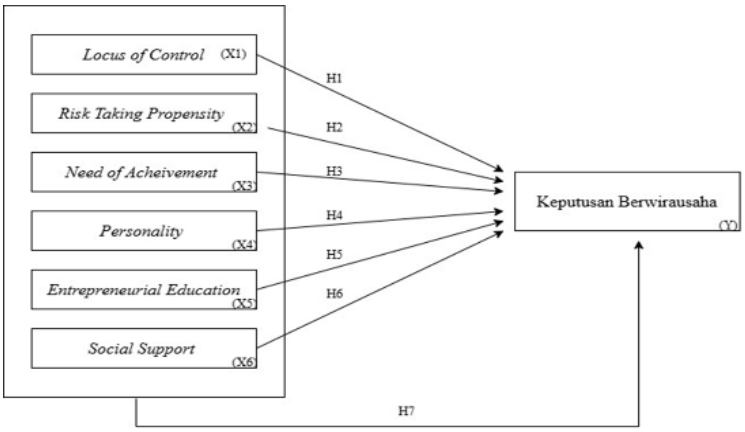

Image 1 Framework

2. Methodology

This quantitative study explores how psychological and contextual factors influence entrepreneurial decision-making in Indonesia's retail sector. With a population of approximately 3.98 million retail outlets, a sample of 400 respondents was determined using Slovin's formula at a 5% margin of error. The research focuses on one dependent variable—entrepreneurial decision—and six independent variables: locus of control, risk-taking propensity, need for achievement, personality, entrepreneurial education, and social support. Each variable is measured using validated indicators, such as control perceptions, risk tolerance, motivational drive, personality traits, educational background, and perceived support.

Data were collected via online questionnaires using Likert and Guttman scales, ensuring clarity and suitability for large-scale surveys. Secondary data were sourced from credible publications. Analysis was conducted using SPSS version 22, including descriptive statistics, validity and reliability testing (Cronbach's alpha > 0.70), and logistic regression. The regression model assessed the probability of entrepreneurial decisions based on the independent variables, with model fit evaluated using Hosmer-Lemeshow's test, Nagelkerke

R^2, and prediction accuracy. Hypothesis testing employed the Wald and Omnibus tests to determine individual and collective variable effects. This approach provides empirical insights into the factors shaping entrepreneurial behavior in Indonesia's retail landscape. The regression model in this study is as follows:

$$\text{Ln}\frac{p}{1-p} = \beta 0 + \beta 1X1 + \beta 2X2 + \beta 3X3 + \beta 4X4 + \beta 4X4 + \beta 5X5 + \beta 6X6$$

Information:
β0= Constant
β1= Koefisien regresi locus of control
β2= Koefisien regresi risk taking propensity
β3= Koefisien regresi need of achievement
β4= Koefisien regresi personality
β5= Koefisien regresi entrepreneurial education
β6= Social support regression coefficient

3. Results and discussion

3.1.Descriptive Statistics

This research utilizes primary data obtained through the distribution of questionnaires to individuals engaged in the retail business sector. A total of 459 respondents participated in the study. The descriptive analysis in Table 1 reveals that the majority of respondents were female, accounting for 241 individuals or 52.5% of the sample. In terms of educational background, the most common level was senior high school or its equivalent, reported by 216 respondents or 47.1%. The highest concentration of respondents by provincial domicile was found in East Java, comprising 187 individuals or 40.7%. Regarding business tenure, the most prevalent duration was between five and less than ten years, represented by 174 respondents or 37.9%. Lastly, the most frequently reported monthly revenue category was below IDR 50,000,000, with 179 respondents or 39.0%.

Table 1 Statistics Descriptive

No	Respond	Characteristics	Total	Percentage
1	**Gender**	Man	218	47,5

		100,000,000 - Less than 250,000,000	90	19,6
		250,000,000 - Less than 500,000,000	32	7,0
		500,000,000 - More than 500,000,000	15	3,3

3.2.Logistic Regression

4.2.1 Overal Model Fit

The decrease in the -2LogL value between model iterations indicates improved model fit. As more independent variables are added, the model better explains the data, enhancing its predictive accuracy. This improvement is shown in Table 2, confirming the effectiveness of including additional variables.

Table 2 Overal Model Fit

Iteration	-2 Log Likehood	Coefficients
		Constant
Step 0	187,754	1,869
Step 1	53,818	-11,611

4.2.2 Goodness of Fit Test.

The Hosmer and Lemeshow test, shown in Table 3, confirmed the regression model's validity, as the significance value exceeded 0.05. This indicates no meaningful difference between the model and observed data, affirming its suitability for predicting entrepreneurial decisions..

Table 3 Hosmer and Lemeshow Test

Hosmer and Lemeshow Test			
Step	Chi-square	df	Itself.
1	,388	8	1,000

4.2.3 Nagelkerke R Square

The coefficient of determination was assessed using the Nagelkerke R Square value, which indicates the extent to which the independent variables explain the variation in the dependent variable. The analysis in Table 4 revealed that the independent variables accounted for 62.7% of the variance in the dependent variable, while the remaining 37.3% is attributed to other factors not included in the model.

Table 4 Model Summary

Model Summary			
Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square
1	53,818a	,157	,627

4.2.4 Prediction Accuracy

The predictive accuracy test was conducted to evaluate the effectiveness of the regression model in forecasting entrepreneurial decisions. The classification table indicates that the model incorrectly predicted 15 cases, with 8 actual responses classified as "no," resulting in a prediction accuracy of 53.3% for that category. Conversely, the model predicted "yes" for 444 cases, closely aligning with the actual count of 441, yielding a prediction accuracy of 99.3%. Overall, the model achieved a total classification accuracy of 97.8%, demonstrating a high level of reliability in predicting entrepreneurial decision outcomes.

Table 5 Classification Table

Classification Table[a]					
Observed			Predicted		
			Results		Percentage Correct
			0 No	1 Ya	
Step 1	Results	0 No	8	7	53,3
		1 Ya	3	441	99,3
	Overall Percentage				97,8

4.3 Hypothesis Testing

4.3.1 Partial Test (Wald Test)

The partial test assessed the individual impact of each independent variable on entrepreneurial decision-making. All variables showed significance levels below 0.05, confirming their statistical relevance. Locus of control, need for achievement, personality, and social support had positive effects, while risk-taking propensity and entrepreneurial education had negative effects. Thus, hypotheses H1, H3, H5, and H6 are accepted, while H2 and H4 are rejected.

Table 6 Wald Test

	Constant	-11,611	2,959	15,398	1	,000	,000		

4.3.2 Simultaneous Test (Omnibus Test)

The test aimed to assess whether all independent variables collectively influence entrepreneurial decision-making. Using a significance threshold of 0.05, the analysis produced a value of 0.000, confirming a statistically significant simultaneous effect of the independent variables on the decision-making process.

Table 7 Omnibus Test Result

Step 1	Step	78,316	6	,000
	Block	78,316	6	,000
	Model	78,316	6	,000

4.4 Discussion

The variable locus of control was found to have a positive and significant influence on entrepreneurial decision-making, supporting hypothesis H1. This finding aligns with prior studies by Ekawarna et al. (2020), Tentama & Abdussalam (2020), Agyemang et al., 2022), Sze et al. (2021, Asante & Affum (2019, and Rayawan (2017), which consistently demonstrate that individuals with a strong internal locus of control are more committed, opportunity-aware, and resilient in business contexts. Thus, locus of control serves as a critical internal factor driving entrepreneurial success in the retail industry.

The variable risk taking propensity was found to have a negative and significant influence on entrepreneurial decision-making, leading to the rejection of hypothesis H2. This finding is consistent with prior studies by Luc et al. (2021), Patricia & Saputra (2022), and Adhimursandi (2016), which suggest that entrepreneurial interest is more strongly driven by confidence and social values than risk tolerance. In the retail sector, high-risk factors—such as intense competition, pricing errors, inventory issues, theft, and market volatility—may discourage individuals with high risk-taking tendencies from pursuing entrepreneurship (Sunreni, 2020).

The variable need for achievement demonstrated a positive and significant influence on entrepreneurial decision-making, supporting hypothesis H3. This finding aligns with studies by Akhtar et al. (2020), Untu & Widjaja (2019), Shahzad et al. (2021), Saif & Ghania (2020), and Zahroh et al. (2023), which consistently show that individuals with a strong drive for achievement are more motivated, confident, and inclined to pursue entrepreneurship. In the retail sector, this internal motivation fosters goal-setting, risk-taking, and a belief that entrepreneurship is a viable path to personal success and fulfillment.

The variable personality was found to have a positive and significant effect on entrepreneurial decision-making, supporting hypothesis H4. This result is consistent with findings from Haider & Shah (2022), Juhari et al. (2023), Mathushan (2023), Bazkiaei et al. (2020), and Kathayat et al. (2023), which highlight that traits such as openness, responsibility, and confidence foster entrepreneurial motivation and success. Strong personality traits enhance

discipline, resilience, and strategic thinking, making individuals more likely to pursue and succeed in entrepreneurship, particularly within the retail sector.

The variable entrepreneurial education was found to have a negative and significant effect on entrepreneurial decision-making, leading to the rejection of hypothesis H5. This finding is consistent with studies by Nabi et al. (2017), Ziemianski & Golik (2020), and Yanti (2019), which suggest that overly theoretical curricula and a lack of exposure to real-world business challenges—such as financial risk and stress—can diminish entrepreneurial interest. In the retail sector, such educational shortcomings may discourage individuals from pursuing entrepreneurship due to inadequate preparation for the realities of business ownership.

The variable social support was found to have a positive and significant effect on entrepreneurial decision-making, supporting hypothesis H6. This finding is consistent with studies by Yesmin et al. (2024), Shehryar & Ahsen (2022), and Cai et al. (2021), which emphasize that a supportive environment enhances entrepreneurial intentions and behavior. Social support plays a crucial role in boosting confidence and motivation, thereby encouraging individuals to pursue entrepreneurship. In the retail sector, such support strengthens one's readiness to start a business by fostering emotional resilience and reinforcing belief in one's entrepreneurial potential.

H7, which posits that locus of control, risk taking propensity, need for achievement, personality, entrepreneurial education, and social support simultaneously influence entrepreneurial decision-making, is supported. This finding aligns with studies by Agustina & Fauzia (2021), Ratnamiasih (2016), and Annisa et al. (2023), which emphasize the complementary roles of psychological traits, education, and social environment in shaping entrepreneurial motivation and readiness. The integration of these factors forms a cohesive system that enhances confidence, adaptability, and practical competence, ultimately encouraging individuals to pursue entrepreneurship in the retail sector.

5. Conclusion

This study concludes that locus of control, need for achievement, personality, and social support positively and significantly influence entrepreneurial decisions in the retail sector, while risk taking propensity and entrepreneurial education have a negative impact. All six variables also show a simultaneous effect. However, limitations include reliance on online questionnaires, geographic concentration of respondents in East Java, and the exclusion of other potential influencing factors. Managerially, the findings suggest the need for more practical entrepreneurship education, risk diversification strategies, and stronger social support systems to enhance entrepreneurial readiness and success.

THE INFLUENCE OF DIGITAL PROMOTION, HEDONIC SHOPPING MOTIVATION, AND SHOPPING LIFESTYLE ON IMPULSE BUYING AMONG MARKETPLACE USERS (A STUDY OF GENERATION Z IN DEPOK CITY)

Mochamad Tri Sultan Firdausy[1], Arie Wibowo Irawan[2], Aditya Prima Yudha[3], Rifli Ramadhan Sabililah[4]

[1-4] Pakuan University, Indonesia

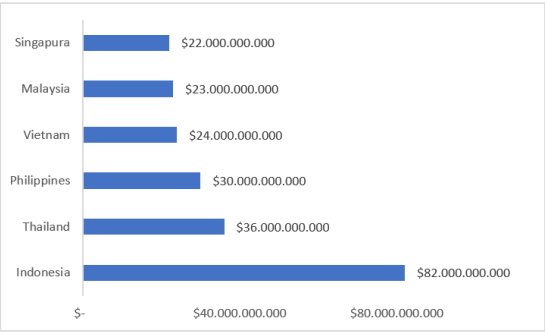
Abstract

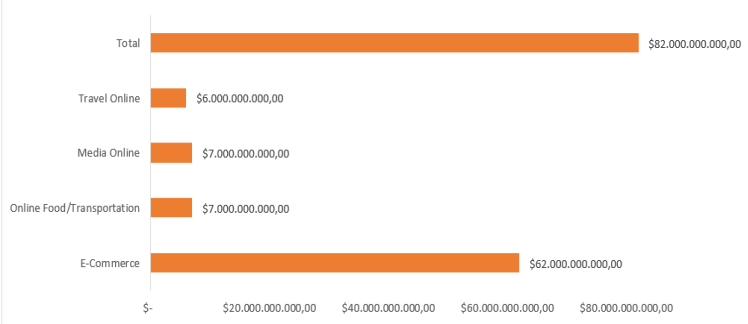
The advancement of digital technology has changed people's consumption patterns, especially with the presence of marketplace platforms that offer easy access to shopping anytime and anywhere. This phenomenon has also driven changes in consumer behavior, including an increased tendency to make impulsive purchases, especially among Generation Z, who are familiar with technology. This study aims to analyze how the influence of Digital Promotion, Hedonic Shopping Motivation, and Shopping Lifestyle on Impulse buying behavior among Marketplace users among Generation Z in Depok City. This study uses a quantitative approach with an associative method. The sample in this study was selected through a purposive sampling technique, with a total of 100 respondents from Generation Z who use marketplaces in Depok City, which was determined based on the Lemeshow formula. Data were analyzed using descriptive analysis, SEM-PLS method, and hypothesis testing with the help of SmartPLS software version 4.0. The results of the study indicate that digital promotion has a negative and insignificant effect on impulse buying behavior. While hedonic shopping motivation has a positive and significant effect on impulse buying behavior, and shopping lifestyle has a positive and significant effect on impulse buying behavior.

Keywords: Digital Promotion, Hedonic Shopping Motivation, Shopping Lifestyle, Impulse Buying

1. Introduction

Figure 1. Gross Transaction Value of the Digital Economy in Southeast Asia and Indonesia in 2023





The development of digital technology has brought about fundamental changes in consumer behavior, particularly in the context of shopping activities. The rapid growth of information and communication technology enables people to conduct online transactions more quickly, practically, and flexibly (Hasibuan et al., 2023). This transformation is reflected in the increasing use of e-commerce platforms or marketplaces in Indonesia, which have become the main channel for meeting the consumption needs of urban communities. The gross transaction value of Indonesia's digital economy Gross Merchandise Value (GMV) in 2023 reached USD 82 billion, making it the highest in Southeast Asia (Amali et al., 2025) .The e-commerce sector contributed 75.6% of the GMV or around USD 62 billion. The most commonly used e -e-commerce platforms are Shopee (56.04 percent), Lazada (32.72 percent), Tokopedia (12.80 percent), and TikTok (8.29 percent) (Amali et al., 2025) .

Figure 2. Percentage of E-commerce Users by Age in Indonesia in 2023

E-commerce Users by Age	
Age	**Percentage (%)**
18-24	45,6
25-30	25
31-35	14,4
36-40	8,3
41-45	5,6
46-50	1,1

Generation Z, consisting of individuals aged 18 to 28, plays a crucial role in this dynamic. According to Sleekflow (2023), 70.6% of e-commerce users in Indonesia come from this age group (Andini, 2023). Generation Z is known for its digital- native characteristics are highly connected to the virtual world and exhibit a rapid response to visual, interactive, and emotional digital campaigns. This has led to the emergence of the impulse buying phenomenon. Impulsive buying or buying behavior characterized by unplanned and emotional purchases. According to Gupta & Nair, (2021), impulse buying is triggered by a sudden, difficult-to-control urge and often occurs in the context of an attractive promotion, a big discount, or a pleasant shopping atmosphere. Many factors influence impulse buying. Buying in the context of online shopping. First, digital promotion which encompasses various internet-based marketing strategies such as flash sales, exclusive discounts, free shipping, app notifications, and the use of influencers (Gupta & Nair, 2021). Second, hedonic shopping Motivation, namely shopping motivation based on the desire to obtain pleasure, entertainment, and emotional experiences during the shopping process (Romadhoni, 2024). Third, shopping lifestyle, namely a means for consumers to express their feelings, perceptions, and views towards a brand through shopping activities (Giveline et al., 2024). Populix's (2023) findings support this phenomenon. The main reasons Indonesians make impulsive purchases are self-satisfaction (39%), the lure of discounts from sellers (35%),

and platform promotions (34%). Furthermore, Goodstats (2023) data states that 73.5% of consumers choose marketplaces because of time flexibility, 65.6% because of attractive promotions, and 60.2% because of the ease of comparing prices.

A pre-survey conducted by researchers on 30 Generation Z individuals in Depok City showed that 83.3% of respondents agreed that digital promotions influenced their impulse buying decisions, 81.6% were driven to shop for personal enjoyment, and 79.2% considered online shopping to be part of their daily lifestyle. In fact, 76.7% admitted to frequently purchasing products spontaneously without planning (Primary Data, 2024). Depok City was chosen as the research location because it is one of the cities with the highest e-commerce transaction rates in Indonesia. Based on Datanesia (2022), approximately 659,958 of Depok City's 2.4 million residents are active as sellers and buyers via the internet, making it a city with a high concentration of digital economic activity (Irawanto et al., 2022) .

Based on the description above, it is important to conduct further research on how digital promotions, hedonic shopping motivation, and shopping lifestyle influence impulse buying among marketplace users, particularly among Generation Z in Depok City.

2. Literature review and hypotheses development

2.1 Consumer Behavior

According to Yudha and Prasetyo (2023), consumer behavior is one of the fields in knowledge marketing that studies how individuals spend money to get goods or services. Meanwhile according to Putri Nugraha et al. (2021), describes behavior consumer as action both by individuals and group in buy and use product or services, which involve the process of taking decision For fulfil need or desire According to Andrian et al. (2022), consumer behavior includes mental and physical activities carried out by consumers, both end consumers and business actors, in terms of obtaining, using, and discontinuing the use of certain goods, services, ideas, or experiences.

2.2 Digital Promotion

According to Habibullah (2023), digital promotion is a promotional activity carried out through digital means with the aim of introducing products to consumers and shaping their preferences. The main goal is to increase company revenue through digital advertising media. Fadillah et al. (2020) state that digital promotion is included in digital marketing strategies that rely on online platforms to convey product information to consumers, with the hope of creating engagement both directly and indirectly. Meanwhile, according to Uday Kiran and Arumugam (2021), digital promotion is the result of a continuous advertising and marketing process, which aims to attract new customers, maintain the loyalty of existing customers, and increase sales through the efficient use of digital technology.

2.3. Hedonic Shopping Motivation

According to Romadhoni (2024), hedonic shopping motivation is the drive within consumers to shop to obtain pleasure and psychological sensations, not solely because of rational needs, this behavior is closely related to the search for pleasure when shopping. According to Tumewu et al., (2024), Hedonic Shopping Motivation is a form of encouragement to enjoy entertainment, emotional satisfaction, or pleasant experiences during the shopping process, which is generally not based on functional considerations. According to Utami (2017), hedonic shopping motivation is the drive for consumer

behavior to shop, both consciously and unconsciously, which is generally influenced by subjective views or emotional factors with the aim of obtaining pleasure.

2.4. Shopping Lifestyle

According to Andrian et al. (2022), a shopping lifestyle is a way of life where a person expresses themselves through shopping behavior patterns that distinguish them from others. According to Giveline et al. (2024), a shopping lifestyle is a means for consumers to express their feelings, perceptions, and views about a brand through shopping activities. This lifestyle sometimes encourages excessive consumer behavior, especially due to various attractive offers from retail businesses. According to Zayusman and Septrizola (2019), a shopping lifestyle reflects a person's pattern of time and money usage. When someone has sufficient time and funds, the tendency to shop increases. This reflects how an individual lives their life, including how they view their surroundings.

2.5. Impulse buying

According to Giveline et al. (2024), impulse buying is the behavior of purchasing goods suddenly without prior planning or careful consideration, usually triggered by emotional impulses. This action arises from a strong urge to immediately own a product, without considering the potential negative consequences. It usually provides instant gratification, but is often accompanied by feelings of doubt or regret afterward due to not considering the risks of the purchase. According to Azmi (2023), impulse buying is when someone buys something without thinking it through. Consumers who act in this way tend not to consider the consequences of their actions.

2.6. Marketplace

According to Kusumaningsih et al. (2021), a marketplace is a platform that acts as an intermediary between sellers and buyers in conducting online product transactions. This online market also offers various facilities, including payment methods, estimated delivery times, product selection by category, and other features. Meanwhile, according to Apriadi and Saputra (2017), a marketplace is a web-based platform that functions as an online medium for business activities and transactions between sellers and buyers. Buyers can search for as many suppliers as possible according to their desired criteria, thus obtaining prices that are in line with market conditions.

2.7. Hypothesis development

H1: There is an influence of digital promotion on impulse buying behavior among Generation Z marketplace users in Depok City.
H2: There is an influence of hedonic shopping motivation on impulse buying behavior among Generation Z marketplace users in Depok City.
H3: There is an influence of shopping lifestyle on impulse buying behavior among Generation Z marketplace users in Depok City.

3. Research methods

3.1 Types and Approaches Study

This research is quantitative, using a descriptive and causal approach. This approach was used to examine and analyze the relationship and influence between digital promotion, hedonic shopping motivation, and shopping lifestyle variables on impulse buying. The

study employed a survey method using a questionnaire distributed online.

3.2 Population and Samples

The population in this study is Generation Z (aged 18–28 years) in Depok City who actively use marketplace platforms. The sampling technique used non-probability sampling with a purposive sampling method, with the following criteria: (1) domiciled in Depok City, (2) included in Generation Z, and (3) have made shopping transactions on the marketplace at least 2–3 times a month. The number of samples determined was 100 respondents, referring to the Lameshow formula (1990), with a confidence coefficient of 95% and a sampling error of 10%.

3.3 Data collection technique

Data were collected through an online questionnaire distributed using the Google Forms platform. The questionnaire was structured as closed-ended statements measured using a Likert scale, which serves to gauge individual or group attitudes, opinions, and perceptions toward social phenomena (Sugiyono, 2013). The instrument was developed based on indicators for each variable that had been validated in previous research.

3.4 Operationalization of Variables

This research involves four main variables:

- Digital Promotion (X1): attractive promotional schemes, informative promotions, useful promotions, and the appeal of influencer marketing (Gupta & Nair, 2021).
- Hedonic Shopping Motivation (X2): Adventure Shopping, Value Shopping, Idea Shopping, Social Shopping, and Relaxation Shopping (Ozen & Engizek, 2014).
- Shopping Lifestyle (X3): Measured through indicator Activities, Interests, and Opinions (Sumarwan, 2017).
- Impulse Buying (Y): Measured through indicator Purchase Spontaneous Purchase Done In a way Rush, Purchase Influenced by Emotions, Purchases Done Without Thinking about Consequences (Wahyuni & Setyawati, 2020).

3.5. Data Analysis Techniques

Data analysis uses the Structural Equation Modeling-Partial Least Square (SEM-PLS) method with the help of the device software SmartPLS version 3.3. Analysis includes :

- Evaluation: Validity Test convergent (loading factor value > 0.7), validity test discriminant (AVE value > 0.5), and reliability test (Cronbach's Alpha and Composite Reliability values > 0.7).
- Evaluation: includes the R-square (R^2) test for known influence variables independent of variables dependent, F-squared test (f^2) for see strength effect, and the Q-square (Q^2) test for predictive relevance.
- Hypothesis Testing: conducted through analysis of t-statistic and p-value using bootstrapping techniques. The hypothesis is said to be significant if the p-value < 0.05 and the t-statistic > 1.96.

4. Results and discussion

4.1 Characteristics of Respondents

This study involved 100 respondents, consumers residing in Depok City and those with experience shopping through marketplace apps. Questionnaires were distributed from February 2025 to March 2025.

a. Gender

Table 1. Respondent Characteristics Based on Gender

No.	Category	Number of Respondents	Percentage (%)
1.	Man	39	39%
2.	Woman	61	61%
Amount		100	100%

Based on Table 1, data obtained from 100 respondents shows that 61 (61%) were female, while 39 (39%) were male. This indicates that the majority of respondents in this study were female.

b. Age

Table 2. Respondents' Age

No	Category	Number of Respondents	Percentage (%)
1.	18-20 years old	12	12%
2.	21-23 years old	38	38%
3.	24-26 years old	25	25%
4.	27-28 years old	25	25%
Amount		100	100%

Based on Table 2, the data obtained from 100 respondents shows that there are 12 respondents aged 18-20 years, with a percentage of 12%. Meanwhile, there are 38 respondents aged 21-23 years with a percentage of 38%. Followed by the 24-26 age group consisting of 25 respondents with a percentage of 25%. Meanwhile, there are 25 respondents aged 27-28 years with a percentage of 25%. From these data, it can be concluded that the majority of respondents are in the 21-23 age range with the highest percentage, namely 38%.

4.2 SEM-PLS Analysis Results

Table 6. *Average Value Variance Extracted*

Variables	**Average Variance Extracted (AVE)**
Digital Promotion	0.517
Hedonic shopping motivation	0.532
Shopping lifestyle	0.514
Impulse buying	0.565

Based on the test results, all loading values The factor values were recorded at more than 0.7, and the AVE value exceeded 0.5. Thus, the indicators used in this study have met the convergent validity criteria and can be considered valid, and it can be identified that each indicator is able to reflect its original latent construct more strongly than other

constructs, as indicated by the cross-correlation value. The highest loading on the construct.

4.2.1.2. Construction Reliability

a. Cronbach's alpha

Table 7. Cronbach's Alpha

Variables	Cronbach's Alpha	Information
Digital Promotion	0.867	Reliable
Hedonic shopping motivation	0.903	Reliable
Shopping lifestyle	0.811	Reliable
Impulse buying	0.890	Reliable

Based on table 7, all variables in this study have Cronbach's α values. Alpha > 0.7, so it can be concluded that the instrument used has met the reliability criteria.

b. Composite Reliability

Table 8. Composite Reliability

Variables	Composite Reliability	Information
Digital Promotion	0.895	Reliable
Hedonic shopping motivation	0.919	Reliable
Shopping lifestyle	0.864	Reliable
Impulse buying	0.912	Reliable

Based on table 8, all variables in this study, namely Digital Promotion, hedonic shopping motivation, shopping lifestyle, and impulse buying, show the composite value reliability which is greater than 0.7. Thus, all variables can be said to have met the reliability criteria.

4.2.2. Structural Model Evaluation Analysis (Inner Model)

4.2.2.1. R-Square (R^2)

Table 9. R-Square Value

Endogenous Variables	R-Square	Prediction Model
Impulse buying	0.648	Strong

In Table 9 above, it can be seen that the R- Square value Impulse latent variable buying is 0.648. This shows that all exogenous latent variable constructs are simultaneously able to explain the variance of the endogenous latent variable Impulse buying of 64.8%, while the remaining 35.2% is explained by other variables not included in this research model. Based on the calculation results, the R-Square value is included in the strong category, so it can be concluded that the prediction model has a good ability to explain the influence of exogenous variables on endogenous variables.

4.2.2.2. Path Coefficient

Table 10. Path Values coefficient

Variables	*Impulse Buying*	Connection

Digital Promotion (X1)	-0.018	Negative
Hedonic shopping motivation (X2)	0.368	Positive
Shopping lifestyle (X3)	0.535	Positive

Based on Table 10, it can be explained that the Digital Promotion variable (X1) has a coefficient value of -0.018, which indicates a negative relationship with the Impulse variable. buying (Y). This shows that the higher the intensity of digital promotions carried out, the lower the tendency of consumers to make impulsive purchases. Meanwhile, the Hedonic variable shopping motivation (X2) has a coefficient value of 0.368, which indicates a positive relationship with Impulse buying (Y). This means that the higher the consumer's motivation to shop for pleasure or emotional satisfaction, the greater their tendency to make impulsive purchases. Furthermore, the Shopping lifestyle variable (X3) shows a coefficient value of 0.535, which is the highest value among the three independent variables. This value indicates a strong positive relationship with Impulse buying (Y). Thus, a high shopping lifestyle significantly drives impulsive buying behavior.

4.2.2.3. F-square

Table 11. F-square value

	f- square	**Information**
Digital Promotion → Impulse buying	0,000	Small Effect
Hedonic shopping motivation → Impulse buying	0.178	Moderate Effect
Shopping lifestyle → Impulse buying	0.463	Big Effect

Based on Table 11, it can be seen that the Digital Promotion variable falls into the category of small effects. Next, Hedonic shopping motivation has an f-square value which is classified as a moderate effect, and Shopping lifestyle shows the f-square value which falls into the category of major effects.

4.2.2.4. Predictive relevance (Q-square)

Table 12. Predictive Values Relevance

Dependent Variable	**Q^2 predict**	**Information**
Impulse buying	0.608	Good

Based on Table 12, it can be seen that the Q- square value on the dependent variable is 0.608. This indicates that this study has good observation quality, because the Q- square value which is greater than 0 (0.608 > 0).

4.2.2.5. Bootstrapping

Table 13. Bootstrapping Values

Influence	**t- statistic**	**P- value**	**Influence**
Digital Promotion (X1) → Impulse buying (Y)	0.208	0.418	Not Significant
Hedonic shopping motivation (X2) → Impulse buying (Y)	3,895	0,000	Significant
Shopping lifestyle (X3) → Impulse buying (Y)	4,939	0,000	Significant

Referring to the results of the statistical analysis, which includes the t-statistic and p-

value, the level of significance of the influence of each independent variable on the dependent variable can be interpreted. The results of this analysis are presented as follows:

1) Digital Promotion does not have a significant effect on impulse buying. This can be seen based on the t- statistic value, which does not exceed the significance threshold (0.208 < 1.96), and P- value, which is greater than the specified level of significance (0.418 > 0.05).
2) Hedonic shopping motivation has a significant influence on impulse buying. This can be seen based on the t-statistic value, which exceeds the significance threshold (3.895 > 1.96), and the P- value, which is smaller than the specified significance level (0.000 < 0.05).
3) Shopping lifestyle has a significant influence on impulse buying. This can be seen based on the t- statistic value, which exceeds the significance threshold (4.939 > 1.96) and P- value, which is smaller than the specified significance level (0.000 < 0.05).

4.2.2.6. Fit Model

Table 14. Model fit values

	Saturated Model	**Estimated Model**
SRMR	0.081	0.081
d_ULS	3,472	3,472
d_G	1,507	1,507
Chi-square	715,401	715,401
NFI	**0.656**	**0.656**

An NFI value that approaches 1 indicates a higher level of fit for the model. In this study, the resulting NFI value was 0.656, indicating a 65.6% fit for the model.

4.3. Hypothesis Results

Table 15. Hypothesis Test Results

No	**Hypothesis**	**Analysis**	**Decision**
1.	There is a negative and insignificant influence between Digital Promotion on Impulse Buying.	The results of the path coefficient analysis on Digital Promotion own a negative relationship with Impulse buying with a value of -0.018, and the t-statistic value is below 1.96, namely 0.208, indicating no significant relationship.	Rejected
2.	There is a positive influence and significant relationship between Hedonic shopping motivation and Impulse buying.	The results of the path coefficient analysis on Hedonic shopping motivation have a positive connection against Impulse buying with a mark of 0.368 and is significant because the own mark t-statistic >1.96 which is 3,895.	Accepted

3.	There is influence positive and significant influence between Shopping lifestyle towards Impulse buying.	Results of path coefficient analysis on Shopping lifestyle own positive relationship with impulse buying value 0.535, and is significant because its own mark t-statistic >1.96, namely 4,939.	Accepted

The value of each aspect refers to the consistency of the direction of the relationship between the variables Digital Promotion, Hedonic shopping motivation, and Shopping lifestyle with Impulse buying. When the path coefficient and t-statistic values show a significant positive relationship, it can be concluded that the variable has a real influence on impulse buying behavior. In the Digital Promotion variable, it shows a negative and insignificant relationship with impulse buying. Conversely, the Hedonic shopping motivation variable shows a positive and significant relationship with impulse buying. Similarly, the Shopping lifestyle variable has a positive and significant influence on impulse buying.

4.4. Discussion and Interpretation of Results

4.4.1. The Influence of Digital Promotion on Impulse Buying

The path coefficient results indicate a negative relationship between digital promotion and impulse buying, with a coefficient value of -0.018, thus statistically the relationship is negative. Furthermore, bootstrapping results indicate that digital promotion does not have a significant effect on impulse buying, as seen from the t-statistic value of 0.208, which is below the significance threshold of 1.96, and the P-value of 0.418, which exceeds the significance level of 0.05. This means that the higher the intensity of digital promotion carried out, it will not automatically have an effect on increasing impulse buying behavior among Generation Z in Depok City when shopping in the marketplace. The results of this study show differences from the findings of previous research conducted by Fadillah et al. (2020), where the differences could be caused by differences in location, methods, economic conditions, or characteristics of the samples used. Furthermore, research conducted by Sarhour (2025) states that Generation Z tends to be more rational, selective, and skeptical of digital promotions that are irrelevant to their needs or preferences.

4.4.2. The Influence of Digital Promotion on Impulse Buying

Based on the path coefficient results, it show that hedonic shopping motivation has a coefficient value of 0.368, which indicates a positive relationship with impulse buying. This means that the higher the motivation of Generation Z consumers to shop for pleasure or emotional satisfaction, the greater their tendency to make impulsive purchases. In addition, the bootstrapping results show that hedonic shopping motivation has a significant influence on impulse buying. This can be seen based on the t-statistic value that exceeds the significance threshold (3.895 > 1.96) and the P-value is smaller than the specified significance level (0.000 < 0.05). This means that the greater the hedonic shopping drive felt by Generation Z in Depok City when shopping in the Marketplace when shopping in the marketplace, the stronger its influence in driving their impulsive purchasing behavior in the marketplace. This shows that hedonic shopping motivation plays an important role in influencing impulse buying behavior among respondents, especially Generation Z in Depok City. The results of this analysis indicate consistency with the findings of previous studies conducted by Wahyuni (2020), which stated that hedonic shopping motivation has a positive and significant influence on impulsive buying.

4.4.3. The Influence of Shopping Lifestyle on Impulse Buying

Based on the path coefficient results show that shopping lifestyle shows a marked coefficient of 0.535, which is the highest among the third variables. This value indicates a strong positive relationship with impulse buying. Thus, a high shopping lifestyle significantly encourages impulsive buying behavior. In addition, the bootstrapping results show that shopping lifestyle has a significant influence on impulse buying. This can be seen based on the t-statistic value that exceeds the significance threshold (4.939 > 1.96) and the P-value is smaller than the specified significance level (0.000 < 0.05). This means that the higher the shopping lifestyle of Generation Z in Depok City in shopping in the marketplace, the more likely they are to make impulsive purchases in the marketplace. The results of this analysis indicate consistency with the findings of previous studies conducted by Wahyuni (2020), which stated that shopping lifestyle has a positive and significant influence on impulsive buying.

5. Conclusion

Based on results research and discussion that has been done, can concluded that digital promotion variables have an influence negative and no significant to impulse buying behavior among Generation Z marketplace users in Depok City, so that the more tall intensity digital promotions carried out No as well as immediately increase trend purchase impulsive among On the other hand, the hedonic shopping motivation variable shows influence positive and significant, which means that the more strong encouragement shopping of a nature emotional and enjoyable feelings felt by Generation Z, increasingly there is a big possibility they do purchase impulsive in the marketplace. In addition, shopping lifestyle variables also have an influence positive and significant influence, which indicates that the taller style of life shopping owned by Generation Z in Depok City, then the bigger trend they follow for making purchases in a spontaneous way. These findings indicate that internal factors such as hedonic motivation and lifestyle play a dominant role in driving impulse buying behavior, compared to the influence of external promotions offered by marketplace platforms.

THE EFFECTIVENESS OF SOCIAL MEDIA ADVERTISING FOR FASHION PRODUCTS THIS IS APRIL

Rohiqim Makhtum[1], Sri Hidajati Ramdani[2], Bayu Dwi Prasetyo[3]

[1]Pakuan University, Bogor, Indonesia

Abstract

Advertising effectiveness is the degree of success an advertisement achieves in reaching its objectives. Advertising effectiveness indicates how effectively an advertisement can influence the feelings, actions, and thoughts of the audience, where consumers can remember the message conveyed by the advertisement as intended by the company, thereby increasing consumer interest in purchasing or even driving their purchasing interest. This study aims to analyze the level of difference in advertising effectiveness between Instagram and TikTok social media. The data analysis methods used in this study include validity and reliability tests processed using IBM SPSS Statistics 26, as well as the EPIC Model by calculating simple tabulation analysis, average scores, and EPIC Rate values. The results of the study show that all research instruments are valid and reliable. The analysis using the EPIC Model indicates that all instruments in this study fall within the effective scale range. With an EPIC Rate of 4.25 for Instagram and 4.03 for TikTok, this indicates that advertisements posted on Instagram are more effective than those on TikTok.

Keywords: Advertising Effectiveness, EPIC Model, Instagram, TikTok, Fashion

1. Introduction

The development of information and communication technology has brought significant changes to various aspects of life, including the business and marketing world. The internet is not only used as a means of information and communication but also as a marketplace for businesses. In the context of marketing, social media has become an indispensable promotional tool for businesses, especially in the highly dynamic and competitive fashion industry, which enables direct communication between businesses and consumers.

Social media is one of the most effective ways for businesses to promote their products through social internet marketing (Aryani & Murtiariyati, 2022). Consumers and producers can interact with each other even without face-to-face contact (Millatina et al., 2020). Advertisements on television, radio, and social media play an important role in shaping consumers' perceptions of products or services.

According to Latifa (2021), content in advertisements is information that can be accessed through products or electronic media. Content has the purpose of communicating a message to the audience. The highly competitive landscape of digital advertising is becoming increasingly competitive. To reach the right audience, the appropriate advertising platform is also necessary. In recent years, Instagram and TikTok have become major influences in the world of social media advertising. Since the pandemic in 2020, both platforms have garnered significant attention with their short video content.

Table 1. Comparison of Instagram and TikTok Content

Aspects	Instagram	TikTok
Content Format	Diverse: Posts, stories, reels	Short music-themed videos (15-60 seconds)
Audience	Diverse age range, from teenagers to adults	Primarily younger demographics (16-24 years old)
Use Cases	Visual storytelling, influencer culture	Trend setting, virality, and challenges.
Strengths	Visual appeal, established user base	Authenticity, viral potential
Engagement Patterns	Algorithm-based feed and explore page	The "For You Page" algorithm is driven by an algorithm
Advertising Opportunities	Instagram ads (feed, stories, explore)	TikTok ads (In-Feed, TopView, Challenges)
Cost Effectiveness	Various ad formats to suit your budget	Cost-effective advertising options
Influencer Marketing	Influencers have credibility and influence	Influencers play a crucial role
Brand Authenticity and Voice Emphasized	Through various content	Through creativity (content and entertainment)

Source: Secondary Data, Taggbox, 2025

This table compares Instagram and TikTok based on several key aspects. Instagram excels in diverse content formats, a broader audience, a focus on visual storytelling and influencer culture, and strong visual appeal. Meanwhile, TikTok stands out in short video formats, a younger audience, emphasis on trends and challenges, and high viral potential with the "For You" algorithm. Both platforms offer advertising and influencer marketing opportunities, but with different characteristics and effectiveness. Instagram emphasizes brand authenticity through diverse content, while TikTok focuses on creativity and entertainment.

The fashion industry has a great opportunity to leverage technology and innovation to create and enhance a more professional and satisfying shopping experience for consumers. The future of the fashion industry is increasingly bright, as it continues to evolve and adapt to changing trends and consumer needs. In line with the development of the digital era, the fashion industry faces new challenges, namely changes in consumer behavior toward online shopping and the influence of social media in shaping fashion trends. Competition among local women's fashion brands in Indonesia is also becoming increasingly intense and dynamic. Each brand strives to target specific segments with distinct designs ranging from minimalist, modern, feminine, casual, to edgy styles, while implementing appropriate marketing strategies. This creates healthy yet fierce competition, as each brand focuses on its unique strengths and advantages.

Table 2. Comparison of the Most Popular Local Clothing Brands on Social Media in 2024

No	Brand	Intagram	TikTok	Instagram Posting Frequency	TikTok Posting Frequency
1	Thenblank	834,000 followers	5,700 followers	2-3 times a week	Several times a week
2	This is April	832,000 Followers	364,700 Followers	Every day	Every day / 1-3 times a day
3	Cotton Ink	659,000 Followers	70,100 Followers	Every day	Every day / 1-3 times a day
4	Shop at Velvet	460,000 Followers	44,200 Followers	Several times a week	Several times a week
5	Callie Cotton	110,000 Followers	3,393 Followers	Several times a week	Less active
6	Kyrra	41,600 Followers	156 Followers	Several times a week	Less active
7	Gaudi	115,000 Followers	37,800 Followers	Several times a week	Every day

Source: Compiled by researchers, 2025

This table shows that Instagram is currently the platform with the largest audience reach for most of the brands we analyzed. When comparing follower counts, brands such as Thenblank, This is April, Cotton Ink, Shop at Velvet, Callie Cotton, Kyra, and Gaudi consistently have significantly more followers on Instagram than on TikTok. However, when looking at the posting frequency on Instagram and TikTok, This is April ranks second among local fashion brands in Indonesia, indicating that there is inefficiency in This is April's ad placements.

This is April is a local Indonesian fashion brand founded by Maria Anggraini in 2012. Maria Anggraini started this business with the hope of creating a high-quality fashion brand that would become a symbol of style, especially for women. This is April has successfully become one of the most popular local fashion brands in Indonesia. One of the brand's key strengths is its unique designs and inspiration for its collections. The This is April fashion brand continues to strive to create diverse products to empower women through fashion.

This study uses the EPIC Model developed by AC Nielsen to measure the effectiveness of advertisements on Instagram and TikTok for This is April fashion products. The results of this study can provide insights and recommendations for other local fashion industries, particularly for This is April in utilizing social media as a platform for promoting its products.

2. Literature review

3.3. Marketing and Advertising

According to Ariyanto (2023), marketing is a managerial process that results in individuals or groups obtaining what they need or desire by creating, offering, and exchanging products of value to others. Simply put, marketing encompasses all efforts made to attract consumer interest and encourage them to purchase the products or services being offered.

According to Indah & Maulida (2023), advertising is a product offered through messages to the general public via specific media. Advertising delivered through media aims to promote a product, service, or idea to the general public. Advertising is also one of the ways media markets and promotes products and services to potential consumers.

3.4. Social Media

According to Tanggang et al., (2024), social media is an online platform where users can easily participate, share, and create content, including blogs, social networks, wikis, forums, and virtual worlds. It serves as a hub for images, videos, text, and interactions between individuals or groups. One of the uses of social media by other users is as a marketing communication medium, such as advertising (Maysaroh et al., 2022). This form of communication can include two-way communication, sharing information, photos, videos, articles, and various other types of content. Meanwhile, according to Tanggang et al., (2024), social media is an online medium where users can easily participate, share, and create content including blogs, social networks, wikis, forums, and virtual worlds. This is a place for collections of images, videos, writings, and interactions between individuals or groups.

3.5. Instagram dan TikTok

According to Carpenter et al., (2020), Instagram is a social media platform for sharing photos and videos, where users access the service through an app or web interface with limited features and can edit content using various filters. This involves the ability to edit photos and videos before uploading them, with the editing process involving various filters that can alter the visual aspects of the content, including color, contrast, and other effects.

According to Batoebara et al. (2020), TikTok is an app created in China, specifically designed for videos, music, and photos. TikTok offers various visual effects, filters, transitions, and stickers that can be used to enhance or modify videos. TikTok often serves as a source for new trends, whether in music, dance, comedy, or other fields. Through videos, images, and music, this app facilitates the transmission of information and can stimulate those who view, imitate, or share it (Mulyani et al., 2022).

3.6. EPIC Model

The EPIC Model is a model used to measure the effectiveness of communication, particularly in the world of advertising and public relations. The EPIC Model provides an effective tool for assessing the success of promotions. Each dimension in the EPIC Model aligns with the objectives of promotion, with the four dimensions comprising empathy, persuasion, impact, and communication.

Empathy can be used to determine how effectively an advertisement can evoke feelings and identify the needs of the audience. In other words, empathy conveys valuable information, brand appeal, and engages the feelings and understanding of the audience.

Persuasion is the company's effort to encourage the target audience to change their behavior, beliefs, and attitudes. This can be used to determine how effective an advertisement is in persuading consumers to take action, such as understanding the product and purchasing it.

Impact in marketing can be used by businesses to understand how much of an impact advertisements have on consumer behavior. This can involve feedback from promotional activities on the understanding of the products or services produced.

Communication can convey information about brands and other activities so that they are remembered by the audience. Communication is used to determine how clear and easy to understand the message conveyed in advertisements is.

3. Methodology

The type of research used is descriptive exploratory research with a case study approach. This research was conducted to analyze and describe the phenomenon in depth, as well as to collect data that has been collected comprehensively.

10.10. Sampling Method

The population in this study consists of Instagram and TikTok followers of @thisisapril_ or the general public who follow Instagram and TikTok @thisisapril_. To determine the sample size for this study, the authors used the Slovin formula with a significance level of 10%. Using the Slovin formula, the sample size is calculated as follows:

Slovin Formula:

$$\text{Rumus Slovin: } n = \frac{N}{1+Ne^2}$$

Notes:

n: Sample Size

N: Population Size

e^2: Error Tolerance Limit

In this study, an error rate of 10% was used in accordance with existing research standards. The sample size in this study was 99.99, rounded to 100 followers on the Instagram social media account @thisisapril_ and 99.97, rounded to 100 followers on the TikTok social media account @thisisapril_.

10.11. *Data Collection Method*

Data collection methods are systematic and standardized procedures for obtaining the necessary data. To obtain the data and information required for this study, the researchers used primary and secondary data, namely:

1. Primary Data

   The primary data used in this study were obtained from the distribution of questionnaires used to measure advertisements on Instagram and TikTok social media for This is April fashion products. The questionnaire will be distributed to 100 followers on the Instagram social media account @thisisapril_ and 100 followers on the TikTok social media account @thisisapril_.

2. Secondary Data

   In this study, the secondary data used by the researcher was obtained through information collected from journals, books, articles, e-books, and documents relevant to the research theme.

10.12. Operational Variables

Table 3. Operational Variables

Variable	Indicator	Measurement	Scale
Advertising (Indah & Maulida, 2023)	*Emphaty*	1. Consumers feel interested when they see This Is April ads on Instagram and TikTok. 2. Consumers want to see This Is April ads on Instagram and TikTok repeatedly. 3. Consumers feel satisfied and happy when they see This Is April ads on Instagram and TikTok. 4. Consumers like This Is April ads on Instagram and TikTok	Ordinal
	Persuasion	1. Consumers feel inclined to purchase products after viewing advertisements on Instagram and TikTok for This Is April 2. Advertisements for This Is April effectively explain the products being promoted 3. Consumers feel confident about the advertised products after viewing advertisements for This Is April on Instagram and TikTok	Ordinal
	Impact	1. Advertising posts on Instagram and TikTok This Is April provide knowledge to consumers 2. Posts generated by Instagram and TikTok This Is April are different from others 3. Consumers are aware of the advantages of This Is April products	Ordinal
	Communication	1. Advertising posts on Instagram and TikTok by This Is April provide clear information to consumers 2. The messages in the posts displayed by This Is April on Instagram and TikTok are easy for consumers to understand 3. Consumers can remember the messages displayed on This Is April products	Ordinal

Source: Processed Data, 2024

4. Results and Discussion

The validity test was conducted to ensure that the research instrument accurately measured the statements being studied. In other words, a valid instrument produces information that is relevant to the actual situation.

Table 4. Results of the Validity Test of Advertising Effectiveness on Instagram Social Media for This is April

No	Variable	Statement	Calculated r		Table r	Description
			Instagram	TikTok		
1	*Emphaty*	E1	0.720	0.815	0.195	Valid
2		E2	0.721	0.784	0.195	Valid
3		E3	0.656	0.804	0.195	Valid
4		E4	0.650	0.834	0.195	Valid
1	*Persuasion*	P1	0.692	0.794	0.195	Valid
2		P2	0.779	0.865	0.195	Valid
3		P3	0.657	0.823	0.195	Valid
1	*Impact*	I1	0.607	0.823	0.195	Valid
2		I2	0.697	0.810	0.195	Valid
3		I3	0.710	0.809	0.195	Valid
1	*Communication*	C1	0.649	0.841	0.195	Valid
2		C2	0.730	0.783	0.195	Valid
3		C3	0.650	0.816	0.195	Valid

Source: Primary Data, 2025

Based on Table 4, it shows that all statement items in the dimensions of empathy, persuasion, impact, and communication used in this study regarding advertising posts on Instagram and TikTok This is April meet the validity criteria. Where the calculated r value for each statement is greater than the table r value. This shows that the research instrument (questionnaire) has been able to measure variables accurately and consistently.

Table 5. Results of the Reliability Test of the Effectiveness of Social Media Advertising This is April

Kuesioner Item	Kriteria Kesimpulan			Description
	Cronbach Alpha	r tabel	N of items	
EPIC	Instagram			
	0,904	0,904 > 0,60	13	Reliabel
	TikTok			
	0,985	0,985 > 0,60	13	Reliabel

Source: Primary Data, SPSS, 2025

Based on Table 5 above, the reliability test results for the effectiveness of advertisements on Instagram This is April social media show a Cronbach's Alpha value of 0.904, and on TikTok social media, a Cronbach's Alpha value of 0.958, which is considered reliable. Therefore, it can be seen that the instruments or questionnaires used to measure the effectiveness of advertisements on both social media platforms, Instagram and TikTok This is April, are reliable or valid.

4.1 Data analysis

The EPIC Model was used to assess the effectiveness of advertisements on Instagram and TikTok for This is April fashion products. The following are the results of data processing using the EPIC Model:

1. Empathy

Empathy in advertising is an affective response that comes from understanding the emotions of others. Does the audience like the advertisement and how does the advertisement depict the relationship between the advertisement and their personal lives? The following are the results of data processing using the EPIC Model on the empathy dimension:

Table 6. EPIC Model Score for the Empathy Dimension

No	STATEMENT	Score Value	
		Instagram	TikTok
1	This is April advertising posts are able to attract interest	4,51	4,07
2	This is April advertising posts are easy to view repeatedly	4,44	4,17
3	This is April advertising posts are able to influence mood	4,02	3,92
4	Liking This is April advertising posts	4,14	4,07
Total Average Score		**4,27**	**4,05**

Source: Processed Data, 2025

Based on Table 6, the statement that This is April advertisements can influence mood is the statement with the lowest score on both social media platforms, Instagram and TikTok, with scores of 4.02 on Instagram and 3.92 on TikTok. This indicates that the advertising posts uploaded by both social media accounts are not sufficient to influence consumer mood. This aligns with Akhirudin's (2022) research, which states that Inces Olshop advertising posts tend to be uploaded directly, causing consumers to be less interested in viewing Inces Olshop product advertising posts.

2. Persuasion

The persuasion dimension can inform what is conveyed by the ad, and by understanding the persuasion dimension of the uploaded ad, one can gain insight into how the audience takes action, such as purchasing the product and understanding it. The following are the results of data processing using the EPIC Model on the persuasion dimension:

Table 7. EPIC Model Score for the Persuasion Dimension

NO	STATEMENT	Score Value	
		Instagram	TikTok
1	This is April's advertising posts successfully attracted interest in purchasing its products.	4,47	4,11
2	This is April's advertising posts were able to provide clarity about the advertised products.	4,33	4,05
3	This is April's advertising posts successfully convinced people to purchase its products.	4,16	4,04
	Total Average Score	**4,32**	**4,06**

Source: Processed Data, 2025

Based on Table 7, the statement that This is April advertisements successfully convince consumers to purchase their products has the lowest score on Instagram and TikTok, with values of 4.16 on Instagram and 4.04 on TikTok. Consumers may not receive much information about the product, such as price, variants, availability, or how to purchase it. This is consistent with Akhirudin's (2022) research, which states that Inces Olshop posts tend to be less interesting, so consumers are less interested in the products offered.

3. Impact

The impact dimension focuses on how much the advertisement or message communicated in the advertisement is able to leave a deep impression and influence the audience's mind. Impact is evaluated to capture the audience's attention and engage in reciprocity to increase brand awareness. The following are the results of data processing using the EPIC Model on the impact dimension:

Table 8. EPIC Model Score for the Impact Dimension

NO	STATEMENT	Score Value	
		Instagram	TikTok
1	Instagram ads for This is April provide information about the product	4,26	3,99
2	Instagram ads for This is April have unique characteristics	4,20	4,03
3	Understanding the advantages of This is April products through Instagram ads for This is April	4,16	4,05
	Total Average Score	**4,20**	**4,02**

Source: Processed Data, 2025

Based on Table 8, the statement regarding awareness of the advantages of the This is April product through advertising posts has the lowest score on Instagram, at 4.16, while on TikTok, the statement regarding This is April advertisements being able to provide knowledge about the product has the lowest score, at 3.99. This indicates that consumers are not yet aware of the advantages and information about the product advertised through This is April's advertising posts. This is consistent with Akhirudin's (2022) research, which states that due to the infrequent promotions by Inces Olshop, consumers are less aware of the products and advantages of Inces Olshop.

4. Communication

The communication dimension focuses on how advertisements can convey messages clearly, easily understood, and relevantly. Advertisements that excel in this dimension show that messages are conveyed effectively, there are no barriers to understanding, and the audience receives information in the manner intended by marketers. The following are the results of data processing using the EPIC Model in the communication dimension:

Table 9. EPIC Model Score for the Communication Dimension

NO	STATEMENT	Score Value	
		Instagram	TikTok
1	This is April's advertising posts are able to provide clear information about its products	4,30	3,98
2	The message in This is April's advertising posts is easy to understand	4,21	4,04
3	Easily remember the message conveyed in This is April's advertising posts	4,19	4,00
	Total Average Score	**4,23**	**4,00**

Source: Processed Data, 2025

Based on Table 4.9, regarding the statement that it is easy to remember the message conveyed in the This is April advertising post has the lowest score on Instagram social media with a value of 4.19. In addition, on TikTok social media, the statement about advertising being able to provide clear information about its products is the statement that has the lowest score, which is 3.98. This allows the messages and information conveyed to be too vague and not

specific in giving messages on the advertised product. This is in line with Akhirudin's research (2022), which states that Inces Olshop posts tend not to explain the main message clearly and optimally so that consumers cannot find out the main message that Inces Olshop wants to convey.

The final step is to determine the average value of the EPIC Rate to measure overall advertising on social media on This is April fashion products. The following are the results of the EPIC Rate calculation:

Table 10. EPIC Rate

Instagram			
No	**EPIC Model Dimension**	**Score**	**Description**
1	*Emphaty*	4,27	Very Effective
2	*Persuasion*	4,32	Very Effective
3	*Impact*	4,20	Effective
4	*Communication*	4,23	Very Effective
Total EPIC Rate		**4,25**	**Very Effective**
TikTok			
No	**EPIC Model Dimension**	**Score**	**Description**
1	*Emphaty*	4.05	Effective
2	*Persuasion*	4,06	Effective
3	*Impact*	4,02	Effective
4	*Communication*	4,00	Effective
Total EPIC Rate		**4,03**	**Effective**

Source: Processed Data, 2025

Measurement of the effectiveness of advertising on Instagram social media shows that overall it is rated very effective with a total EPIC Rate value of 4.25 presented in table 4.20. In this case, the persuasion dimension is the highest dimension with a value of 4.32 and the impact dimension is the lowest dimension with a value of 4.20 on Instagram social media. This is in line with Akhirudin's research (2022), which shows the same results with the order of the persuasion dimension being the highest and the impact dimension being the lowest as the weakest dimension in advertising research at the Inces olshop.

In connection with that, measuring the effectiveness of advertising on TikTok social media shows that overall it is in the effective category with a total EPIC Rate value of 4.03 presented in table 4.20. In this case, the persuasion dimension is the most dominant dimension with the highest score of 4.06 and the communication dimension is the dimension with the lowest order, with a value of 4.00. This has alignment with Billah's research (2022), that the persuasion dimension is in the highest order and the communication dimension is in the lowest order in Ughgurl fashion store product research.

Thus, Instagram social media advertising is considered superior to TikTok social media advertising based on the strengths and weaknesses of each dimension measured. Although both are in the effective category, advertising on Instagram This is April social media indicates an overall content and engagement strategy that successfully attracts consumer attention and interest and encourages positive interactions. In this case, it has alignment with Imilda et al.'s research, (2024), which states that Instagram is superior in building emotional connections with consumers through visual appeal and influencer credibility. In contrast, TikTok is more

effective in attracting young consumers through more dynamic content and more spontaneous interactions, as well as an emphasis on limited-time promotions

5. Conclusion

Measurement of the effectiveness of advertising on social media on This is April fashion products shows the EPIC Rate of 4.25 on Instagram social media and 4.03 on TikTok social media, this shows that advertisements uploaded by This is April's Instagram social media account involving the dimensions of empathy, persuasion, impact, and communication are more effective than advertisements uploaded by TikTok social media accounts. Thus, This is April's Instagram ads are more successful in attracting audience attention, delivering the right and clear message, and encouraging consumers to take action.

Abstract

This study aims to determine the effect of Profitability, Leverage and Asset Activity performance on processed foods subsector companies in 2019-2023. The type of research used in this research is verification research with an explanatory survey method that uses inferential statistical research techniques. The samples used in this study were 8 processed foods subsector companies in 2019-2023 with a sample withdrawal method using purposive sampling. The data analysis used is the classic assumption test, panel data regression analysis, t test and F test with e-views 12 software. The results of this study indicate that partially the Profitability variable proxied by Net Profit Margin and Leverage proxied by Debt to Equity Ratio has no effect on profit growth, while Asset Activity proxied by Total Asset Turnover affects profit growth. Simultaneously, the variables Net Profit Margin, Debt to Equity Ratio, Total Asset Turnover affect earnings growth. The panel data regression test results show an Adjusted R-Square value of 29.47%, which means that the contribution of the influence of the Net Profit Margin, Debt to Equity Ratio, and Total Asset Turnover variables on profit growth is 29.47%.

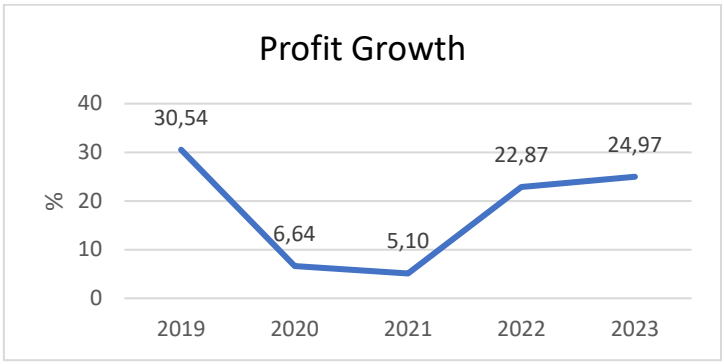
Keywords: Profitability, Leverage, Asset Activity Profit Growth

1. Introduction

In the current era of globalization in Indonesia, companies are growing more rapidly so that competition in the business world is increasingly competitive. Increasingly competitive conditions require companies to innovate and improve company performance well so that they can compete with other companies. The prospect of the processed industry in the country will still grow. The estimate, until the end of the year, the processed industry can still grow 5 percent, this type includes basic food needs. If it is implemented, Adhi, Chairman of the Indonesian Food and Beverage Manufacturers Association (Gapmmi), stated that the selling price of MBDK in the market and retail stores could increase by up to 30 percent. This is because the increase in excise duty costs cannot be covered by entrepreneurs, so it will be passed on to consumers. The world market for processed food and beverage products can reach 22 billion US dollars, while Indonesia's contribution to the world market is only 360 million US dollars or ranked 18th in the world (Kompas, 2024).

Profit growth describes the growth of the company's assets which will affect the company's profitability, and the percentage change in total assets is a very good indicator of company growth. Profit is the basis for measuring management's ability to run the company's assets to realize them effectively. Earnings growth can have an impact on the quality of a company's

income, because if a company has the opportunity to grow in profit, the company's finances are likely to grow well (Riany, 2022).



Source: IDX data processed by the author, 2025

Image 1. Profit Growth Companies Processed Foods Period 2019-2023

Based on Image 1 the annual average of companies in the processed foods sector period 2019-2023 was the highest profit growth over the last 5 years with a value of 30.54%. In 2020, there was a decrease in profit to 6.64%, this could occur due to several factors during the pandem covid-19 period and an increase in production costs, namely an increase in food raw material prices, an increase in costs, and an increase in labor wages. This suppresses the profit margins of companies in the Processed Foods sector. In 2021 it decreased by 5.10%, and experienced a significant increase in 2022 of 22.87% and in 2023 profit growth rose again by 24.97%. The decline in profit growth in the Processed Foods sector occurred in 2020 with a fairly low decline, one of which was from PT Garudafood Putra Putri Jaya Tbk, this could occur due to rising costs in the domestic market and the impact of the co-19 pandemic. Profit in 2019 decreased 37.76% compared to the previous year, 2019. This was also due to net sales which fell 8.3% in 2020 (Aziz, 2021).

	2019	2020	2021	2022	2023
NPM	12,46	11,49	11,28	9,89	9,45
DER	60,23	71,78	61,74	58,01	45,19
TATO	1,75	1,38	1,36	1,48	1,39
GROWTH	30,54	6,64	5,10	22,87	24,97

Source: IDX data processed by the author, 2025

Image 2. Average Net Profit Margin, Debt to Equity Ratio, Total Asset Turnover, and Profit Growth of Processed Foods Subsector Companies Period 2019-2023

Based on Image 2, companies in the processed foods sector have an annual average NPM value in 2020 of 11.49% above the average NPM of 10.92% and profit growth of 6.64% below the average growth of 18.02%. This data shows that in 2020 NPM has increased but profit growth has decreased. This can occur due to operational factors such as increased production

costs including raw materials, labor, and overhead so that the level of sales decreases at the beginning of the pandemic. And in 2021 NPM experienced the same thing as in 2020 NPM increased and profits decreased below the average, this could occur due to the factor of shipping goods or spreading production because in 2021 the government appealed to the public to minimize outdoor activities. The existing data is not in line with the existing theory, namely that the higher the NPM ratio, the better the position of the company owner which has implications for increasing profits. This shows that high NPM contributes positively to profit growth. (Kasmir, 2018)

The average annual DER in 2019 has increased, namely 60.23% above the average DER value of 59.39% and profit has increased by 30.54% above the average growth value of 18.02%. The data shows an increase in DER value and an increase in profit. The data is not in line with the theory that an increasing DER value indicates poor company performance because a higher debt burden makes it difficult for the company to maintain profits and increase them. (Rahayuningsih, 2022).

The average annual TATO in 2023 was 1.39 below the average TATO of 1.47, this value is inversely proportional to the Growth which increased with a value of 24.97% above the average of 18.02%. This is not in line with the theory explained that if the TATO value decreases, profits decrease. The analysis results show a significance value which indicates that a decrease in TATO will affect the company's profit (Alvionita, 2021).

The phenomenon that occurred from 2019-2023 from the results of the ratio calculation that when NPM, DER, and TATO increased, growth was not always in line this could occur due to high sales volume with low margins, decreased debt but decreased profits, the Covid-19 pandemic which changed consumption patterns.

2. Literature Riview

Signaling theory is a theory that explains a management that wants to give instructions to outsiders. The information presented relates to business results, business prospects and the company's balance sheet. This activity is carried out by management because outsiders cannot see directly what is happening in the company due to information asymmetry (Sunardi, 2021).

Profit growth shows how much profit increases in the company, earnings growth is measured by the difference in total profit in the year to be studied with total profit in the previous year which is then divided by total profit in the previous year. Operationally, profit comes from income from sales that are realized with the costs that must be incurred to get income. Earnings growth is the addition and subtraction of current earnings compared to the previous year's earnings. Earnings growth can be used in projecting how future earnings growth will be, by several parties such as company management (Wijaya, 2023).

2.1. The Effect of Probability (NPM) on Profit Growth

Profitability ratio is a ratio that also provides a measure of the effectiveness of a company's management. Profitability can be measured by net profit margin which is a ratio that shows the ratio of net profit after tax to sales (Larasati, 2023).

H_1: Profitability (NPM) Affects Profit Growth in *Processed Foods* sub sector companies in 2019-2023

2.2 The Effect of Leverage (DER) on Profit Growth

A high Debt to Equity Ratio (DER) indicates that the company has a large proportion of debt in its capital structure. This means that the company is highly dependent on debt rather than equity (Sa'adah, 2022).

H_2: Leverage (DER) Affects Profit Growth in *Processed Foods* sub sector companies in 2019-2023

2.3 The Effect of Asset Activity (TATO) on Profit Growth

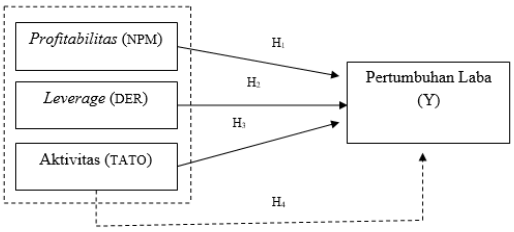
The higher the total asset turnover value, the greater the profit earned. The amount of profit earned is because the company can utilize its assets to support sales activities which will affect the company's revenue, thus causing profit growth to increase (Arfandi, 2021).

H_3: Asset Activity (TATO) Affects Profit Growth in *Processed Foods* sub-sector companies in 2019-2023

2.4 The Effect of Profitability (NPM), Leverage (DER), and Asset Activity (TATO) Simultaneous Effect on Profit Growth

The higher the net profit margin, it shows that the company can generate high profits at the sales level, the Debt to Equity Ratio decreases, the net profit generated will increase, the high Total Asset Turnover value shows the high turnover of assets in the company and can support profit growth (Kasmir, 2018).

H_4: Profitability (NPM), Leverage (DER), and Asset Activity (TATO) Simultaneously Affect Profit Growth in Processed Foods sub-sector companies in 2019-2023.



Based on the explanation above, the authors create a framework with three independent variables, namely profitability, leverage, asset activity from one dependent variable, namely earnings growth.

The Following is a picture of the research constellation:

Image 3 Research Constellation

3. Methodology

The type of research used is verification research with a quantitative approach and using explanatory survey research methods. Verification research which aims to test and prove the truth of existing theories. Research that explains the phenomena that occur in the form of relationships between variables. In this study, it explains the effect of financial performance variables on profit growth in processed foods sub-sector companies period 2019-2023. The unit of analysis in this study used is an organization which is a source of data generated from an

organization as a unit of analysis. In this case, the unit of analysis is the financial position report and comprehensive income statement of the processed foods sub-sector company.

This study determines the sample using purposive / judgment sampling method with the following criteria: (1) Processed foods sector companies listed and listed on the Indonesia Stock Exchange in 2018-2023; (2) Processed foods sub-sector companies that have complete financial data for the 2018-2023 period; (3) Processed foods sub-sector companies that generate positive profits during the 2018-2023 research period.

With the predetermined criteria, the sample used in this study is data on processed foods subsector companies. And the research sample consists of 8 companies that have met the predetermined criteria as follows:

1. PT Mayora Indah Tbk
2. PT Ultrajaya Milk Industri & Trading Company Tbk
3. PT Indofood Sukses Makmur Tbk
4. PT Wilmar Cahaya Indonesia Tbk
5. PT Garuda Food Putra Putri Jaya Tbk
6. PT Siantar Top Tbk
7. PT Sekar Bumi Tbk
8. PT Formosa Ingredient Factory Tbk

In this study, the independent variables used are profitability, leverage, and asset activity. While the dependent variable is profit growth (Growth). The operational variables in this study are summarized in the following table:

Table 1

Operationalization of Variables

Variables	Sub-Variables	Indicator	Scale
Profitability	*Net Profit Margin* (NPM)	Net Profit / Sales	Ratio
Leverage	*Debt To Equity Ratio* (DER)	Liabilities / Equity	Ratio
Asset Activity	*Total Assets Turnover* (TATO)	Sales / Asset	Ratio
Profit Growth	Profit Period t and Profit Previoous Period	Profit Perid t –Profit Period t-1 / Profit Period t-1	Ratio

4. Results and Discussions

4.1. Best regression selection results

Based on the results of the chow test, the Prob. Cross Section F value of 0.8751> 0.05, it can be concluded that the right model to use is the Common Effect Model compared to the Fixed Effect Model. And based on the results of the lagrange multiplier test, the value of 0.2136> 0.05, it can be concluded that the most appropriate model used in the study is the Common Effect Model.

4.2. Normality Test

The data normality test in this study is to identify whether or not there is a normality problem that can be seen from the Jarque-Bera probability whose results are greater than 0.05. The following are the results of the normality test processed using Eviews 12

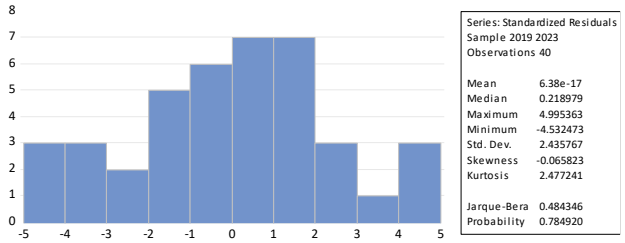


Image 4 Normality Test Results

Based on the results of the normality test, the Jarque-Bera probability value is 0.784920. these results show that the normality value is greater than 0.05 so it can be interpreted that the regression model is normally distributed.

4.3. Multicollinearity Test

To test for multicollinearity problems, it can be seen from the correlation matrix of the independent variables, if there is a coefficient of more than 0.8, it means that there is multicollinearity and otherwise.

Table 2. Multicolinearity Test Results

	NPM	DER	TATO
NPM	1.000000	0.162915	0.000302
DER	0.162915	1.000000	-0.137115
TATO	0.000302	-0.137115	1.000000

Source: Data processed by the author with Eviews 12, 2025

Based on the multicollinearity test results, the correlation coefficient value for Net Profit Margin (X1), Debt to Equity Ratio (X2), Total Asset Turnover (TATO) produces a value below 0.8 so that it can be interpreted that the data in this study does not occur multicollinearity.

4.4. Heteroscedasticity Test

In this study, the heteroscedasticity test used the Glejser Test. In this test it can be said that there is no heteroscedasticity problem if the significant value is > 0.05.

Tabel 3. Glejser Test Results

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	1.838647	0.399834	4.598521	0.0001
NPM	-0.220154	0.145033	-1.517962	0.1378
DER	0.420272	0.281137	1.494901	0.1437
TATO	0.013997	0.342809	0.040829	0.9677

Source: Data processed by the author with Eviews 12, 2025

Based on the results of the heteroscedasticity test, the probability value for the independent variable> 0.05, namely Net Profit Margin (X1) of 0.1378, Debt to Equity Ratio (X2) of 0.1437, Total Asset Turnover (X3) of 0.9677. From the results of this analysis it can be concluded that there is no heteroscedasticity problem in the regression model in this study.

4.5 Autocorrelation Test

In this study, the autocorrelation test used the Lagrange Multiplier Test (LM test). In this test if the value (Obs * R2)> 0.05, it means that there is no autocorrelation problem.

Tabel 4. Lagrange Multiplier Test Results

F-statistic	0.510014	Prob. F(2,34)	0.6050
Obs*R-squared	1.165079	Prob. Chi-Square(2)	0.5585

Source: Data processed by the author with Eviews 12, 2025

Based on the results of the lagrange multiplier test, the probability value (Obs * R2) is 0.5585> 0.05. So it can be concluded that there is no autocorrelation problem in the regression model in this study.

4.6 Panel Data Regression Test

Table 5. Regression Test Results

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	0.008934	0.165590	0.053953	0.9573
NPM	0.722410	0.463765	1.557707	0.1281
DER	-0.086157	0.152460	-0.565112	0.5755
TATO	0.190227	0.048709	3.905364	0.0004

Source: Data processed by the author with Eviews 12, 2025

In this study, the panel data regression model used is the Common Effect Model (CEM) with the following regression equation:

Growth = 0,008934 + 0,722410NPMit - 0,086157DERit + 0,190227TATOit + 0,165590

Based on the regression equation, it shows a constant value of 0.008, meaning that if Net Profit Margin, Debt to Equity Ratio, Total Asset Turnover is 0, then growth is positive at 0.008. The Net Profit Margin regression coefficient value is positive, namely 0.722410, meaning that every 1% increase in Net Profit Margin will increase growth by 0.722410 assuming other independent variables are constant. The *Debt to Equity Ratio* regression coefficient value is negative at -0.086157, meaning that every 1% decrease in Debt to Equity Ratio, growth will decrease by -0.086157 assuming other independent variables are constant. The Total Asset Turnover regression coefficient value is positive at 0.190227, meaning that every 1% increase in Total Asset Turnover, growth will increase by 0.190227 assuming other independent variables are constant. This finding illustrates how each variable contributes differently to changes in earnings growth.

Table 6. Cross-section Fixed Test Results

R-squared	0.348967	Mean dependent var	0.324500
Adjusted R-squared	0.294714	S.D. dependent var	0.395960
S.E. of regression	0.332532	Akaike info criterion	0.730480
Sum squared resid	3.980800	Schwarz criterion	0.899368
Log likelihood	-10.60961	Hannan-Quinn criter.	0.791545
F-statistic	6.432244	Durbin-Watson stat	2.472303
Prob(F-statistic)	0.001334		

Source: Data processed by the author with Eviews 12, 2025

Based on Table 6 of the panel data regression test results, the Adjusted R-Square value is 29.47%, which means that the contribution of the influence of the Net Profit Margin, Debt to Equity Ratio, and Total Asset Turnover variables on profit growth is 29.47%. Adjusted R-Square is used because the variables in this study are more than one variable.

4.7. Test t (Partial)

Referring back to Table 5, the results of the t (partial) test are as follows:

H_1: Net Profit Margin (NPM) Has no Effect on Profit Growth in Processed Foods sub-sector Companies Period 2019-2023.

The first hypothesis (H1) results of the NPM variable (X1) with a statistical t value = 1.5577, a positive regression coefficient value and a probability of 0.1281. The significance value of the t test is 0.1281> 0.05 with a count value of 1.5577 < t table 2.0280, meaning that Net Profit Margin (NPM) has no effect on profit growth in Processed Foods subsector companies in 2019-2023. So it can be concluded that H1 is rejected. This shows that the level of profitability has not been a factor influencing profit growth in Processed Foods subsector companies in 2019-2023.

H_2: Debt to Equity Ratio (DER) has No Effect on Profit Growth in Processed Foods sub-sector Companies Period 2019-2023.

The second hypothesis (H2), the results of the DER variable (X2) with a statistical t value = -0.5651, a negative regression coefficient value of -0.5755. The significance value of the t test is 0.5755> 0.05 with a count value of -0.5651 < t table 2.0280, meaning that the Debt to Equity Ratio (DER) has no effect on profit growth in the Processed Foods subsector company in 2019-2023. So it can be concluded that H2 is rejected. This shows that the company's funding structure through debt does not affect the profit growth of Processed Foods companies period 2019-2023.

H_3: Total Asset Turnover (TATO) Affects Profit Growth in Processed Foods sub-sector Companies Period 2019-2023.

The third hypothesis (H3), the results of the TATO variable (X3) with a statistical t value = 3.9053, the regression coefficient value is 0.0004. The significance value of the t test is 0.0004 <0.05 with a count value of 3.9053> t table 2.0280, meaning that Total Asset Turnover (TATO) has an effect on profit growth in the Processed Foods subsector company in 2019-2023. So it can be concluded that H_3 is accepted.

4.8 F Test (Simultaneous)

H_4: Net Profit Margin, Debt to Equity Ratio, and Total Asset Turnover affect profit growth in Processed Foods subsector Companies Period 2019-2023.

Referring back to Table 6, the results of the F test or simultaneous regression coefficient test show that the F-statistic is 6.432244 with a probability of 0.001334. The significant value of F is 0.0013 <0.05 with fcount 6.4322> ftabel 2.8662. This shows that net profit margin, debt to

equity ratio, and total asset turnover simultaneously affect profit growth in Processed Foods companies in 2019-2023. So it can be concluded that H4 is accepted.

4.9. Discussion

4.9.1 The Effect of Net Profit Margin (NPM) Performance on Profit Growth

Based on the partial research results, Net Profit Margin (NPM) has no effect on profit growth. This shows that even though the Processed Foods subsector company is able to generate high sales, this does not directly affect the company's profits because there is an increase in operating expenses. This is evidenced from the results of data collection that there are six companies out of eight companies that are research samples that are not in line with the increase or decrease in NPM on profit growth (growth). The results of hypothesis testing show that NPM has no effect on the profit growth of Processed Foods subsector companies or hypothesis 1 is rejected.

This can occur due to the characteristics of the industry with high competition, dependence on the stability of raw material prices, and changes in people's consumption patterns. In addition, there are expenses that have increased from the previous period to support the company's operations, which is one of the factors causing the increase and decrease between NPM and Growth when compared to the previous period and the company's average results.

According to Lev and Thiagarajan (2019) NPM as one of the profitability ratios does not always reflect the underlying profit. Companies with high NPM can have very different revenue and expense structures resulting in different profit growth patterns from the previous period.

The results of research by Ardian Wijaya, Anton Arisman (2023), Lailatus Sa'adah (2022), Liliana Rizkidayanti (2023) state that net profit margin partially has no effect on profit growth This can occur because the Net Profit Margin ratio fluctuates every year and production costs increase and competition is significant enough to suppress profits from sales. Dia Lailil Widad (2023) explains that NPM has no effect on profit growth due to fluctuating factors in the components of production and operational costs that are not proportional to the increase in product selling prices, as a result, even though the company managed to maintain or increase sales in one period, this condition is not sustainable in the next period.

4.9.2 The Effect of Debt to Equity Ratio (DER) Performance on Earnings Growth

Based on the research results partially Debt to Equity Ratio (DER) has no effect on profit growth. This shows that the higher and lower debt levels of a company have no direct effect on the profit growth of processed foods companies. The results of hypothesis testing show that DER has no effect on profit growth in Processed Foods subsector companies or hypothesis 3 is rejected.

Based on the analysis of the DER value, it shows that despite improvements in the capital structure of processed foods subsector companies, this is not directly positively correlated with profit growth. The use of debt to expand production capacity has the potential to increase revenue and profits if the debt is managed by risk management properly and efficiently, but the capital structure reflected in DER is not the main determinant of company profit growth. Therefore, companies need to focus more on other aspects that have a direct impact on company performance in increasing profit growth. DER only shows how much the company is financed by debt compared to equity, it does not show whether the funds are used productively. Therefore, the increase or decrease in DER does not reflect a significant change in profit growth.

Amyum et al (2021) that DER has a negative and insignificant effect on earnings growth, meaning that an increase or decrease in DER has no significant effect on earnings growth. And the results of Dia Lailil's research (2023) resulted in an analysis that the Debt to Equity Ratio has no effect on profit growth (growth) due to inefficient capital management. Yuslinda et al (2022) that partially Debt to Equity Ratio has no significant effect on profit growth in basic chemical sector manufacturing companies, profit growth is not only influenced by capital structure, but also external factors such as market conditions, consumer demand, and the company's business strategy.

4.9.3 The Effect of Total Asset Turnover (TATO) Performance on Profit Growth

Based on the research results partially Total Asset Turnover (TATO) has an effect on profit growth. This shows that the increase in TATO is in line with the increase in profit growth (growth). The results of this study are in accordance with hypothesis 3 which states that Total Asset Turnover has an effect on earnings growth. Then hypothesis 3 is accepted.

Total asset turnover is a ratio to measure the overall level of use of the company's assets in generating a certain sales volume. The higher this ratio, the more effective the management of assets owned by the company to generate sales and can increase profit growth. In this study, Total Asset Turnover affects profit growth in Processed Foods subsector companies, and identifies that this company is effective in managing asset turnover to generate sales and increase profit growth.

This is consistent with research conducted by Yuslinda et al (2022), that Total Asset Turnover (TATO) has a significant effect on profit growth in basic chemical sector manufacturing companies. This condition means that the company utilizes all its activities that affect production in making sales to achieve maximum profit. So that all assets have been managed by the company effectively, from this it proves that Total Asset Turnover has an effect on profit growth.

4.9.4 The Effect of Net Profit Margin (NPM) Performance, Debt to Equity Ratio (DER), Total Asset Turnover (TATO) on Earnings Growth

Based on the research results simultaneously Net Profit Margin, Debt to Equity Ratio, Total Asset Turnover have a significant effect on earnings growth. The results of this study are in accordance with hypothesis 4 which states that Net Profit Margin, Debt to Equity Ratio, and Total Asset Turnover have an effect on profit growth. This shows that the company's financial performance can affect profit growth in Processed Foods sub-sector companies. Then Hypothesis 4 is accepted.

The results of this study are in line with research conducted by Syahida et al (2021) which states that Net Profit Margin, Debt to Equity Ratio, Total Asset Turnover have a significant effect on profit growth. This shows that in the Processed Foods sub-sector companies the role of the Net Profit Margin, Debt to Equity Ratio, Total Asset Turnover ratios is very noteworthy because these ratios support profit growth

5. Conclution

Based on the results of research conducted on Processed Foods subsector companies in 2019-2023, it can be concluded that; (1) Profitability (NPM) has no effect and is not significant to profit growth in Processed Foods subsector companies in 2019-2023, this can occur because the characteristics of the industry owned with high competitive intensity and there are expenses that have increased to support the company's operations are one of the factors causing profits to decline from the previous period; (2) Leverage (DER) has no effect and is not significant to

profit growth in Processed Foods subsector companies in 2019-2023, capital structure such as DER is not a major factor in determining company profit growth; (3) Asset Activity (TATO) has a significant effect on profit growth in Processed Foods subsector companies in 2019-2023, Based on the results of this analysis which proves that the more efficient the company is in using its assets to generate sales, the more likely the company's profits will increase; (4) Simultaneously Profitability (NPM), Leverage (DER), Asset Activity (TATO) together affect profit growth in Processed Foods subsector companies in 2019-2023. This shows that the performance of operational efficiency as measured by NPM, capital structure as measured by DER, and asset activity using TATO affects the ability to increase profits in Processed Foods companies.

6. Advice

Based on the results of this study, profitability and leverage have no effect on the profit growth of Processed Foods subsector companies. Therefore, companies should focus on managing and saving production costs and operating costs to maintain profit growth. By analyzing and identifying what costs are incurred during the production process. Conduct analysis and control in each component of operational costs such as utility and distribution costs, and adjust the number and placement of employees based on the volume or level of production that is running according to production needs so that labor costs remain under control to maintain the company's profit growth. And companies need to manage debt wisely so as not to burden finances. The company is advised to focus more on optimizing the use of capital for activities that can have a direct impact on profit growth, namely external factors such as inflation which can reduce profitability, and control production costs effectively to support an increase in net profit. The company should prioritize the efficiency of working capital management which has a greater influence on profit growth than the long-term capital structure.

For Investors and Prospective Investors who will invest in Processed Foods subsector companies, it is necessary to pay attention to profitability and leverage ratios because based on the analysis there is a mismatch between Net Profit Margin and profit earned, and Debt to Equity Ratio which shows that on average the company generates high profits but high debt because it is also influenced by the expenses used in supporting the company's operations. Prospective investors must make the right choice through strong consideration to invest so as to avoid the risk of loss.

Future researchers should use different variables from this study such as ROA, ROE, DAR which will produce a more significant effect on earnings growth, and by using the latest research period with the last 3 years of the research year to see a more optimal level of fluctuation. Future researchers can also make comparisons between subsectors in the processed foods industry to identify whether the influence patterns found are universal or specific to certain subsectors.

THE ROLE OF DIGITAL MARKETING SOCIAL MEDIA TIKTOK, INSTAGRAM, TWITTER ON PURCHASING DECISIONS ON GACOAN NOODLES

Cut Farrah Selene Aurelia[1,*], Desma Alsheka Widyastuti[2], Sarjaya[3], Indra Permana[4]

[1,2,3,4] Universitas Pelita Bangsa, Bekasi, Indonesia

Abstract

Social media has become an important channel for businesses in today's digital age to promote products and build relationships with consumers. TikTok, Instagram, and Twitter have the potential to increase brand awareness and engagement as they are very popular platforms among the younger generation. Studies have shown that engaging and interactive content on TikTok and Instagram is more effective in attracting user attention than other platforms such as Facebook. This study aims to analyze the influence of social media TikTok, Instagram, and Twitter on consumer purchasing decisions on Gacoan Noodle products. Social media has developed into an important tool in digital marketing, but its effectiveness in driving direct purchasing decisions remains unclear. The method used in this research is a quantitative approach with the Partial Least Square (PLS) model to measure the influence of each variable. The research sample was social media users who were exposed to Mie Gacoan content on the three platforms, and data was collected through an online questionnaire. Validity and reliability analysis showed that only Instagram, TikTok, and Twitter were valid with AVE values above 0.50, while the purchase decision variable did not meet this requirement. The results show that these three social media platforms do not have a significant influence on the purchase decision of Gacoan Noodles. TikTok has a coefficient of 0.236 with a p-value of 0.299, Instagram 0.166 with a p-value of 0.342, and Twitter 0.217 with a p-value of 0.361, all of which are higher than the significance threshold of 0.05. Thus, the three social media platforms were more instrumental in raising brand awareness than driving direct purchase decisions for this product.

Keywords: Social Media, TikTok, Instagram, Twitter, Purchase Decision, Gacoan Noodles

1. Introduction

In today's digital age, social media plays a significant role in everyday life, including in shaping consumer purchasing decisions. Along with the development of technology, social media platforms such as TikTok, Instagram, and Twitter have become key channels for many companies to introduce products and increase brand awareness. Social media offers various advantages in reaching a broader audience in an efficient, interactive and measurable way. However, the effectiveness of each platform in influencing consumer purchasing decisions may vary depending on the characteristics of the audience and the type of content offered.

TikTok, as one of the independent variables in this study, is characterized by highly dynamic and fast-paced content. TikTok is known as a platform that prioritizes short video-based content, with much content focused on entertainment and virality (Aryadi & Putri, 2022). The use of technology is expected to bring enormous benefits to an increasingly competitive business world, making social media one of the effective marketing strategies to influence consumer purchasing decisions (Risnawati & Chamidah, 2022). Based on the data listed in the file, the analysis results show that TikTok has a coefficient of 0.236 with a p-value of 0.299,

which indicates that its effect on purchasing decisions is not significant. This suggests that while TikTok may attract consumers' attention through viral content, the platform may not be strong enough to drive direct purchase decisions. TikTok may be more effective in raising brand awareness than driving purchases, as its consumers are more likely to seek entertainment rather than in-depth product information.

Instagram, as the second platform analyzed, has a broad user base and is a popular choice for many consumers to seek visual and lifestyle inspiration. Unlike TikTok, Instagram allows users to explore visual content that is more aesthetically pleasing and sometimes accompanied by more informative product descriptions (Fakhira et al., 2022). Nonetheless, the results show that Instagram has a coefficient of 0.166 with a p-value of 0.342, which indicates that its effect on purchasing decisions is also not significant. This data indicates that although Instagram is effective in building brand awareness through attractive visual displays, users may not be immediately compelled to make a purchase. Most Instagram users use the platform for inspiration or visual exploration rather than to make an immediate purchase (Fredik & Dewi, 2019). Features such as “Shop” and “Swipe Up” in Instagram Stories make it easier for users to access products. However, in reality, many consumers are more likely to save or like content as a reference rather than buy directly.

Twitter, as the third independent variable, is a more widely used platform for quick communication, news, and discussion. Twitter allows users to engage in more spontaneous and direct conversations compared to other platforms but has character limitations that often make it less suitable for detailed product promotion (Askaria, 2019) Based on the data in the study, Twitter has a coefficient of 0.217 and a p-value of 0.361, which indicates that its effect on purchasing decisions is also not significant. This is in line with the characteristics of Twitter as a platform that is more effective for strengthening brand relationships through direct interaction and quick responses than for triggering direct purchases (Oktaviani & Estaswara, 2022). Content on Twitter is often limited to brief and temporary information, so it is less able to have a strong enough impact to influence consumer purchasing decisions.

Research with the title “The Effect of Social Media on Purchasing Decisions Through Consumer Motivation on Fast Fashion Products” by Indriyani et al., (2023) shows that social media significantly influences consumer purchasing decisions. The purchasing decision indicator that has the highest average value is the willingness to sacrifice to get a product. If the influence of social media is more substantial, the purchasing decisions made by consumers to make purchases will also be stronger, resulting in actual purchases. Consumers use social media to find all information about the product to be purchased. This is evidenced by the indicator of using social media related to the ease of searching for information, which has the highest average value of 3.94. Previous research conducted by Megarezky et al., (2024) proved a similar thing, namely that 75% of the people of Mumbai, India, used social media to find information before deciding to buy products. Research by Putri Dewi et al., (2023) entitled “The Effect of Tiktok Content on Consumer Decisions in Buying Products at Tiktok Shop, Nusa Putra University” shows that the effect of TikTok content on purchasing decisions is only 24.8%; the remaining 75.2% is another factor that we do not know, so it is not because of the engaging Tiktok content that makes consumers consider deciding to buy products at TikTok shop but other influences, variables that allow buying and selling transactions to occur. Of course, this research is only limited in scope. The campus environment, namely at Nusa Putra University Sukabumi and our semple testing is limited to 30 respondents, namely students.

2. Literature review

2.1. Purchasing Decisions

Purchasing decisions are a series of processes that start with consumers recognizing their problems, seeking information about specific products or brands and evaluating these products or brands on how well each alternative can solve their problems, which then leads to a purchase decision. In research (Megarezky et al., 2024), it is concluded that social media strongly influences purchasing decisions. In addition, research by Mustapa et al., (2022.) concluded that consumer purchasing decisions increased due to social media. The amount of the influence coefficient is obtained at 34.9%, which means that when there is a one per cent increase in social media, it will increase purchasing decisions by 34.9%.

2.2. Tiktok

Tiktok is a social media network in the form of videos or what is also called content, which has a duration of 15-30 seconds. In a study by Putri Dewi et al., (2023), it was found that the creative content produced by TikTok users had a significant impact on consumer purchasing decisions. Although the influence of content on purchasing decisions only reaches 24.8%, this shows that entertainment elements and creativity in content can attract consumers' attention and encourage them to make purchases. Several key factors influence purchasing decisions through TikTok, including price, promotion, and ease of access to information. Product price is one of the primary considerations for consumers; where they tend to choose products with prices that fit their budget. In addition, promotional techniques such as discounts and free shipping offers have proven effective in attracting attention and driving purchasing decisions (Widya K. S , 2023).

2.3. Instagram

Instagram is an application for sharing photos and videos that allow users to take pictures and videos and share them with various social networking services, including themselves. Research by Gusria A & Busyra, (2023) says that Instagram social media has a positive and significant impact on purchasing decisions. Based on the results of data processing, it shows that Instagram social media has an effect of 48.1% on purchasing decisions in these research variables and the rest is influenced by other variables that are not tested as much as 51.9%. On the other hand, research by (Virginia, 2023) shows that the variables of Instagram social media promotion and product quality are proven to have a positive effect in influencing customer satisfaction.

2.4. Twitter

Consumer reviews on social media, such as Twitter, can significantly influence purchasing decisions. Research by Fatih Adiyatma et al., (n.d.) shows that information shared through this platform can be quickly spread and accessed by potential buyers. Twitter's influence on purchasing decisions is complex and involves a variety of variables, such as consumer reviews, social norms, communication between users, and parasocial emotions and interactions. Research shows that all of these factors contribute to how consumers make decisions in an e-commerce environment. Another study (Okt Oktaviani & Estaswara, (2022) said that the positive talk built on Twitter was able to increase users in Indonesia by 76.6%. Twitter can be a key driver in purchasing products online. Talk on Twitter, as many as 51% make users make purchases when there are reviews by other consumers. Meanwhile, 37.4% spend on products when they get many likes and positive comments.

3. Methodology

This research uses quantitative methods, with the type of data used in this research being primary data. Primary data is data that is obtained directly by providing primary data to data

collectors. In this study, primary data was obtained through answers to questionnaires distributed to people who met the criteria. A questionnaire or questionnaire is a tool used to collect data through a series of questions that have been designed with the aim of measuring research variables (Ardiansyah et al., 2022) The sample in this study was 100 respondents. The data collection technique used in this study was to use a questionnaire or questionnaire by distributing questionnaires to respondents and distributing questionnaire links that have been made using Google Forms.

4. Results and discussions

Outer Model Results
Validity Test Results

Table 1. Average Variance Extracted (AVE) Test Results

	Average Variance Extracted (AVE)
Instagram	0.674
Purchase Decision	0.397
Tiktok	0.616
Twitter	0.730

Based on the information displayed in Table 1, it can be concluded that the Average Variance Extracted (AVE) value for each variable shows different variations. The Instagram variable has an AVE value of 0.674, the Purchase Decision variable shows an AVE value of 0.397, the Tiktok variable records an AVE value of 0.616, and the Twitter variable has an AVE value of 0.730. Based on the construct validity criteria, which state that an AVE value greater than 0.50 indicates adequate validity, it can be said that the Instagram, Tiktok, and Twitter variables have an AVE value above this threshold, so they can be declared statistically valid. However, for the Purchase Decision variable, the AVE value obtained is 0.397, which is below the minimum limit value of 0.50. Therefore, the Purchase Decision variable is invalid based on this AVE criterion. This conclusion confirms that there are different levels of validity among the variables analyzed in this study.

Reliability Test Results

Table 2. Cronbach Alpha Test Results

	Cronbach's Alpha
Instagram	0.879
Purchase Decision	0.564
Tiktok	0.846
Twitter	0.907

Based on the information in Table 2, Cronbach's Alpha value shows the different levels of reliability among the variables analyzed. The Instagram variable has a Cronbach's Alpha value of 0.879, the Tiktok variable of 0.846, and the Twitter variable of 0.907, all of which are above the 0.70 threshold, so it can be concluded that these three variables have a high and consistent level of reliability in measuring the intended construct. In contrast, the Purchase Decision variable has a Cronbach's Alpha value of 0.564, which is below the 0.70 threshold, thus indicating that the variable has a low level of reliability and is less reliable in representing the measured construct. Thus, it can be concluded that the variables Instagram, Tiktok, and

Twitter meet the criteria for high reliability, while the Purchase Decision variable does not meet these criteria.

Inner Model Results
R Square Test Results

Table 3. R Square Test Results

	R Square	Adjusted R Square
Purchase Decision	0.314	0.293

Based on the data presented in Table 3, the R-Square value for the Purchase Decision variable of 0.314 indicates a relationship that is classified as moderate. This means that the independent variables in the model can explain 31.4% of the variation in the Purchase Decision variable. The remaining 68.6% is influenced by other factors outside the model not discussed in this study. In addition, the Adjusted R-Square value of 0.293 indicates that after considering the complexity of the model, about 29.3% of the variation in the Purchase Decision variable can still be explained by the variables included in the model. This shows that the variables in the model make a significant contribution, although other external variables still have a considerable influence.

Bootstrapping Test Results

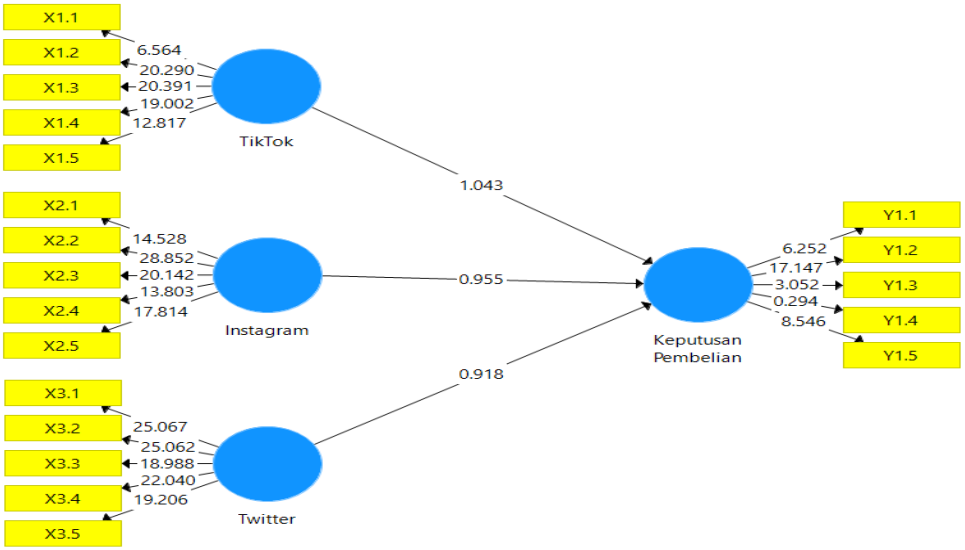

Figure 1. Bootstrapping Test Results

Figure 1 above shows the results of the hypothesis test conducted to analyze and identify the influence of the various constructs involved in this study. In this context, the variables tested are TikTok, Instagram, and Twitter, which act as independent variables. These three social media variables are considered to influence the dependent variable, namely Purchasing Decisions. In hypothesis testing, a variable is considered to significantly influence other

variables if the P-value obtained is smaller than 0.05 (5%). This means that the relationship between the independent and dependent variables can be considered accurate and not caused by mere coincidence. Conversely, the relationship is considered insignificant if the P-value is more significant than 0.05. This means that the independent variable does not have a strong enough influence on the dependent variable being measured. This process helps understand the extent of social media's influence on purchase decisions and provides insight into the importance of each platform in influencing consumer behavior.

Path Coefficient Test Results

Table 4. Path Coefficient Test Results

	Original Sample	Sample Mean	Standard Deviation	T Statistics	Purchase Decision
TT → KP	0.236	0.189	0.226	1.043	0.299
IG → KP	0.166	0.222	0.174	0.955	0.342
TW → KP	0.217	0.245	0.236	0.918	0.361

From Table 4 above, it can be concluded that:

The results obtained from the Path Coefficient Test show that using social media platforms has no significant effect on consumer purchasing decisions in this study. Based on the analysis, Instagram has a coefficient value of 0.166 with a p-value of 0.342. This p-value, which is greater than 0.05, indicates that the use of Instagram does not significantly influence purchasing decisions, so the relationship between the two can be considered non-existent or weak in the context of this study. TikTok also shows similar results, with a coefficient of 0.236 and a p-value of 0.299. These results indicate that TikTok, as one of the popular social media platforms, does not significantly influence purchase decisions. Therefore, its influence on purchase decisions cannot be considered significant. In addition, Twitter, which has a coefficient of 0.217 with a p-value of 0.361, also shows results that align with the other two social media platforms. A p-value greater than 0.05 corroborates the finding that Twitter usage does not significantly influence consumer purchasing decisions. Overall, the analysis results show that the three social media platforms-Instagram, TikTok, and Twitter- did not significantly contribute to increasing consumer purchase decisions in this study. The three platforms each showed insignificant coefficient values, indicating that marketing strategies that rely on social media, at least in the context of this study, may not have played a significant role in influencing purchase decisions. This suggests that other factors in this study may be more dominant in shaping consumer purchasing behavior.

Discussion

TikTok on the Purchase Decision of Gacoan Noodles

TikTok has a coefficient value of 0.236 with a p-value of 0.299, which means that its effect on the purchase decision of Gacoan Noodles is not significant. One of the underlying reasons for this ineffectiveness is the nature of TikTok's content, which focuses more on entertainment and virality than on in-depth information. TikTok users tend to consume content quickly and spend little time browsing or purchasing products directly. While TikTok has excellent potential to increase brand awareness through viral content, several underlying reasons explain why the platform has little impact on purchasing decisions. First, the main characteristics of TikTok is short video content that aims to entertain and provoke quick

reactions. However, according to research by the Journal of Interactive Marketing, this type of content often only generates temporary interest rather than an immediate purchase. Consumers who view videos on TikTok tend to seek entertainment or inspiration rather than detailed product information, so the effect is more impulsive and rarely leads to a planned purchase, especially for food products. Research by (Risnawati & Chamidah, 2022) states that the use of technology is expected to provide significant benefits for the increasingly competitive business world. One application is to make social media an effective marketing strategy to influence consumer purchasing decisions. In addition, TikTok's algorithm, which focuses on viral content, often displays videos that attract attention quickly but only facilitate deeper information or product reviews. As a result, although promotions on TikTok may attract users, they are likely to seek more information through other platforms before making a purchase decision. Research by (Aryadi & Putri, 2022) shows that TikTok is known as a platform that prioritizes short video-based content, with much of the content focusing on entertainment and virality alone.

Instagram on Purchasing Decisions of Gacoan Noodles

Instagram has a coefficient of 0.166 and a p-value of 0.342, which shows that its effect on purchasing decisions for Gacoan Noodles is also insignificant. One of the underlying reasons for this is that Instagram users tend to use it to seek visual or lifestyle inspiration rather than as a direct purchasing platform. Instagram, being visual-based, also did not show a significant influence on the purchase decision of Gacoan Noodles, and several reasons support this. Firstly, Harvard Business Review research shows that Instagram content is more effective for building brand awareness than driving direct purchases, especially in the food product category. Research (Fredik & Dewi, 2019) also says most Instagram users use the platform for inspiration or visual exploration, not to make direct purchases. Instagram attracts users through images and videos that emphasize aesthetic or lifestyle aspects, but these often only serve to showcase products in general rather than influence the final purchase decision. In addition, while features like “Shop” and “Swipe Up” on Instagram Stories allow users to access products, according to the Digital Marketing Institute, most Instagram users are in the “inspiration” or “research” stage when viewing food content. They tend not to buy products right away but simply save or like posts to look back on. This indicates that Instagram is more suitable as a brand image creation tool than as a direct promotional tool that influences purchasing decisions. Research by (Fakhira et al., 2022) also shows Instagram to be a popular choice for many consumers to seek visual and lifestyle inspiration. Unlike TikTok, Instagram allows users to explore visual content that is more aesthetically pleasing and sometimes accompanied by more informative product descriptions.

Twitter on Purchasing Decisions for Gacoan Noodles

Twitter has a coefficient of 0.217 and a p-value of 0.361, which indicates that its effect on purchasing decisions for Gacoan Noodles is also insignificant. This is in line with the characteristics of Twitter, which is more widely used as a platform for quick communication, news, or direct interaction than a means for direct sales promotion. One of the main reasons is the character of Twitter as a platform that is more often used for news, discussions, and quick updates. Research (Askaria, 2019) also said that Twitter is a more widely used platform for quick communication, news, and discussion. Twitter allows users to engage in more spontaneous and direct conversations than other platforms, but it has character limitations that often make it less suitable for detailed product promotion. Since content on Twitter is often limited by the number of characters, it is difficult for brands to convey detailed product information or arouse consumers' interest in buying immediately. While Twitter can increase brand engagement, its effects are more focused on long-term relationships and building loyalty

rather than driving immediate purchases. According to research by (Oktaviani & Estaswara, 2022) also said this is in line with Twitter's characteristics as a platform that is more effective for strengthening brand relationships through direct interaction and quick responses than for triggering direct purchases.

5. Conclusion

From the data above, the influence of social media such as TikTok, Instagram, and Twitter on Mie Gacoan's decision to buy something is not significant. TikTok has a coefficient of 0.236 and a p-value of 0.299, which indicates that entertainment and viral content are not deep enough to influence planned purchase decisions. Customers often consume the content quickly without seeking more information about the product. Instagram also has no significant influence, with a coefficient of 0.166 and a p-value of 0.342; the website focuses more on providing visual inspiration rather than promoting direct purchases. Despite its shopping features, users are usually still in the research stage and do not buy something after viewing the content. With a coefficient of 0.217 and a p-value of 0.361, Twitter emphasizes interaction and quick communication rather than direct sales promotion. Overall, although these three social media platforms can increase brand awareness and customer engagement with Gacoan Noodles, customers' buying decisions are not influenced by them. To convert conversion from interest to actual purchase, marketers should consider a more in-depth and informative marketing approach. Marketers should consider ways to provide more complete and relevant product information on each platform so that they can maximize the influence of social media on customer buying behaviour. The implications of this study are several important. From an academic perspective, the findings underscore the need for further research into the role of social media in purchasing decisions, particularly in the food sector. Future research could expand the scope by considering other factors such as product quality, consumer reviews, or comparisons with other social media platforms. In addition, this study contributes to the literature on the effectiveness of digital marketing strategies, which is relevant for academics in marketing and communication management. From a social perspective, the results show that social media content consumption patterns are heavily influenced by entertainment and aesthetic preferences rather than direct purchase goals. This reflects the changing behavior of consumers in the digital age, where quick and visual information often dominates but only sometimes deeply influences decision-making. This understanding can help companies and organizations to design more relevant and contextual content according to people's needs. For the public, this research highlights the importance of being a critical consumer in the digital age. While social media offers many opportunities to explore products, people must understand that wise purchasing decisions often require deeper information and more rational analysis. By doing so, consumers can avoid impulsive influences.

THE INFLUENCE OF INFLUENCER MARKETING AND PRODUCT INNOVATION ON PURCHASING DECISIONS AT E-COMMERCE SHOPEE

Desma Alsheka Widyastuti[1,*], Cut Farrah Selene Aurelia[2], Murni Rahayu[3], Erna Apriani[4]

[1,2,3,4]Universitas Pelita Bangsa, Bekasi, Indonesia

Abstract

This study aims to analyze the effect of influencer marketing and product innovation In the digital age, influencer marketing has become a significant factor influencing purchasing decisions on the Shopee e-commerce platform the effective marketing strategies for attracting consumer attention through the influence of individuals with a broad follower base. In addition, product innovation also plays a vital role in creating added value and differentiating products in a highly competitive market. This study employs a quantitative research methodology, utilizing data collected through questionnaires distributed to active Shopee users. The analysis of the data was performed using multiple linear regression techniques to measure the extent to which influencer marketing and product innovation influence consumer purchasing decisions. The results showed that influencer marketing significantly influences purchasing decisions through trust and content relevance. Product innovation is important in purchasing decisions because it increases consumer satisfaction and interest in the products offered. These findings provide practical implications for e-commerce businesses to maximize digital marketing strategies through collaboration with influencers and developing product innovations relevant to market needs. E-commerce serves as a moderating factor that enhances the connection between influencers and consumer purchasing decisions, while simultaneously diminishing the impact of product innovation on those same purchasing decisions.

Keyword: Influencer Marketing, Product Innovation, Purchase Decision, E-Commerce, Shopee

1. Introduction

The rapid development of e-commerce in Indonesia, especially the Shopee platform, has triggered various innovations in marketing strategies to attract consumers. One of the increasingly popular strategies is influencer marketing, which utilizes well-known figures on social media to promote products. According to research by (Jessica Novin Prananda Putri et al., 2023), influencer marketing can increase brand awareness and consumer trust, thus potentially driving purchasing decisions. In addition, research by (Nyoman Anjali Seruni et al., 2024). shows that recommendations from trusted influencers can strengthen consumer purchase intentions, especially among the younger generation who are active on digital platforms.

On the other hand, product innovation also plays an important role in attracting consumers' attention and maintaining their loyalty. Research by (Aldira Layza Madina, 2024) (Aldira Layza Madina, 2024) revealed that products that are constantly updated with new features are able to increase competitiveness in a competitive market3. This innovation includes not only the physical aspects of the product but also digital features such as applications and customer service. This is in line with the findings by (Firdaus et al., 2021) (Firdaus et al., 2021), which show that innovations in e-commerce services, such as the development of interactive features and more flexible payment methods, can improve the consumer shopping experience and drive

purchasing decisions. Thus, this study aims to analyze the effect of influencer marketing and product innovation on consumer purchasing decisions at Shopee. The results of this study can provide deeper insight into the factors that influence shopping behaviour on the e-commerce platform. As stated by Subianto & Basuki, (2024), understanding the influence of these two factors is very important to formulate effective marketing strategies in facing competition in the e-commerce industry.

The rapid development of e-commerce in Indonesia, especially the Shopee platform, has triggered various innovations in marketing strategies to attract consumer interest. One of the increasingly popular strategies is influencer marketing, which utilizes well-known figures on social media to promote products. According to research by Jessica Novin Prananda Putri et al., (2023) , influencer marketing can increase brand awareness and consumer trust, thus potentially driving purchasing decisions. In addition, research by (Nyoman Anjali Seruni et al., 2024) shows that recommendations from trusted influencers can strengthen consumer purchase intentions, especially among the younger generation who are active on digital platforms. On the other hand, product innovation also plays an important role in attracting consumer attention and maintaining their loyalty. Research by Aldira Layza Madina, (2024) revealed that products that are constantly updated with new features are able to increase competitiveness in a competitive market. This innovation includes not only the physical aspects of the product but also digital features such as applications and customer service. This is in line with the findings by Firdaus et al., (2021), which show that innovations in e-commerce services, such as the development of interactive features and more flexible payment methods, can improve the consumer shopping experience and drive purchasing decisions. Thus, this study aims to analyze the effect of influencer marketing and product innovation on consumer purchasing decisions at Shopee. The results of this study can provide deeper insight into the factors that influence shopping behaviour on these e-commerce platforms. As stated by Subianto & Basuki, (2024), understanding the influence of these two factors is very important to formulate effective marketing strategies in facing competition in the e-commerce industry.

2. Literature review

2.1. Purchase Decision

Various external and internal factors influence consumer purchase decisions. In this study, it was found that influencer marketing significantly influences purchase decisions through increased trust and content relevance. Research shows that when consumers see recommendations from influencers they trust, they tend to be more open to trying new products, thus increasing the likelihood of a transaction. This is in line with research conducted by Fitrianti et al. (2022), who found that influencer marketing can significantly increase consumer purchasing decisions by creating a strong emotional connection between influencers and their audience (Arti Sukma Lengkawati & Taris Qistan Saputra, 2021; Majid & Nur Faizah, 2024). This confirms the importance of selecting influencers that match the target market to maximize the impact on purchase decisions.

2.2. Influencer

Influencer marketing has proven to be effective in building relationships between brands and consumers. Influencers who have an emotional attachment to their audience are able to create more authentic and relatable content, thus increasing engagement levels. Research by (Majid & Nur Faizah, 2024) shows that influencers with smaller but more engaged followings are often more effective compared to prominent influencers who are less personally connected to their audience. This suggests that influencer selection strategies should consider not just the

number of followers but also the quality of their interactions. Thus, marketers need to identify influencers who are not only popular but also have credibility and relevance within their market niche.

2.3. Product Innovation

Product innovation plays an important role in attracting consumer attention in the e-commerce market. New or updated products can meet the changing needs of consumers and increase brand competitiveness in the market. Research by (Aldira Layza Madina, 2024; Firdaus et al., 2021) shows that innovation not only increases customer satisfaction but also strengthens brand loyalty, as consumers tend to return to buy products from brands that continue to innovate and offer new solutions to their needs. Therefore, companies must continue to invest in product development to remain relevant in the market. The right product innovation can be a determining factor in attracting consumer attention and encouraging purchasing decisions.

2.4. E-Commerce

In the context of e-commerce, digital platforms such as Shopee provide easy access and convenience for consumers in making transactions. Research by (Arti Sukma Lengkawati & Taris Qistan Saputra, 2021; Majid & Nur Faizah, 2024) shows that a good shopping experience on an e-commerce platform can strengthen purchasing decisions. E-commerce not only functions as a distribution channel, but also as a medium to communicate product values to consumers. With various interactive features and flexible payment methods, e-commerce is able to create a pleasant shopping experience for consumers, thus increasing their likelihood of making a purchase. Therefore, the integration between influencer marketing, product innovation, and e-commerce platforms is crucial to increase consumer appeal and satisfaction.

3. Methodology

This study uses a quantitative approach with a survey method to collect data from consumers who actively shop on the Shopee e-commerce platform and are exposed to influencer marketing campaigns. The research sample consists of individuals who have shopping experience on Shopee and have been exposed to various promotions conducted by influencers (Budi Harto et al., 2023). Data was collected through a questionnaire designed to measure consumers' perceptions of influencer marketing, product innovation, as well as their purchasing decisions. The questionnaire included questions relating to the level of trust in the influencer, the appeal of the product innovation, and the influence of both on the decision to purchase. Data collection was conducted online to ensure broader and more representative participation from the target population.

The analysis technique used in this study is multiple regression analysis with SmartPLS statistical software. This method was chosen for its ability to handle complex models and provide more accurate parameter estimates in the context of relationships between variables. The test is carried out by setting a significance level of 5%, which is a reference to determine whether there is a significant influence between the independent variables (influencer marketing and product innovation) on the dependent variable (purchase decision). The results of this analysis are expected to provide deep insight into how these two factors interact and influence consumer shopping behavior on e-commerce platforms, as well as contribute to the development of more effective marketing strategies in the future.

4. Results and discussions

.

Table 1. Average Variance Extracted (AVE) Test Results

	Average Variance Extracted (AVE)
Eccomerce	0.422
Influencer	0.465
Product Innovation	0.359
Customer Decision	0.449

Source: SmartPLS (2025)

Information Table 1 can be concluded that the Average Variance Extracted (AVE) value on each Influencer variable (X1) is 0.422, the Product Innovation variable (X2) is 0.465, the Ecommerce variable (X3) is 0.359 and the Purchasing Decision (Y) is 0.449. So, all variables in this study have an AVE value <0.50 and are declared invalid.

Reability Test Results

Table 2. Cronbach Alpha Test Results

	Cronbach's Alpha
Eccomerce	0.663
Influencer	0.704
Product Innovation	0.547
Customer Decision	0.694

Source: SmartPLS (2025)

Information table 2 can be concluded that the value of the Influencer variable (X1) has a Cronbach alpha value of 0.663 or> 0.70, which means that this variable has a low level of reliability. The Product Innovation variable (X2) has a Cronbach alpha value of 0.704 or> 0.70, which indicates that this variable also has a high level of reliability. In addition, the Ecommerce variable (X3) has a Cronbach alpha value of 0.547, which is also> 0.70 and indicates a low level of reliability and the dependent variable, namely Purchasing Decisions (Y), has a Cronbach alpha value of 0.694 or> 0.70, which means that this variable has a low level of reliability. From the reliability test results, it can be concluded that only the Influencer variable is declared reliable.

Inner Model Results

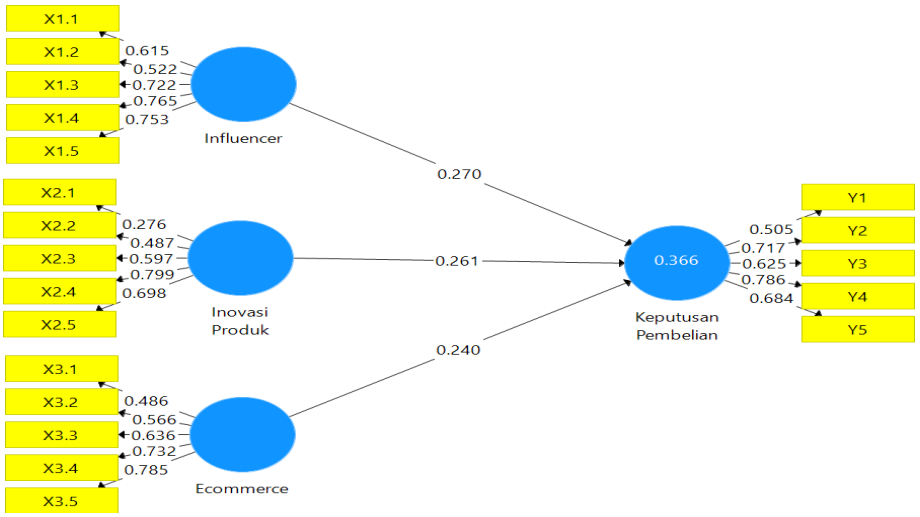
Table 3. R Square Test Results

	R Square	Adjusted R Square
Customer Decision	0.366	0.346

Source: SmartPLS (2025)

Table 3 information can be concluded that the R-Square value on the Purchase Decision variable is 0.366, which indicates that the model does not have a strong relationship. This means that 36.6% of the Purchasing Decision variable is influenced by the factors studied, while the remaining 63.4% is influenced by other variables that have not been studied.

Bootstrapping Test Results



Source: SmartPLS (2025)

Figure 1. Bootstrapping Test Results

The information in Figure 1 above is the result of this hypothesis test carried out to determine the effect of a construct on other constructs. Where a variable can be said to have an effect if the P-ValueP-Value value is> 0.05 or 5%, but if the P-ValueP-Value value is <0.05 or 5%, then the variable can be said not to affect other variables.

Path Coefficient Test Results

Table 4. Path Coefficient Test Results

	Original Sample (O)	Average Sample (M)	STD EV	(O/STDEV)	P Values
E → KP	0.240	0.262	0.121	1.978	0.049
I → KP	0.270	0.273	0.093	2.890	0.004
IP → KP	0.261	0.287	0.098	2.672	0.008

Source: SmartPLS (2025)

From Table 4 above, it can be concluded that:

E-commerce on Purchasing Decisions**:** It is known that the P Values value of 0.049 is smaller than 0.05. Therefore, there is an influence between the E-commerce variable on Purchasing Decisions. Influencer on Purchasing Decisions It is known that the P Values value of 0.004 is smaller than 0.05. Therefore, there is an influence between the Influencer variable on Customer Decisions. Product Innovation on Purchasing Decisions is known that the P Values value of 0.008 is smaller than 0.05. Therefore, there is an influence between the Product Innovation variable on Customer Decisions. Overall, the path coefficient analysis shows that all variables have a significant influence on Purchasing Decisions.

Discussion

The Effect of E-Commerce on Purchasing Decisions

The results showed that e-commerce has a significant influence on purchasing decisions, with a P-value of 0.049, which is smaller than 0.05. This shows that e-commerce variables contribute to facilitating the consumer buying process through the ease of access and convenience offered. This finding is in line with research by (Laudon Carol Guercio Traver et al., n.d.)), which states that user experience on e-commerce platforms greatly influences purchasing decisions. E-commerce not only functions as a distribution channel, but also as a

medium for communicating product values to consumers. Research by (Ye et al., 2023) highlights the importance of interactive features in e-commerce, which can increase consumer engagement and drive purchase decisions. Thus, marketers need to ensure that their e-commerce platforms are not only visually appealing but also functional to enhance consumers' shopping experience.

Influencer Influence on Purchasing Decisions

The influence of influencer marketing on purchasing decisions is also significant, with a P-value of 0.004. This shows that recommendations from trusted influencers can strengthen consumer purchase intentions, especially among the younger generation who are active on digital platforms. Research by (Freberg et al., 2011) supports these findings by showing that influencers can build trust and credibility among their audience, which in turn drives purchase decisions. In addition, (Kanwar and Huang, 2022) found that influencer marketing can create a strong emotional connection between brands and consumers, thus increasing the likelihood of a transaction. Therefore, marketers need to select influencers that match their target market to maximize the impact on purchase decisions.

The Effect of Product Innovation on Purchasing Decisions

The effect of product innovation on purchasing decisions also shows significant results, with a P-value of 0.008. Research by (Aldira Layza Madina, 2024) confirms that product innovation that is constantly updated with new features can increase competitiveness in a competitive market. This innovation includes not only the physical aspects of the product but also digital features such as applications and customer service, which contribute to increased consumer satisfaction. This finding is in line with research by (Firdaus et al., 2021), which shows that innovations in e-commerce services, such as the development of interactive features and more flexible payment methods, can improve consumers' shopping experience and drive purchasing decisions.

5. Conclusion

. The conclusion of this study shows that both influencer marketing and product innovation have a significant influence on consumer purchasing decisions on the Shopee e-commerce platform. The results of the analysis show that influencer marketing can increase consumer trust and content relevance, which in turn drives purchasing decisions. In addition, product innovation that is constantly updated with new features is also proven to contribute to consumer satisfaction and loyalty, Thus, to maximize marketing strategies in this digital era, e-commerce businesses need to integrate both aspects. Collaboration with the right influencers and development of relevant product innovations will be crucial to attract consumer interest and increase purchase decisions. This research provides valuable insights for marketers in formulating more effective marketing strategies to face competition in the e-commerce industry, and confirms that an in-depth understanding of consumer behavior is necessary to achieve success in digital marketing.

social, academic and societal implications of this research are significant. Socially, the results show that influencer marketing and product innovation not only have an effect on consumer purchasing decisions but also create stronger relationships between brands and audiences. This may encourage companies to pay more attention to ethics in selecting influencers, ensuring that they are not only popular but also have credibility and relevance to the products being promoted. On the academic side, the findings contribute to the digital marketing literature by highlighting the importance of product innovation and influencer strategy in the context of e-commerce in Indonesia. This research can serve as a reference for future studies that want to explore the relationship between digital marketing and consumer

behaviour, as well as provide insights for researchers to develop more comprehensive methods in analyzing the factors that influence purchasing decisions.

FINANCIAL AGILITY IN FMCG FIRMS: ANALYZING THE POST-PANDEMIC NEXUS OF WORKING CAPITAL AND PROFITABILITY

Julian Hernandes[1] and Dwitya Aribawa[2]

[1]Management Department Universitas Atma Jaya Yogyakarta

E-mail: dwitya.aribawa@uajy.ac.id

Abstract

This study aims to analyze the effect of working capital management and capital structure on the financial performance of Fast-Moving Consumer Goods (FMCG) companies in Indonesia after the COVID-19 pandemic. The independent variables used in this study include the Quick Ratio (QR) as an indicator of working capital management, and the Debt to Equity Ratio (DER) and Short-Term Debt to Asset Ratio (STDTA) as indicators of capital structure. Financial performance is measured using the Return on Capital Employed (ROCE). A quantitative approach with a panel data-based multiple linear regression method was applied. The sample consisted of 29 non-cyclical FMCG companies listed on the Indonesia Stock Exchange during the 2021–2024 period, selected using purposive sampling. The results show that QR and STDTA have a significant positive effect on ROCE, while DER does not have a significant effect. These findings highlight the importance of efficient liquidity and capital structure management in enhancing corporate profitability in the post-pandemic era.

Keywords: *Fast-Moving Consumer Goods; Quick Ratio; Debt to Equity Ratio; Short-Term Debt to Asset; ROCE*

VALUE CO-CREATION IN DIGITAL PLATFORMS: IMPACT ON CUSTOMER SATISFACTION AND WELL-BEING

Puspita Chairun Nisa

Doctoral Candidate, Esa Unggul University

Abstract

In the era of digital transformation, it is increasingly urgent to understand how customer participation in service delivery impacts not only satisfaction but also long-term psychological well-being. This study explores how value co-creation (VCC) in digital platforms contributes to customer satisfaction and further enhances customer well-being. Grounded in the Service-Dominant Logic (S-D Logic) and Transformative Service Research (TSR), the research focuses on the influence of participatory digital experiences on affective and psychological consumer outcomes.

Data were gathered from 230 Indonesian users aged 17–27 who actively engage with digital platforms. Using Structural Equation Modeling with the Partial Least Squares (SEM-PLS) method, the analysis reveals that value co-creation significantly increases customer satisfaction. Furthermore, satisfied users demonstrate higher levels of emotional, psychological, and social well-being. This indicates that participatory actions—such as feedback provision, service customization, and collaborative content creation—not only improve service perception but also contribute to a more meaningful and empowering customer experience.

The findings strengthen the theoretical linkage between co-creation and well-being by validating satisfaction as a key driver. Practically, the study suggests that digital service providers should prioritize co-creative service strategies to deliver deeper, more fulfilling value to consumers.

1. Introduction

In the digital era, the nature of value creation in service delivery has undergone a major transformation. Customers are no longer passive recipients of products and services; they actively participate in shaping experiences, providing feedback, and co-creating value with service providers (Vargo & Lusch, 2004; Ramaswamy & Ozcan, 2016). This paradigm shift, conceptualized under the Service-Dominant Logic (SDL), emphasizes that value is not embedded in offerings but is co-created through dynamic interactions between firms and consumers (Vargo & Lusch, 2008). This interaction-centric view becomes especially relevant for younger generations who demand personalized, responsive, and meaningful digital experiences.

Despite the growing adoption of value co-creation strategies, its deeper psychological implications—particularly in terms of customer well-being—remain insufficiently explored. While customer satisfaction has long been recognized as a key outcome of service quality (Oliver, 1997), only a limited number of studies have extended this analysis to examine its role as a predictor of emotional, psychological, and social well-being (Anderson *et al*., 2013). Moreover, studies that integrate satisfaction as a bridge between value co-creation and well-

being in digital service environments, especially in emerging economies like Indonesia, are still scarce. This gap presents both a theoretical and practical challenge.

Therefore, the objective of this study is to examine how value co-creation in digital platforms influences customer satisfaction and how this satisfaction subsequently contributes to customer well-being. Using a simplified model based on empirical testing, the research focuses on understanding whether customer participation through digital services leads to affective and psychological gains, especially among Indonesian Gen Z users.

The findings of this study are expected to offer significant contributions. Theoretically, it provides empirical support for the integration of Service-Dominant Logic and Transformative Service Research (TSR), showing how customer participation can enhance not only satisfaction but also broader life outcomes (Anderson *et al*., 2013). Practically, this research can inform service designers and digital platform developers on how to structure more engaging, empowering, and meaningful service experiences that elevate user well-being.

To ensure conceptual clarity, the core variables of this study are defined as follows. Value Co-Creation refers to customer participation in the design, delivery, or evaluation of services, including giving feedback, customizing experiences, and generating content (Prahalad & Ramaswamy, 2004). Customer Satisfaction is defined as the consumer's emotional and cognitive evaluation of whether a service has met or exceeded expectations (Oliver, 1997). Customer Well-Being is defined as the perceived emotional, psychological, and social benefit that consumers gain from service interactions (Anderson *et al*., 2013).

2. Literature Review

2.1 Value Co-Creation (VCC)

Value Co-Creation (VCC) refers to the collaborative process in which consumers actively engage with service providers to create meaningful and personalized experiences. This concept originates from the Service-Dominant Logic (SDL) paradigm, which posits that value is not created solely by firms, but through the dynamic interaction between the firm and the customer (Vargo & Lusch, 2004, 2008). Unlike traditional marketing logic, which views customers as passive recipients, SDL emphasizes the active role of customers in shaping value through participation, customization, and feedback.

Prahalad & Ramaswamy (2004) further developed the VCC concept by introducing the four building blocks of co-creation: dialogue, access, risk-benefit, and transparency. In digital platforms, value co-creation is operationalized through user-generated content, online reviews, product customization, and co-design activities. Ramaswamy & Ozcan (2016) argue that digital technology has significantly expanded the scope of co-creation by enabling real-time interaction and user empowerment.

Empirical studies show that customers who engage in co-creation exhibit higher levels of engagement, loyalty, and perceived service quality (Yi & Gong, 2013). Moreover, co-creation leads to positive psychological responses, including a sense of control, autonomy, and

recognition (Chathoth *et al*., 2014). These responses are foundational to the development of customer satisfaction and longer-term relational outcomes.

2.2 Customer Satisfaction

Customer Satisfaction is a well-established construct in marketing literature, commonly defined as the customer's evaluative judgment regarding a service or product's ability to meet or exceed expectations (Oliver, 1997). It encompasses both cognitive assessments and emotional reactions, forming the basis for consumer loyalty, repeat purchase intentions, and positive word-of-mouth (Anderson & Srinivasan, 2003).

Satisfaction has often been conceptualized as the result of a disconfirmation process, where customer expectations are compared to perceived performance (Oliver, 1980). When performance matches or surpasses expectations, satisfaction increases. In digital service contexts, satisfaction is influenced by responsiveness, personalization, convenience, and interactivity (Zeithaml *et al*., 2002).

Recent literature also recognizes the mediating role of satisfaction in linking various experiential and psychological variables. For instance, satisfaction is seen as a critical intermediary outcome that translates service experience into more complex outcomes, such as trust, loyalty, or well-being (Brady & Cronin, 2001; Homburg, Koschate, & Hoyer, 2006).

In the context of value co-creation, studies suggest that when customers are involved in service design and decision-making, their satisfaction levels increase due to perceived control, personalization, and social validation (Grissemann & Stokburger-Sauer, 2012).

2.3 Customer Well-Being

Customer Well-Being (CWB) refers to the overall emotional, psychological, and social benefits that individuals derive from consumption experiences. It extends beyond transactional satisfaction and incorporates elements of positive affect, sense of purpose, autonomy, and social connectedness (Anderson *et al*., 2013; Sirgy, 2021). CWB is a central concept in Transformative Service Research (TSR), which seeks to explore how service systems can enhance the lives of individuals and communities (Ostrom *et al*., 2015).

In digital contexts, CWB is influenced by factors such as personalization, empowerment, emotional engagement, and perceived support (Rosenbaum & Massiah, 2011). When customers feel heard, respected, and involved in value creation, their service experiences contribute positively to their subjective well-being.

Anderson *et al*. (2013) propose that service experiences designed with empathy, transparency, and participatory principles are more likely to yield transformative effects, including enhanced quality of life and individual flourishing. Moreover, satisfaction has been found to be a strong predictor of well-being, suggesting that fulfilling service interactions lay the foundation for deeper emotional outcomes (Sirgy & Lee, 2006).

Thus, customer well-being should be considered a strategic goal for digital service providers seeking to build meaningful, long-term relationships with users—particularly in high-engagement sectors such as tourism, e-commerce, and digital platforms.

3. Methodology

3.1 Research Paradigm

This study adopts a **positivist paradigm**, which emphasizes objective measurement and hypothesis testing using quantitative data. The goal is to examine causal relationships between value co-creation, customer satisfaction, and customer well-being using empirical evidence. The positivist approach is appropriate for studies that aim to validate theories through statistical testing (Creswell, 2014), particularly when working with established constructs and structured instruments.

3.2 Unit of Analysis and Observation

The **unit of analysis** in this study is the **individual consumer** who uses digital platforms, while the **unit of observation** is each respondent's perception as captured through their answers in the survey instrument. Respondents were selected based on their active use of digital platforms and their experience in interacting with digital service features such as feedback mechanisms, customization, and content bicontribution.

3.3 Research Method

A **quantitative research method** was employed, using a **cross-sectional survey design** to collect data at a single point in time. This approach allows for the identification of statistical relationships between variables and is suitable for testing structural models using SEM-PLS. The survey method was chosen for its ability to reach a large number of participants efficiently and generate standardized data for analysis (Malhotra, 2010).

3.4 Operationalization of Variables

The three core constructs in this study were operationalized based on validated measurement scales from prior literature:

- **Value Co-Creation (VCC)** was measured using four dimensions: feedback participation, content contribution, co-design, and personalization (adapted from Prahalad & Ramaswamy, 2004; Yi & Gong, 2013).
- **Customer Satisfaction (CS)** was measured using cognitive and affective items capturing customer evaluation of service performance (Oliver, 1997).
- **Customer Well-Being (CWB)** was assessed using emotional, psychological, and social indicators (Anderson *et al*., 2013; Sirgy, 2021).

All items were rated using a **5-point Likert scale** ranging from 1 (strongly disagree) to 5 (strongly agree).

3.5 Questionnaire Design

The questionnaire was divided into three main sections:

1. **Demographic Profile:** Age, gender, occupation, frequency of digital platform use.
2. **Screening Questions:** Confirming active use of digital platforms and engagement with interactive features.
3. **Main Constructs:** A series of closed-ended statements measuring VCC, CS, and CWB.

The questionnaire was pre-tested with 30 respondents to ensure clarity, reliability, and face validity. Revisions were made based on feedback before full deployment.

3.6 Data Collection Procedure

Data were collected through **online distribution** using Google Forms over a four-week period. A **purposive sampling** method was applied, targeting individuals aged 17–27 who actively use digital platforms in Indonesia. To ensure data integrity:

- Each IP address was restricted to one submission.
- Incomplete responses were excluded.
- Participation was voluntary and anonymous, with informed consent provided at the beginning of the form.

3.7 Data Analysis Techniques

Data analysis was performed using **Structural Equation Modeling (SEM)** with the **Partial Least Squares (PLS)** technique, facilitated by SmartPLS 4.0 software. The following procedures were applied:

- **Descriptive Analysis:** To summarize respondent demographics.
- **Measurement Model Evaluation:** Testing reliability (Cronbach's Alpha, Composite Reliability), convergent validity (Average Variance Extracted/AVE), and discriminant validity (Fornell-Larcker criterion).
- **Structural Model Evaluation:** Path coefficient analysis, R^2 for endogenous variables, and bootstrapping to assess the significance of the relationships.

This method is suitable for predictive research and theory development, particularly when the model involves latent constructs with multiple indicators (Hair *et al*., 2019).

3.8. Research Model

H1:*Value Co-Creation positively influences Customer Satisfaction.*
H2:*Customer Satisfaction positively influences Customer Well-Being.*

4. Results And Discussion

4.1 Results

This study used **Partial Least Squares Structural Equation Modeling (PLS-SEM)** to examine the structural relationships between value co-creation, customer satisfaction, and customer well-being. Data from **230 respondents** were analyzed using SmartPLS 4.0, following two stages: evaluation of the **measurement model (outer model)** and the **structural model (inner model)**.

4.1.1 Measurement Model Evaluation

The measurement model was assessed to verify the reliability and validity of the constructs.

- **Convergent Validity**: All indicator loadings exceeded the recommended threshold of 0.70. The **Average Variance Extracted (AVE)** values were above 0.50 for all constructs, indicating adequate convergent validity (Hair *et al*., 2019).
- **Internal Consistency Reliability**:
  - Value Co-Creation: Cronbach's Alpha = 0.891; Composite Reliability (CR) = 0.917
  - Customer Satisfaction: Cronbach's Alpha = 0.866; CR = 0.901
  - Customer Well-Being: Cronbach's Alpha = 0.878; CR = 0.912
    All values exceeded the 0.70 threshold, indicating strong internal consistency.
- **Discriminant Validity**: The **Fornell-Larcker criterion** was satisfied for all constructs, where the square root of AVE for each variable was greater than the inter-construct correlations. Additionally, **cross-loading analysis** confirmed that all indicators loaded highest on their respective constructs.

4.1.2 Structural Model Evaluation

After confirming the measurement model, the structural model was tested using **bootstrapping (5,000 subsamples)**. The **coefficient of determination (R^2)** and **path coefficients** were used to evaluate model performance.

- **R^2 for Customer Satisfaction** = 0.486
  (48.6% of the variance in satisfaction is explained by value co-creation)
- **R^2 for Customer Well-Being** = 0.531
  (53.1% of the variance in well-being is explained by satisfaction)

The **path coefficients and their statistical significance** are presented below:

Path	**Coefficient (β)**	**t-value**	**p-value**	**Result**
Value Co-Creation → Satisfaction	0.678	14.27	< 0.001	Supported
Satisfaction → Customer Well-Being	0.649	12.81	< 0.001	Supported

These results confirm that both relationships in the model are statistically significant and positive. Value co-creation has a strong and direct effect on customer satisfaction, and satisfaction significantly enhances customer well-being.

4.2 Discussion

The findings of this study reveal that customer participation in value co-creation on digital platforms plays an important role in enhancing customer satisfaction. When customers are involved in giving feedback, customizing services, or contributing content, they feel more

valued and empowered in shaping their own service experience. This sense of involvement leads to a more positive perception of the platform and increases overall satisfaction.

This aligns with the perspective of Service-Dominant Logic, which emphasizes that value is not delivered by the company alone, but is co-created through interaction between the service provider and the customer (Vargo & Lusch, 2008). In digital environments, value co-creation becomes easier and more dynamic, allowing users to feel directly involved in the service process.

Moreover, the study confirms that customer satisfaction contributes significantly to customer well-being. Satisfied customers do not just feel happy with the service—they also experience emotional and psychological benefits such as feeling appreciated, more connected, and emotionally uplifted. This supports the foundation of Transformative Service Research, which suggests that well-designed service experiences should improve the lives of customers beyond mere functional value (Anderson *et al*., 2013).

In conclusion, value co-creation enhances satisfaction, and satisfaction plays a key role in fostering customer well-being. Satisfaction is not only an end goal for service providers but also a powerful bridge toward building long-term emotional and psychological well-being for digital users.

5. Conclusion

5.1 Conclusion

This study investigated the relationship between value co-creation, customer satisfaction, and customer well-being within the context of digital platforms. The findings confirm that value co-creation plays a critical role in enhancing customer satisfaction, and that satisfaction, in turn, contributes meaningfully to customer well-being. These results highlight the importance of shifting from traditional, provider-centric service approaches to participatory models where customers are actively involved in shaping their own experiences.

By integrating Service-Dominant Logic and Transformative Service Research, this study affirms that services should not only meet functional needs but also foster emotional, psychological, and social benefits for users. Satisfaction is shown to be a key mechanism through which co-created experiences translate into well-being, especially for digital users who seek interactive and empowering service journeys.

5.2 Limitations

While the study provides valuable insights, several limitations must be acknowledged. First, the sample was limited to 230 respondents within the 17–27 age group, which may not represent older or less tech-savvy populations. Second, the research applied a cross-sectional design, capturing perceptions at a single point in time. This limits the ability to infer long-term behavioral or psychological effects. Third, self-reported measures may be subject to social desirability bias or inaccuracies in individual perception.

5.3 Future Research Directions

Future studies could expand on this research in several ways. Longitudinal research designs would allow scholars to examine how satisfaction and well-being evolve over time through continuous co-creation. Comparative studies across age groups, industries (e.g., tourism, e-commerce, health tech), or cultural settings would enhance generalizability. Furthermore, future research may explore **moderating variables**, such as **trust**, **digital literacy**, or **user personality traits**, to understand under what conditions value co-creation has the strongest impact on satisfaction and well-being.

By addressing these areas, researchers and practitioners alike can gain a more comprehensive understanding of how digital services can be designed to support both satisfaction and holistic customer well-being.

THE EFFECT OF BRAND AMBASSADOR AND WORD OF MOUTH ON REPURCHASE INTENTION THROUGH BRAND IMAGE MINERAL WATER AQUA IN DKI JAKARTA

Griselda Elysia Nabilla[1], Resti Hardini[2]

Faculty of Economics and Business Universitas Nasional, Jakarta, Indonesia

Abstract

This study focused on how much influence the figure known to the public as a Brand Ambassador and word of mouth can influence Repurchase Intention through Brand Image. The sample used in this study was 96 respondents who were consumers of AQUA mineral water in DKI Jakarta. The results of this study indicate that Brand Ambassador does not influence Repurchase Intention and does not have a significant positive effect on Brand Image, so Brand Ambassador does not have a positive and significant effect on Repurchase Intention through Brand Image. Brand Image has a positive and significant effect on Repurchase Intention. While Word of Mouth has a positive and significant effect on Repurchase Intention and Brand Image. So Word of Mouth has a positive and significant effect on Repurchase Interest through Brand Image.

ANALISIS BEBAN KERJA TERHADAP ORGANIZATIONAL CITIZENSHIP BEHAVIOR PADA GURU HONORER SD NEGERI PASIRIPIS

Monica Anija Elizabeth Sihombing[1], Khaerul Rizal Abdurrahman[2]
[1]Faculty of Economics and Business, Universitas Jenderal Achmad Yani Jl. Terusan Jenderal Sudirman, Cimahi City, West Java
monicaanija_21p107@mn.unjani.ac.id[1], khaerulrizal@mn.unjani.ac.id[2]

Abstract

Organizational Citizenship Behavior (OCB) refers to voluntary work behaviors beyond formal duties that positively impact the effectiveness and productivity of an organization, including educational institutions. One factor that can encourage the emergence of OCB is a well-managed workload. This study aims to analyze the influence of workload on Organizational Citizenship Behavior (OCB) among honorary teachers at SD Negeri Pasiripis. These teachers are not only responsible for teaching but also carry out administrative duties, which significantly increase their workload. This research employs a qualitative approach, with data collected through observation, interviews, and documentation involving six honorary teachers as informants. The findings indicate that an appropriate workload such as dual roles in teaching and administration contributes to the development of strong OCB traits, including altruism, courtesy, and civic virtue. However, excessive workloads also lead to physical and mental exhaustion, which can diminish teaching quality. Therefore, while workload can enhance OCB, a balanced task distribution is necessary to maintain optimal teacher performance. This study provides valuable insights into human resource management in the educational sector, particularly in managing the responsibilities of honorary teachers, by emphasizing the importance of OCB in creating a positive work environment, strengthening collaboration among colleagues, and encouraging performance that exceeds formal expectations. These findings underscore the need for serious attention to the development and reinforcement of OCB among educators.

PREDICTION OF CNY/IDR EXCHANGE RATE USING MOVING AVERAGE, EXPONENTIAL SMOOTHING, AND REGRESSION FAMILY MODELS

Gloria Christina Sunny, Naflah Rahmatunnisa, Cheren Lois Wowor, Regi Muzio Ponziani*
Sekolah Tinggi Ilmu Ekonomi Trisakti

Corresponding Author: ichnimzo@gmail.com

Abstract

This research aims to compare the forecasting performance among moving average, exponential smoothing, and regression models. The forecast object is CNY/IDR exchange rate. CNY has been known to be a managed float currency and the literature is scant that attempt to forecast CNY exchange rates. The data in this research spanned from the first week of 2018 until the second week of December 2024. The data were split into training and test data. The forecast accuracy is measured using Mean Absolute Percentage Error (MAPE). The results showed that moving average (MA) with an order of 4 is the best performing among MAs. For exponential smoothing, the α of 0.1 is the best for the exponential smoothing models. Lastly, regression using autoregressive component and trend is the best for regression models. When we compare MA with exponential smoothing and regression models, exponential smoothing is the best. This indicates that exponential smoothing with α of 0.1 can deal with uncertainties. Because this means 10% of the forecast component of exponential smoothing coming from the actual value, and the rest from previous forecasts. This previous forecast component is able to cope with uncertainty in the exchange rate movement. The forecast error of exponential smoothing is 0.281% while MA(4) is 0.286%. For regression with an autoregressive component and a trend the error is 0.343%. Future research may compare the performance of the exponential smoothing method with deep learning method.

PROFITABILITY UNDER PRESSURE: THE INTERPLAY OF FINANCIAL RISKS AND CORPORATE AGE IN INDONESIAN BANKING AND MULTIFINANCE SECTORS

Stella Tania[1] and Dwitya Aribawa[2]

[1,2]Management Department Universitas Atma Jaya Yogyakarta

E-mail: dwitya.aribawa@uajy.ac.id

Abstract

This study aims to analyse the effects of credit, liquidity, and operational risks on the profitability of companies in the banking and multifinance sectors, with the age of the company's IPO as moderator. The study uses multiple linear regression analysis with moderated regression analysis (MRA) as interaction variables. The sampling method used is purposive sampling with a sample of 172 companies in the banking and multifinance sectors listed on the Indonesia Stock Exchange from 2020 to 2023. The results of the study show that credit risk and liquidity risk do not affect the profitability of banking and multifinance companies, while operational risk in banking and multifinance companies has a negative impact on profitability. The IPO age variable in banking companies shows a negative impact on profitability, while in multifinance companies, the IPO age has a positive impact on profitability. Additionally, the IPO age variable only moderates the operational risk variable in banking companies.

PENGARUH MODEL TAM TERHADAP *ATTITUDE* DAN *BEHAVIORAL INTENTION*: SEBUAH KAJIAN TERHADAP DOKTER DI RUMAH SAKIT KELAS C DI PULAU JAWA

Eka Setiawan

Universitas Esa Unggul

Abstract

Digital transformation through the implementation of Electronic Medical Records (EMR) is a strategic national agenda in Indonesia. However, the adoption rate of EMR remains low, particularly in Type C hospitals, reflecting significant barriers to technology acceptance among medical professionals. This study investigates the influence of the Technology Acceptance Model (TAM) on physicians' attitudes and behavioral intentions, while also examining the roles of discomfort, outcomes expectation, and technology self-efficacy. Data were collected from doctors at Type C hospitals across Java and analyzed using Partial Least Squares Structural Equation Modeling (PLS-SEM). The results reveal that TAM, through perceived usefulness and perceived ease of use significantly affects attitude, and that attitude significantly influences behavioral intention. Behavioral intention was also found to have a significant effect on actual use. Discomfort negatively but significantly impacts TAM perceptions. However, the direct relationship between TAM and behavioral intention was not supported. Additionally, outcomes expectation failed to moderate the attitude–behavioral intention link, and technology self-efficacy did not moderate the relationships between TAM and either attitude or behavioral intention. These findings underscore the importance of addressing internal psychological and organizational readiness in promoting EMR adoption. The integration of TAM and Resource-Based Theory provides valuable insights for developing targeted interventions in resource-constrained hospital settings.

Keywords: Technology Acceptance Model (TAM), Electronic Medical Records (EMR), attitude, behavioral intention, actual use, discomfort, self-efficacy, outcomes expectation

STRENGTHENING GREEN LOYALTY: HOW GREEN MARKETING, GREEN PERCEIVED VALUE, AND ENVIRONMENTAL CONCERN DRIVE GREEN SATISFACTION A STUDY OF UNIQLO'S CONSUMER IN BANDUNG METROPOLITAN

Eka Septiarini[a*], Horas Djulius[b], Dudung Juhana[c]
[a]Universitas Jenderal Achmad Yani Cimahi
[b]Universitas Pasundan Bandung
[c] Sekolah Tinggi Ilmu Ekonomi Pasundan

Corresponding author e-mail address: eka.septiarini@lecture.unjani.ac.id

Abstract

The objective of this study is to identify, examine, and analyze the influence of green marketing on green customer satisfaction, the influence of green perceived value on green customer satisfaction, the influence of environmental concern on green satisfaction, and the influence of green satisfaction on green customer loyalty of Uniqlo consumers in Bandung Metropolitan. Data were collected from respondents aged between 17 and 55 years old, residing in the Bandung Metropolitan area, and having purchased Uniqlo's green products at least twice in the past year. The analysis was performed using Lisrel - Structural Equation Modeling version 8.8. The findings reveal that green marketing, green perceived value, and environmental concern simultaniously contribute 73.6% to green customer satisfaction with Uniqlo in Bandung Metropolitan, while the remaining 26.4% is influenced by other variables. Partially, green marketing contributes 18.5%, green perceived value 24.4%, and environmental concern 30.7% to green satisfaction. Additionally, green satisfaction has been proven to have a significant influence of 79.9% on green loyalty among Uniqlo consumers in Bandung Metropolitans.

DETERMINANTS OF CAPITAL STRUCTURE IN INFRASTRUCTURE COMPANIES LISTED IN INDONESIA

Richo Wivilano, Stella
Trisakti School of Management, Jakarta, Indonesia
wivilano@gmail.com, stella@stietrisakti.ac.id

Abstract

This research examines the Determinants of Capital Structure in Infrastructure Companies listed in Indonesia during the 2017-2023 period. The study employs purposive sampling to select 16 companies as the research sample and uses multiple linear regression for data analysis. The findings reveal that Firm Size, Profitability, Business Risk, and Current Ratio significantly affect the Capital Structure of infrastructure sector companies, while Asset Structure has no significant effect on Capital Structure.

Keywords: Capital Structure, Asset Structure, Firm Size, Profitability, Business Risk, Current Ratio.

DISRUPTIVE BANKING TECHNOLOGIES AND INSTITUTIONAL PERFORMANCE: A PANEL ANALYSIS OF INDONESIAN BANKS

Rosintia[1], Dwitya Aribawa[2]
[1,2] Management Department Universitas Atma Jaya Yogyakarta
dwitya.aribawa@uajy.ac.id

Abstract

This study aims to discover and analyze the influence of the development of digital banking on the performance of banks listed in IDX 2016-2024. The sample technique applied by the researcher was purposive sampling and it was found that there are twelve banks that were in accordance with KBMI book 3 and KBMI book 4 which adopted digital banking services earlier and later than which were listed on IDX 2016-2024. The variables examined in this study consist of Return on Assets (ROA). Return On Equity (ROE), Net Profit Margin (NPM), digital banking, firm size, Non-Performing Loan (NPL), and Non-Interest Income (NII). This study compares the financial performance of banks which adopted digital banking services earlier and later and uses using multiple linear regression model with IBM SPSS 25 software. The result shows that there are differences on financial performance of banks in Indonesia on 2016-2024 where banks that adopted digital bank services earlier had better financial performance and bank that adopted later had not been able to show better banking performance.

Keywords: Digital Banking, Profitability Ratio, Firm Size, Non-Performing Loan, Non-Interest Income.

THE EFFECT OF PROFITABILITY AND LIQUIDITY ON DIVIDEND POLICY IN REGISTERED PRIVATE COMMERCIAL BANKS ON THE INDONESIA STOCK EXCHANGE 2020-2024 PERIOD

Virgia Putri Bhayangkari
Master of Management, Faculty of Economics and Business, University Jenderal Achmad Yani

Abstract

This study aims to determine the effect of Profitability and Liquidity on Dividend Policy. This study is a quantitative study. The type of data used is secondary data obtained fromwww.idx.com . The analysis model used is Multiple Linear Regression Analysis using SPSS Software version 20. The population in this study is Private Commercial Banks Listed on the Indonesia Stock Exchange for the period 2020-2024. The sampling method used is purposive sampling with a sample size of 9 over a period of 5 consecutive years, resulting in 45 processed data. The results of this study indicate that partially profitability has a positive effect. on Dividend Policy while Liquidity has no effect on Dividend Policy and simultaneously Profitability and Liquidity have a significant effect on Dividend Policy.

Keywords: Dividend Policy, Profitability, Liquidity.

THE EFFECT OF ESG DISCLOSURE ON THE FINANCIAL PERFORMANCE OF COMPANIES LISTED ON THE INDONESIA STOCK EXCHANGE IN PERIOD 2021 – 2023

Yan Paresae Tiranda[1], Ferikawita Magdalena Sembiring[2]
[1.2]Master of Management, Faculty of Economics and Business, Jenderal Achmad Yani University, Cimahi, Indonesia

Abstract

This study explores the impact of Environmental, Social, and Governance (ESG) disclosure on the financial performance of companies listed on the Indonesia Stock Exchange (IDX) especially IDX ESG Leader during the period 2021 - 2023. ESG disclosure has become a major concern for companies and investors, as it not only reflects corporate social responsibility but is also considered a factor that can influence financial performance. This research uses panel data regression methods to analyze data from companies listed on the IDX ESG Leader, measuring sustainability and financial performance through indicators ESG Score and profitability. The results of the study indicate that ESG disclosure has a significant impact on the financial performance of companies. These findings provide important insights for companies and investors regarding the importance of ESG disclosure in improving financial performance. Additionally, the study highlights the additional benefits of ESG disclosure, such as enhanced corporate reputation, easier access to capital, and increased customer loyalty. Thus, this research contributes to a better understanding of the relationship between ESG disclosure and the financial performance of companies in Indonesia.

Keywords: ESG disclosure, profitability, return on asset (ROA)

EXPLORATION OF A HYBRID CRM APPROACH IN BUILDING LONG-TERM RELATIONSHIPS WITH STUDENTS IN DISTANCE EDUCATION ENVIRONMENTS

Ana Rimbasari
STIE YKPN
Universitas Siber Muhammadiyah
anarimbasari@sibermu.ac.id

Abstract

Distance education faces challenges of low student engagement and high dropout rates due to limited relational interactions. This study developed and tested a Hybrid Customer Relationship Management (CRM) model integrating technology (AI-based chatbots, learning analytics) with human interactions (academic advising) to enhance student retention in Indonesian distance education institutions. Employing a mixed methods approach, the research combined a literature review, Focus Group Discussions (FGDs) with 30 students, 10 lecturers, and 5 academic administrators, and questionnaires completed by 200 distance education students at Universitas Siber Muhammadiyah. FGDs identified students' relational needs, while questionnaires assessed engagement, satisfaction, and perceptions of the Hybrid CRM. A semester-long trial of the Hybrid CRM prototype increased student retention by 18% and student-institution interaction frequency by 25% compared to conventional CRM systems. Thematic analysis of FGDs revealed that combining responsive chatbots with personalized advising strengthened student trust. Linear regression analysis of questionnaire data indicated that service personalization ($\beta=0.62$, $p<0.01$) and technological responsiveness ($\beta=0.48$, $p<0.05$) were key predictors of engagement. The resulting Hybrid CRM model provides a strategic framework for distance education institutions, offering context-specific implementation recommendations. This study contributes to the theory of digital relationship management and the practice of higher education transformation, aligning with Indonesia's National Research Master Plan 2017–2045.

Keywords: Hybrid CRM; Distance Education; Student Retention; Human-Tech Collaboration; *Academic Engagement*

ECO-FINANCE SYNERGIES: HOW GREEN BANKING INITIATIVES AFFECT FINANCIAL PERFORMANCE METRICS IN INDONESIAN BANKS

Karen Angelica[1], Dwitya Aribawa[2]

[1,2]Management Department Universitas Atma Jaya Yogyakarta
E-mail: dwitya.aribawa@uajy.ac.id

Abstract

Environmental damage is now a central concern in society, pushing companies to adopt sustainability practices [1]. This study aims to examine the impact of green banking and financial performance—measured by Capital Adequacy Ratio (CAR), Non-Performing Loans (NPL), Operational Costs to Operational Income (BOPO), and Loan to Deposit Ratio (LDR)—on the profitability of commercial banks in Indonesia listed on the Financial Services Authority (OJK) during the 2020–2024 period [4]. Return on Assets (ROA) is used to measure profitability [10]. Using a quantitative approach, secondary data were collected from annual and sustainability reports [5]. Fifteen banks were selected using purposive sampling [6]. Data were analyzed using multiple linear regression with SPSS. Findings show that green banking and BOPO negatively impact ROA, while CAR, NPL, and LDR have a positive effect [3]. Simultaneously, all variables significantly influence bank profitability. These findings suggest a trade-off between sustainability investment and short-term profit [1].

KEYWORDS: *Green Banking, Financial Performace, Return on Assets, Bank Profitability*

A QUANTITATIVE APPROACH WAS CONDUCTED WITH MEDICAL STAFF IN TYPE C AND D HOSPITALS, AND DATA WERE ANALYZED USING PARTIAL LEAST SQUARES STRUCTURAL EQUATION MODELING (PLS-SEM)

Siswanto

Doctoral Candidate, Universitas Esa Unggul, Indonesia
Email : paksiswanto1707@student.esaunggul.ac.id

Abstract

The implementation of health information systems such as Electronic Medical Records (EMR) requires a comprehensive understanding of the psychological and behavioral factors influencing healthcare professionals' technology adoption. This study aims to examine the influence of digital competence and personal innovativeness on technology perceptions within the Technology Acceptance Model (TAM) framework, while also assessing the moderating role of age. A quantitative approach was conducted with medical staff in Type C and D hospitals, and data were analyzed using Partial Least Squares Structural Equation Modeling (PLS-SEM). The results show that both digital competence and personal innovativeness significantly affect perceived usefulness and perceived ease of use (TAM). Furthermore, TAM significantly influences attitude, which in turn has a significant impact on intention to use. However, age did not moderate the relationship between TAM and attitude. These findings highlight the strategic importance of enhancing digital literacy and fostering individual innovativeness to support the effective adoption of health information systems, while also indicating that demographic variables such as age may not be decisive factors in shaping technology acceptance.

Keywords: *Technology Acceptance Model, digital competence, personal innovativeness, attitude, intention to use, age, EMR*

THE EFFECT OF INCOME LEVEL, TAX KNOWLEDGE, AND TAX AUTHORITIES' SERVICES ON EMPLOYEE TAXPAYER COMPLIANCE WITH TAX POLICY AS A MODERATING VARIABLE

Muhammad Adam Zahran[1,*], Halimah Nasmi [1], Heni Suryanti[1]
adamzahran303@gmail.com[1,*], halimahnasmi@gmail.com, henisuyanti52@gmail.com

[1]Faculty of Economics and Business, National University,
Jakarta, Indonesia

Abstract

The study aims to determine the effect of income level, tax knowledge, and the quality of tax authorities' services on employee tax compliance. Data were obtained through a questionnaire involving 97 respondents and analyzed using the Partial Least Squares (PLS) method with SmartPLS 4.0. The results showed that the three factors have a positive influence on tax compliance. In addition, tax policy strengthens the effect of income level and the quality of tax authorities' services on tax compliance, but has no effect on the relationship between tax knowledge and compliance. Based on these findings, the study recommends KPP Pratama Jagakarsa to increase the socialization of tax policies through various methods, such as special education classes, and encourage the government to improve the tax administration and calculation system to make it fairer for the community. Theory Planned Behavior in this study relates to the role of taxpayer behavior. Taxpayers who have a high level of income, have a lot of tax knowledge and good fiscal services will affect tax compliance.

Keywords: *Tax Policy; Taxpayer Compliance; Tax Knowledge; Fiscal Service; Income Level.*

1. Introduction

Developed countries are formed through good governance and sustainable national development for the welfare of the people. National development requires funds, which come from the tax and non-tax sectors. According to Adriani, translated by R. Sasonto Brotodiharjo (1991:2), taxes are voluntary contributions made by the people to the state (with a coercive nature) without compensation, used to finance the state's general expenditures and related to the state's duties in managing the government. Based on the State Budget, the tax sector is the largest contributor to state revenue. In 2023, tax revenue reached 1,718.0 trillion, an increase of 6.8% from the previous year. (Source: APBN 2023, data processed in 2004) Tax revenue is the accumulation of revenue collected by tax offices throughout Indonesia, one of which is the Jagakarsa Tax Office.

Based on data on the tax compliance of individual taxpayers who are employees of the Jagakarsa Tax Office, there is a significant difference between the number of individual taxpayers who are employees who report their tax returns (SPT) and those who do not. In 2023, the number of individual taxpayers who reported their taxes was recorded at 28,815, while those who did not report totaled 161,561 (KPP Jagakarsa, 2025). Submitting tax returns is one aspect of tax compliance. Based on these data, it can be concluded that many taxpayers are still not compliant in fulfilling their tax obligations.

Tax compliance is influenced by internal and external factors (Pradhana, 2020). Internal factors that influence tax compliance include tax knowledge, income level, socialization, and so on, while external factors include the quality of fiscal services.

Income is the first internal factor that influences taxpayer compliance. According to Kukuh

Bhagaskara et al (2023), tax collection must take into account the taxpayer's ability to pay taxes, as this depends on their income level. Therefore, taxes should be collected when taxpayers have the funds to pay them.

Another factor in taxpayer compliance is the taxpayer's own knowledge. According to Ardiano Abdullah (2023), taxpayer knowledge is a method used by taxpayers to recognize their tax obligations through data on taxes, including the type of tax to be paid, tax rates, tax benefits, consequences, penalties, and other tax regulations. Based on research by Hidayati et al (2022), it was revealed that if taxpayers have good knowledge of tax regulations and tax administration, it will increase taxpayer compliance. Taxpayer knowledge can be concluded to have a strong influence on taxpayer compliance.

Tax compliance is not only due to taxpayers' knowledge of taxation, but must also be supported by good fiscal services in order to improve tax compliance. Service is the attitude of helping to take care of everything that is needed, while a fiscal officer is a tax official. Fiscal service is the way tax officials help and take care of everything that taxpayers need.

Good tax services provided by tax officials will make taxpayers feel comfortable, thereby encouraging them to comply with their tax obligations. Previous studies have shown different results regarding the factors that influence taxpayer compliance. Barlan et al. (2021) found that income levels affect taxpayer compliance, while Amanda et al. (2023) stated the opposite. Hapsari & Ramayanti (2022) mention that tax knowledge influences compliance, but Amanda et al. (2023) show different results. Similarly, Hidayati et al. (2022) found that tax administration services have an influence, while Fitria, E et al. (2021) state that they do not.

To address this controversy, this study adds a moderating variable in the form of taxation policy. One of the policies implemented is the Average Effective Rate, which simplifies tax calculations but has the potential to cause underpayment or overpayment risks. Anne Monica Sijabat & Christina Dwi Astuti (2024) found that the public agrees with this policy, while Andreas et al. (2023) highlighted challenges related to the refund mechanism and companies' readiness to bear employee taxes.

Based on this background, this research is about "The Influence of Income Level, Tax Knowledge, and Tax Services on the Tax Compliance of Individual Employee Taxpayers with Tax Policy as a Moderating Variable."

2. Literature Review

2.1 Theory of Planned Behavior (TPB),

The Theory of Planned Behavior (TPB) developed by Ajzen (1980, 1991) explains that a person's behavior is influenced by three main factors: behavioral belief, normative belief, and control belief. Behavioral belief refers to an individual's perception of the consequences of a behavior. In the context of taxation, a good understanding of the tax system can increase awareness of the benefits of taxation, thereby encouraging compliance. Normative beliefs relate to social pressure or the expectations of the surrounding environment. Interaction with tax officials shapes subjective norms that influence taxpayer behavior, where good service can increase compliance. Meanwhile, control belief refers to an individual's belief in their ability to control internal and external factors. In taxation, the taxpayer's income level is the main factor determining compliance, as the availability of resources affects the ability to pay taxes. Thus, TPB explains how understanding, social environment, and economic conditions play a role in taxpayer compliance.

2.2 Taxes

Taxes are mandatory contributions from the public to the state that are enforced by law, without direct compensation. Taxes are used to finance public interests such as infrastructure, education, and health (Soeparman Soemahamidjaja, 1993 & Mardiasmo, 2016). Law No. 28 of 2007 emphasizes that taxes are intended for the prosperity of the people. Thus, taxes play an important role in national development and community welfare.

2.3 Tax Compliance

Tax compliance is the awareness of fulfilling tax payment and reporting obligations, both monthly and annually (Agun et al., 2022). This compliance is influenced by tax sanctions, income levels, and tax knowledge (Barlan et al., 2021). Formal compliance occurs when taxpayers fulfill administrative requirements in accordance with regulations. Material compliance is achieved when taxpayers not only fulfill administrative aspects but also ensure that their tax obligations are correct in substance.

2.4 Income Level

Everyone's income varies depending on their job and position. In taxation, tax rates vary based on annual salary, PTKP, taxable objects, and tax brackets. Taxable income is income received from work to meet living needs (Amamnda et al., 2023). Income is closely related to income tax and influences taxpayers' compliance in paying taxes (Pardi 2009., in Beddu et al., 2022).

2.5 Tax Knowladge

Taxpayer knowledge is an understanding of tax obligations through information related to tax types, rates, benefits, interest, penalties, and tax regulations (Abdullah, 2023). (Yulia et al, 2020) add that tax knowledge includes understanding regulations, registration procedures, calculations, reporting, and benefits. Taxpayers with good knowledge will be more aware of their tax obligations, thereby increasing tax compliance.

2.6 Tax Services

Services are efforts to assist and provide convenience for taxpayers (Aprilia & Fidiana, 2021). Tax officials are responsible for providing quality services, with expertise, knowledge, and experience in taxation (Nugraha et al., 2020). Tax officials are required to educate and guide taxpayers to understand their tax rights and obligations (klikpajak.com). In modern administrative systems, there are Account Representatives (ARs) stationed at Medium Tax Offices (KPP Madya) and Basic Tax Offices (KPP Pratama). ARs play a role in tax consultation, refunds, regulatory interpretation, data verification, dissemination of new regulations, and monitoring taxpayer compliance to minimize the risk of administrative sanction.

2.7 Tax Policy

Tax policy is the government's effort to improve taxpayer compliance by simplifying the tax system. One of the policies implemented is the Average Effective Rate (AER), which aims to simplify the calculation of employee taxes by accumulating income and non-taxable income in determining the percentage of tax payable. The AER was issued on December 27, 2023, through Government Regulation No. 58 of 2023 and PMK No. 168 of 2023. This rate has three categories: Category A for taxpayers with unmarried status (TK/0), TK/1, and married without dependents (K/0); Category B for TK/2, TK/3, K/1, and K/2; and Category C for married taxpayers with three dependents (K/3).

The Average Effective Rate (TER) has a much simpler calculation compared to the progressive rate. The TER calculation only uses the formula Gross Income x TER according to the taxpayer's PTKP status, which is divided into three categories: A, B, and C.

In practice, the use of TER may result in underpayment (KB) or overpayment (LB) conditions. If underpayment occurs, the tax deduction in December will be larger and affect the take-home pay. However, if overpayment occurs, it will become a tax credit for the next tax period.

3. Methodology

This type of research uses a quantitative approach and data was collected through questionnaires distributed via Google Forms to 97 respondents at the Jagakarsa Tax Office in Jakarta. The sampling technique used was probability sampling, with a simple random sampling approach. The data was analyzed using Partial Least Squares (PLS) with SamrtPLS4.0..

4. Result And Discussion

4.1 Analisis Deskriptif Statistik

The descriptive statistical analysis in this study aims to provide an overview of the data collected in the questionnaire for each variable. The statistical description consists of the minimum value, maximum value, mean, and standard deviation (Table 1).

Table 1. Statistical Description of Independent Variables (X), Dependent Variables (Y), and Moderating Variables (Z)

Variabel	Simbol	N	Min	Max	Mean	Std. Deviation
Income Level	X1	97	7	20	17.35	2.753
Tax Knowledge	X2	97	12	20	18.07	2.117
Tax Services	X3	97	13	25	21.28	3.291
Compliance of Individual Employee Taxpayers	Y	97	9	20	17.50	2.259
Tax Policy	Z	97	10	20	15.17	2.798
Valid N (listwise)		97				

Source: data processed by author

Each variable shows an average value greater than the standard deviation, so it can be concluded that the overall data of the variables is evenly distributed.

4.2 Measurement Model Evaluation (Outer Model)

Multicollinearity testing was conducted to ensure that the regression model had correlations between its independent variables. The results showed that all variables met the multicollinearity requirements, with Variance Inflation Factor (VIF) values < 5 (Figure 1).

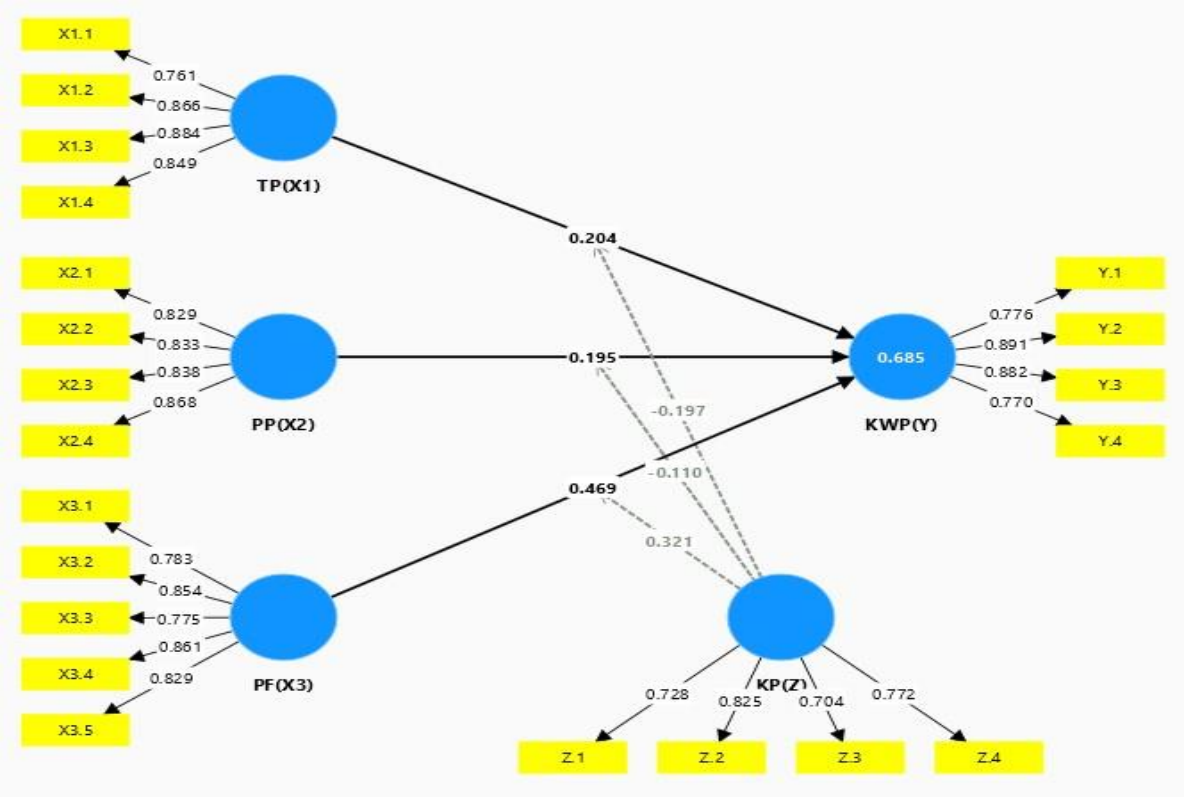

Figure 1. Multicollinearity of All Test Variables

4.3 *Convergent Validity Test*

The convergent validity test was conducted by looking at the loading factor and Average Variance Extracted (AVE) value. The results showed that all variables used in this study had a loading factor of more than 0.7, indicating high validity. Table 2 shows the AVE values of all research variables above 0.5, indicating good convergent validity. Thus, it can be said that convergent validity has been fulfilled by this study.

Table 2. Average Variance Extracted (AVE) Test Results

Variabel	**Simbol**	***Average variance extracted* (AVE)**
Income Level	X1	0.708
Tax Knowledge	X2	0.709
Tax Services	X3	0.675
Compliance of Individual Employee Taxpayers	Y	0.692
Tax Policy	Z	0.576

Source: SmartPLS output, data processed in 2025

4.4 Disctiminant Validity Test

Tabel 3 shows the correlation between constructs, with the numbers on the diagonal representing the AVE square root values. The results indicate that the AVE square root values. The results indicate that the AVE square root values of each construct are higher than the correlations between constructs.

Tabel 3. Results of the discriminant validity test for each research variable

	Z	Y	X3	X2	X1
Z	**0.759**				
Y	0.405	**0.832**			
X3	0.440	0.747	**0.821**		
X2	0.372	0.667	0.693	**0.842**	
X1	0.285	0.671	0.668	0.612	**0.842**

4.5 Validity and Reliability Test

Table 4 shows that the Composite Dependability and Cronbach's Alpha values for all research variables exceed 0.7. Therefore, it can be said that all variables used in this study are reliable.

Tabel 4. Reliability test results for each research variable

Variabel	Cronbach's alpha	Composite reliability	Reliabel
Income Level	0.863	0.906	✓
Tax Knowledge	0.863	0.907	✓
Tax Services	0.879	0.912	✓
Compliance of Individual Employee Taxpayers	0.850	0.899	✓
Tax Policy	0.754	0.844	✓

Sources: SmartPLS output, data processed 2025

4.6 R-Square Test

Table 5 shows that the R-Square value for the tax compliance variable is 0.661, which means that the tax compliance variable can be explained by the variables of Income Level, Tax Knowledge, and Fiscal Services by 66.1%. Meanwhile, the remaining 33.9% is influenced by other variables outside the scope of this study.

Tabel 5. Structural Model Evaluation Results (Inner Model)

	R-*square*	R-*square adjusted*
Kepatuhan Wajib Pajak	0.685	0.661

The SRMR value in Table 6 represents the probability that the hypothesized model can describe the input data well. The model fit can be said to be appropriate with an SRMR value < 0.08.

Tabel 6. Model fit test results

	Saturated Model	Estimated Model
SRMR	0.075	0.75

4.7 Uji Hipotesis

Tabel 7 shows the results of hypothesis testing for each variable studied.

Tabel 7. Hypothesis test results

Hubungan	Koefisien	T-*statistics*	P-*values*	Hasil
$X_1 \rightarrow Y$	0. 204	1987	0.047	Significant Positive
$X_2 \rightarrow Y$	0.195	2.006	0.045	Significant Positive
$X3 \rightarrow Y$	0.469	4.044	0.000	Significant Positive
$Z \times X_1 \rightarrow Y$	-0.197	2.14	0.032	Has Moderating Effect
$Z \times X_2 \rightarrow Y$	-0.110	0.958	0.338	Not Significant
$Z \times X_3 \rightarrow Y$	0.321	2.514	0.012	Has Moderating Effect

Source: SmartPLS output, data processed in 2025; T-table for sample 97, 1661.

Hypothesis testing shows that Income Level (X1) has a positive effect on individual taxpayer compliance with a coefficient of 0.204 and a P-value of 0.047 < 0.05, so H1 is accepted. Tax Knowledge (X2) also has a positive effect with a coefficient of 0.195 and a P-value of 0.045 < 0.05, so H2 is accepted. Furthermore, Tax Services (X3) has a stronger positive effect with a coefficient of 0.469 and a P-value of 0.000 < 0.05, so H3 is accepted. Tax Policy was found to moderate the relationship between Income Level and Taxpayer Compliance with a coefficient of -0.197 and a P-value of 0.032 < 0.05, but in this case, it weakened the relationship, so H4 is accepted. Meanwhile, the interaction on taxpayer compliance, as indicated by the coefficient of -0.110 and P-value of 0.338 > 0.05, leads to the rejection of H5. Finally, Tax Policy was found to strengthen the relationship between Tax Administration and Taxpayer Compliance with a coefficient of 0.321 and a P-value of 0.012 < 0.05, so H6 is accepted.

Discussion

The Effect of Income Level on Tax Compliance Among Individual Employees The results of the test show that income level has a positive effect on tax compliance. The higher a person's income, the more likely they are to fulfill their tax obligations, as they have greater financial capacity. In line with the Theory of Planned Behavior (Ajzen, 1991), tax compliance is influenced by attitude, subjective norms, and behavioral control. Taxpayers with sufficient income tend to have a positive attitude toward taxation and find it easier to fulfill their obligations. Additionally, subjective norms from the surrounding environment also encourage compliance, especially if the tax system is perceived as fair and transparent. This finding is

consistent with research (Ariwangsa & Kariyani, 2022) stating that the higher an individual's income, the greater the likelihood of their compliance with tax obligations.

The Effect of Tax Knowledge on Tax Compliance Among Individual Taxpayers The results of the study indicate that the higher the taxpayers' understanding of tax regulations, the better their tax compliance. In line with the Theory of Planned Behavior (TPB), tax knowledge shapes positive attitudes, intentions, and behavioral control, which encourage taxpayers to be more compliant. Better understanding increases confidence in fulfilling tax obligations and reduces errors due to the complexity of regulations. This is consistent with research (Triandani & Apollo, 2020), which states that taxpayer compliance increases as taxpayers' understanding of tax compliance increases, because non-compliance is often not caused by intent but by difficulties in understanding complex regulations.

The influence of tax administration services on the compliance of individual taxpayer employees from the test results shows that the better the services provided by the tax administration, the higher the level of taxpayer compliance in fulfilling their obligations. In line with the Theory of Planned Behavior (TPB), professional, responsive, and transparent services can foster positive attitudes, intentions, and behavioral control, thereby increasing taxpayers' trust and comfort in fulfilling their tax obligations. Clear information from tax authorities also reduces confusion and increases the intention to pay on time. Additionally, good service accessibility improves taxpayer behavioral control, enabling them to fulfill their obligations without obstacles. This is consistent with research (Hidayati et al., 2022) stating that the better the quality of tax administration services, the higher the taxpayer compliance.

The influence of taxation policy as a moderating variable of income level on the compliance of individual taxpayers has the effect of weakening the compliance of individual taxpayers who are employees. Taxation policy has different impacts depending on the tax deduction mechanism. Employees whose taxes are directly withheld by the company tend to be administratively compliant, although in the long term, this policy may affect well-being through reduced benefits. Conversely, employees who pay taxes independently may feel burdened if tax policies are perceived as complex and burdensome, potentially reducing compliance. In line with the Theory of Planned Behavior (TPB), a decrease in control over tax obligations can reduce compliance intentions. Therefore, clear policy socialization and administrative support are needed to minimize the negative impact of tax policies on taxpayer compliance.

The influence of tax policy as a moderating variable of tax knowledge on individual taxpayer compliance cannot moderate the influence of tax knowledge on taxpayer compliance. The inability of tax policy to moderate this relationship may be due to taxpayers' lack of understanding of the policy or suboptimal implementation due to insufficient socialization. Additionally, limitations in the research, such as an unrepresentative sample or moderating variables that do not fully capture the relationship between tax knowledge and compliance, may also be factors. Therefore, an evaluation of the effectiveness of the TER PPh 21 policy is needed, along with other strategies such as increased socialization, simplification of regulations, or the provision of incentives so that tax policies are more effective in improving compliance. Further research can be conducted with a broader sample coverage and consideration of other external factors to produce more targeted policies.

The influence of tax policy as a moderating variable of fiscal services on the compliance of individual taxpayers can strengthen the relationship between the quality of fiscal services and tax compliance by providing a clear regulatory framework, facilitating understanding of deduction rules, reporting, and administrative compliance. The TER PPh 21

policy supports the effectiveness of fiscal services by reducing uncertainty and increasing voluntary compliance. Additionally, this policy functions as a reinforcer by providing incentives, simplifying rules, and creating harmony between the rights and obligations of taxpayers. Transparency in tax withholding allows tax authorities to focus more on education and guidance rather than merely enforcing rules. Therefore, it is necessary to optimize tax services and conduct more extensive policy outreach to ensure effective policy implementation and encourage taxpayer compliance.

5. Conclusion

The analysis shows that income level, tax knowledge, and fiscal services each have a positive effect on taxpayer compliance. Taxpayers tend to be more compliant as their income increases, their tax knowledge improves, and fiscal services are optimized. Tax policies can moderate the influence of Income Level on compliance, where recent policies increase compliance but reduce net revenue efficiency, especially toward the end of the year. However, tax policies do not moderate the influence of Tax Knowledge on compliance because ongoing reforms make it difficult for taxpayers to adapt. Meanwhile, high-quality tax services can strengthen their impact on compliance, as taxpayers feel more supported and valued in fulfilling their tax obligations.

THE INFLUENCE OF COMPANY GROWTH, SUSTAINABILITY REPORT AND IMPLEMENTATION OF GREEN ACCOUNTING ON PROFITABILITY COMPANIES IN THE ENERGY SECTOR COMPANIES REGISTERED IN INDONESIA STOCK EXCHANGE 2020-2024

Nadilasari Molina

Universitas Nasional

Abstract

The growth of energy sector not only contributes to economic development, but also has an impact on the environment. This stimulated accounting to development, not only focusing on financial reporting, but also including the presentation of sustainability information and the application of green accounting as a form of corporate social and environmental responsibility. This study focus to examine the influence of company growth, sustainability report and the application green accounting on company profitability. This study uses a quantitaive approach and focuses on the energy sector companies listed on the Indonesia Stock Exchange (IDX) during the eriod 2020 to 2024. Sample selection was caried ut using a purposive sampling technique, namely based on certain criteria that have been previously determined. The number of samples used in this study were 90 companies. To prcess data and test the model used, the analysis was done using the multipe linear regression method using the assistance of SPSS version 26 software.

PENGARUH BRAND IMAGE, KUALITAS PRODUK, DAN HARGA TERHADAP MINAT BELI KONSUMEN PADA BRAND PUMA DI JAKARTA SELATAN

Rizki Amirullah, Olivia Yolanda

Universitas Nasional
Email: rizkiamirullah.unas17@gmail.com , olivia.yolanda@civitas.unas.ac.id

Abstract

Industri fashion dan olahraga mengalami transformasi besar dalam satu dekade terakhir, dengan merek seperti Puma menjadi pemain utama di pasar global. Dalam konteks Indonesia, dengan pasar yang didominasi oleh merek seperti Nike dan Adidas, Puma menghadapi tantangan dalam meningkatkan daya saingnya. Penelitian ini bertujuan untuk menganalisis pengaruh brand image, kualitas produk, dan harga terhadap minat beli konsumen terhadap produk Puma di Jakarta Selatan. Fenomena ini penting untuk dipelajari karena persaingan yang semakin ketat di industri produk olahragaPenelitian ini menggunakan pendekatan kuantitatif dengan metode survei melalui penyebaran kuesioner kepada konsumen Puma di Jakarta Selatan. Sampel penelitian terdiri dari 100 responden yang diambil dengan teknik purposive sampling. Data yang dikumpulkan dianalisis menggunakan SPSS untuk menguji hubungan antara variabel brand image, kualitas produk, harga, dan minat beli konsumen melalui regresi linier berganda.Hasil penelitian menunjukkan bahwa ketiga variabel brand image, kualitas produk, dan harga memiliki pengaruh positif dan signifikan terhadap minat beli konsumen. Brand image yang kuat dan kualitas produk yang baik memberikan kontribusi besar terhadap keputusan pembelian, sementara harga yang kompetitif juga memengaruhi minat beli konsumen.penelitian ini menunjukan bahwa brand image, kualitas produk, dan harga memiliki pengaruh signifikan terhadap minat beli konsumen pada produk Puma di Jakarta Selatan. Oleh karena itu, perusahaan Puma perlu meningkatkan citra merek, memastikan kualitas produk tetap tinggi, dan menyesuaikan harga untuk memperkuat daya saing di pasar Indonesia.

THE INFLUENCE OF WORLD OF MOUTH AND BRAND IMAGE ON THE DECISION TO PURCHASE ROOM SERVICES AT THE GRAND MERCUE JAKARTA KEMAYORAN HOTEL

Siti Rohmah Agustin[1,*], Rachmad Rizky Trianto [2], Gagih Pradini[3]

[1]Faculty Of Economics and Business Tourism Study Program, National University

Abstract

In this study, quantitative analysis methods were used, using data collected through questionnaires. A total of 100 respondents participated, and the data was analyzed using SPSS version 25. The analytical techniques used include descriptive and inferential analysis, with a particular focus on multiple linear regression. The results showed that both word-of-mouth and brand image have a significant positive impact on room service purchase decisions at Grand Mercure Jakarta Kemayoran Hotel.

DOES THE AUDIT COMMITTEE MODERATE THE IMPACT OF AUDITOR REPUTATION AND TENURE ON FINANCIAL STATEMENT FRAUD?

Muhammad Rizky Ainurrakhman[1*], Hendro Sasongko[1], Enok Rusmanah[1]

[1]Accounting Department, Faculty of Economics and Business, University Pakuan, Bogor, Indonesia

Abstract

This study investigates the impact of auditor reputation and audit tenure on financial statement fraud, with the audit committee acting as a moderating variable. The research analyzed 20 consumer cyclical companies listed on the Indonesia Stock Exchange from 2020 to 2023. Using a quantitative approach with multiple and moderated regression analysis. The results show that auditor reputation significantly reduces the likelihood of financial statement fraud, while audit tenure has no significant individual effect. However, the two variables jointly have a significant impact. Furthermore, the audit committee does not significantly moderate the relationship between either auditor reputation or audit tenure and financial statement fraud. These findings highlight the limited role of the audit committee in enhancing fraud prevention and suggest the need for strengthened governance mechanisms.

Keywords**:** *auditor reputation, audit tenure, audit committee, financial statement fraud, consumer cyclical companies*

ADOPTION OF AI TOOLS AND ITS IMPACT ON LEARNING BEHAVIOR AND ETHICAL CONDUCT: A STUDY OF FUTURE WORKFORCE READINESS AMONG UNIVERSITY STUDENTS

Misnanto

Tuban Institute of Technology & Business, East Java, Indonesia
College of Economics of the National Heroes family Foundation, Yogyakarta, Indonesia
misnantoscholar@gmail.com

Abstract

The rapid adoption of generative Artificial Intelligence (AI) tools such as ChatGPT, Gemini, and Copilot is reshaping higher education landscapes worldwide. While these tools offer unprecedented efficiency and support for learning, their integration raises complex pedagogical and ethical concerns. This study investigates how university students' adoption of AI tools influences their learning behavior, academic ethical conduct, and readiness for the future workforce. Using a modified Unified Theory of Acceptance and Use of Technology (UTAUT) framework, enriched with perceived risk, trust, and tech-savviness variables, we surveyed 320 undergraduate students across Indonesia through a structured online questionnaire. Structural Equation Modeling (PLS-SEM) was employed to analyze 14 hypotheses. The results reveal that trust and tech-savviness significantly drive students' intention to use AI, which in turn predicts actual usage. Moreover, actual AI usage has a strong positive impact on students' learning behavior, ethical awareness, and perceived job readiness. In contrast, traditional predictors such as performance expectancy, social influence, and institutional support were found to be non-significant. These findings highlight a paradigm shift: students are increasingly guided by intrinsic trust and digital competence rather than external enablers. The study offers critical insights for educators and policymakers in designing ethically grounded, future-oriented AI integration strategies in higher education.

SPIRITUAL CAPITAL THAT INCREASES THE RESILIENCE OF A CLEANING SERVICE IN DIFFICULT WORK SITUATIONS

[1]Maria Yolanda Oktaviani, [2]Helena Anggaraeni Tjondro Sugianto

[1,2]Institut Shantibhuana

email : [1]my0365490@gmail.com, [2]helena@shantibhuana.ac.id

Abstract

This research examines the role of spiritual capital in enhancing the resilience of a cleaning service worker facing demanding work conditions at a banking unit in the border region of West Kalimantan. Using a qualitative-ethnographic approach, this study explores the lived experience of a cleaning service who performs various tasks with extended working hours beyond the normal standard. Data were collected through participatory observation, in-depth interviews with the cleaning service and colleagues, and documentation over a six-month period. The findings reveal that the subject's spiritual capital—comprising religious beliefs, routine worship practices, and transcendental meaning-making—plays a crucial role in building resilience. Significant dimensions of spiritual capital include gratitude, perceiving work as a form of worship, and belief in divine assistance during hardships. This resilience manifests in the ability to adapt to high workloads, overcome physical fatigue, and maintain a positive attitude amid challenging work situations. This research enriches our understanding of spiritual capital as an internal resource that organizations can develop to enhance employee resilience, especially for those working under pressured and underappreciated conditions.

FROM INFORMATION OVERLOAD TO ACTION: BEHAVIORAL BIASES AND GEN Z'S EQUITY INVESTMENT BEHAVIOR

Bintang Ari Suwardi[1] and Dwitya Aribawa[2]

[1,2] Universitas Atma Jaya Yogyakarta

E-mail: dwitya.aribawa@uajy.ac.id

Abstract

Generation Z is a digital-native generation that is now becoming increasingly active as investors in the stock market. As individuals raised during the age of information and technology, they have extensive access to financial data, yet they remain vulnerable to emotional influences and psychological biases in making investment decisions. This study aims to examine the influence of behavioral biases—overconfidence bias, herding bias, loss aversion bias, and anchoring bias—on Generation Z's investment decisions in the stock market. A quantitative method was applied using multiple linear regression analysis with a Weighted Least Squares approach to address potential heteroscedasticity. The results reveal that overconfidence bias and loss aversion bias significantly influence investment decisions among Generation Z. Meanwhile, herding bias has no significant effect, indicating that Generation Z tends to make investment decisions independently and is less likely to follow majority opinions or market trends. This contrasts with the findings of several previous studies and highlights Generation Z's more rational and financially literate behavior. Anchoring bias also shows no significant effect at the 5 percent level, but it does show a positive influence at the 10 percent significance level. These findings suggest that Generation Z is relatively adaptive to new information and accustomed to reevaluating their decisions, making them less fixated on initial references.

FINANCIAL LITERACY AND THE GENDERED DYNAMICS OF FINANCIAL BEHAVIOUR: EVIDENCE FROM HOUSEWIVES IN AN EMERGING COUNTRY

Yohana Aditha Martien[1] and Dwitya Aribawa[2]

[1,2] Universitas Atma Jaya Yogyakarta

E-mail: dwitya.aribawa@uajy.ac.id

Abstract

Currently, financial literacy is the most important point for creating a healthy and organized financial condition, which is focused on housewives so that housewives have directed financial behavior. This study aims to determine the impact of financial literacy, debt ownership and home ownership on the financial behavior of housewives in Yogyakarta. This study uses a quantitative method with the population used being housewives in Yogyakarta. In addition, this study used 122 samples for research. The results of this study are, first: financial literacy has an effectpositive and significanton the financial behavior of housewives in Yogyakarta, second: debt ownership has an effectpositive and significanton the financial behavior of housewives in Yogyakarta, and finally home ownership has an effectpositive and significanton the financial behavior of housewives in Yogyakarta.

ACCOUNTING STANDARDS IN THE DIGITAL ERA: ADAPTING REGULATIONS TO TECHNOLOGICAL INNOVATIONS — A CASE STUDY OF A MILITARY-AFFILIATED FOUNDATION IN INDONESIA

Apriyanto, Jati Dwi[1],* Kustinah, Siti[1]

Jenderal Achmad Yani University, Cimahi, Indonesia

Abstract

This study investigates the adaptation of accounting regulations to digital transformation within a semi-government nonprofit entity, the Kartika Eka Paksi Foundation (YKEP), affiliated with the Indonesian Army. Technological innovations such as Enterprise Resource Planning (ERP), Artificial Intelligence (AI), and cloud-based accounting have been increasingly adopted in public sector reporting systems. However, regulatory adaptation remains limited, especially in hybrid organizations where institutional, bureaucratic, and military frameworks intersect. Using a qualitative case study approach involving in-depth interviews and field observations, the research reveals that while YKEP has initiated digital transformation through ERP and MYOB systems, reporting practices still heavily rely on internal military guidelines. Although ISAK 335 is referenced, full alignment with nonprofit accounting standards is lacking. Findings suggest that regulatory reform, standardized reporting frameworks, and capacity building are essential for ensuring accountability and transparency in digital financial reporting. The research contributes to public sector accounting literature by highlighting the regulatory and institutional challenges faced by military-affiliated nonprofit organizations in Indonesia.

Keywords: digital accounting, ERP, nonprofit standards, military foundation, ISAK 335, regulatory adaptation, institutional pressure

ASSESSING STUDENTS' ACCEPTANCE OF ACCURATE SOFTWARE IN THE TEACHING AND LEARNING PROCESS

Yanto Darmawan[1*], Evieana Riesty Saputri[2], Rahimah[3]

[1,3]Politeknik YKPN Yogyakarta,
[2]YKPN Yogyakarta

Abstract

This study aims to analyze students' acceptance of the Accurate accounting application. The background of this research is the low student pass rate in certification exams, which is assumed to be caused by a lack of readiness in using technology. This study adopts the Technology Readiness Acceptance Model (TRAM), which combines personality dimensions from the Technology Readiness Index (TRI) and constructs from the Technology Acceptance Model (TAM). Four TRI dimensions—optimism, innovativeness, discomfort, and insecurity—are examined to determine their effect on perceived ease of use and perceived usefulness of Accurate, which in turn are analyzed for their impact on students' intentions to take the certification. Data were collected through questionnaires distributed to students of Politeknik YKPN Yogyakarta who had participated in the accounting application certification exam, and analyzed using the SEM-PLS method. The findings are expected to provide input for higher education institutions in improving students' technology readiness and participation in certification exams.

INTEGRATING INSTITUTIONAL, STAKEHOLDER, AND LEGITIMACY THEORIES: INSIGHTS FROM A SYSTEMATIC REVIEW OF GOVERNMENT STRATEGIES FOR SUSTAINABLE DEVELOPMENT

Tri Ciptaningsih[1*], Baldric Siregar[2], Maria Pampa Kumalaningrum[3]
[1,2,3] STIE YKPN, Yogyakarta, Indonesia
*Corresponding author email: tata@stieykpn.ac.id

Abstract

The research draws its data from peer-reviewed journal articles found in Scopus-indexed sources between 2015 and 2025. The research encompasses a range of national contexts from various countries, with a particular emphasis on emerging economies. The research combines institutionalism with stakeholder theory and legitimacy theory to synthesise findings through an integrative framework. The overarching structure of the framework is designed to facilitate the analysis of governmental approaches to sustainable development, with a particular emphasis on their progress in achieving the United Nations Sustainable Development Goals (SDGs). Government institutions primarily adhere to institutional norms through organizational mechanisms, while concurrently promoting stakeholder inclusion to enhance their policy effectiveness. Strategic communication functions as a vital instrument for developing public trust and legitimacy in sustainable governance initiatives. The review uncovers significant theoretical perspective deficiencies in empirical studies concerning their integration across disparate political and cultural contexts. The research indicates an immediate requirement for detailed studies that analyse multiple levels of analysis. It is imperative that research be conducted to explore the interplay between institutional pressures and the dynamics of stakeholder legitimacy over time. The development of sustainable development strategies necessitates this approach. The policy environment of our globalised world has become increasingly complex. The research findings will facilitate the development of sustainable development policies by governments that are better aligned with institutional limitations and stakeholder needs. The policy's success is contingent upon its acceptance by a wide range of stakeholders.

Keywords: *isomorphism, institutional, stakeholder, legitimacy, sustainable, SDGs, government, public-sector*

1. Introduction

The global adoption of Sustainable Development Goals (SDGs) has compelled governments to reconfigure their institutional systems and governance structures in order to address complex sustainability issues. The process of converting universally accepted goals into national and local action is faced with significant obstacles due to institutional barriers, stakeholder engagement issues, and legitimacy concerns. Park & Park (2024) demonstrate that the Republic of Korea, with its advanced system, faces obstacles in implementing the Sustainable Development Goals (SDGs). The implementation of the SDGs is encumbered by the fact that it extends beyond the realms of technical and functional aspects. The implementation of Sustainable Development Goals (SDGs) is contingent upon the dynamic nature of social institutions, which exhibit fragmentation and conflicting sustainable development values, as well as unclear interpretations. The process of implementing the Sustainable Development

Goals (SDGs) necessitates the establishment of comprehensive institutional frameworks. In order to align with the requirements of the local environment, global standards must undergo an internal adaptation process.

The adoption of analogous sustainability strategies by governments can most effectively be comprehended through the lens of institutional theory and its associated concepts, as elucidated by Dimaggio & Powell (1983a). The alignment of policy frameworks does not inherently ensure the attainment of effective or legitimate outcomes. As Monteiro *et al.* (2024) assert, the disclosure and communication efforts related to the SDGs on the part of Portuguese municipalities are generic in nature, with meaningful engagement being absent. It is evident that the majority of local governments are not effectively disseminating comprehensive information or explicit references regarding the SDGs through their designated official platforms. The difference between compliance and genuine progress demonstrates how stakeholder engagement together with legitimacy serve as essential factors for achieving actual advancement. Local government governance transparency depends on institutional elements for its advancement. Brás *et al.* (2025) show that this development remains unbalanced because regional inequalities continue to persist. The research shows that institutional pressures fail to produce the desired results. Active stakeholder participation together with contextual adaptation becomes necessary to achieve both equitable and effective results. Micro-level actors develop sustainable intentions and behaviors through institutional components which consist of government initiatives and social conventions. Koe *et al.* (2024) suggest that emerging economies need special attention because their sustainability transformation remains in its initial phase.

The relationship between quality governance and sustainable development outcomes is most apparent in healthcare administration. As asserted by Rahman *et al.* (2025), the efficacy of public health investment in achieving Sustainable Development Goals (SDGs) is augmented by the presence of robust governance systems. Conversely, the absence of effective institutions has been demonstrated to result in the degradation of the value of such expenditures, a phenomenon that is particularly pronounced in BRICS economies. The accumulated research evidence indicates that the implementation of an integrated analytical framework is imperative. The research framework must integrate institutional analysis with stakeholder involvement and legitimacy assessment. This analysis provides a necessary framework for the improvement of government strategies with regard to sustainable development.

The extant literature demonstrates fragmentation, as it lacks sufficient empirical evidence regarding institutionalism and its relationship with stakeholder engagement and legitimacy-building during the implementation of the Sustainable Development Goals. The discrepancy is most evident in emerging economies, as these forces evolve dynamically according to context-specific requirements. The objective of the present research is to address the following fundamental questions.

RQ1: How do institutional isomorphism mechanisms shape government strategies for SDGs implementation across varied political and cultural contexts?

RQ2: What role does stakeholder engagement play in mediating the effectiveness of isomorphic sustainability policies?

RQ3: How do governments leverage strategic communication to legitimize sustainability initiatives amid competing institutional and stakeholder demands?

The research methodology consists of a systematic literature review that examines peer-reviewed articles from the Scopus database between 2015 and 2025, while incorporating the mentioned key studies. The present study synthesises the findings from these works to establish a robust multi-level framework. The framework demonstrates how institutional pressures, together with stakeholder dynamics and legitimacy, evolve to produce effective government strategies for SDG achievement that adapt to specific contexts.

The research adds substantial value to existing knowledge by creating a new analytical framework which unites institutionalism with stakeholder theory and legitimacy theory to analyze Sustainable Development Goals implementation challenges. The research uses empirical data from three separate settings which include Korean institutional fragmentation and adaptation challenges (Park & Park, 2024) and Portuguese municipal transparency evolution (Brás *et al.*, 2025) and institutional elements that affect sustainable entrepreneurial intentions (Koe *et al.*). The research establishes a novel framework which connects macro-level institutional conformity to micro-level stakeholder engagement and meso-level legitimacy construction. The research results match the findings from 2024 and 2025. The method enables standard comparison between global and local contexts which helps policymakers and practitioners develop sustainable development policies that work effectively across different national environments (Dimaggio & Powell, 2021; Monteiro, Ribeiro, Gomes, *et al.*, 2024a).

2. Literature Review

Achievement of Sustainable Development Goals (SDGs) is contingent on institutional approaches and stakeholder participation and legitimacy construction. It is imperative for organisations and governments to address these challenges by navigating the intricate balance between global standards, local needs and the varied governance capabilities inherent in their respective contexts. The institutional theory posits that policy convergence is precipitated by three primary forces: coercive, mimetic and normative pressures. The internalisation of SDGs in Korea is evidenced by the aforementioned processes, as demonstrated by the fragmented administrative structure and unclear objectives of the nation, in addition to the requirement for collective governance among various stakeholders (Dimaggio & Powell, 1983; Park & Park, 2024). At the local level, there is an absence of uniformity in the practices pertaining to stakeholder engagement and transparency. The majority of Portuguese municipalities make general SDG disclosures; however, there are substantial variations in transparency levels between regions, attributable to institutional and geographic factors (Brás *et al.*, 2025; Monteiro, Ribeiro & Gomes, 2024). The success of the implementation of the Sustainable Development Goals (SDGs) is contingent upon the presence of effective governance and institutional support. Research indicates that government effectiveness, in conjunction with e-government maturity, contributes to the reduction of gender inequality among nations (Kumar *et al.*, 2024). Furthermore, institutional factors have been observed to enhance sustainable entrepreneurial intentions among Malaysian MSMEs (Koe *et al.*, 2024). The extant literature maintains its fragmented nature because it focuses on technical indicators and voluntary reporting yet fails to examine the intricate socio-political and historical aspects of SDG localization and implementation. The governance of Sustainable Development Goals (SDGs)

necessitates comprehensive frameworks that integrate island adaptation with participatory stakeholder processes and strategic legitimacy-building, given the complex institutional and contextual challenges confronting emerging economies (Dimaggio & Powell, 1983; Monteiro, Ribeiro, & Gomes, 2024; Park & Park, 2024).

2.1 Theoretical Framework

A robust theoretical framework serves as the foundation for the study of the interaction between institutional elements, stakeholder interests, and legitimacy factors during the implementation of Sustainable Development Goals (SDGs). The theoretical framework consists of institutional theory and stakeholder theory and legitimacy theory which serve as its base. The framework enables complete evaluation of how governments implement global Sustainable Development Goals (SDGs) norms through their work with different actors to build policy legitimacy. The theories provide separate yet harmonious perspectives, which collectively form a fundamental basis for answering research questions and achieving the objectives of this study.

2.1.1 Institutional Isomorphism: Conformity and Adaptation in SDGs Implementation

The institutional theory of isotropy, as proposed by Dimaggio and Powell (1983a, 2021), posits that organisations, including governmental entities, tend to exhibit increasing similarities over time as a result of coercive, mimetic, and normative pressures. The Sustainable Development Goals (SDGs) illustrate coercive isolationism through mandatory international agreements and national regulations that compel governments to implement SDGs frameworks (Dimaggio & Powell, 1983; Park & Park, 2024). The practice of governments adopting Sustainable Development Goals (SDGs) strategies from successful peers or leaders is known as mimeticomorphism (Park & Park, 2024). The combination of professionalisation with the dissemination of best practice can result in normative isolation. The implementation of these practices is primarily facilitated by expert networks in conjunction with international organisations and civil society groups (Brás *et al.*, 2025). The Korean case study by Park & Park (2024) demonstrates that implementation pressures from these sources do not invariably result in effective or contextually appropriate SDG outcomes. The internalisation of global norms is a complex process, hindered by the fragmentation of institutions across distinct sectors. Additionally, the term "sustainable development" is ambiguous, allowing stakeholders to present their individual values. The adaptation and localization process is of the utmost importance, as it facilitates genuine transformation for organisations (Dimaggio & Powell, 1983; Koe *et al.*, 2024).

2.1.2 Stakeholder Theory: Multi-Actor Engagement and Participatory Governance

The Stakeholder Theory demands that governments understand and manage multiple interests between civil society and local communities, businesses and international organisations for the achievement of the SDGs. (Monteiro, Ribeiro, Gomes, *et al.*, 2024a). The theory posits that inclusive engagement is conducive to enhanced public policy effectiveness and legitimacy (Freeman, 1984). The size and location of municipalities, in conjunction with stakeholder expectations and pressures, have been demonstrated to influence local governments to disclose their SDGs and maintain transparency practices in Portugal (Brás *et al.*, 2025; Monteiro, Ribeiro, Gomes, *et al.*, 2024a).

The effectiveness of SDGs-oriented policies is contingent on stakeholder participation. For example, Rahman *et al.* (2025) definitively find that in BRICS economies, strong governance and stakeholder engagement amplify the positive impact of public health expenditure on SDG 3 outcomes. Fragmented or superficial participation undermines policy

outcomes. Many local governments disclose limited and generic SDGs (Monteiro, Ribeiro, Gomes, *et al.*, 2024a).

2.1.3 Legitimacy Theory: Trust is Built Through Transparency And Communication

Suchman (1995a) established legitimacy theory as the foundational framework for studying organisational acceptance in society among public entities and private firms. Organisations are able to maintain social approval through their actions and disclosures, which must align with societal norms and values and public expectations. Suchman (1995) defines legitimacy as "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (p. 101). Legitimacy is defined as an organisational resource that is required to be managed actively by organisations. This is due to the fact that it is a dynamic resource. However, this management is especially important when organisations are facing increased public attention and social disputes.

Suchman (1995) proposed a taxonomy of legitimacy comprising three distinct categories: pragmatic, moral and cognitive legitimacy. Pragmatic legitimacy is derived from the evaluative appraisals of organisations' primary stakeholders, who stand to directly benefit from the activities of the organisation. The concept of moral legitimacy is predicated on the premise that an organisation's actions are in accordance with established ethical standards and societal values, as recognised and endorsed by societal approval. The concept of cognitive legitimacy emerges when organisations engage in activities that are inherently understood by individuals as being fundamental to their social environment. It is evident that organisations employ a variety of strategies with the objective of building and maintaining, or rebuilding, stakeholder approval of their actions. Transparent reporting, in conjunction with stakeholder engagement and regulatory or global standards alignment, has been demonstrated to assist organisations in building their legitimacy (Suchman, 1995a).

Suchman (1995b) asserts that organizations must align their actions with social expectations if they wish to gain public trust and acceptance. As posited by Monteiro *et al.* (2024a), the legitimacy of the SDGs is enhanced by the complete disclosure of pertinent information, in conjunction with strategic communication methodologies, which have been demonstrated to engender specific benefits for stakeholders. The legitimacy of SDGs initiatives is contingent upon two factors: the fulfilment of global norms and the effective demonstration of their relevance and impact to local populations.

Monteiro *et al.* (2024) reveal that the majority of Portuguese municipalities lack meaningful SDGs-related website content because they neglect to link their disclosures to local strategies and narratives. Brás *et al.* (2025) define "pseudo-transparency" as the practice of disclosing information that lacks real substance in their research. The organisations must develop appropriate communication methods to connect with stakeholders and establish trust and address particular situations even though procedural compliance does not automatically guarantee legitimacy.

3. Methodology

3.1 Research Design

The research design employs systematic literature review (SLR) methodology which adheres to the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines. The PRISMA framework functions as the standard framework for systematic review processes because it establishes transparent and rigorous methods for literature selection and evaluation. The research methodology integrates article synthesis with analysis to examine the connections between Isomorphism and stakeholder theory and legitimacy and sustainability and governmental involvement.

3.2 Literature Search Criteria

The search for relevant articles was conducted in the Scopus database. The search was restricted to articles published between the years 2015 and 2025. The key search terms included in the title, abstract, and keywords were: ((("isomorphism" OR "institutional-theory") OR ("stakeholder-theory") OR ("legitimacy-theory")) AND ((("sustainable-development-goals" OR "SDGs") AND ("government" OR"governmental" OR "public-sector")). This combination of search terms was selected to ensure that the review focused on articles discussing the intersection of institutional theory, stakeholder theory, legitimacy, sustainability, and government about sustainable development goals (SDGs). The search criteria were meticulously defined, and the initial retrieval of 69 articles from Scopus was successful.

3.3 Exclusion Criteria

The first exclusion criterion required a publication year filter to be applied to articles. The review focused on articles from 2015 to 2025 because all articles before or after this period were excluded from evaluation. The total number of retrieved articles reached 69 because no articles were available beyond this time range. The second exclusion criterion was the removal of book chapters. The evaluation process showed that nine articles served as book chapters. The evaluation process continued with 60 articles after removing them from consideration. The third exclusion criterion specified that articles needed to be written in English. The total number of articles stayed at 60 because all articles were published in English.

3.4 Screening Process

The remaining 60 articles were subjected to a screening process to ascertain their relevance to the research focus following preliminary inclusion and exclusion procedures. The subsequent stage of the research involved the examination of articles that focused on government subjects as opposed to corporate or private sector topics. The analysis indicates that 44 articles concentrate on corporate domains rather than governmental domains. As a consequence of the exclusion process, which resulted in the removal of 16 articles that met the established eligibility criteria, articles were eliminated.

3.5 Final Selection

The remaining 16 articles were directly related to the research question and were therefore eligible for further analysis. The analysis of these articles will be performed to extract relevant findings which will help answer the research questions about the relationship between isomorphism, stakeholder theory, legitimacy, and sustainability in the context of government and SDGs. The final analysis will comprise 16 articles, and their insights will be synthesised to provide a comprehensive understanding of the topic.

3.6 Data Collection and Extraction

The systematic literature review (SLR) process required data collection and extraction after articles were determined eligible for inclusion. The researchers retrieved the full versions of the 16 articles that made it to the review stage. The extraction of vital information from each article concentrated on essential themes which addressed the research questions during this phase. The extraction process produced information about government strategies together with institutional corruption problems and stakeholder involvement and legitimacy within sustainable development systems. The review assessed the research methods used in each study together with their geographical locations and theoretical frameworks. The researchers used a standardized template to perform data extraction. The researchers used this method to achieve uniformity and precision in their analysis of all articles. The systematic process helped researchers to organize their findings and compare results across different settings. This method maintained the review to both extensive and scientifically sound standards.

3.7 Analytical Framework and Data Analysis

The research design integrated institutionalism with stakeholder theory and legitimacy theory to analyze government strategies for implementing the Sustainable Development Goals. The research investigated how institutional forces shape policy alignment while stakeholder participation creates legitimacy and strategic communication acts as the key factor for building public trust. The research framework supported a thematic analysis of 16 Scopus-indexed articles from 2015 to 2025 which showed governments use coercive, mimetic and normative pressures to execute SDG policies. The effectiveness of these policies depends on their ability to adjust to specific situations while motivating stakeholders to actively participate. The research evaluation showed institutionalisation faces ceremonial compliance problems while stakeholder engagement remains tokenistic and disclosure practices remain generic. The synthesis of qualitative data showed that sustainable governance needs institutional conformity to achieve authentic collaboration and context-sensitive communication. The framework allowed researchers to structure their findings systematically while connecting them to their research goals. The European Union demonstrated its role in standardizing global policies. The research established that local legitimacy development together with adaptive governance systems must be established to achieve Sustainable Development Goals because this process enables the conversion of commitments into concrete and fair results. The following image illustrates the PRISMA process that was applied in this study:

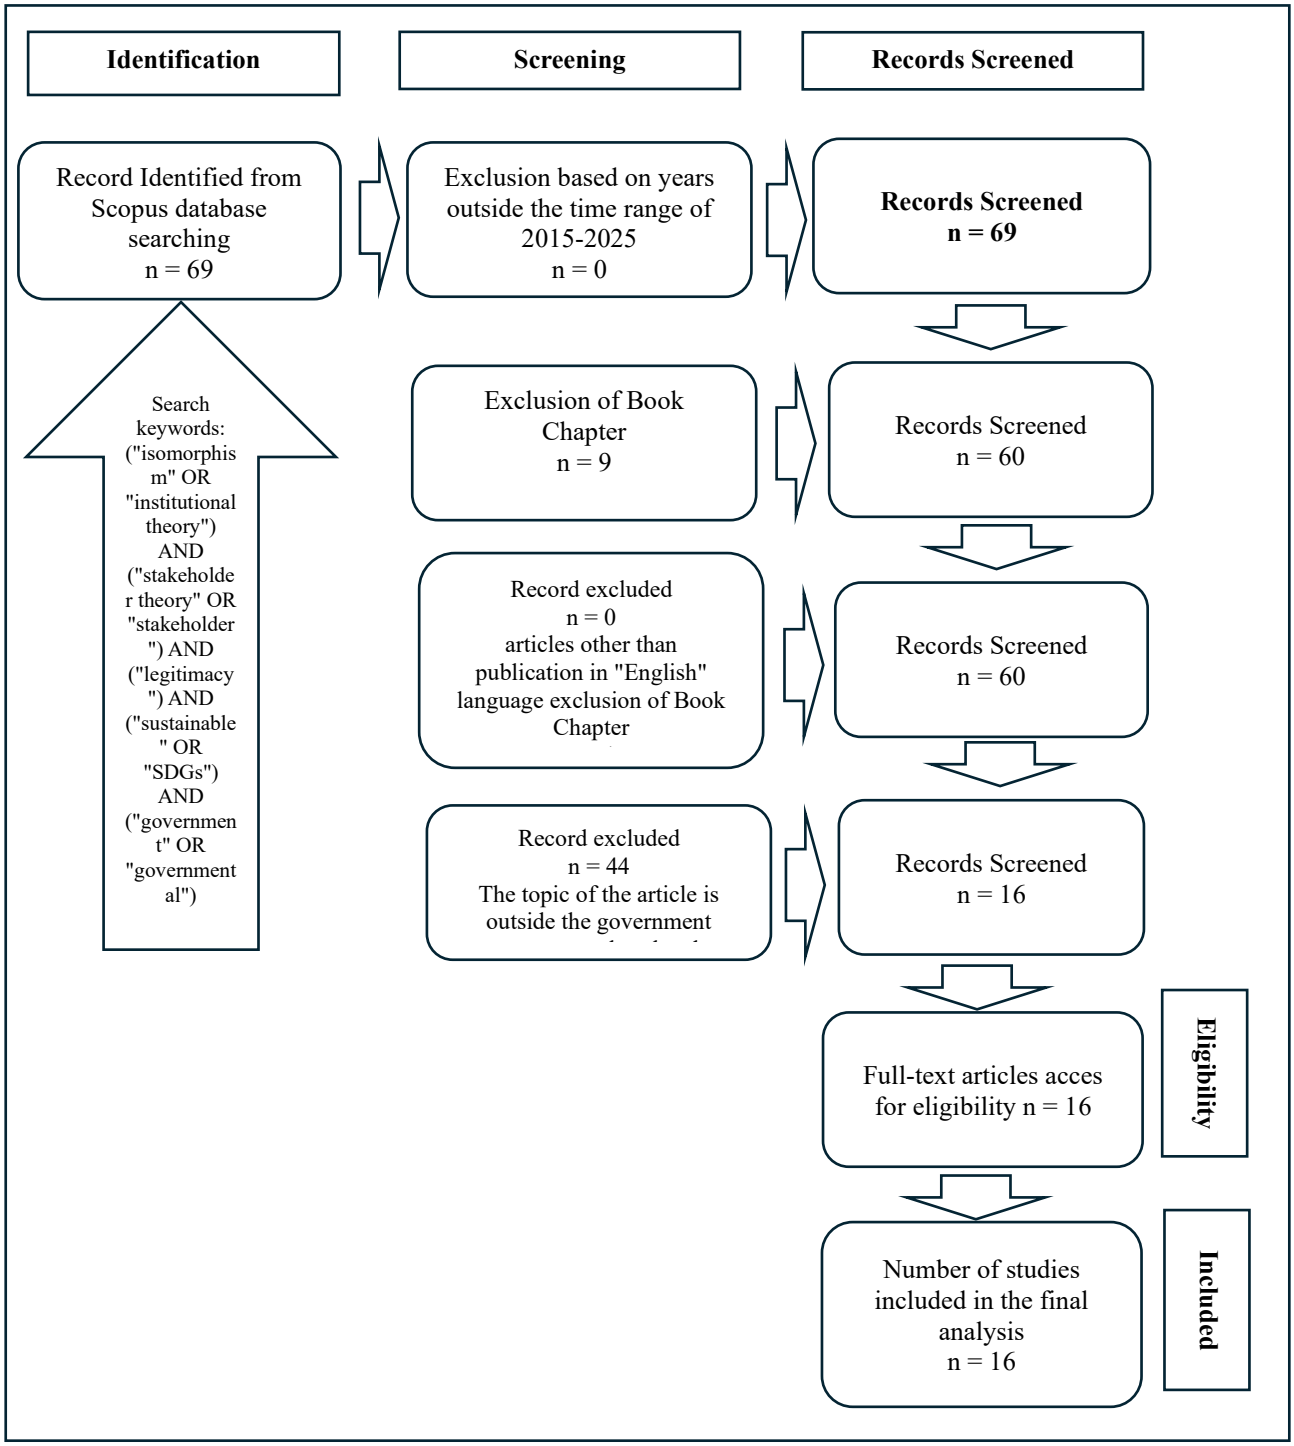

Figure 1. PRISMA Framework

The data collection and extraction process together with the analytical framework and data analysis provided a thorough understanding of government strategies for achieving the SDGs. The PRISMA guidelines were used to guide the methodology to ensure transparency, rigour and consistency in the systematic literature review.

4. Results and Discussions

The research base for this section comes from a systematic literature review about government strategies for implementing Sustainable Development Goals (SDGs) in emerging economies. The review shows how institutional pressures work with stakeholder dynamics and legitimacy concerns. Governments adopt international sustainability frameworks through institutional convergence because of global standards and national laws that generate coercive and mimetic pressures. The process of stakeholder engagement plays a crucial role in shaping policy relevance and legitimacy because it helps governments adapt global standards to local contexts. The long-term success of SDG initiatives depends on transparency and accountability together with public trust which can be improved through strategic communication and institutional support.

4.1 Articles Analyzed to Address the Research Questions

The section presents a concise overview of Scopus-indexed publications from 2015 to 2025 that investigate institutional pressures and stakeholder dynamics and legitimacy concerns during government Sustainable Development Goals (SDGs) implementation in emerging economies. The evaluation process chose articles that directly addressed the research questions. The selected articles employ institutionalism and stakeholder theory and legitimacy theory to deliver both theoretical and empirical insights. The review integrates the scope and methodologies with vital findings of included studies to demonstrate the existing research landscape while exposing gaps and establishing a strong base to answer the research questions. The following table summarizes the articles that underwent analysis.

Table 1. List of Articles

No.	Authors	Title	Source Title/Journal/Proceeding
1	(Erin *et al.*, 2025)	Sustainable development goal research in accounting: a systematic literature review and direction for future research	Journal of Financial Reporting and Accounting

The researcher employed VOSviewer to analyse the connections between theoretical frameworks and government SDG achievement. The following image illustrates the results of the data analysis conducted in this study using VOSviewer:

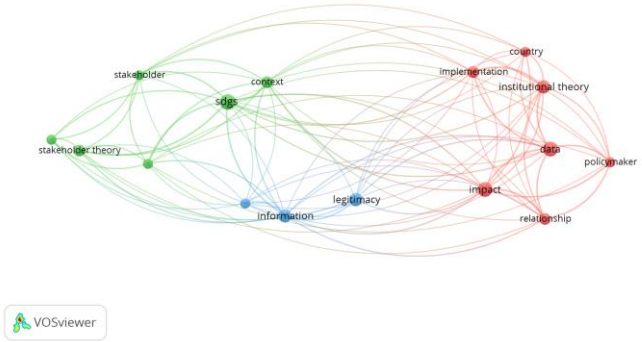

Figure 2. Network Visualization

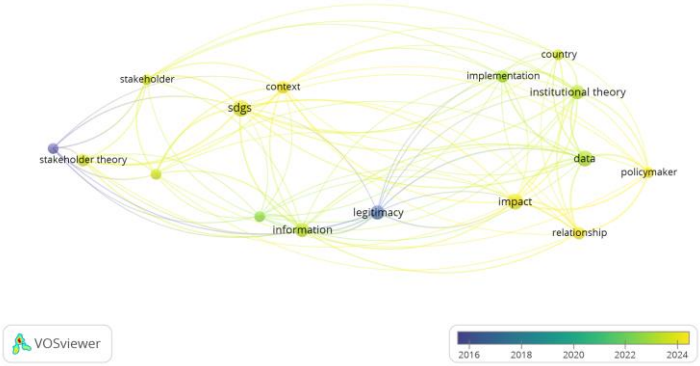

Figure 3. Overlay Visualization

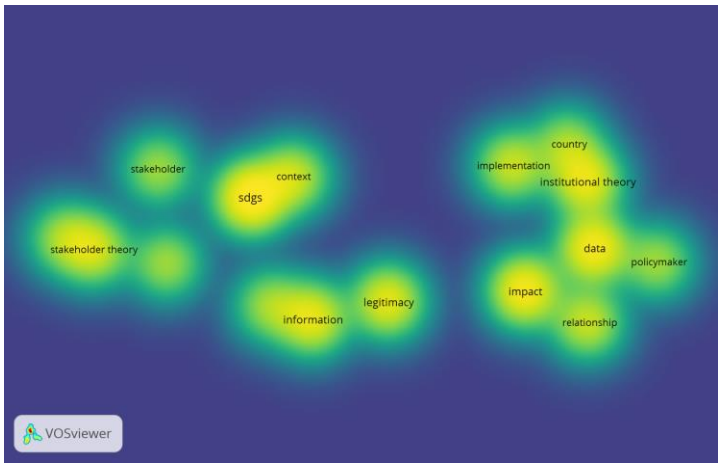

Figure 4. Density Visualization

The VOSviewer software produces network maps which show three connected clusters that manage the Sustainable Development Goals governance framework. The institutional framework produces various internal pressures that affect governments. The three types of institutional pressures which affect governments include coercive and mimetic and normative forces. Governments face institutional forces which push them to adopt global frameworks that they modify to suit their local needs. The policy alignment in Korea together with Portugal's

transparency practices demonstrate this phenomenon. Municipalities which involve stakeholders in their processes demonstrate stakeholder engagement. The two cases in point illustrating this phenomenon are Italy's climate reporting and Portugal's ODSLocal. The combination of global norms with local requirements in these processes demonstrates how they achieve better legitimacy and effectiveness. South Korea and Portugal implement digital tools for strategic communication to enhance transparency which builds public trust and establishes legitimacy. The research shows that Sustainable Development Goals (SDGs) achievement needs strategies which combine universal standards with local creative approaches and stakeholder partnerships and context-specific priority definition. The growing academic interest in these dynamics indicates governments need to build complete governance frameworks which address institutional barriers alongside participation issues and legitimacy concerns to achieve fair and practical sustainability results.

4.2 Synthesis of Research Articles

The articles that answer the research question are presented in a diagrammatic form for synthesis. The SDG Strat. The "SDG Strat. The "Influences" diagram shows how institutional drivers and contextual factors combine to produce government SDG strategy legitimacy which determines their effectiveness. The diagram integrates institutionalism with stakeholder engagement and strategic communication through local capacity and cultural context as moderating factors. The analysis draws its influences from a range of empirical studies, including those conducted in Italy, Spain, Korea and Portugal, as well as from global research findings.The left-hand side of the diagram delineates three forms of institutionalism: coercive, mimetic and normative pressures. These are posited as foundational drivers. Research has shown that coercive pressures arise from a combination of external requirements and regulatory mandates, including national Sustainable Development Goal frameworks and international agreements (Dimaggio & Powell, 1983; Erin *et al.*, 2025). These pressures have been known to force governments to adapt their practices to meet global standards. The process of mimetic pressures has been demonstrated to result in governments emulating the successful approaches of top-performing organisations, particularly during periods of uncertainty or heightened competition. Documentation of this phenomenon has been recorded in northern Italian and Spanish municipalities (Benito *et al.*, 2023; Raimo *et al.*, 2024). The pressures that stem from professional standards, in conjunction with societal expectations, form the basis of normative influences. Such influences encompass transparency norms that have been observed in Portugal and Korea. The present study seeks to contribute to the extant literature on the subject by exploring the relationship between such norms and the adoption of established models of good governance by governments.

The diagram uses continuous stakeholder engagement approaches to show how authentic participation differs from symbolic participation. Authentic multi-actor participation produces better policy legitimacy and relevance and Korean and Portuguese compliance remains minimal when symbolic participation occurs (Monteiro *et al.*, 2024; Park & Park, 2024). Strategic communication serves as a key element because governments employ reporting channels alongside digital platforms and public campaigns to create legitimacy and control stakeholder expectations during Sustainable Development Goals accomplishment displays. Such communication becomes effective based on its transparency level and credibility together with its presentation of both successes and challenges (Brás *et al.*, 2025; Nicolò *et al.*, 2024). This study demonstrates that cultural elements together with institutional capabilities function as adjustment variables which modify the way organisational forces and stakeholder

involvement produce legitimacy. SDG strategies implemented by local governments face resource constraints together with complicated governance systems and varied population demographics which affect their adaptability (Erin *et al.*, 2024; Raimo *et al.*, 2024).

The diagram shows these components working together to create "legitimacy." The concept of legitimacy goes beyond the basic requirement of outside regulatory compliance. This method requires two fundamental components that include substantial engagement and dependable communication. The diagram shows that the legitimacy of an initiative determines the achievement of Sustainable Development Goals (SDGs). The results of modern politics depend heavily on stability levels as well as fragmentation patterns and local governance systems (Benito *et al.*, 2023; Park & Park, 2024).

The diagram shows that institutional pressures work together with stakeholder engagement and strategic communication to determine the success of the SDG strategy. A particular strategy's success depends on building local capacity and understanding the context which validates the strategy. The present framework is supported by extant research evidence. SDGs require actual stakeholder involvement together with open information sharing and adaptive universal norm enforcement to achieve implementation success (Brás *et al.*, 2025; Dimaggio & Powell, 1983; Monteiro, Ribeiro, Gomes, *et al.*, 2024b; Park & Park, 2024; Raimo *et al.*, 2024).

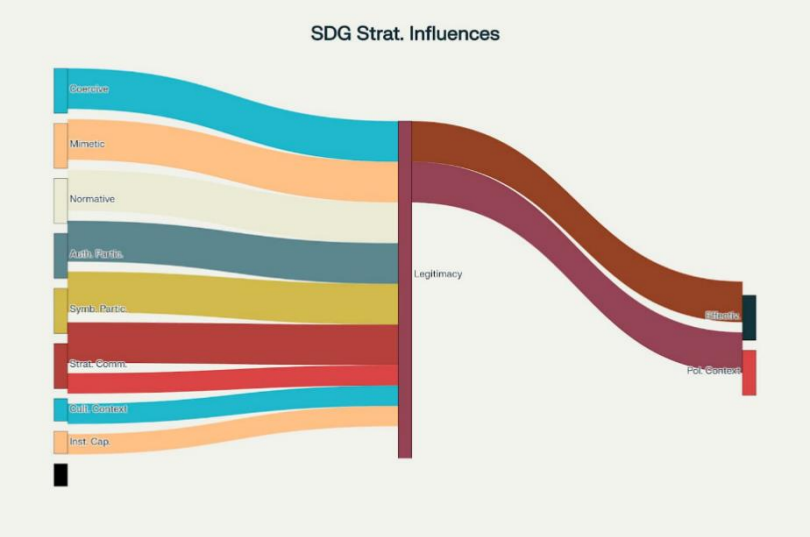

Figure 5. Conceptual Model of Institutional and Stakeholder Influences on SDG Legitimacy and Effectiveness

The illustration demonstrates that SDGs achievement requires both external institutional pressures and effective government stakeholder engagement and communication. The diagram demonstrates how these factors interact dynamically to require integrated sustainability governance approaches (Brás *et al.*, 2025; Nicolò *et al.*, 2024).

5. Conclusion

The systematic literature review methodically addresses research questions by conducting a comprehensive analysis of 16 Scopus-indexed articles from 2015 to 2025. The research findings demonstrate that governments of emerging economies are able to successfully implement the Sustainable Development Goals (SDGs) through the utilisation of institutionalism and stakeholder engagement, which in turn results in stakeholder legitimacy. The review provides a thorough exposition of the mechanisms through which policy

convergence is achieved, utilising coercive, mimetic and normative pressures, as well as authentic stakeholder participation and strategic communication. These mechanisms serve to enhance the legitimacy and efficacy of the process. The extant literature on this topic is fragmented due to a paucity of comprehensive empirical research which examines these three theoretical perspectives across various political and cultural contexts. The research provides satisfactory answers to the research questions, but it is important to note that it is subject to certain limitations. The research faces challenges because of empirical and contextual gaps which prevent a complete or exhaustive resolution. The study is subject to certain limitations, as it is dependent on a specific time period of Scopus-indexed English articles. The majority of research studies are conducted within the confines of national boundaries, a factor which serves to limit the ability to generalise the findings. It is imperative that future research incorporates multi-level, cross-country methodologies, in conjunction with adaptive, participatory and context-sensitive frameworks. A comprehensive study of institutional pressures and stakeholder engagement and legitimacy in sustainable development governance requires this approach. The implementation of Sustainable Development Goals (SDGs) strategies must be both compliant and effective, while also being inclusive and legitimate in various local contexts.

THE EFFECT OF INFLATION, INTEREST RATES AND EXCHANGE RATES ON THE FINANCIAL SECTOR STOCK PRICE INDEX FOR THE PERIOD 2019-2023

Khafifah Pajrianti[1], Herdiyana[2], Abel Gandhy[3], Vira Anggraini[4]

[1]Pakuan University, Indonesia

Abstract

This study aims to analyze the effect of macroeconomic variables such as inflation, interest rates and exchange rates on the financial sector stock price index for the 2019-2023 period. The type of research used is verification research with explanatory survey research methods. In this study, the research objects used are Inflation (INF1), Interest Rates (SBI2), Exchange Rates (NT3), and the Stock Price Index. The unit of analysis of this research is data from the Financial Sector Stock Price Index (IHSK) or the Financial Index (JKFINA). The type of research data used is quantitative data and the data source in this study is secondary data in the form of time series data. While the data analysis method used is multiple linear regression analysis. With the help of SPSS 26 software. The results of this study partially show that inflation has a positive effect on the financial sector stock price index for the 2019-2023 period. Interest rates have a negative effect on the financial sector stock price index for the 2019-2023 period. The exchange rate has no effect on the financial sector stock price index for the 2019-2023 period. Simultaneously shows that inflation, interest rates and exchange rates affect the financial sector stock price index for the 2019-2023 period.

Keywords: Inflation, Interest Rate, Exchange Rate, Financial Sector Stock Price Index

DETERMINANTS OF CLOUD-BASED ACCOUNTING ADOPTION IN MSMES: A BIBLIOMETRIC ANALYSIS AND SYSTEMATIC LITERATURE REVIEW

Abdul Razik Luneto[1], Annastry Widyakusuma[2], I Putu Edi Darmawan[3], Phatra Anggana Djuri[4], Muhammad Bashri Bas[5], Rika Febby Rhamadhani[6], Husnul Hatimah[7], and Andi Muhammad Rizqan[8]
[1] Faculty of Economics and Business, Universitas Tadulako

Abstract

The purpose of this study is to conduct a thorough analysis of the literature concerning the determinants of cloud-based accounting adoption of the MSMEs. It aims to provide an organizing framework to identify research gaps and propose future research directions. By analyzing data from the Scopus database, the research reveals significant patterns in publication trends, authorship, and thematic evolutions. These findings serve as a guide for designing and positioning new research projects in this domain. This study used a systematic literature review methodology, with data collected from the Scopus database. A bibliometric analysis was performed using VOSviewer software. In this stufy, scholarly articles were scrutinized to construct a conceptual framework and identify thematic trends related to the adoption of cloud-based accounting in MSMEs. This review provides a comprehensive overview of the determinants of cloud-based accounting adoption in MSMEs, simultaneously uncovering significant research trends, prominent authors, and the most influential countries and journals. By identifying research gaps and suggesting future research directions, its findings contribute to the design and positioning of subsequent studies in this field. The study's limitations may stem from its reliance on a limited set of databases and the inherent possibility of selection bias in the reviewed literature. To build upon this research, future studies could broaden its scope by including additional databases or by integrating qualitative methods to achieve a richer understanding of determinants of cloud-based accounting adoption within MSMEs. This study offers actionable insights for software developers, accountants, policymakers, government, practitioners, management, accountants, and academics by identifying the key determinants of cloud-based accounting adoption among MSMEs. These insights can inform strategic decision-making, the creation of effective adoption policies, and the establishment of frameworks designed to foster the uptake of cloud-based accounting within the MSME sector. Understanding the determinants that drive the long-term success of cloud-based accounting adoption in MSMEs has significant social implications, particularly for non-adopting firms. By focusing on these key determinants, targeted interventions can empower MSMEs to improve their financial management efficiency and effectiveness, which in turn contributes to wider socio-economic development. This study contributes to the existing literature by providing a comprehensive analysis of cloud-based accounting adoption factors in MSMEs and employing bibliometric analysis to reveal research trends. The paper's primary contribution is the development of a structured map of the field, which delineates thematic clusters, highlights the most influential works, and pinpoints specific gaps for subsequent academic exploration.

BUILDING BRAND EQUITY IN INDONESIAN PRIVATE UNIVERSITIES: THE ROLE OF STRATEGIC ATTRIBUTES AND THE MEDIATING POWER OF BRAND TRUST

Abstract

In a competitive Indonesian higher-education market, private universities must leverage brand equity to distinguish themselves. Grounded in Aaker's and Keller's frameworks, this study investigates four strategic attributes marketing activities (H1, H5), service attributes (H2, H6), symbolic attributes (H3, H7), and provider attributes (H4, H8), and tests their direct effects on brand equity, while positioning brand trust (H9) as a mediator (H10a–H10d). We surveyed 487 undergraduates (97.4% response rate) across five accredited PTS in Bandar Lampung (May–June 2025) and applied LISREL-based SEM. Empirical results show that marketing activities (β = .380, p < .001), symbolic attributes (β = .269, p < .001), and provider attributes (β = .422, p < .001) significantly enhance brand equity, whereas service attributes do not (β = .095, p = .104). All four antecedents also predict brand trust (β's .318–.576, p's < .001), and bootstrapped mediation tests confirm substantial indirect effects of each attribute on equity via trust (H10a: .272; H10b: .191; H10c: .347; H10d: .298; all p < .001). By validating key direct paths and mapping a conceptual mediation model, this study extends higher-education branding theory and offers SDG-aligned guidance for building institutional credibility and stakeholder loyalty.

Abstract

This study aims to analyze the impact of merger and acquisitions on the financial performance of companies using publicly listed companies on the Bursa Efek Indonesia as the research objects. The population consists of 106 companies, from which a purposive sampling method was applied, resulting in a sample of 6 public companies. The analysis focuses on the comparison of financial ratios use Current Ratio (CR), Debt to Equity Ratio (DER), Nett to Profit Margin (NPM), and Total Asset Turnover (TATO). This research employs a descriptive quantitative approach using secondary data sources. The 6 selected companies experienced mergers and acquisitions in 2019. The analytical method used include descriptive statistics, a normality test using the shapiro wilk method due to the sample size being fewer than 50 observations, and the Wilcoxon Signed-Rank Test, processed using SPSS version 30. The results indicate that among the four financial ratios, only the DER showed a significant change, while the CR, NPM, and TATO did not exhibit significant differences. This suggests an increase in debt as a result of the merger and acquisition process. The suggests an increase in the proportion of debt to equity capital as a result of the merger and acquisitions process.

Keywords: *Merger and Acquisitions, Financial Performance, Financial Ratio, Wilcoxon Signed Rank-Test.*

1. Introduction

Indonesia has shown relatively stable economic growth over the past decade, however it remains vulnerable to external shocks that can trigger financial crises (Hadjaat et al., 2021). One of the largest crises that hit the world, including Indonesia, is the COVID-19 pandemic, which emerged at the end of 2019 and had widespread impacts on almost all industrial sectors. According to data from the Central Statistics Agency (2020), the accommodation and food and beverage industries experienced a revenue decline of more than 90%, followed by the transportation, warehousing, and property sectors (Nurhaliza, 2021).

This situation has prompted companies to make immediate adjustments, one of which is through corporate actions such as mergers and acquisitions to strengthen capital structure and operational efficiency (Paramarta, 2024). Mergers and acquisitions have become adaptive strategies in facing market uncertainties and addressing cash flow pressures due to the crisis (Damodaran, 2005). Large companies tend to acquire firms in crisis to expand their business ecosystem and create long-term synergies. Although this strategy is widely adopted, research findings regarding the impact of mergers and acquisitions on corporate financial performance still show varied conclusions. Normalita (2018) found that mergers and acquisitions have a significant impact on the financial ratios of Debt to Equity Ratio (DER) and Return on Assets (ROA), while Dewi (2020) and Suryantini (2024) concluded that there were no significant changes in the majority of financial indicators. These differing results indicate a gap in the

literature, particularly in examining the long-term effects of mergers and acquisitions post-pandemic on public companies in Indonesia.

Therefore, this study aims to analyze the differences in financial performance of companies before and after conducting mergers and acquisitions during the period of 2020-2024, focusing on four financial ratios: liquidity ratio measured by the Current Ratio (CR), solvency ratio measured by the Debt to Equity Ratio (DER), profitability ratio measured by the Net Profit Margin (NPM), and activity ratio measured by the Total Asset Turnover (TATO). This research is expected to contribute to the academic literature and business practitioners by providing empirical insights into the effectiveness of merger and acquisition strategies in enhancing corporate financial performance after the global crisis caused by the COVID-19 pandemic.

2. Literature review

3.7. There is a Difference in Financial Performance of the Liquidity Ratio (Current Ratio) After Merger and Acquisitions.

This ratio is used to determine the extent to which a company's current assets are utilized to settle current liabilities that are due. It is expected that acquisitions and mergers can increase the value of the Current Ratio (CR), as a higher CR is considered better, indicating that the company is more liquid. This is supported by the research findings of Putri Novaliza and Atik Djajanti (2013). According to Sartono (2012), the higher the current ratio, the greater the company's ability to meet its obligations. Sutrisno (2012) states that liquidity ratios reflect a company's ability to pay obligations that must be fulfilled immediately. The obligations that need to be met are short-term debts. The ratio used as a measurement tool is the Current Ratio. In terms of short-term finance, this ratio is a comparison between current assets and current liabilities.

Dewi (2012) stated that the current ratio experiences an average increase in the five years following merger and acquisition activities, which contradicts the findings of Putri (2013), where the current ratio showed no significant difference after mergers and acquisitions. The research conducted by Dewi (2012) indicates that liquidity, measured by the current ratio, experiences an average increase in the five years following merger and acquisition activities. Therefore, the hypothesis in this study is as follows:

H1: There is a difference in the value of the liquidity ratio after mergers and acquisitions.

3.8. There is a Difference in Financial Performance of the Leverage Ratio (Debt to Equity Ratio) After Merger and Acquisitions.

The Debt to Equity Ratio (DER) reflects the financing decisions made by management, especially when a company utilizes debt to fund the acquisition process. This is supported by Mulherin et al. (2004), who state that acquisitions generally lead to an increase in DER as a result of external financing. Additionally, Jaffe et al. (2013) add that DER is also an important indicator for investors and creditors to assess the financial risk of a company following a merger. Therefore, significant changes in DER can signal adjustments in capital structure or potential financial risks arising from the acquisition. Thus, the hypothesis in this study is as follows:

H2: There is a difference in leverage levels after mergers and acquisitions.

3.9. There is a Difference in Financial Performance of the Profitability Ratio (Nett to Profit Margin) After Merger and Acquisitions

The Net Profit Margin (NPM) reflects the efficiency of cost management by management post-acquisition, making it a benchmark for the effectiveness of a company's performance after the acquisition. This is also stated by Sari, who indicates that NPM serves as concrete evidence of whether growth strategies through acquisitions have a positive impact on financial performance or instead burden operations. Thus, the hypothesis in this study is as follows:

H3: There is a difference in profitability values after mergers and acquisitions.

3.10. There is a Difference in Financial Performance of the Activity Ratio (Total Asset Turnover) After Merger and Acquisitions

Total Asset Turnover (TATO) is a ratio that indicates a company's efficiency in using its assets to generate a certain volume of sales (Sari et al., 2014). This ratio reflects the level of efficiency in the overall use of the company's assets to generate sales volume, and it is expected that acquisitions and mergers can improve this ratio. If asset turnover slows down, it indicates that the assets held by the company are greater than the company's ability to make sales. A higher total asset turnover figure indicates that the company is more effective in managing its assets (Hanafi, 2013:40). This is supported by the research findings of Agustin (2016).

H4: There is a difference in activity levels after mergers and acquisitions.

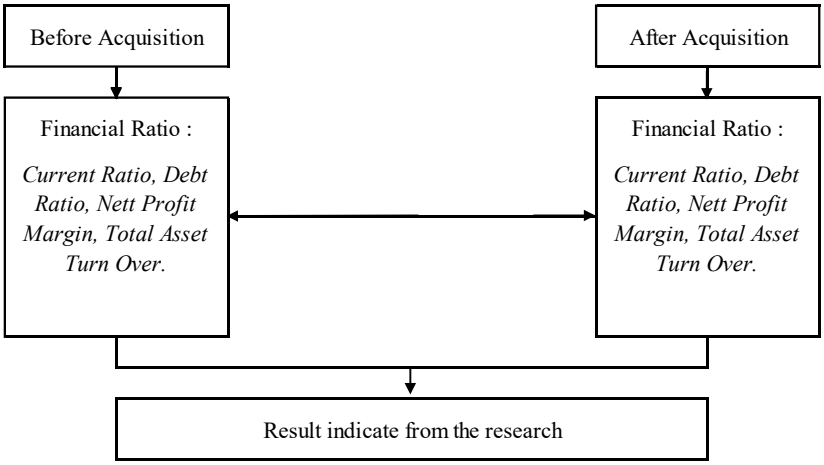

Figure 1. Conceptual Framework

3. Methodology

The type of research used in this study is descriptive research with a quantitative approach. The quantitative research method involves using data obtained from a population. The use of descriptive research in this study aims to describe the research object or the research results. This study will examine the financial performance of companies before and after merger and acquisition activities in publicly listed companies on the Indonesia Stock Exchange (IDX).

This research will review the financial performance before and after acquisitions in publicly listed companies on the Indonesia Stock Exchange (IDX) for the period of 2020 – 2024. The research object used in this study is merger and acquisition activities and their impact on a company's financial performance, which is reflected in its financial statements measured using financial ratios, including Current Ratio (CR), Debt to Equity Ratio (DER), Net Profit Margin (NPM), and Total Asset Turnover (TATO).

The unit of analysis is adjusted to the issues being studied regarding the financial performance of companies, specifically the annual financial statement data of companies listed on the Indonesia Stock Exchange. The unit of analysis consists of financial data from publicly listed companies that have undergone mergers and acquisitions during the year 2019.

The type and source of data used in this study are quantitative data, which is a type of information represented by numerical symbols. Based on these numerical symbols, which constitute secondary data, quantitative calculations can be performed. Secondary data generally consists of evidence, records, or historical reports that have been compiled in archives. This data is obtained from the Indonesia Stock Exchange through its website www.idx.co.id. Other sources include literature such as books, journals, and data from other internet sites that support the research, including sahamok.com, www.kppu.go.id, and the websites of the companies sampled in this study.

Regarding data total assets, total equity, net income, total debt, sales, current assets, and current liabilities are obtained from the audited annual financial statements of each company for the five years before and five years after the merger and acquisition activities on the Indonesia Stock Exchange (IDX). This study analyzes descriptively the measurement of the financial performance of companies before and after mergers and acquisitions. Therefore, it is necessary to test the hypotheses that have been presented. Hypothesis testing is conducted according to the research methods and analyses designed in accordance with the variables being studied to obtain accurate results. Essentially, the variables in this study are the financial performance of the company represented by four financial ratios, including the Liquidity Ratio measured by the Current Ratio, the Solvency Ratio measured by the Debt to Equity Ratio, the Profitability Ratio measured by the Net Profit Margin, and the Activity Ratio measured by the Total Asset Turnover.

Table 1. Variable Operationalization

Variable	Indicator	Instrument	Schale
X Variable : Acquisition & Merger	Financial Statement of Companies that have Merger and Acquisition	The number one (1) for companies that have undergone mergers and acquisitions, and the number zero (0) for companies that have not.	Ordinal
Y Variable : Financial Performance			
Liquidity Ratio	*Current Ratio*	$\frac{Current\ Asset}{Current\ Liabilities}$	Ratio
Leverage Ratio	*Debt to Equity Ratio*	$\frac{Liabilities}{Equity}$	Ratio
Profitability Ratio	*Nett Profit Margin*	$\frac{Nett\ Income}{Nett\ Sales}$	Ratio
Activity Ratio	*Total Asset Turnover*	$\frac{Sales}{Total\ Assets}$	Ratio

4. Results and Discussions

4.1 Collection Data Result

The data used in this study is secondary data in the form of financial statements from publicly listed companies that underwent mergers and acquisitions during the 2019 period, registered on the Indonesia Stock Exchange (IDX). The financial statements used cover the period from 2014 to 2024, including the Income Statement, Statement of Financial Position, and Notes to the Financial Statements (CALK), which were obtained from www.idx.co.id and the respective company homepages.

Table 2. Current Ratio In 2014 – 2024

No	Companies	Before Acquisition					In Period	After Acquisition				
		2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
1	BBCA	1,05	1,11	1,14	1,16	1,52	1,17	1,20	1,15	1,13	1,15	1,19
2	DSNG	1,14	0,39	0,13	1,65	1,03	0,82	1,14	0,20	1,07	1,00	1,15
3	BBNI	0,22	0,26	0,17	0,14	0,18	0,19	0,14	0,20	0,21	0,20	0,20
4	ASSA	0,40	0,43	0,49	4,12	3,53	0,53	0,44	0,90	0,86	0,88	0,84
5	TBIG	0,36	1,36	0,68	0,99	0,32	0,53	0,23	0,36	0,41	0,34	0,21
6	MIDI	0,82	0,79	0,77	0,72	0,73	0,78	0,65	0,07	0,76	0,95	0,94

Based on the results of the liquidity ratio calculation using the current ratio (CR), it can be seen that in the five years prior to the mergers and acquisitions, the company with the lowest CR was ASSA at 0,13%, while the highest CR was recorded by DSNG at 4,12%. In the five years following the mergers and acquisitions, the lowest CR was recorded by MIDI at 0,07%, and the highest CR was recorded by BBCA at 1,20%.

Table 3. Debt to Equity Ratio In 2014 – 2024

No	Companies	Before Acquisition					In Period	After Acquisition				
		2014	2015	2016	2017	2018	2014	2015	2016	2022	2023	2024
1	BBCA	6,09	5,63	5,00	4,71	4,44	4,28	4,82	5,06	4,94	4,81	4,51
2	DSNG	2,13	2,13	0,67	0,67	2,21	2,11	1,27	0,95	0,88	0,82	0,76
3	BBNI	5,84	5,51	5,78	5,78	6,35	5,50	6,57	6,60	5,74	6,66	5,77
4	ASSA	2,54	2,38	1,85	1,85	2,57	2,62	2,59	2,42	1,94	1,82	1,78
5	TBIG	9,41	13,86	14,14	14,14	7,54	5,08	3,12	3,46	3,12	2,95	3,48
6	MIDI	3,17	3,39	3,76	3,76	3,59	3,09	3,23	2,79	2,48	0,99	1,04

Based on the results of the solvency ratio calculation using the debt to equity ratio (DER), it can be observed that in the five years prior to the mergers and acquisitions, the lowest value was recorded by DSNG at 0,67%, while the highest value was recorded by TBIG at 14,14%. In the five years following the mergers and acquisitions, the lowest value was again held by DSNG at 0,76%, while the highest value was recorded by BBNI at 6,66%.

Table 4. Nett to Profit Margin Ratio In 2014 – 2024

No	Companies	Before Acquisition					In Period	After Acquisition				
		2014	2015	2016	2017	2018	2014	2015	2016	2022	2023	2024
1	BBCA	0,80	0,80	0,80	0,80	0,79	0,79	0,81	0,81	0,81	0,81	0,80
2	DSNG	0,38	0,26	0,27	0,34	0,29	0,12	0,27	0,37	0,39	0,33	0,38
3	BBNI	0,80	0,79	0,80	0,80	0,76	0,80	0,25	0,34	0,36	0,34	0,81
4	ASSA	0,13	0,08	0,14	0,21	0,23	0,12	0,09	0,16	0,29	0,02	0,22
5	TBIG	0,27	0,49	0,39	0,70	0,20	0,23	0,06	0,08	0,10	0,11	0,29
6	MIDI	0,10	0,08	0,09	0,04	0,06	0,07	0,06	0,08	0,10	0,11	0,14

Based on the results of the profitability ratio calculation using the nett profit margin (NPM), it can be seen that in the five years prior to the mergers and acquisitions, the lowest

value was recorded by MIDI at 0,04%, while the highest NPM was held by BBCA at 0,80%. In the five years following the mergers and acquisitions, the lowest value was recorded by ASSA at 0,02%, while the highest value was again recorded by BBCA at 0,81%

Table 5. Total Asset Turnover In 2014 – 2024

No	Companies	Before Acquisition					In Period	After Acquisition				
		2014	2015	2016	2017	2018	2014	2015	2016	2022	2023	2024
1	BBCA	0,07	0,08	0,08	0,08	0,08	0,08	0,07	0,06	0,07	0,07	0,07
2	DSNG	0,68	0,56	0,48	0,61	0,41	0,49	0,47	0,52	0,63	0,59	0,81
3	BBNI	0,08	0,07	0,07	0,06	0,06	0,07	0,06	0,05	0,05	0,06	0,06
4	ASSA	0,45	0,48	0,52	0,51	0,46	0,48	0,08	0,84	0,81	0,61	0,64
5	TBIG	0,15	0,15	0,16	0,16	0,15	0,15	0,15	0,15	0,15	0,14	0,15
6	MIDI	2,34	2,22	1,99	2,00	2,16	2,33	2,14	2,15	2,26	2,23	2,28

Based on the results of the activity ratio calculation using the total asset turnover (TATO), it can be observed that in the five years prior to the mergers and acquisitions, the lowest TATO was recorded by BBNI at 0,06%, while the highest TATO was recorded by MIDI at 2,34%. In the five years following the mergers and acquisitions, the lowest TATO was again held by BBNI at 0,05%, while the highest TATO was recorded by MIDI at 2,28%.

4.2 Descriptive Statistical Analysis Before and After Mergers and Acquisitions

It can be noted that the number of samples used in this study is six, with a research period covering five years of activity before the mergers and acquisitions, resulting in N = 30.

Table 6. Descriptive Statistical Test Before Merger and Acqusitions

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
CR	30	0,13	4,12	0,9267	0,89948
DER	30	0,67	14,14	5,0837	3,61686
NPM	30	0,04	0,80	0,4230	0,29869
TATO	30	0,06	2,34	0,5790	0,73968
Valid N (listwise)	30				

The maximum and minimum values of the current ratio (CR) before the mergers and acquisitions are 4,12 and 0,13, respectively. The average current ratio (CR) before the mergers and acquisitions is 0,9267, with a standard deviation of 0,899, indicating that the average ability of the companies to use current assets to meet current liabilities is 0,93%.

The maximum and minimum values of the debt to equity ratio (DER) before the mergers and acquisitions are 14,14 and 0,67, respectively. The average debt to equity ratio (DER) before the mergers and acquisitions is 5,0837, with a standard deviation of 3,617. The lower standard deviation compared to the average indicates less variation or a smaller gap between the minimum and maximum values. The average DER of 5,0837 shows that the average level of debt relative to the assets owned by the companies is 5,08%.

The maximum and minimum values of the net profit margin (NPM) before the mergers and acquisitions are 0,80 and 0,04, respectively. The average net profit margin (NPM) before the mergers and acquisitions is 0,4230, with a standard deviation of 0,29869. The low standard

deviation compared to the average indicates less variation or a smaller gap between the minimum and maximum values. The average NPM of 0,4230 indicates that the companies ability to generate profit is 0,42%.

The maximum and minimum values of the total asset turnover (TATO) before the mergers and acquisitions are 2,34 and 0,06, respectively. The average total asset turnover (TATO) before the mergers and acquisitions is 0,5790, with a standard deviation of 0,73968. The higher standard deviation compared to the average indicates more variation between the minimum and maximum values. The average TATO of 0,5790 shows that the ability of the funds invested in total assets to generate revenue is 0,58%.

Table 7. Descriptive Statistical Test After Merger and Acquitions

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
CR	30	0,14	1,20	0,6933	0,38761
DER	30	0,76	6,66	3,2457	1,89407
NPM	30	0,02	0,81	0,3263	0,26901
TATO	30	0,05	2,28	0,6140	0,77375
Valid N (listwise)	30				

The maximum and minimum values of the current ratio (CR) after the mergers and acquisitions are 1,20 and 0,14, respectively. The average current ratio (CR) after the merger and acquisition activities is 0,6933, with a standard deviation of 0,38761. The lower standard deviation compared to the average indicates less variation or a smaller gap between the maximum and minimum values. The average current ratio (CR) of 0,6933 shows that the average ability of the companies to use current assets to meet current liabilities is 0,69%.

The maximum and minimum values of the debt to equity ratio (DER) after the mergers and acquisitions are 6,66 and 0,76, respectively. The average debt to equity ratio (DER) after the mergers and acquisitions is 3,2475, with a standard deviation of 1,89407. The lower standard deviation compared to the average indicates less variation or a smaller gap between the maximum and minimum values. The average DER of 3,2457 shows that the average level of debt relative to the assets owned by the companies is 3,25%.

The maximum and minimum values of the net profit margin (NPM) after the mergers and acquisitions are 0,81 and 0,02, respectively. The average net profit margin (NPM) after the mergers and acquisitions is 0,3263, with a standard deviation of 0,26901. The lower standard deviation compared to the average indicates less variation or a smaller gap between the maximum and minimum values. The average NPM of 0,3263 indicates that the companies' ability to generate profit is 0,33%.

The maximum and minimum values of the total asset turnover (TATO) after the mergers and acquisitions are 2,28 and 0,05, respectively. The average total asset turnover (TATO) after the mergers and acquisitions is 0,6140, with a standard deviation of 0,77375. The higher standard deviation indicates more variation or a greater gap between the maximum and minimum values. The average TATO of 0,6140 shows that the ability of the funds invested in total assets to generate revenue is 0,61%.

4.3 Normality Test of Data

This study uses the Shapiro-Wilk Test as the method for testing normality. The decision criteria for the normality test are as follows: if the significance value (Sig.) > 0,05, then the data is normally distributed; and if the significance value (Sig.) < 0,05, then the data is not

normally distributed. The following are the results of the normality test for the variables used in the study.

Table 8. Shapiro Wilk Test Result

Tests of Normality			
Rasio	Shapiro-Wilk		
	Statistic	Df	Sig.
CR	0,726	30	<0,001
DER	0,822	30	<0,001
NPM	0,827	30	<0,001
TATO	0,678	30	<0,001

a. Lilliefors Significance Correction

Based on the results of the normality test data in Table 8, it can be seen that all significance values (Sig.) for each variable in the Shapiro-Wilk Test are less than 0,05. This indicates that the distribution of the four variables being analyzed is not normal. Consequently, in the hypothesis testing of this study, a non-parametric statistical method is used, specifically the Wilcoxon Signed-Rank Test, due to the failure to meet the normality assumption.

4.4 Hypothesis Testing and Interpretation of Research Results

Wilcoxon Signed-Rank Test for five years before and five years after the merger and acquisition process.

Table 9. Wilcoxon Signed Rank Test Result

Ranks				
		N	Mean Rank	Sum of Ranks
CR_After - CR_Before	Negative Ranks	17[a]	15,79	268,50
	Positive Ranks	12[b]	13,88	166,50
	Ties	1[c]		
	Total	30		
DER_After - DER_Before	Negative Ranks	20[d]	18,88	377,50
	Positive Ranks	10[e]	8,75	87,50
	Ties	0[f]		
	Total	30		
NPM_After - NPM_Before	Negative Ranks	14[g]	19,32	270,50
	Positive Ranks	15[h]	10,97	164,50
	Ties	1[i]		
	Total	30		
TATO_After - TATO_Before	Negative Ranks	15[j]	9,07	136,00
	Positive Ranks	9[k]	18,22	164,00
	Ties	6[l]		

	Total	30		
	CR_After - CR_Before	**DER_After - DER_Before**	**NPM_After - NPM_Before**	**TATO_After - TATO_Before**
Z	-1,103[b]	-2,983[b]	-1,149[b]	-0,401[c]
Asymp. Sig. (2-tailed)	0,270	0,003	0,251	0,688

Based on the results presented in Table 9, the following can be explained:

The analysis of the current ratio (CR) variable using the Wilcoxon Signed-Rank Test shows a significance value of 0,270 > 0,05, leading to the conclusion that **H_1 is rejected** based on the results of the Wilcoxon Signed-Rank Test because the significance value is greater than 0,05. Additionally, there is a difference in descriptive statistics between the periods before and after the mergers and acquisitions. This indicates that the companies ability to utilize their current assets to meet current liabilities has not been maximized after the merger and acquisition process. This may also occur because the amount of current assets increases each year, as does short-term debt. This indicates that the acquisition process is often financed by increasing short-term debt, which in turn raises short-term obligations, resulting in no significant change in liquidity ratios. These findings align with research conducted by Anggraini and Wibowo (2023), which found no significant change in the current ratio after merger and acquisition activities, as well as research by Normalita (2018), which indicated that mergers and acquisitions do not affect the current ratio (CR). In contrast, research by Aswinarti (2023) on the financial performance of companies before and after mergers and acquisitions in companies listed on the Indonesia Stock Exchange from 2014 to 2018 showed a significant change in the current ratio (CR) after the merger and acquisition process.

The analysis of the debt to equity ratio (DER) variable using the Wilcoxon Signed-Rank Test shows a significance value of 0,003 < 0,05, leading to the conclusion that **H_2 is accepted** based on the results of the Wilcoxon Signed-Rank Test because the significance value is lower than 0,05. This indicates that there is a significant change in the companies after engaging in merger and acquisition activities. The majority of companies experienced an increase in DER after the merger and acquisition activities, meaning that companies tend to increase their debt proportion relative to their equity. These findings are consistent with research conducted by Davin (2025), which stated that the debt to equity ratio variable experienced a significant increase post-merger and acquisition. This is also similar to the findings of Magdalena, et all (2024), which reported the same results, indicating a change in capital structure dominated by debt during the pandemic, with company operations relying on debt as a source of operational costs. Additionally, research by Sudiartha (2013) on financial performance in companies listed on the Indonesia Stock Exchange showed no significant change in the net profit margin (NPM) variable, but a significant increase in the DER variable, indicating an increase in debt proportion to finance company activities. This could negatively impact the company if the increase is not balanced with an increase in profitability (NPM). However, if the debt is used productively and efficiently, the company could benefit in the long term. This is connected to the COVID-19 pandemic, which led many companies to engage in mergers and acquisitions to restructure their finances due to cash flow pressures, ultimately resulting in an increase in DER (Lock Son, 2021). Companies opted to take on debt as an additional means of financial restructuring during the COVID-19 pandemic (Brooking, 2020). This phenomenon was not only observed in companies that recently underwent mergers and acquisitions during the pandemic but also in those that had previously engaged in such activities (Science Direct, 2023).

The analysis of the net profit margin (NPM) variable using the Wilcoxon Signed-Rank Test shows a significance value of 0,251 > 0,05, leading to the conclusion that **H_3 is rejected** based on the results of the Wilcoxon Signed-Rank Test because the significance value is greater than 0,05. This indicates that after the merger and acquisition, there is no significant change in the ability to generate profit or earnings with the capital available. Additionally, there is a difference in descriptive statistics between the periods before and after the mergers and acquisitions. The NPM did not change significantly because, in this study, the DER ratio increased, indicating an increase in debt to finance capital during the acquisition process. If most acquisitions are financed using debt, the company faces additional interest burdens, which directly impacts net income and profit margins. This may also be influenced by external conditions such as COVID-19, which occurred during the study period (2020-2024), leading to decreased revenues, increased operational costs, and market uncertainty, thereby constraining the company's ability to enhance its net income. These results align with research conducted by Sandika Putra and Sasi Agustin (2016), which stated that there were no significant changes in the net profit margin (NPM) after the merger and acquisition process, as well as research by Kurniati (2022), which also indicated no significant changes in the net profit margin (NPM). This suggests that, in general, merger and acquisition activities have not had a tangible impact on the company's profitability in the short term.

The analysis of the total asset turnover (TATO) variable using the Wilcoxon Signed-Rank Test shows a significance value of 0,688 > 0,05, leading to the conclusion that **H_4 is rejected** based on the results of the Wilcoxon Signed-Rank Test because the significance value is greater than 0,05. These results are consistent with research conducted by Suryantini (2024), where the researcher used a paired sample t-test on the total asset turnover (TATO) activity ratio variable, and the findings indicated no significant differences in financial performance before and after mergers and acquisitions in the banking sector in Indonesia. The TATO did not change significantly because asset growth was not matched by proportional sales growth, which can be linked to the profitability ratio (NPM) that did not experience significant changes after the acquisition process. External factors such as COVID-19 also affected the efficiency of asset utilization by reducing market demand and causing production capacity to be underutilized, resulting in stagnation in the company's activity ratios during the study period. This is also consistent with research conducted by Agustin (2016), which stated that there were no significant differences in the TATO variable after the acquisition of PT Indospring Tbk. Wibowo (2023) also reported similar findings, indicating no significant changes in the TATO variable post-acquisition in manufacturing companies listed on the Indonesia Stock Exchange. This suggests that merger and acquisition activities do not influence the company's ability to generate sales from its assets.

5. Conclusion

Based on the results of the Wilcoxon Signed-Rank Test on the financial performance of publicly listed companies before and after acquisitions, it can be concluded that there is no difference in financial performance before and after merger and acquisition activities in terms of liquidity ratios represented by the current ratio (CR). However, there is a significant difference in solvency ratios represented by the debt to equity ratio (DER), which experienced a significant change after the merger and acquisition activities. Meanwhile, the profitability ratio represented by the net profit margin (NPM) and the activity ratio represented by total asset turnover (TATO) did not show any changes, indicating that merger and acquisition activities have not yet had a tangible impact on the liquidity, profitability, and efficiency of asset utilization in the companies.

Overall, the results of this study indicate that post-acquisition, companies experience significant changes in the capital structure aspect (DER) but have not been able to demonstrate significant improvements in liquidity (CR), profitability (NPM), and asset utilization efficiency (TATO). The operational integration process, working capital management, asset utilization efficiency, and the influence of external factors such as the COVID-19 pandemic are factors that affect the financial performance of companies post-acquisition. This indicates an increase in the proportion of debt to finance company activities, which could negatively impact the company if the increase is not balanced with an increase in profitability (NPM). However, if the debt is used productively and efficiently, the company could benefit in the long term.

This study also suggests that companies should better prepare for post-merger and acquisition integration comprehensively, investors should conduct financial statement analyses before making decisions, and future researchers should expand the period and analysis indicators, including considering differences in industry types and merger and acquisition types for more in-debth results.

Abstract

This study aims to analyze the influence of Transfer Funds and Regional Original Revenue on Capital Expenditure in Cirebon City in 2019–2023. Capital expenditure is an important component in supporting sustainable regional infrastructure development. Transfer funds from the central government and Regional Original Revenue are the main sources of financing for capital expenditure, but the effectiveness of their contribution needs to be further studied. This study uses a quantitative approach with secondary data obtained from the Budget Realization Report (LRA) of the Cirebon City Government. The analysis method used is multiple linear regression to see the simultaneous and partial effect between independent variables (Transfer Funds and Regional Original Revenue) on dependent variables (Capital Expenditure). The results of the study show that simultaneously Transfer Funds and Regional Original Revenue have a significant influence. Partially, Transfer Funds have a positive and significant influence, showing that increased funds from the central government encourage an increase in regional capital expenditure. Meanwhile, PAD has no significant effect, indicating that its contribution is still limited. Therefore, it is important for Regional Governments to increase fiscal independence through the optimization of Regional Original Revenue so that regional development can be more sustainable.

Keywords : Transfer Funds, Regional Original Revenue, Capital Expenditure.

1. Introduction

Effective and efficient regional financial management is one of the ways local governments play a strategic role in national development. Since capital expenditure directly supports the sustainable provision of infrastructure and public services, its realization is a key metric for assessing the success of regional development. The dedication of local governments to encourage sustainable economic growth and improve people's welfare is demonstrated by capital expenditure.

Local governments are empowered to investigate revenue streams and control their own expenditures under the concept of regional autonomy. Regional Original Revenue and Transfer Funds from the central government, which include the General Allocation Fund, Special Allocation Fund , and Revenue Sharing Fund , are the two main sources of funding for regional spending. While transfer payments indicate the region's dependence on the federal government, the local revenue demonstrates the region's financial strength and autonomy. In reality, areas with low local revenue often rely on transfer money to cover capital expenditures and other development requirements.

Despite financial limitations, Cirebon City, one of the autonomous regions in West Java Province, has had difficulty improving public service and infrastructure standards. The COVID-19 pandemic crisis also impacted the fiscal dynamics of Cirebon City between 2019 and 2023, forcing local governments to reallocate funds and refocus on social safety nets and the health sector. This situation raises the question of how the current distribution of capital expenditure is affected by transfer funds and PAD.

This study is very important to assess how well Cirebon City's development funding works. In addition, it is anticipated that the findings of this study will help local governments create more autonomous fiscal policies that focus on sustainable development. The purpose of this study is to find out whether Fund Transfers and ROR have a significant impact on capital expenditure in Cirebon Regency between 2019 and 2023.

2. Sastra Riview

Capital expenditure is a component of the local government budget allocated for the development of fixed assets and long-term infrastructure. The increase in capital expenditure reflects the seriousness of local governments in building public services and supporting economic growth. In its implementation, capital expenditure is greatly influenced by regional financial capacity, especially from the source of Transfer Funds and Regional Original Revenue .

2.1 Public Accounting Theory

Public economic theory focuses on the role of government in allocating resources, distributing income, and stabilizing the economy. According to Musgrave (1959), the government has the main function in public finance, namely allocation, distribution, and stabilization functions. The allocation function is directly related to capital expenditure and is financed by regional original revenue and Fund Transfer in the context of providing public goods in the regions. In this context, capital expenditure is an important component because it reflects government investment in long-term development, such as infrastructure development, fixed asset procurement, and other public facilities.

The concept of public accounting, which emphasizes responsibility, openness, and efficiency in the use of public funds, is closely related to regional financial management. Public accounting is an information system used by the government sector to track, supervise, and report financial transactions related to the implementation of regional revenue and expenditure budgets, according to Mardiasmo (2018). Because it represents government investment in long-term development, including infrastructure development, fixed asset acquisition, and other public facilities, capital expenditure is an important component in this context.

2.2 Budget Theory and Budget Reallocation

The process of making and implementing government fiscal policies is based on budget theory. Budgets are the government's primary tool for setting development priorities, allocating revenues, and maintaining economic stability, according to Musgrave & Musgrave (1989). The percentage of capital expenditure in the regional budget shows the government's focus on physical development. Capital expenditure is usually funded by transfers from the central

government and Regional Original Revenue. While transfer funds help balance the region's ability to offer public services, the PAD represents the region's budget capacity.

However, budget reallocations have changed the budget structure in several circumstances, including the COVID-19 pandemic. According to Wildavsky (1986), reallocation is a step in the budget policy process that takes into account changes in urgent demands and external circumstances. To move funds from capital expenditure to operational costs, health, and social assistance, reallocations are done in different locations. This has an impact on how development projects are carried out hampered. The majority of local governments saw a decline in capital expenditure during the pandemic as a result of significant budget reallocation, according to Hasanah's (2022) research.

2.3 The Effect of Fund Transfer on Capital Expenditure

Fund transfers from the central government to the regions consist of the General Allocation Fund , the Special Allocation Fund , and the Profit Sharing Fund . The fund aims to support the implementation of government and regional development equally. In the context of capital expenditure, transfer funds are the main source of financing, especially for regions with low local revenue . However, a high reliance on transfer funds can hinder budget flexibility and development effectiveness, especially when there is a budget refocus such as during the COVID-19 pandemic.

Research by Made Ari Juniawan and Ni Putu Santi Suryantini (2019) It shows that transfer funds have a significant influence on changes in capital expenditure allocation, but tend to reduce regional fiscal independence. This finding is in line with the condition of Cirebon City, where most of the capital expenditure still comes from central transfers. Thursday, the hypothesis in this study is as follows:

H1: It is suspected that the Transfer of Funds has an effect on Capital Expenditure.

2.4 The Influence of Regional Revenue on Capital Expenditure

Regional revenue is a reflection of the ability of regions to explore sources of revenue from within their regions, such as regional taxes, levies, and results from regional asset management. The larger the region or, the greater the flexibility of local governments in determining development priorities, including in financing capital expenditure.

According to Ade Ony Sigaian (2020) The local revenue has a significant positive effect on capital expenditure because it shows the ability of the regions to finance development without being completely dependent on the central government. Areas with high locel revenue are usually more efficient and effective in managing their budgets on Thursdays, the hypothesis in this study is as follows:

H2: It is suspected that Regional Original Revenue has an effect on Capital Expenditure.

2.5 The Simultaneous Effect of Transfer Funds and Local Original Income on Capital

When Fund Transfer and local revenue are analyzed together, they are the main source in the regional revenue structure. The combination of the two will determine the amount of fiscal space available to be allocated for productive spending, such as capital spending. Regions with

strong local revenue can utilize Fund Transfers as a complement, not as the main source, so that capital expenditure becomes more optimal.

Marlina's research (2019) states that Fund Transfer and local revenue simultaneously have a significant influence on capital expenditure, and the efficiency of their management greatly determines the results of development. Thursday, the hypothesis in this study is as follows:

H3: It is alleged that the Transfer of Funds and Local Original Revenue simultaneously affect the Capital Expenditure.

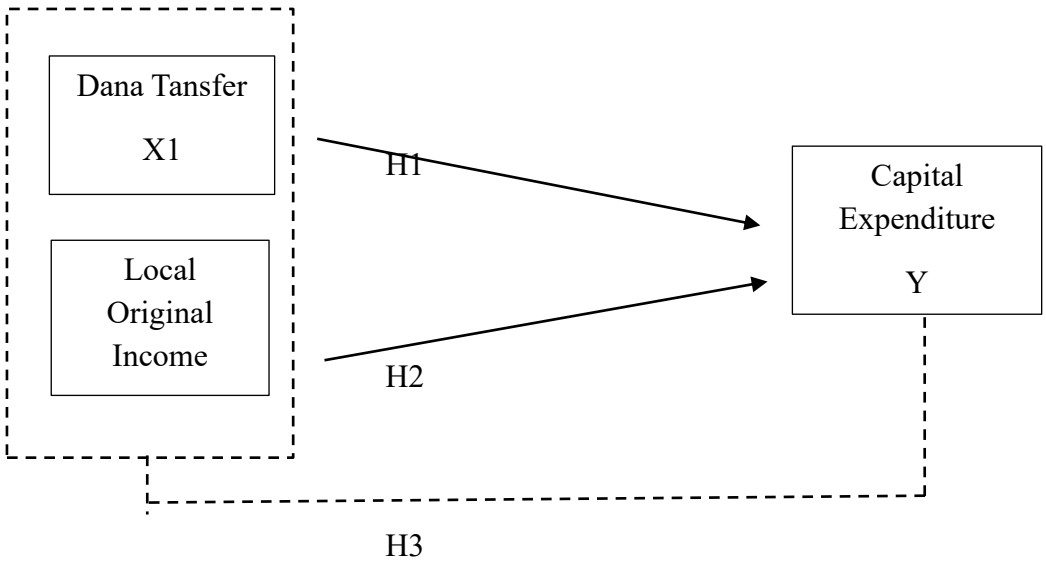

Figure 1. Conceptual Framework

3. Methodology

This study adopts a quantitative approach that aims to examine the relationship between independent variables—Fund Transfer and Local Revenue Income —and dependent variables, namely Capital Expenditure in Cirebon City during the period 2019 to 2023. This approach was chosen because it provides an empirical understanding of the relationship between variables based on actual financial data from local governments.

The data used in this study is secondary data, obtained through documentation from official institutions, especially the Cirebon City Government's Budget Realization Report, issued by the Regional Finance Agency , along with additional data from the Cirebon City Central Statistics Agency . The data analyzed includes the total amount of Transfer Funds, total regional original revenue, and total Capital Expenditure for the five-year period 2019 to 2023.

The number of residents in this study consists of all financial statements of the Cirebon City Government during the specified period. Due to the limited amount of data available and the fact that the data covered the entire population, the study used the intended sampling technique, where the selection of samples was based on special considerations.

This study uses one dependent variable, Capital Expenditure (Y), and two independent variables, namely Fund Transfer (X_1) and Local Revenue Income (X_2). The three variables are expressed in Indonesian Rupiah (IDR) and analyzed using natural logarithmic, transformations to reduce scale differences and improve the normality of data distribution.

Data processing and analysis is carried out using SPSS software version 26. The analysis procedure begins with a classical assumption test to ensure the reliability of the regression model, which includes the Normality test (to ensure that the data is distributed normally), the Multicollinearity test, (to detect high correlations between independent variables) the heteroscedasticity test (to identify unequal variances in the residue), and the Autocorrelation test, (to determine if there is a correlation between residues across the entire time period).

Once the regression model meets the assumptions, multiple linear regression analysis is performed to assess the effect of each independent variable on the dependent variables, either partially (using the t-test) or simultaneously (using the F-test). In addition, the determination coefficient (R^2) is used to determine how much variation of dependent variables can be explained by independent variables.

The entire analysis process is directed to test three main hypotheses, namely the Effect of Fund Transfer on Capital Expenditure, the Effect of regional original revenue on Capital Expenditure, and, The combined effect of Fund Transfer and regional original revenue on Capital Expenditure in Cirebon City.

The variables used in this study are explained as follows:

Variabel	**Sub-Variabel**	**Indicator**	**Measurement**	**Scale**
Transfer Dana	- Special Allocation Fund (DAK)- General Allocation Fund (DAU)- Profit Sharing Fund (DBH)	Regional Dependency Ratio	(Transfer of Funds / Regional Revenue) × 100%	Rasio
Locally Generated Revenue (PAD)	- Local taxes- Regional levies- Profits from separate regional assets- Other legitimate local revenues	Regional Financial Independence Ratio	(Local Revenue/Fund Transfer) × 100%	Rasio
Capital Expenditure	- Land capital expenditure- Expenditure	Capital Expenditure Activity Ratio	(Capital Expenditure / Total Regional	Rasio

	on equipment and machinery- Expenditure on buildings and structures- Expenditure on roads, irrigation and networks- Other capital expenditures		Expenditure) × 100%	

Table 1. Operational Variables

4. Results and Discussion

4.1 General Description of Cirebon City

Administratively, Cirebon City was officially designated as a Municipality based on Statute 1906 No. 125. The development of Cirebon City began in the 15th century when Prince Cakra Buana established the center of government in the area, then handed over power to his son-in-law, Syarif Hidayatullah, better known as Sunan Gunung Jati. Under his leadership, Cirebon developed into the first Islamic Sultanate in West Java, which played a major role in the spread of Islam and the culture of the north coast of Java.

After Indonesia's independence, Cirebon was maintained as an administrative city. Based on Law Number 16 of 1950, Cirebon was designated as a level II autonomous region with the name Cirebon City, which means it has the authority of self-government, equivalent to a district. Based on Law No. 22 of 1999 concerning Regional Government, Cirebon City has obtained broad autonomy. Since then, the Mayor and Deputy Mayor are directly elected by the people through general elections. City governments have begun to develop public services that are more transparent, accountable, and technology-based. Cirebon City is currently divided into 6 sub-districts and 22 sub-districts with the support of technical institutions such as agencies, agencies, and public service offices.

4.2 Development and Business Activities of the Cirebon City Government

Cirebon City is one of the cities in West Java Province, which is located in the administrative area of West Java Province. Geographically, Cirebon City has a strategic position as a link between West Java and Central Java Provinces, as well as being the center of economic, trade, and government activities in the Greater Cirebon area. In the context of regional financial management, Cirebon City receives transfer funds from the central

government and manages Regional Original Revenue as a source of funding to finance expenditures, including capital expenditures.

The economy of Cirebon City is supported by the trade, services, and small to medium industries sectors. From the fiscal side, the regional revenue structure of Cirebon City consists of Transfer Funds (balancing funds, regional incentive funds, and others), and Regional Original Revenues, such as regional taxes, regional levies, and the results of regional wealth management.

During the period 2019 to 2023, there were dynamics of transfer fund receipts and regional original revenue which had an impact on the level of capital expenditure in Cirebon City. Cirebon City experiences fluctuations in transfer fund receipts and regional original revenue, which affects the amount of regional expenditure allocation, especially capital expenditure. Budget realization data shows the relationship between revenue and establishing spending priorities. Therefore, it is important to look at how the relationship between transfer funds, PAD, and capital expenditure over a given period is concerned.

4.3 Description or Realization of the Variables Studied

In this study, there are three components or data, namely Fund Transfers, Regional Original Revenue, and Capital Expenditure. To describe and test the influence between independent and dependent variables, this section will present a description of the data that has been obtained. The data presented and obtained in the following table :

Year	Transfer Fumd	Local Revenue	Capital Expenditure
2019	IDR 817,473,644,852	IDR 370,836,491,722	IDR 98,850,576,254
2020	IDR 817,506,344,852	IDR437.212.356.611	IDR 294,349,725,481
2021	IDR 781,480,595,484	IDR 401.086.141.279	IDR 113,104,657,435
2022	IDR 785,571,543,248	IDR 540.343.015.082	IDR 150,426,743,343
2023	IDR 794,770,094,338	IDR 532,653,850,484	IDR 92,790,771,193

Table 2. Total Realization of Transfer Funds, Regional Original Revenue (LOI), and Capital Expenditure in Cirebon City 2019-2023

Table 2 shows that transfer funds originating from the central government to the regions through the Special Allocation Fund, General Allocation Fund , and Revenue Sharing Fund schemes have a large portion in the APBD, which is more than 55% during the 2019-2023 period. In 2020-2021, there was a decrease in the realization of transfer funds due to the refocusing of the Covid-19 budget.

Then in table 4.1 for Regional Original Revenue, it is relatively small compared to transfer funds. The contribution is around 26-36% of the total regional revenue. The pandemic also led to a decline in 2020-2021 from the hotel, restaurant, and entertainment tax sectors. After 2022, there will be a recovery of regional original revenue in line with the increase in digital economic activity of the tax system. Because it is limited, PAD is more widely used to cover mandatory and non-binding expenses.

Capital expenditure is an expenditure for the construction or procurement of fixed assets such as roads, bridges, buildings, and heavy equipment. The proportion of capital expenditure

in Cirebon City is still very low, which is around 16-10% of the total APBD. The pandemic has led to a reallocation of capital expenditures for health spending and social assistance. It can be seen in table 4.1 that there was an increase in 2022 and 2023 as a form of infrastructure recovery. However, there is no consistent pattern between the increase in transfer funds and regional revenues and capital expenditures.

4.4 Data Analysis

The descriptive statistical test aims to provide an overview of the characteristics of each research variable based on the mean value, maximum value, minimum value, and standard deviation. The variables analyzed in this study include Fund Transfer (X_1), Regional Original Revenue (X_2), and Capital Expenditure (Y). Based on quantitative descriptive statistical analysis, the following description was obtained:

Descriptive Statistics

	N	Minimum	Maximum	Mean	Hours of deviation
Transfer Fund	5	7.81481E+11	8.17506E+11	7.99361E+11	17235356068
ROR	5	3.70836E+11	5.40343E+11	4.56426E+11	76827912195
Capital expenditure	5	90964667870	2.06155E+11	1.49905E+11	42368329563
Valid N (listwise)	5				

Table 3. Descriptive Statistical Analysis of Transfer Funds, Local Original Income, and Capital Expenditure

Based on the results of the descriptive statistical test, it is known that:

Transfer funds have an average value of IDR 799 billion with a minimum value of IDR 781 billion and a maximum of IDR 935 billion. Standard deviation of Rp 17,23 billion, indicating that the value of transfer funds received by Cirebon City from 2019 to 2023 fluctuated quite largely.

PAD has an average value of IDR 540 billion, with a minimum value of IDR 370 billion and a maximum of IDR 540 billion. The standard deviation of IDR 76.83 billion indicates that the PAD of Cirebon City fluctuates quite large from year to year when compared to the average.

Capital Expenditure has an average value of IDR 150 billion, with a minimum value of IDR 79 billion and a maximum of IDR 24 billion. Standard deviation of IDR 57.81 billion. This value shows that there is a fairly high level of variation or fluctuation in the allocation of capital expenditure from year to year. A high standard deviation indicates that the amount of capital expenditure is inconsistent and undergoes significant changes between years.

In general, the results of these descriptive statistics show that although the Transfer Fund and PAD have increased slightly from year to year, the average capital expenditure remains relatively low, which reinforces the results of the previous activity ratio.

The Normality Test is performed to see whether the residual value is distributed normally or not.

The following are the results of the normality test analysis using SPSS.

Normality Test						
	Kolmogorov-Smirnova			Shapiro-Wilk		
	Statistics	Df	Itself.	Statistics	Df	Itself.
Non-Standard Residue	0,209	5	0.200*	0,929	5	0,590

Table 4. Normality Test Analysis

In table 4 the normality test is carried out using the Kolmogorov-Smirnov test, the test results showed that Sig. was 0.200 and Shapiro-Wilk was 0.590 This means that the significance value for all variables > 0.05, so that the data is declared normal.Hypothesis Testing and Interpretation of Research Results

The t-test is performed to see the influence of independent variables on partially dependent variables. This test is performed with the following criteria: H1 is accepted if Sig. < 0.05. H1 is rejected if Sig. > 0.05.

The multicollinearity test aims to see whether there is a high correlation between independent variables in a double linear regression model or not. By looking at the value of the Tolerance and Variance Inflation Factor (VIF).

Koefisiensa			
	By	Statistics Colinearitas	
		Tolerance	BRIGHT
1	(Konstan)		
	Transfer Fund	0,792	1,263
	ROR	0,792	1,263

Table 5. Multicollinearity Test

Table 5 shows the result that the Tolerance value of both variables >0.10 and VIF <10, i.e. for the Tolerance value in the variables Dana TranSphere (X1) and PAD (X2) is 0,792, and the value of VIF is 1,263. So that the data is stated that there is no multicollinearity between independent variables.

The t-test is performed to see the influence of independent variables on partially dependent variables. This test is performed with the following criteria: H1 is accepted if Sig. < 0.05. H1 is rejected if Sig. > 0.05.

Koefisiensa						
By		Non-Standard Coefficients		Standard Coefficients	t	Itself.
		B	Std. Error	Beta		
1	(Konstan)	-2.12075E+12	3.42897E+11		-6,185	0,025
	Transfer Fund	2,699	0,403	1,098	6,700	0,022
	ROR	0,248	0,090	0,449	2,738	0,111

Table 6. Partial Test T Test

Table 4 shows that the t-test results for each independent variable are as follows:

Variable X1 (Transfer Funds) Sig. = 0.023 < 0.05 , and for the value of T the calculation is 6,700 > Table T 4.303, meaning that the transfer funds have an effect positive and significant to capital expenditure. This indicate that an increase in the Transfer Fund is followed by

Increase capital expenditure. So it can be implied that H1 in receive, which means that partially transfer funds have a positive effect on capital expenditure.

Variable X2 (PAD) sig. = 0,111 > 0.05, and for the value of T the calculation is 2,738 < T table 4,303, which indicates that regional original revenue has on positive but insignificant to Capital Expenditure. This shows that Increased. PAD does not have a significant effect on Capital Expenditure. Although the direction of influence is positive, its statistical contribution is not strong enough to conclude that PAD significantly affects Capital Expenditure. This can be caused by fluctuations in regional original revenue, regional dependence on transfer funds, or low efficiency of expenditure allocation . So it can be concluded that H2 rejected, meaning that partially the original income of the region not affect capital expenditure.

Simultaneous f-tests or F-tests are performed to determine whether the independent variables simultaneously have a significant effect on the dependent variables.

ANOVA						
Pattern		Number of Squares	Df	Square Average	F	Sig.
1	Regression	6.87484E+21	2	3.43742E+21	22,506	0.043b
	Remnant	3.05462E+20	2	1.52731E+20		
	Entire	7.1803E+21	4			

Table 7. Simultaneous Test (F Test)

Based on the results of processing the data of the F test in table 7, the following results were produced, the calculated F value was 22.506, the significance value (Sig.) was 0.043

It can be concluded that simultaneously the variables of transfer funds and regional revenues together have a significant influence on capital expenditure in Cirebon City in 2019-2023. This is shown by the results of Sig. which shows a result of 0.043 < 0.05, and indigo F is calculated as 22.506 > T table 19.00.

5. Discussion and Interpretation of Analisys Results

Based on the results of multiple linear regression analysis conducted in this study, it was found that transfer funds have a positive and significant effect, and regional revenues have a positive and insignificant effect on capital expenditure.

Based on the ratio analysis, it is known that the data on the fiscal dependency ratio of Cirebon City during 2019-2023 shows that the average transfer funds provided is 55.33% of total regional revenue and is categorized as a moderate level of fiscal dependence. This ratio shows that most of the region's revenue still comes from transfer funds provided by the central government, including the General Allocation Fund, the Special Allocation Fund, and the Revenue Sharing Fund.

The results of the regression test in table 4.10 were obtained t calculated by 6,700 more big from the t table which is 4.303 and the significant value is 0.022 < 0.05, which concludes that the transfer funds have a significant effect and positive to capital expenditure. This

indicates that statistically transfer funds have a real contribution in encouraging an increase in capital expenditure in Cirebon City.

However, to finance regional spending during the pandemic, the Cirebon City Government relies more on Transfer Funds from the central government. This suggests that during the pandemic, transfer funds were more focused on routine and unexpected expenses (such as social assistance, medical care, and emergency surgeries) than on long-term projects such as capital expenditures.

When a region has a high dependence on transfer funds, its fiscal freedom or flexibility is limited. The allocation of expenditure is still highly dependent on central policy. In accordance with the initial discussion, Cirebon City has challenges in managing or allocating its budget, so that the ability of the region to allocate its budget independently, including capital expenditure, is limited.

Based on the results of the calculation of the financial independence ratio of the Cirebon City Government during 2019 to 2023, it shows that the level of fiscal independence is in the low category. During the observation period, local revenue only accounted for around 26% - 36% of the total regional revenue, which is with an average value 36,57%.

Based on general criteria, this value is in the low category, which means that the regions are still highly dependent on central government funds. The low ratio of independence in Cirebon City to finance government and development activities independently is still limited. Low regional original revenue causes regional fiscal space to become narrow and development policies are more influenced by the direction of central policy.

This indication is in line with the results of regression analysis which shows the results of the regression analysis showing a value of 0,111 > 0.05, and the t-value is calculated as 2,738 more small from t table which is 4.378 which means that. Local revenue does not have a significant effect on Capital Expenditure. Although the direction of influence is positive, its statistical contribution is not strong enough to conclude that local revenue significantly affects Capital Expenditure.This interpret that increase in regional original revenue from tofu to year, the increase is not statistically strong enough to encourage a significant increase in regional capital expenditure. When The COVID-19 outbreak that hit Indonesia, especially in 2020–2022, also had an impact on the dynamics of Cirebon City's budget throughout the 2019–2023 period. Due to declining purchasing power, limited business activities, and hampered regional economic activities, the pandemic has resulted in a decrease in regional original revenue. This can be seen in 2020, when the fiscal independence ratio was at the second lowest position at 26.76% and regional original revenue decreased compared to the previous year's trend.With these conditions, Cirebon City is not yet fully fiscally independent and needs to strengthen regional revenue capacity so that dependence on transfer funds can be reduced in the future.

Based on the analysis of the ratio of Cirebon City's capital expenditure activities to total regional expenditure in 2019-2023, the average percentage of capital expenditure is only 10% or is included in the Low category. This shows that only a small portion of local government annual spending is allocated to long-term investment and fixed asset development.

In 2020, the Capital Expenditure ratio had increased to 18.60% (Low category), which was most likely influenced by the need to handle infrastructure or certain capital expenditures

during the early days of the pandemic. However, this trend did not continue, even in 2023 it decreased drastically to 6.42%, so overall it returned to the Very Low category.

This low ratio indicates that most of the regional budget is used for routine spending. Moreover, during the pandemic, the budget for spending is more focused on routine spending such as social assistance, medical care, and emergency surgery. This is in line with the regression results, which show that.

Influential Transfer Funds positive and significant to capital expenditure. This means that theoretically and statistically, an increase in transfer funds should encourage an increase in capital and regional spending. However, empirical data shows that even though transfer funds are increasing, the proportion of capital expenditure is still fluctuating, even tending to decrease. This can be explained through the context of policies during the pandemic. During the pandemic, the central government instructed *refocussing* and budget reallocation to support healt] h care, economic recovery, and social protection.

The very low ratio of capital expenditure activities strengthens the finding that Cirebon City has not allocated the budget optimally for development investment. Dependence on Transfer Funds without the support of regional original revenue independence leads to fiscal limitations to increase the proportion of Capital Expenditure. Therefore, increasing regional original revenue and the efficiency of using transfer funds is key to encouraging future development spending activities.

Based on the results of multiple linear regression analysis conducted by this study, it was found that transfer funds have an influence on positive and significant, and local revenue has a positive effect but not significant to capital expenditure.

Based on the results of the study using a simultaneous test (f-test) in table 4.12, the Fcal value of Fcal > Ftabel or 22.506 > 19.00 was obtained, and the Sig. < value of the alpha value, which was 0.043 < 0.05. Then it can be concluded that transfer funds and local revenue have a joint effect on capital expenditure in Cirebon City in 2019-2023. This indicates that although only partial transfer funds have a positive and significant effect, when combined with PAD in one regimen, these two variables together are able to explain the variation that occurs in capital expenditure.

This is in line with the theory of spending effectiveness which states that regional development spending is influenced by several sources of regional revenue, both sourced from the central government and sourced from the region's own capabilities. However, it should be noted that the magnitude of the influence of each variable is different. Based on the previous t-test, Transfer Funds have a more dominant influence on capital expenditure than regional original revenue, which is statistically insignificant. This is also strengthened by the fiscal reality of Cirebon City which shows that the level of fiscal dependence on the central government is still high, and the proportion of capital expenditure is still very low, even though transfer funds are quite large.

The task faced by Cirebon City is to reduce dependence on transfer funds and increase the efficiency of the use of regional original revenue to encourage sustainable development.

Capital expenditure will continue to depend on central policies, which are not always in line with regional demands, unless regional fiscal power is strengthened.

6. Conclusion

The conclusions outlined above, the researcher provides the following suggestions. The Cirebon City Government is expected to further increase the effectiveness of the use of transfer funds, especially the General Allocation Fund, Special Allocation Fund, so that it is more directed to fund productive and sustainable capital expenditure. And also reduce dependence on central transfer funds by increasing fiscal capacity through innovation and intensification of regional original revenue management, so that development policies are not too affected by changes in central policies, especially in critical times. Optimizing sources of Regional Original Revenue must be a strategic priority, especially in potential sectors such as tourism, trade, and local services. This can be done by expanding the tax base, increasing taxpayer compliance, and improving the regional tax service system to be more digital and efficient. Capital expenditure planning must pay attention to fiscal resilience and sustainable development. Local governments need to prepare adaptive and anticipatory financial planning in risks, such as pandemics or economic crises, so that capital expenditure is not neglected and remains sustainable.

THE EFFECT OF PER CAPITA INCOME, ECONOMIC GROWTH RATE, AND TAX RATE TOWARDS TAX RATIO IN ASIA PACIFIC ECONOMIC COOPERATION (APEC) COUNTRIES IN 2016-2022

Vita Roro Pramudita, Bani Binekas

Faculty of Economics and Business, Universitas Jenderal Achmad Yani, Indonesia
Vitaroro_21p040@ak.unjani.ac.id , bani.binekas@lecture.unjani.ac.id

Abstract

This study aims to analyze the effect of Income Per Capita, Economic Growth Rate, and Tax Rate on the Tax ratio in Asia Pacific Economic Cooperation (APEC) countries in 2016-2022. This study is quantitative with secondary data and uses purposive sampling techniques, so that 8 countries were obtained as samples. The analysis method used is multiple linear regression. The results of the study partially show that Income Per Capita has a significant positive effect on the Tax ratio, Economic Growth Rate has no effect on the Tax Ratio, and Tax Rate has a significant negative effect on the Tax Ratio. Simultaneously, all three variables have a significant effect on the Tax Ratio. This finding indicates that increasing income per capita can encourage an increase in the tax ratio, while tax rates that are too high can actually reduce the tax ratio due to tax avoidance and economic growth does not always increase tax revenue. Therefore, an optimal fiscal policy is needed in determining tax rates and expanding the tax base in order to increase the tax ratio sustainably.

Keywords: *Income per capita, economic growth rate, tax rate, tax ratio*

1 Introduction

Among the sources of state revenue, taxes have always been the main source of funds for a country (Hanifa & Binekas, 2023). Taxes are an important element of resources for governments in various countries. The government utilizes revenue from taxes and other sources of revenue to support the economic stability of a country (Putriana, 2022). In the context of supporting economic stability in a country, there is an important role in state tax revenue. However, the issue of efficiency and effectiveness of tax revenue remains a significant challenge for several countries. In fact, some countries in the Asia Pacific region such as Sri Lanka, Bangladesh, Pakistan, Bhutan and Indonesia have relatively small tax revenue to Gross Domestic Product compared to countries in the Asian Region (Septian & Anis, 2024). Therefore, the tax ratio is an important measure in calculating the effectiveness of the tax system in a country.

Tax ratio is a measure used to assess tax revenue in a country. However, the tax ratio is not the only indicator used to measure tax revenue. Even today, the tax ratio is still considered an indicator that provides an overview of the taxation conditions in a country (Rinaldi, 2019). In 2022, the average OECD tax ratio in 2022 was 34%, while the tax ratio in Asia Pacific countries was an average of 19.3%. This indicates that the tax ratio in APEC countries is fairly low when compared to the OECD tax ratio. The Asia Pacific country that has a tax ratio exceeding the average OECD tax ratio is Japan with a tax ratio of 34.1% (OECD, 2024).

Asia Pacific Economic Cooperation (APEC) countries in the Asia Pacific region such as Sri Lanka, Bangladesh, Pakistan, and Bhutan have a small tax ratio compared to other countries in

the Asia Pacific Region. The OECD states that the tax ratio of these countries is below the Asia Pacific average of 19.3%. The tax ratio of Sri Lanka, Bangladesh, Pakistan, and Bhutan is lower by approximately 22 percentage points when compared to the OECD average (34%) (Wildan, 2024).

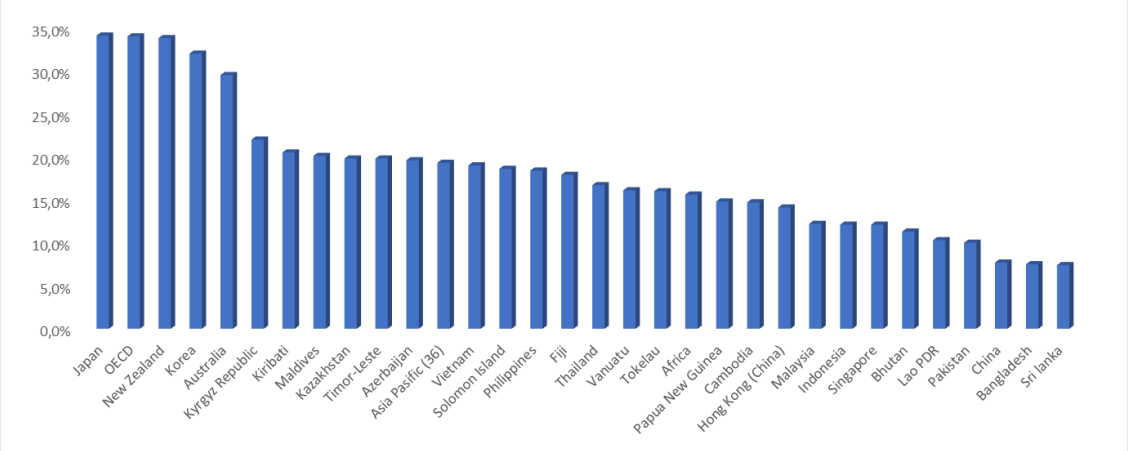

Figure 15. Tax ratio achievements of Asia Pacific countries

There are several factors that affect the tax ratio in a country, the first of which is per capita income (Rinaldi, 2019). Per capita income is measured using GDP divided by the population in the current period (Listikarini & Wijaya, 2023).

Research by Wulandari et al. (2020) states that the higher the country's income, the greater the ability to pay and collect tax revenue so that it will increase the tax ratio. Meanwhile, research by Septiani & Sastradipraja (2023) states that the situation where GDP per capita has increased but tax revenue has decreased.

The next factor that affects the tax ratio is the economic growth rate. A measure of development success, especially in the economic field (Damanik & Saragih, 2023). Research by Rahayu et al. (2023) states that if a country's economy increases, the country's tax ratio will increase. Meanwhile, research by Silfiani & Febyansyah (2022) states that the relationship between economic growth and tax ratio is not always linear.

Another factor that affects the tax ratio is the tax rate. Tax rate is a mandatory contribution paid after taking into account tax credits or tax deductions Silfiani & Febyansyah (2022). Erion & Taryana research (2021) explains that the increase in income tax as a result of the application of tax rates, the increase in income tax paid also increases the tax ratio. Meanwhile, research by Kurniawati & Fadillah (2020) states that the greater the tax rate, the higher the likelihood of people working on tax avoidance practices and causing people not to carry out tax obligations.

2 Literature Review

2.1 Theoretical background

2.1.1 Macroeconomic Theory

Macroeconomics can be defined as a branch of science that studies the economy as a whole. This science explains economic changes that affect households, companies, and markets (Syaiful et al., 2022). In macroeconomic issues, it tries to explain various problems that arise in the economy, one of the main problems in the economy is economic growth (Veritia et al., 2019). In addition, macroeconomics can emphasize that the main focus is on economic variables as a whole, such as national income, national product, savings, investment, unemployment, inflation, and so on (Likuayang & Matindas, 2021).

2.1.2 The Laffer Curve

A theory to relate tax rates to total tax revenue and illustrate how tax rates can be optimized to increase the country's tax revenue (Yossinomita et al., 2024). The curve describes the extreme levels of tax rates ranging from 0-100% that are used to drive increased tax revenue (Haq, 2023).

2.1.3 Tax Ratio

A measure used to evaluate a country's tax revenue. Although there is some evidence in the literature suggesting that the tax ratio is not the only indicator of tax performance, it is considered a measurement tool that provides an overview of a country's tax situation. Tax ratio can be measured by comparing a country's total tax revenue with GDP in the current year (Rinaldi, 2019).

2.1.4 Income Per Capita

It is an indicator of the welfare level of a society and facilitates comparison between one country and another. Per capita income can be calculated using GDP per capita. This value is obtained from dividing GDP by the total population in the relevant year (Veritia et al., 2019).

2.1.5 Economic Growth Rate

Economic growth is a process characterized by an increase in GNP (Gross National Product) or real national income (Syaiful et al., 2022). According to Wildan (2020) in research (Larasati & Purwanto, 2022) the Organization for Economic Coorperation and Development (OECD) states that contraction in Gross Domestic Product (GDP) growth will significantly erode tax revenue. Economic growth rate is related to the increase in output per capita. In this context, economic growth can occur if per capita income compares population growth, accompanied by fundamental changes in the economic structure of a country and the distribution of the population in the country (Syaiful et al., 2022). Economic growth can be measured by comparing the Gross Domestic Product (GDP) of the current year with the previous year multiplied by 100% (Veritia et al., 2019).

2.1.6 Tax Rate

The government sets tax rates in the form of percentages through laws and their derivative regulations, including government regulations for certain types of taxes (Fitriya, 2024). Tax collection rates that have a certain percentage for each amount used as the basis for tax imposition are called proportional or similar tax rates. This means that if the amount used as the basis for tax imposition increases, the tax to be paid will also increase. VAT, which is levied at 10% of the selling price, is one example (Karsam et al., 2022).

2.2 Theoritical framework and hypotheses

In macroeconomic theory, one of the variables at the center of economic attention is high per capita income to be able to emphasize tax payments so that it will increase the tax ratio (Likuayang & Matindas, 2021). In addition, economic growth is a major issue in macroeconomic theory, because the success of a country in carrying out economic activities can be seen from an increase in economic growth so that it can increase the tax ratio in a country (Rahayu et al., 2023). Laffer argues that the economy does not grow due to lack of demand, but because the tax burden is too high which can cause many taxpayers to practice tax avoidance, so the tax ratio will decrease if the tax rate is too high (Kurniawati & Fadillah, 2020).

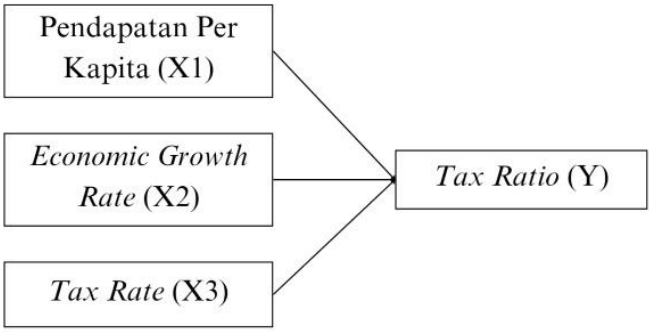

Figure 16. Framework of thought

The relationship between the independent variable and the dependent variable can be described by researchers as follows:

H_1 : Per Capita Income has a positive effect on the Tax Ratio.
H_2 : Economic Growth Rate has a positive effect on the Tax Ratio.
H_3 : Tax Rate has a negative effect on Tax Ratio.
H_4 : Per Capita Income, Economic Growth Rate, and Tax Rate simultaneously affect the Tax Ratio.

3 Methodology

The research adopts a quantitative approach, with the formulation of descriptive and associative problems. The object of this research is a country registered with the Asia Pacific Economic Coopertaion (APEC) with a total population of 11 countries. The sampling technique used is purposive sampling where the sample obtained is 8 countries with a research period of 7 years, thus the sample obtained is 56 samples.

4 Result and Discussion

4.1 Descriptive Statistical Analysis

Table 1: Descriptive Test Result

Descriptive Statistics					
	N	Minimum	*Maximum*	*Mean*	*Std. Deviation*
Income Per Capita	56	7308.00	71099799.00	7371387.7857	19310852.48143

Descriptive Statistics					
	N	Minimum	*Maximum*	*Mean*	*Std. Deviation*
Economic Growth Rate	56	-11.42	26.12	7.0039	7.63893
Tax Rate	56	0.00	20.00	8.2679	6.28271
Tax Ratio	56	1.18	14.89	10.6098	3.90700
Valid N (listwise)	56				

The results in table 1, the results of the analysis for the per capita income variable explain the value of the minimum of 7308.00 and the maximum of 71099799.00, with a mean of 7371387.7857 and a standard deviation of 19310852.48143. The economic growth rate variable explains the value of the minimum recorded -11.42 and the maximum value recorded 26.12, resulting in a mean of 7.0039 and a standard deviation of 7.63893. Meanwhile, the tax rate variable obtained a minimum value of 0.00 and a maximum of 20.00, with a mean of 8.2679 and a standard deviation of 6.28271. Finally, the tax ratio variable shows a minimum value of 1.18 and a maximum value of 14.89, with a mean of 10.6098, then a standard deviation of 3.90700.

4.2 Classical Assumption Testing

4.2.1 Normality Test

Table 2: Normality Test Result

One-Sample Kolmogorov-Smirnov Test	
	Unstandardized Residual
N	41
Asymp. Sig. (2-tailed)[c]	.200[d]

The results in table 2, show that after handling outliers, the significance value is recorded as 0.200, which exceeds 0.05. It can be concluded that the data for this study is normal.

4.2.2 Heteroscedasticity Test

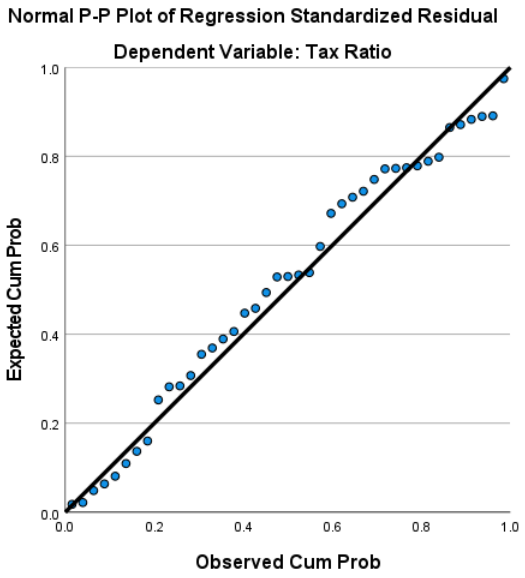

Figure 17. Regression P-Plot Test Result

The results of Figure 3, show that the heteroscedasticity test with the distribution of points above and below, and around zero on the x and y axes, without a certain pattern. Therefore, it is concluded that there is no heteroscedasticity in the regression model.

4.2.3 Multicollinearity Test

Table 3: Multicollinearity Test Result

Coefficients[a]			
Model		*Collinearity Statistics*	
		Tolerance	VIF
1	*(Constant)*		
	Pendapatan Per Kapita	0.814	1.228
	Economic Growth Rate	0.918	1.089
	Tax Rate	0.783	1.278
a. Dependent Variable: Tax Ratio			

The results of table 3, from the multicollinearity test show that the tolerance value for per capita income is 0.814, while the VIF value for per capita income is 1.228. For the economic growth rate variable, the tolerance value is recorded at 0.918, with a VIF value of 1.089. As for the tax rate variable, the tolerance value is 0.783, and the VIF value is 1.278. These results explain that independent variables with a VIF value of less than 10 and a tolerance value of more than 0.10, these variables do not experience multicollinearity, and can continue the next classical assumption test.

4.2.4 Autocorrelation Test

Table 4: Durbin-Watson Autocorrelation Test Result (Cochrane Ocrutt Method)

Model Summary[b]					
Model	*R*	*R Square*	*Adjusted R Square*	*Std. Error of the Estimate*	*Durbin-Watson*

1	.777[a]	0.603	0.570	0.94891	1.907
a. Predictors: (Constant), LAG_X3, ***Cochrane Ocrutt*** *LAG_X2, LAG_X1*					
b. Dependent Variable: LAG_Y					

The results of table 4 above, the dW value is recorded at 1.907. Referring to the Durbin-Watson table with n = 41, k = 3, the dU and dL values are 1.6603 and 1.3480 respectively, while the 4-dU value is 2.3397. This value meets the criteria dU < dW < 4-dU, namely 1,340 < 1,907 < 2,3397. Thus, no autocorrelation symptoms ocrutt.

4.3 Multiple Regression Analysis Test

Table 5: Multiple Linear Regression Analysis Result

Coefficients[a]						
Model		*Unstandardized Coefficients*		*Standardized Coefficients*	t	*Sig.*
		B	*Std. Error*	*Beta*		
1	*(Constant)*	13.638	0.444		30.745	0.000
	Pendapatan Per Kapita	2.014E-06	0.000	0.266	2.127	0.040
	Economic Growth Rate	0.047	0.036	0.153	1.293	0.204
	Tax Rate	-0.266	0.042	-0.815	-6.380	0.000
a. Dependent Variable: Tax Ratio						

The results in table 5, multiple linear regression analysis can produce an equation:
Y = 13.638 + 2.014E-06X1 + 0.047X2 - 0.266X3
The explanation of the multiple linear regression model above is as follows:

1. The constant is 13.638, meaning that if the independent variable is 0, the tax ratio is 13.638.
2. The regression coefficient value of per capita income (X_1) is 2.014E-06. These results explain the high income per capita will increase the tax ratio by 2.014E-06.
3. The regression coefficient value of economic growth rate (X_2) is 0.047. The higher the economic growth rate, the higher the tax ratio value by 0.047.
4. The value of the tax rate regression coefficient (X_3) is -0.266. The higher the tax rate, the lower the tax ratio value by -0.266.

4.4 Coefficient of Determination Analysis Test

Table 6: Coefficient of Determination Analysis Results

Model Summary[b]				
Model	R	R *Square*	*Adjusted R Square*	*Std. Error of the Estimate*
1	.726[a]	0.527	0.489	1.42775
a. Predictors: (Constant), Tax Rate, Economic Growth Rate, Pendapatan Per Kapita				
b. Dependent Variable: Tax Ratio				

The results in table 6, the coefficient of determination (Kd) value is recorded at 52.7% and the adjusted R Square value is 0.527. This value indicates that 52.7% of the variation in the dependent variable, namely the tax ratio, can be influenced by the independent variables. Meanwhile, the remaining 47.3% is explained by other independent variables outside the variables studied.

4.5 Inference Result

4.5.1 Partial Test Result (t Test)

Table 7: Partial Test Result (t Test)

Coefficients[a]						
Model		*Unstandardized Coefficients*		*Standardized Coefficients*	*t*	*Sig.*
		B	*Std. Error*	*Beta*		
1	(Constant)	13.638	0.444		30.745	0.000
	Pendapatan Per Kapita	2.014E-06	0.000	0.266	2.127	0.040
	Economic Growth Rate	0.047	0.036	0.153	1.293	0.204
	Tax Rate	-0.266	0.042	-0.815	-6.380	0.000
a. *Dependent Variable: Tax Ratio*						

As shown in Table 7, the significance value was recorded at 0.000 which is less than 0.005. The following is the interpretation of these results:

1.) The calculated t value of the per capita income variable is 2.127 > t table value of 2.026, it can be explained that the t count is greater than the t table and the significant value is 0.040 < 0.05. This means that income per capita has a significant positive effect on the tax ratio.
2.) The t value of the economic growth rate variable is 1.293 < the t table value of 2.026, it can be explained that the t count is smaller than the t table and the significant value is 0.204 > 0.05. This means that the economic growth rate has no significant effect on the tax ratio.
3.) The t value of the tax rate variable is -6.380 < the t table value of 2.026, it can be explained that the t count is smaller than the t table and the significant value is 0.000 < 0.05. This means that the tax rate has a significant negative effect on the tax ratio.

4.5.2 Simultaneous Test Result (F Test)

Table 8: Simultaneous Test Result (F Test)

ANOVA[a]						
Model		*Sum of Squares*	*df*	*Mean Square*	*F*	*Sig.*
1	*Regression*	84,143	3	28,048	13,759	.000[b]

ANOVA[a]						
Model		*Sum of Squares*	*df*	*Mean Square*	*F*	*Sig.*
	Residual	75,423	37	2,038		
	Total	159,566	40			
a. *Dependent Variable: Tax Ratio*						
b. *Predictors: (Constant), Tax Rate, Economic Growth Rate*, Pendapatan Per Kapita						

The results in table 8 explain that the F count value of all variables is 13.759 > 2.85 with a simultaneous significant value of 0.000 < 0.05, meaning that H_0 is rejected and H_a is accepted. These results explain that the independent variables have a significant effect on the tax ratio.

5 Conclusion

Based on the results of research on APEC countries during the period 2016 to 2022, it is found that the variables of Per Capita Income, Economic Growth Rate, Tax Rate, and Tax Ratio show a fluctuating pattern from year to year. The results of further analysis show that partially, Per Capita Income has a positive and significant effect on the Tax Ratio, which means that the higher the level of productivity per capita of a country, the tax revenue tends to increase, resulting in an increase in the tax ratio.

In contrast, the Economic Growth Rate does not show a significant effect on the Tax Ratio, indicating that high economic growth is not always followed by an increase in tax performance. Meanwhile, the Tax Rate has a negative and significant effect on the Tax Ratio, indicating that the higher the tax rate imposed, the greater the potential for tax evasion by taxpayers, which ultimately reduces state tax revenue. Simultaneously, the three variables - Income Per Capita, Economic Growth Rate, and Tax Rate - are proven to have a positive and significant effect on the Tax Ratio, indicating that together, they have an important contribution in shaping the performance of the tax ratio in APEC economies.

Universitas Tadulako
andi.indriani.ibrahim@gmail.com

Abstrak

Penelitian ini bertujuan untuk menjelaskan pengaruh budaya kerja dan teamwork terhadap produktivitas kerja karyawan pada PT. Prima Gelora Agung Lestari Kota Palu. Penelitian ini menggunakan jenis penelitian (explanatory Research) dengan pendekatan kuantitatif. Variabel yang digunakan dalam penelitian ini ada tiga yaitu, budaya kerja, teamwork dan produktivitas kerja karyawan. Pengumpulan data diperoleh dari penyebaran kuesioner kepada karyawan yang bekerja di PT. Prima Gelora Agung Lestari Kota Palu. Teknik sampling yang digunakan dalam penelitian ini adalah proposional random sampling dengan jumlah sampel sebanyak 108 responden. Analisis data yang digunakan adalah analisis regresi linear berganda. Hasil penelitian ini menunjukkan bahwa budaya kerja dan teamwork secara serempak memiliki pengaruh yang signifikan terhadap produktivitas kerja karyawan. Selain itu penelitian ini juga membuktikan adanya pengaruh parsial budaya kerja terhadap terhadap produktivitas kerja karyawan dan kemudian pengaruh parsial teamwork terhadap produktivitas kerja karyawan.
Kata Kunci : *Budaya Kerja, Teamwork, Produktivitas Kerja Karyawan*

Abstract

This study aims to explain the influence of work culture and teamwork on employee work productivity at PT. Prima Gelora Agung Lestari, Palu City. This study uses an explanatory research type with a quantitative approach. There are three variables used in this study, namely, work culture, teamwork, and employee work productivity. Data collection was obtained from distributing questionnaires to employees working at PT. Prima Gelora Agung Lestari, Palu City. The sampling technique used in this study was proportional random sampling with a sample size of 108 respondents. Data analysis used was multiple linear regression analysis. The results of this study indicate that work culture and teamwork simultaneously have a significant influence on employee work productivity. In addition, this study also proves the partial influence of work culture on employee work productivity and then the partial influence of teamwork on employee work productivity.
Keywords : *Work Culture, Teamwork, Employee Work Productivity*

1. PENDAHULUAN

Sumber daya manusia (SDM) merupakan salah satu faktor yang sangat penting dalam organisasi, karena sumber daya manusia memiliki peran dalam membantu perusahaan mengembangkan usahanya agar terwujud apa yang menjadi tujuannya. Dalam kondisi masyarakat modern yang konteks dan cepat berubah, penelitian perilaku organisasi menunjukkan nilai mempertahankan kemampuan untuk mengelola perubahan, belajar dan meningkatkan daya saing perusahaan (Ibrahim *et a*l., 2024).

PT. Prima Gelora Agung Lestari merupakan salah satu perusahaan di Kota Palu yang bergerak dalam bidang *furniture*. Perusahaan ini dikenal juga dengan produk *bigland* dan *napolly*. PT. Prima Gelora Agung Lestari merupakan bagian dari Cahaya Buana Grup. Perusahaan

manufaktur dan perdagangan *furniture* yang berskala nasional yang berkantor pusat di Sentul Bogor. PT. Prima Gelora Agung Lestari berdiri pada tahun 2006, awal berdirinya perusahaan ini masih menjadi tempat penampungan produk jadi (gudang). Seiring bertambahnya kapasitas permintaan PT. Prima Gelora Agung Lestari akhirnya mulai memproduksi barang jadi pada tahun 2007 dimulai dengan memproduksi busa, dan dibuatkan kasur busa. PT. Prima Gelora Agung Lestari kini telah memperluas lini produknya untuk mencangkup kebutuhan dan permintaan pasar. Demi meningkatkan kualitas perusahaan. PT. Prima Gelora Agung Lestari mulai memproduksi *furniture* dari bahan *plastic* antara lain, memproduksi kursi, meja, dan memproduksi lemari pakaian dari plastik. Sejak tahun 2006 sampai saat ini PT. Prima Gelora Agung Lestari telah memproduksi berbagai macam produk yang berkualitas dengan harga terjangkau. Berdasarkan pengamatan yang dilakukan oleh peneliti, pada PT. Prima Gelora Agung Lestari Kota Palu masih terdapat berbagai masalah yang terjadi khususnya yang terkait dengan budaya kerja dan *teamwork* terhadap produktivitas karyawan PT. Prima Gelora Agung Lestari Kota Palu.

Hasil observasi ditemukan beberapa permasalahan terkait dengan budaya kerja dan *teamwork* yang belum maksimal, berkaitan dengan budaya kerja dan *teamwork* diantaranya disiplin kerja yang kurang optimal, kurangnya keterbukaan antar karyawan, dan kurangnya sikap saling menghargai. Kerjasama yang kurang, kekompakkan yang kurang dan kepercayaan yang kurang. Sebagai contoh dalam pengerjaan atau kegiatan yang diintruksikan oleh pimpinan kepada karyawan baik secara individu maupun tim kerja, dari segi budaya kerja masih belum memenuhi standar, yakni terjadi ketidak disiplinan disebabkan beberapa karyawan tidak mematuhi jadwal kerja dan tidak mengikuti prosedur yang di tetapkan, beberapa karyawan tidak merasa nyaman untuk berbagi pendapat dan ide terhadap sesama karyawan, beberapa karyawan tidak merasa dihargai dan diakui atas kontribusi mereka. Menurut Dwi & Maulana (2022) budaya kerja berararti kebiasaan yang dilakukan berulang-ulang oleh pegawai dalam suatu organisasi, pelanggaran dengan kebiasaan ini memang tidak ada sangsi tegas, namun dari perilaku organisasi, secara moral telah menyepakati bahwa kebiasaan tersebut merupakan kebiasaan yang harus ditaati dalam rangka pelaksanaan pekerjaan untuk mencapai tujuan.

Beberapa tim kerja tidak bekerja dengan efektif dikarenakan kurangnya komunikasi antar tim kerja mereka bekerja secara individualis, tidak terbangunnya komunikasi disebabkan kebiasaan kerja yang dilakukan secara mandiri yang sudah berlangsung selama mereka menjadi karyawan, sehingga terkesan beberapa karyawan merasa tidak percaya dengan cara kerja rekan kerja mereka, mereka merasa lebih maksimal ketika bekerja secara mandiri. Menurut Muclisin (2019) kerjasama tim (*teamwork)* adalah kolaborasi antara dua orang atau lebih untuk saling berbagi waktu, bakat dan pengetahuan dalam melaksanakan tugas sebagai upaya mencapai tujuan yang telah ditentukan. Setiap orang dalam *teamwork* memiliki derajat yang sama penting, memahami peran dan tugas, saling percaya, saling mendukung, bertanggung jawab serta saling berhubungan satu sama lain melalui pemimpin yang telah ditunjuk.Hal ini tentunya akan berdampak pada produktivitas kerja karyawan PT. Prima Gelora Agung Lestari Kota Palu. Faktor lain yang juga dapat mempengaruhi produktivitas kerja karyawan PT. Prima Gelora Agung Lestari Kota Palu adalah kondisi kesehatan individu (Tohardi, 2021).

2. LANDASAN TEORI

2.1 Budaya Kerja

Budaya kerja merupakan kelompok pola perilaku yang melekat secara keseluruhan pada diri setiap individu dalam sebuah organisasi. Membangun budaya berarti juga meningkatkan dan mempertahankan sisi positif, serta berupaya membiasakan pola perilaku tertentu agar tercipta suatu bentuk baru yang lebih baik. Budaya kerja berararti kebiasaan yang dilakukan berulang-ulang oleh pegawai dalam suatu organisasi, pelanggaran dengan kebiasaan ini memang tidak

ada sangsi tegas, namun dari perilaku organisasi, secara moral telah menyepakati bahwa kebiasaan tersebut merupakan kebiasaan yang harus ditaati dalam rangka pelaksanaan pekerjaan untuk mencapai tujuan (Dwi & Maulana, 2022).

Ruliyansa (2018) mengemukakan bahwa budaya kerja adalah cara kerja sehari-hari yang bermutu, mendasari nilai-nilai yang penuh makna. Sehingga menjadi motivasi, memberi inspirasi, senantiasa bekerja lebih baik dan memuaskan bagi masyarakat yang dilayani. Budaya kerja menurut Palendeng *et al*., (2022) yaitu pemahaman hidup yang berisikan nilai-nilai dalam bekerja yang dapat memberikan inspirasi tentang bagaimana fungsi, sitandar, pandangan dan perilaku setiap individu atau perkumpulan dalam melakukan suatu tugas untuk mencapai tujuan organisasi.

Budaya organisasi dapat di definisikan sebagai seluruh pengetahuan, kepercayaan, seni, hukum, moral, kemampuan dan kebiasaan yang dipelajari seseorang. Serta makna untuk seluruh pengetahuan sebagai mahluk sosial yang digunakan untuk memahami lingkungan sekitar dan pengalaman yang bisa menjadi pegangan dalam hidup dan kepribadiannya. Budaya organisasi seperangkat sistem nilai-nilai (*values*), keyakinan, asumsi atau norma-norma yang telah lama berlaku, disepakati, di ikuti oleh para anggota organisasi, sebagai pedoman perilaku dan pemecahan masalah organisasi. Sebelum menjelaskan konsep budaya organisasi, maka terlebih dahulu dijelaskan konsep organisasi. Organisasi adalah setiap bentuk perserikatan antara dua orang atau lebih bekerjasama untuk tujuan bersama, terkait secara formal dalam persekutuan yang terdapat hubungan antar seorang atau sekelompok orang disebut pemimpin dan seorang atau orang lain yang disebut bawahan (Sumartik & Abadiyah, 2022).

2.2 Teamwork

Muclisin (2019) menyatakan bahwa kerjasama tim (*teamwork)* adalah kolaborasi antara dua orang atau lebih untuk saling berbagi waktu, bakat dan pengetahuan dalam melaksanakan tugas sebagai upaya mencapai tujuan yang telah ditentukan. Setiap orang dalam *teamwork* memiliki derajat yang sama penting, memahami peran dan tugas, saling percaya, saling mendukung, bertanggung jawab serta saling berhubungan satu sama lain melalui pemimpin yang telah ditunjuk. Kerjasama tim (*teamwork)* adalah upaya kolaborasi dari suatu kelompok untuk mencapai tujuan bersama atau menyelesaikan tugas dengan cara yang paling efektif dan efisien secara berkelompok.

Kerjasama tim (*teamwork*) merupakan suatu tindakan yang harus kita bangun antar karyawan. Karena di dalam suatu organisasi terdapat tujuan yang sama, apabila kerjasama tim telah berjalan dengan baik maka setiap karyawan akan terfokus dalam kelompoknya, oleh karena itu kita harus bekerjasama untuk mencapai tujuan tersebut (Amanda, *et al*., 2020). Kesenjangan terjadi diantaranya, sehingga tidak adanya kerjasama yang baik antar karyawan didalam suatu *department* tidak perduli dengan tanggung jawabnya sehingga menyebabkan masalah bagi karyawan lain. *Team* kerja atau kerjasama tim yaitu kerja kelompok dengan keterampilan yang saling melengkapi serta berkomitmen untuk mencapai visi yang sudah disepakati sebelunya untuk mencapai tujuan bersama secara efektif dan efisien (Hidayat, 2021).

Tim kerja yang efektif memberikan anggota-anggotanya saling berkolaborasi dan kompak untuk mencapai tujuan bersama dan memiliki sikap yang saling mendukung dalam kerjasama tim. Kerjasama tim menjadi hal yang penting, karena dapat melengkapi dan membantu pekerjaan agar lebih mudah dan cepat terselesaikan. Kerjasama tim dapat terwujud dengan baik ketika karyawan bekerja secara kohesif dengan menciptakan suasana dan lingkungan kerja yang positif. Suatu kerjasama tim lebih penting dari skil dan finansial, namun seringkali dalam sebuah tim tidak bisa bekerjasama dengan baik yang dapat menyebabkan hilangnya inovasi, efektifitas dan efisiensi kerja. Hal ini dapat berpengaruh terhadap produktivitas dan kinerja, (Gultom, *et al.*, 2023).

2.3 Produktivitas Kerja

Tohardi (2021) mengemukakan bahwa produktivitas merupakan sikap mental yang meyakini bahwa seseorang dapat melakukan pekerjaan lebih baik dari pada hari kemarin dan esok akan lebih baik. Produktivitas kerja adalah kemampuan seseorang atau sekelompok orang guna menghasilkan suatu produk, baik berupa barang maupun jasa, yang secara kualitatif maupun kuantitatif semakin bertambah dari waktu ke waktu. Faktor penting yang turut menentukan produktivitas tenaga kerja yaitu, kondisi kesehatan individu. Produktivitas kerja sangat penting untuk menjaga ritme atau tempo perjalanan organisasi atau perusahaan, terutama dalam menghadapi persaingan yang semakin sulit dari waktu ke waktu. Pemahaman pimpinan atau manajer terkait manajemen sumber daya manusia, terutama produktivitas kerja, merupakan sesuatu yang wajib dan penting untuk dimiliki.

Produktivitas karyawan adalah kemampuan karyawan dalam berproduksi dibandingkan dengan input barang atau jasa sesuai dengan hasil yang diharapkan dalam waktu yang singkat atau tepat (Apriani & Sriathi, 2019). Produktivitas berasal dari bahasa inggris *Productive* yang artinya menghasilkan, dan *productivity having the ability make or kreate, creative* yang artinya kekuatan atau kemampuan dalam menghasilkan sesuatu karena dalam organisasi yang kreatif. Produktivitas kerja yang dihasilkan adalah wujud dari tujuannya. Jadi, produktivitas sangat penting untuk meningkatkan kesejateraan nasional (Damayanti, *et al*., 2022).

3. METODE

Jenis penelitian yang digunakan adalah jenis penelitian *eksplanatory research* dengan menggunakan metode penelitian kuantitatif. Penelitian ini melakukan pengujian analisis data dengan menggunakan program *software statistical product solution* (SPSS) versi 23 dengan beberapa tahap untuk menganalisis data sebagai berikut : Uji Validitas, Uji Reliabilitas, Uji Normalitas, Uji Multikolinearitas, Uji Heteroskedastisitas, Uji t (Uji Signifikansi Parsial), dan Uji F (Uji Serempak), Uji Determinasi.

4. HASIL PENELITIAN

Uji Validitas

Uji validitas merupakan derajat ketetapan antara data yang akan terjadi dengan objek penelitian dan data yang dapat dilaporkan oleh peneliti. Dengan demikian data yang valid merupakan data yang tidak berbeda dengan data yang dilaporkan oleh peneliti dan data yang sesungguhnya terjadi pada objek penelitian.Untuk menguji validitas instrumen penelitian apabila koefisien-koefisien korelasi antara skor suatu indikator, dengan skor total seluruh indikator (*corrected Item Total Correlation*) lebih besar dari 0,1891(≥ 0,1891)maka instrumen tersebut dianggap valid.

Tabel 1. Hasil Uji Validitas

No	Variabel Penelitian	Indikator Penelitian		*Corrected Item-total correlation*	Keterangan
1	Budaya kerja (X1)	**Disiplin (X1.1)**			
		X1.1	Saya datang tepat waktu untuk bekerja	0,606	Valid
		X1.1	Saya istirahat sesuai ketentuan perusahaan	0,505	Valid
		X1.1	Saya pulang sesuai ketentuan perusahaan	0,518	Valid
		Keterbukaan (X1.2)			
		X1.2	Saya khawatir bahwa keterbukaan dalam bekerja dapat membahayakan keamanan atau kerahasiaan perusahaan	0,602	Valid
		X1.2	Saya mengemukakan pendapat secara langsung	0,582	Valid
		X1.2	Saya percaya bahwa keterbukaan dalam bekerja dapat membantu meningkatkan kepercayaan antar karyawan	0,504	Valid
		Saling Menghargai (X1.3)			
		X1.3	Saya menghormati pendapat rekan kerja	0,502	Valid
		X1.3	Saya merasa sangat dihargai ketika rekan kerja mengakui prestasi saya	0,676	Valid
		X1.3	Saya percaya bahwa saling menghargai antar rekan kerja dapat membantu menciptakan lingkungan kerja yang lebih positif	0,707	Valid
2	*Teamwork* (X2)	**Kerjasama (X2.1)**			
		X2.1	Saya sangat menghargai kerjasama yang baik dengan rekan-rekan dalam menyelesaikan pekerjaan	0,571	Valid
		X2.1	Saya percaya bekerjasama dengan rekan kerja dapat meningkatkan kinerja	0,672	Valid
		X2.1	Saya percaya dengan kerjasama yang baik dapat meningkatkan kualitas produk	0,644	Valid
		Kepercayaan (X2.2)			

No	Variabel Penelitian	Indikator Penelitian		*Corrected Item-total correlation*	Keterangan
		X2.2	Saya sangat menghargai kepercayaan yang telah dibangung antar tim kerja	0,661	Valid
		X2.2	Saya percaya kepercayaan yang kuat antar tim kerja dapat meningkatkan produktivitas	0,652	Valid
		X2.2	Saya percaya bahwa kepercayaan yang kuat antar tim dapat membantu memecahkan masalah	0,504	Valid
		Kekompakkan (X2.3)			
		X2.3	Saya percaya bahwa kekompakkan tim yang baik dapat meningkatkan komunikasi yang efektif dalam tim kerja	0,546	Valid
		X2.3	Saya percaya bahwa kekompakkan tim dapat membantu menyelesaikan masalah	0,658	Valid
		X2.3	Saya percaya bahwa kekompakkan tim dapat membantu menyelesaikan masalah	0,674	Valid
3	Produktivitas kerja (Y)	**Kemampuan melaksanakan tugas (Y.1)**			
		Y.1	Saya menyelesaikan pekerjaan tepat waktu agar produktivitas kerjaterja	0,524	Valid
		Y.1	Saya menggunakan waktu kerja sebaik mungkin	0,808	Valid
		Y.1	Dengan menggunakan waktu kerja secara efektif saya dapat menyelesaikan pekerjaan dengan lebih cepat dan akurat	0,654	Valid
		Meningkatkan hasil (Y.2)			
		Y.2	Y.2 Saya percaya dengan meningkatkan kualitas bahan baku dapat meningkatkan hasil produksi	0,576	Valid
		Y.2	Y.2 Saya percaya dengan meningkatkan kualitas proses produktif dapat meningkatkanhasil produksi	0,807	Valid
		Y.2	Y.2 Saya memiliki kemempuan untuk berinovasi dan berkreasi untuk meningkatkankualitas produk	0,421	Valid
		Efisiensi (Y.3)			
		Y.3	Saya percaya denganjumlah karyawan yan memadai dapat meningkatkan efisiensi dalamproses produksi	0,817	Valid
		Y.3	Saya percaya bahwa dengan meningkatkan efisiensi kerja	0,809	Valid

No	Variabel Penelitian	Indikator Penelitian		*Corrected Item-total correlation*	Keterangan
			dapat mencapaitujuan organisasi		
		Y.3	Saya percaya bahwa kuantitas karyawan yang memadai sangat penting untuk menunjang proses produksi	0,761	Valid

Berdasarkan hasil uji validitas terhadap instrument yang di uji pada penelitian sesuai *table* di atas, maka dapat diketahui bahwa 27 pernyataan semuanya valid.

Uji Reliabilitas

Sebuah kuesioner dikatakan *reliable* atau handal jika jawaban sesorang terhadap pertanyaan adalah konsisten atau stabil dari waktu ke waktu (Ghozali & Imam, 2018). Pengukuran reliabilitas dilakukan dengan cara *one shot* atau pengukuran sekali saja dengan alat bantu SPSS uji statistic *Crounbach alpha* (a). Suatu konstruk atau *variable* jika memberikan nilai *Crounbach alpha*>0,60.

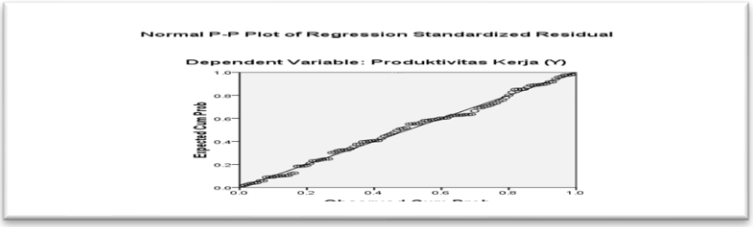
Tabel 2. HasilUji Reliabilitas

Variabel Penelitian	*Croundback Alpha*	*Alpha* Toleransi	Ket.
Budaya Kerja (X1)	0,764	0,60	Reliabel
Teamwork (X2)	0,776	0,60	Reliabel
Produktivitas Kerja (Y)	0,759	0,60	Reliabel

Hasil uji validitas dan reliabilitas terhadap *instrument* penelitian (kuesioner) sesuai *table* di atas, maka dapat diketahui bahwa semua variabel telah memenuhi syarat uji validitas dan reliabilitas. Sehingga kuesioner ini telah layak untuk disebar dan dilakukan penelitian lebih lanjut.

Uji Normalitas

Bertujuan untuk menguji apakah sebuah model regresi variabel terikat (*dependen*) dan variabel bebas (*independent*), ataupun keduanya memiliki distribusi normal (Ghozali & Imam, 2018). Seperti diketahui bahwa uji F dan uji t mengasumsikan bahwa nilai residual mengikuti distribusi normal. Jika asumsi dilanggar maka uji statistik menjadi tidak *valid* untuk jumlah sampel kecil. Deteksi normalitas dilakukan dengan melihat penyebaran data berupa titik-titik pada sumbu diagonal dan grafik.



Gambar 2. Hasil Uji Normalitas

Berdasarkan gambar 2 diatas dapat diketahui bahwa distribusi normal yang ditunjukkan pada titik-titik yang menyebar dan penyebarannya mengikuti asumsi normalitas.

Uji Multikolinearitas

Uji multikolinearitas adalah menguji apakah pada model regresi ditemukan adanya korelasi antar variabel bebas (*independent*), apabila terjadi korelasi, maka terdapat masalah multikolinearitas (Ghozali & Imam, 2018). Nilai *cut off* yang umumnya dipakai untuk menunjukkan adanya multikolinearitas adalah nilai *tolerance* <0,10 atau sama dengan nilai VIF >10. Apabila dalam sebuah model regresi tidak ditemukan asumsi deteksi seperti diatas, maka model regresi yang digunakan dalam penelitian ini bebas dari multikolinearitas dan sebaliknya.

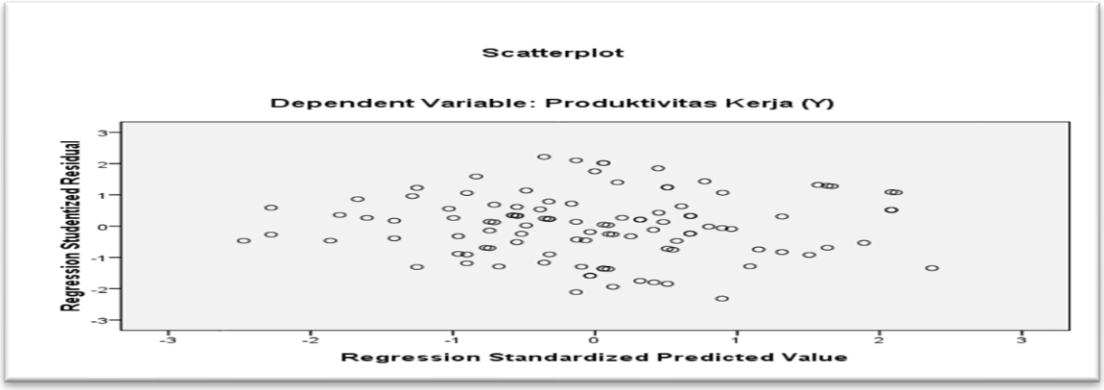
Tabel 3. Hasil Uji Multikolinearitas

Variabel bebas	Toleransi	VIF	Keterangan
Budaya kerja	,993	1,007	Non Multikol
Teamwork	,993	1,007	Non Multikol

Berdasarkan tabel diatas bahwa nilai VIF dari variabel-variabel independen dalam model regresi yang digunakan kurang dari angka 10 sedangkan nilai *tolerance* lebih besar dari ≥0,10 sehingga dapat disimpulkan bahwa variabel-variabel tersebut tidak terdapat gejala multikolinearitas. Dengan demikian asumsi non multikulinearitas dalam model regresi yang digunakan terpenuhi maka semua variabel memenuhi kriteria dalam analisis dapat dilanjutkan.

Uji Heteroskedastisitas

Uji heteroskedastisitas adalah untuk menguji apakah model regresi terjadi ketidaksamaan varians dari residual satu pengamatan ke pengamatan yang lain tetap. Maka disebut heteroskedastisitas dan jika varians berbeda disebut heteroskedastisitas. Model regresi yang baik adalah yang heteroskedastisitas atau tidak terjadi heteroskedastisitas (Ghozali & Imam, 2018).



Berdasarkan gambar 3 diatas terlihat tidak ada pola yang jelas, serta titik-titik menyebar diatas dan dibawah angka 0 pada sumbu Y, dengan demikian pada model regresi diatas tidak terjadi heteroskedastisitas.

Uji Simultan (Uji F)

Ghozali & Imam (2018) dalam penelitian ini, uji F digunakan untuk mengetahui tingkat signifikasi pengaruh variabel-variabel independen (Budaya Kerja dan *Teamwork*) secara bersama-sama (simultan) terhadap variabel dependen (Produktivitas Kerja).

Tabel 4. Hasil Pengujian Serempak

ANOVA[b]

Model		*Sum of Squares*	df	*Mean Square*	F	Sig.
1	Regression	299.041	2	149.520	11.576	.000[a]
	Residual	1356.172	105	12.916		
	Total	1655.213	107			

a. Predictors: *(Constant), Teamwork2*, Budaya Kerja

b. Dependent Variable: Produktivitas Kerja

Berdasarkan hasil uji regresi pada tabel di atas diperoleh F hitung sebesar 11,576 dengan tingkat signifikasi 0,000 ≤ 0,05 yang dapat diartikan bahwa variabel budaya kerja Karyawan (XI) dan *teamwork* (X2) secara serempak berpengaruh signifikan terhadap variabel produktivitas kerja (Y).

Uji Parsial (Uji t)

Uji t digunakan untuk menguji signifikasi hubungan antara variabel X dan Y, apakah variabel X1 dan X2 (Budaya kerja dan *Teamwork*) benar-benar berpengaruh terhadap variabel Y (Produktivitas kerja) secara individual atau parsial Ghozali & Imam, (2018).

Tabel 5. Hasil Pengujian Secara Parsial

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	32.388	4.929		6.571	.000
	Budaya Kerja	.370	.109	.300	3.388	.001
	Teamwork2	-.321	.088	-.323	-3.649	.000

a. Dependent Variable: Produktivitas Kerja

Uji t dilakukan dengan membandingkan nilai t signifikansi lebih kecil dari ≤a maka dapat dipastikan bahwa variabel independen berpengaruh signifikan terhadap variabel dependen, sebaliknya jika nilai t signifikasi lebih besar dari a maka dapat dipastikan bahwa variabel independen berpengaruh tidak signifikan terhadap variabel dependen, dapat dijelaskan hasil uji t dan variabel independen adalah sebagai berikut:

1. Budaya kerja (XI)

Variabel budaya kerja memiliki tingkat signifikasi t sig (0,001) ≤a (0,05). Hal ini bermakna secara parsial variabel budaya kerja karyawan ditempat kerja berpengaruh signnifikan terhadap produktivitas kerja karyawan PT. Prima Gelora Agung Lestari Kota Palu. Berdasarkan hasil diatas, maka hipotesis untuk variabel budaya kerja ditempat kerja dalam penelitian yang telah dilakukan dalam hal ini terbukti di terima. Artinya variabel budaya kerja di tempat kerja berpengaruh signifikan terhadap produktivitas kerja karyawan di PT. Prima Gelora Agung Lestari Kota Palu.

2. *Teamwork* (X2)

Variabel *teamwork* memiliki tingkat signifikasi t sig (0,000) ≤a (0,05). Hal ini bermakna secara parsial variabel *teamwork* ditempat kerja berpengaruh signifikan terhadap produktivitas kerja karyawan PT. Prima Gelora Agung Lestari Kota Palu. Berdasarkan hasil

atas, maka hipotesis kedua untuk variabel *teamwork* di tempat kerja dalam penelitian yang telah dilakukan dalam hal ini terbukti di terima. Artinya variabel *teamwork* ditempat kerja berpengaruh signifikan terhadap produktivitas kerja karyawan PT. Prima Gelora Agung Lestari Kota Palu.

4.1 Pembahasan

Pengaruh Budaya Kerja dan Teamwork Terhadap Produktivitas Kerja Karyawan

Penelitian ini menunjukkan bahwa adanya pengaruh positif budaya kerja dan *teamwork* terhadap produktivitas kerja karyawan PT. Prima Gelora Agung Lestari Kota Palu. Budaya kerja karyawan dan *teamwork* berpengaruh terhadap produktivitas kerja karyawan, meskipun pengaruhnya *relative* kecil. Hal ini menunjukkan bahwa apabila budaya kerja karyawan dan *teamwork* pegawai ditingkatkan maka produktivitas kerja karyawan di PT. Prima Gelora Agung Lestari Kota Palu juga akan meningkat. Hasil penelitian ini sejalan dengan hasil penelitian yang dilakukan oleh, (Arham & Rosadi, 2023). Dengan tiga (3) dimensi pada *teamwork* adalah memiliki kerjasama, kepercayaan, dan tanggung jawab yang jelas. Jika hal tersebut terwujud maka *teamwork* (kerjasama tim) akan meningkat. Peningkatan *teamwork* juga akan berpengaruh positif pada produktivitas kerja karyawan. Hasil penelitian juga membuktikan bahwa *teamwork* merupakan tolak ukur untuk meningkatkan produktivitas kerja karyawan. Hasil tersebut menunjukkan bahwa untuk dapat meningkatkan produktivitas kerja diperlukan *teamwork* agar memberikan kontribusi yang positif bagi sebuah perusahaan yang nantinya akan menuju peningkatan produktivitas.

Pengaruh Budaya Kerja Terhadap Produktivitas Kerja Karyawan

Hasil pengujian menunjukkan bahwa budaya kerja berpengaruh positif terhadap produktivitas karyawan PT. Prima Gelora Agung Lestari Kota Palu. Hasil penelitian ini sejalan dengan penelitian (Asnora, 2020) yang menunjukkan bahwa budaya kerja berpengaruh terhadap produktivitas kerja karyawan. Peningkatan produktivitas kerja karyawan akan tercapai bila aturan perilaku, norma, nilai domina, filosofi dan peraturan dijadikan sebagai sebuah kebiasaan yang dilakukan setiap hari dalam bkerja oleh karyawan PT. Prima Gelora Agung Lestari Kota Palu. Kebiasaan-kebiasaan yang dilakukan karyawan, peraturan yang berlaku dan nilai-nilai yang dijalani oleh seorang karyawan merupakan pembentuk perilaku organisasi (Mulyani & Amin, 2021). Untuk meningkatkan produktivitas kerja karyawan maka kebiasaan-kebiasaan karyawan harus sesuai dengan peraturan yang dilaksanakan dengan penuh penghayatan. Maka dengan kebiasaan tersebut akan mampu menjalankan dan menyelesaikan tugas yang diberikan dengan baik. Budaya kerja terdiri dari tiga (3) dimensi, yaitu disiplin waktu kerja, keterbukaan antar karyawan dan sikap saling menghargai. Hasil penelitian ini juga menunjukkan membuktikan bahwa budaya kerja merupakan tolak ukur untuk meningkatkan produktivitas kerja karyawan. Menunjukkan bahwa untuk dapat meningkatkan produktivitas kerja karyawan diperlukan budaya kerja karyawan agar memberikan kontribusi yang positif bagi PT. Prima Gelora Agung Lestari Kota Palu.

Pengaruh Teamwork Terhadap Produktivitas Kerja Karyawan

Hasil pengujian menunjukkan bahwa variabel *teamwork* berpengaruh negatif terhadap produktivitas kerja karyawan PT. Prima Gelora Agung Lestari Kota Palu. Pengaruh negatif ini menunjukkan bahwa *teamwork* pada PT. Prima Gelora Agung Lestari Kota Palu tidak terbangun dengan baik. Pada hasil observasi langsung peneliti menemukan fenomena bahwa para karyawan dalam bekerja saling menonjolkan diri sehingga lebih mencerminkan cara bekerja individualis. Dari hasil wawancara terbuka pada umumnya karyawan mengungkapkan bahwa mereka masih mampu menangani pekerjaannya secara individu, bahkan mereka merasa

lebih produktif jika bekerja secara mandiri dibandingkan kerja tim, mereka mengatakan, komunikasi yang kurang baik justru tidak mendukung mereka bekerja secara tim, mereka tidak mampu berkoordinasi dengan baik, malah membuat mereka memiliki ketergantungan dalam melakukan pekerjaan sehingga lebih tidak produktif jika bekerja secara tim maka inilah yang menyebabkan teamework memiliki pengaruh negatif terhadap produktivitas kerja. Pekerjaan yang diselesaikan secara individu tentunya tidak akan produktif, sebagaimana Anggraini & Yusuf, (2024) memandang bahwa *teamwork* merupakan fondasi dari sukses yang sejati. Karyawan yang ingin merasakan kesuksesan dalam pekerjaan haruslah karyawan yang memiliki *teamwork* yang tinggi. Namun para karyawan PT. Prima Gelora Agung Lestari, dapat membuktikan bahwa dengan menyelesaikan pekerjaanya secara individu mereka justru dapat lebih produktif karena menurut pengakuan para karyawan, mereka lebih fokus dan menikmati pekerjaannya ketika bekerja secara individu dibandingkan sacara teamwork, mereka mengakui sudah sangat menguasai pekerjaannya masing-masing sehingga tidak terlalu membutuhkan penyelesaian pekerjaan secara tim, karena mereka rata-rata sudah sangat berpengalaman. Hasil penelitian ini sejalan dengan hasil penelitian Arif, *et al*, (2023) bahwa *teamwork* berpengaruh secara parsial terhadap produktivitas kerja karyawan PT. Prima Gelora Agung Lestari Kota Palu.

5. KESIMPULAN

1. Variabel budaya kerja dan *teamwork* secara simultan berpengaruh terhadap produktivitas kerja karyawan PT. Prima Gelora Agung Lestari Kota Palu.
2. Variabel budaya kerja dan *teamwork* berpengaruh signifikan terhadap produktivitas kerja karyawan PT. Prima Gelora Agung Lestari Kota Palu.
3. Variabel *teamwork* berpengaruh signifikan terhadap produktivitas kerja karyawan di PT. Prima Gelora Agung Lestari Kota Palu.

BITCOIN VS FINANCIAL SECTOR STOCKS IN INDONESIA STOCK EXCHANGE: A SYSTEMATIC RISK COMPARISON

Failur Rahman, Suparman, Wahyuningsih, Muzakir, Muhammad Akbar

Correspondent Author:
Failur Rahman: myfaiels@gmail.com

Abstract

This research compares the systematic risk (beta) of Bitcoin and financial sector stocks in the Indonesian capital market, focusing on their sensitivity to macroeconomic fluctuations and market volatility in Indonesia. BBCA stock as the highest stock price in financial sector stock is compare to Bitcoin as a highest price in Cryptocurrency Index. The comparison is focusing on systematic risk between BBCA and Bitcoin, the measurement based on the return on each asset to the return of market that can be affected by macroeconomic fluctuations.

Using the Capital Asset Pricing Model (CAPM) as a method, this research analyze daily returns of selected financial stocks (BBCA) and Bitcoin (IDR-denominated) along 2024. Market returns are proxied by the Indonesia Stock Exchange Composite Index (IHSG), while the risk-free rate uses BI 7-Day Reverse Repo Rate. Regression analysis measures beta (β) to assess systematic risk.

Result of this research is Financial sector stock shows $\beta > 1$ (higher volatility), indicating stronger sensitivity to local market conditions. Bitcoin exhibit $\beta < 1$ (lower volatility than the market), reflecting stability due to regulatory oversight. Otherwise, Bitcoin exhibit higher beta (β) value on Nasdaq Cryptocurrency Index than IDX, indicating stronger sensitivity to global crypto trends than local market conditions.

The Implications is Investors can use these insights to optimize portfolios—combining low-beta Bitcoin for stability and high-beta Financial Sector for growth, while considering regulatory and macroeconomic risks.

Keywords: *Systematic risk, CAPM, Bitcoin, financial stocks, Indonesia Stock Exchange.*

1. Introduction

The comparison of Bitcoin and financial sector stocks on the Indonesia Stock Exchange (IDX) necessitates an examination of systematic risk—a crucial concept denoting risks that cannot be mitigated through diversification. Systematic risk is often measured using beta coefficients, reflecting the sensitivity of an asset's returns to overall market returns. Different studies illuminate the distinct behaviours of cryptocurrency, particularly Bitcoin, compared to traditional financial equities.

Firstly, Bitcoin's volatility presents it as a potential hedge against traditional market risks. Research indicates that Bitcoin operates independently of stock market fluctuations, showcasing uncorrelated movements with major stock indices, which suggests its utility for risk mitigation in diverse investment portfolios. According to Dyhrberg, Bitcoin not only functions as a "virtual gold" but also exhibits capabilities to hedge against stock market downturns, reinforcing its positioning as an alternate asset class distinct from traditional financial sector stocks (Dyhrberg, 2016). This perspective is essential in understanding how investors might allocate assets in varying market conditions.

In the context of Indonesia, specific studies have revealed that factors influencing systematic risk among traditional equities, such as those in the financial sector, differ from those affecting cryptocurrencies. For instance, research examining listed firms on the IDX

identifies that macroeconomic variables—including interest rates, inflation, and GDP growth—have significant effects on the stock returns of financial sector companies. Studies employing Vector Error Correction Model (VECM) methodologies have illustrated how sensitive financial sector stocks are to these macroeconomic indicators, leading to the conclusion that they are inherently exposed to systematic risk influenced by external economic conditions (Yusmia & Asianto, 2020).

Moreover, the unique systemic behavior of stocks on the IDX has been highlighted in studies examining different sectors. A study found that the degree of financial leverage directly influences the systematic risk of stocks, demonstrating that more leveraged firms exhibit increased sensitivity to market movements (Maulana et al., 2018).

Conversely, Bitcoin has attracted significant investor attention surrounding major events like the Bitcoin halving, which manifests in pronounced shifts in trading volumes and market activities. This phenomenon indicates a behavioral shift among investors who may seek cryptocurrencies during periods of uncertainty in traditional markets (Ramadhani, 2022). This suggests that during heightened market volatility, investors might opt for Bitcoin, viewing it as a less correlated investment, thus contributing to its appeal as an alternative asset class.

Finally, the implications for investor decisions between Bitcoin and financial sector stocks are further complicated by the inherent risks associated with each. Financial sector stocks are subject to extensive regulatory oversight which, while providing some level of risk transparency and governance, can significantly shape risk profiles through compliance requirements. Conversely, Bitcoin operates in a relatively unregulated environment, leading to heightened perceptions of risk and reward that could both attract and deter investors based on their risk tolerance levels.

In conclusion, the systematic risk associated with Bitcoin compared to that of financial sector stocks listed on the IDX presents a multifaceted evaluation paradigm. Bitcoin, recognized for its volatility and independence from traditional financial metrics, offers distinct hedging capabilities, while conventional stocks respond predictably to macroeconomic stimuli. This differentiation is critical for investors strategizing for diverse financial climates, illustrating the nuanced interplay between traditional equities and burgeoning cryptocurrency markets.

The advent of cryptocurrencies, particularly Bitcoin, has transformed investment paradigms, prompting an increasing number of investors to explore alternatives to traditional financial instruments. In Indonesia, the Indonesia Stock Exchange (IDX) provides a critical framework for comparing such investment options. The IDX serves as a platform for trading stocks and reflects investor sentiment, influenced by various macroeconomic factors including inflation rates, exchange rates, and economic growth indicators. Financial sector stocks listed on the IDX exhibit different levels of systematic risk exposure and volatility compared to Bitcoin.

Understanding the systematic risk associated with both Bitcoin and financial sector stocks is essential due to the distinct nature of these assets. Financial sector stocks are significantly affected by economic conditions, with their prices shaped by factors such as interest rates and market dynamics (Astuti & Yusuf, 2023); (Sitasari & Firmansyah, 2022). Conversely, Bitcoin has been characterized as an uncorrelated asset, which operates independently of traditional financial market fluctuations and is often viewed as a potential hedge against systemic risks in established financial markets, thus garnering substantial interest from retail and institutional investors (SİVRİKAYA et al., 2021).

Analyzing this dichotomy is particularly relevant in the current economic climate, where global disruptions, including the COVID-19 pandemic, have affected investment landscapes. The resilience of Bitcoin during such disruptions contrasts with the vulnerabilities

exhibited by financial sector stocks, which respond to macroeconomic shocks (Mugiarni & Wulandari, 2021); (Rachmawati, 2019). Research indicates that fluctuating economic indicators impact stock returns, emphasizing the necessity for a nuanced understanding of the interactions between Bitcoin and traditional equities (Zhafira et al., 2021a).

This study aims to systematically compare the systematic risk profiles of Bitcoin and financial sector stocks listed on the IDX. By investigating the factors influencing these risks and assessing investor behavior, this research seeks to provide a comprehensive understanding of how cryptocurrency and traditional financial securities operate within Indonesia's investment environment, offering valuable insights for investors navigating this evolving landscape.

2. Literature Review

Systemic Risk of Bitcoin as Cryptocurrency Highest Price

Bitcoin's systemic risk is significantly influenced by macroeconomic factors and global events. For instance, (Hsu & Wang, 2024) highlight how major fluctuations in macroeconomic indicators can trigger systemic jump risks, which are pertinent to Bitcoin given its reactive nature to global occurrences such as financial crises and pandemics. This insight is reinforced by Cayón and Sarmiento-Sabogal (Cayón & Sarmiento-Sabogal, 2021), who demonstrate that during the COVID-19 pandemic, the systemic risk affecting Bitcoin markedly increased, with a notable rise in its idiosyncratic risk as influenced by commodity and stock price movements.

Moreover, Bitcoin's volatility is not only higher than traditional equities but also exhibits susceptibility to spillover effects from major financial markets. (Zeng & Ahmed, 2022) examine the risk relationships between Bitcoin and East Asian stock markets, illustrating how risks in these markets can extend to Bitcoin and vice versa. This spillover effect indicates that Bitcoin's fluctuations can amplify overall market instability and presents a challenge for investors attempting to hedge risk effectively.

Financial Sector Systemic Risk in Indonesia

Market risk is another significant driver of systemic risk in Indonesia's financial sector. Research by Josepin Josepin (2022) highlights that fluctuations in global and domestic markets can have severe repercussions for banking performance, especially for foreign exchange banks. The study argues that these banks must navigate unpredictable market conditions which can lead to reduced financial performance and increased risk exposure (Josepin, 2022). Furthermore, Budiarso et al. Budiarso et al. (2020) demonstrate that the COVID-19 pandemic introduced new layers of complexity to the financial sector, causing disruptions that affected both financial performance and risk perception across various sectors (Budiarso et al., 2020).

The regulatory environment in Indonesia plays a pivotal role in shaping systemic risk. OJK's efforts to continuously enhance regulations to curb financial fraud are critical; however, the effectiveness of these measures has varied. Effective governance and transparency are crucial for sustaining confidence among investors and other stakeholders. According to Sa'Adah et al. (Sa'adah et al., 2024), the presence of women directors in executive roles positively impacts financial stability and reduces risks within banks. This highlights the importance of diversity in leadership as a mitigating factor against systemic risk.

Indonesia Stock Exchange and Interest Rate of Bank Indonesia

The relationship between the Indonesia Stock Exchange (IDX) and the Bank Indonesia (BI) interest rate constitutes a critical area of study, especially in the context of

macroeconomic stability and investment opportunities within Indonesia's financial sector. This synthesis illuminates various dynamics at play in this relationship, supported by empirical findings exploring how macroeconomic variables influence stock market performance.

Astuti and Yusuf (Astuti & Yusuf, 2023) emphasize the role of macroeconomic indicators in shaping the banking sector's share prices on the IDX, pointing to the interplay between market liquidity, profitability, and the prevailing interest rates. Their research aligns with Widyakto et al. (Widyakto et al., 2023), which finds that the net interest margin (NIM) significantly impacts share prices of banking companies, further indicating the intricate relations between bank performance metrics and stock valuation against the backdrop of fluctuating interest rates.

The influence of interest rates extends beyond the banking sector as well. Zhafira et al. (Zhafira et al., 2021b) show that during the COVID-19 pandemic, fluctuations in the BI interest rate influenced the exchange rate dynamics, which subsequently affected stock indices. This domino effect underscores the interconnectedness of inflation rates and interest rates and illustrates the overarching significance of monetary policy enacted by Bank Indonesia on investor sentiment and stock market performance.

Moreover, Sitasari and Firmansyah (Sitasari & Firmansyah, 2022) analyze how inflation, exchange rates, and interest rates collectively influence financial sector stock prices, with evidence supporting that changes in these macroeconomic factors lead to observable reactions in market performance. They argue that a stable monetary policy, reflected through controlled interest rates, is paramount for ensuring better performance of financial stocks listed on the IDX.

3. Methodology

CAPM (Capital Asset Pricing Model)

The Capital Asset Pricing Model (CAPM) is a foundational theory in finance that seeks to explain the relationship between systematic risk and expected return on investments. It aims to help investors make informed decisions regarding their portfolios by quantifying expected returns based on the risk of specific assets. This synthesis explores various aspects of the CAPM, including its principles, applications, limitations, and enhancements suggested in contemporary research.

At the core of the CAPM, developed by William Sharpe and later refined by others, is the notion that the return expected by an investor is proportional to the risk-free return plus a risk premium that compensates for the asset's systematic risk. This relationship is encapsulated in the formula:

$$E(R_i) = R_f + \beta(E(R_m) - R_f)$$

*(E(R*i)) represents the expected return of the asset, (R*f)* is the risk-free rate*, (beta*) is the measure of the asset's risk in relation to the market, and (E(R*m)) is the* expected return of the market.

Sample of The Reasearch

This study uses secondary data consisting of daily returns on Bitcoin prices (IDR/BTC) and financial sector stock prices. Samples were taken from BBCA (PT Bank Central Asia Tbk). BBCA was chosen as the sample because it has the highest stock price among banking stocks on the IDX. This price is assumed to be comparable to the cryptocurrency sector, where Bitcoin is the highest-priced coin on the Nasdaq Cryptocurrency Index. The IHSG return was used as

the independent variable to measure the impact of the Indonesian stock market on Bitcoin and financial sector stocks, specifically BBCA. The macroeconomic variable used to measure asset-specific risk is the BI Rate (BI 7DRR). Data was collected daily for each variable throughout 2024. Table 1 below shows an example of the data tabulation.

Table 1. Sampling Data

Date	BBCA Return	BTC Return	IDX Return	Risk-Free Rate (BI Rate)	Excess Return of BBCA	Excess Return of BTC	Excess Retrun of IDX
01/02/2024	3.28%	-1.36%	0.50%	5.75%	-2.47%	-7.11%	-5.25%
01/03/2024	-2.14%	1.23%	-1.29%	5.75%	-7.89%	-4.52%	-7.04%
...	...	...	...	...	...	...	...
12/30/2024	2.14%	1.94%	0.28%	6.00%	-3.86%	-4.06%	-5.72%

Hypothesis:

The hypothesis developed in this study aims to compare the systemic risk of Bitcoin and BBCA shares as financial sector shares is as follows.

H01: If ß BBCA < 1, then BBCA stock assets are safer and less sensitive to the market.

HA1: If ß BBCA > 1, then BBCA stock assets are highly sensitive to the market and carry greater risk.

H02: If ß BTC < 1, then Bitcoin assets are safer and less sensitive to the market.

HA2: If ß BTC > 1, then Bitcoin assets are highly sensitive to the market and carry greater risk.

The significance level of the market's influence on Bitcoin and BBCA stocks can be seen in the p-value of each model. If the p-value is less than 0.05, then Bitcoin and BBCA stock values are significantly influenced by the market and the macroeconomic variables included in the model (namely, the BI Rate [BI 7DRR]), and vice versa.

4. Result And Discussion

Measurement of CAPM (Capital Asset Pricing Model)

Before applying the CAPM, the daily returns on BBCA shares, Bitcoin prices, and the Composite Stock Price Index must be calculated. Next, calculate the excess return by examining the difference between each daily return and the free rate (BI rate), one of the macroeconomic variables influencing the Indonesian market. Finally, we calculate the CAPM model to compare the beta values of BBCA stock and Bitcoin through the market influence of the IDX. The results of the calculations are as follows:

CAPM (Capital Asset Pricing Model) of BBCA (Financial Sector Stock)

The CAPM (Capital Asset Pricing Model) is used to calculate the beta value of the excess return on BBCA shares influenced by the excess return of the Indonesia Stock Exchange Composite Index. The results are presented in Table 2 below.

Table 2. Result of BBCA and IDX

Variable	Coefficient	Std. Error	*t-Statistic*	*Prob*
C	-0.004392	0.003030	-1.449207	0.1478
ExRetIDX	0.930425	0.050620	18.38041	0.0000

As shown in Table 2, the ExRetIDX (Excess Return IDX) variable significantly affects the excess return of BBCA shares, as indicated by a probability level of less than 0.05 (namely, 0.0000). The beta in the model is 0.930425, meaning that beta is less than 1. If there is volatility or a change in the BI Rate macro variable affecting the Indonesia Stock Exchange Composite by one unit, the price of BBCA shares will change by 93.04%. A high beta value close to 1 indicates that BBCA shares are sensitive to the market and carry significant risk in the event of local market volatility. Therefore, in the CAPM, the BBCA share price supports the HA1 hypothesis. The high beta indicates that financial sector shares are highly volatile in response to local market conditions. The obtained R-squared value is 0.417168, meaning 41.72% of stock return variation is explained by market or independent variables. The CAPM model can be formulated as follows:

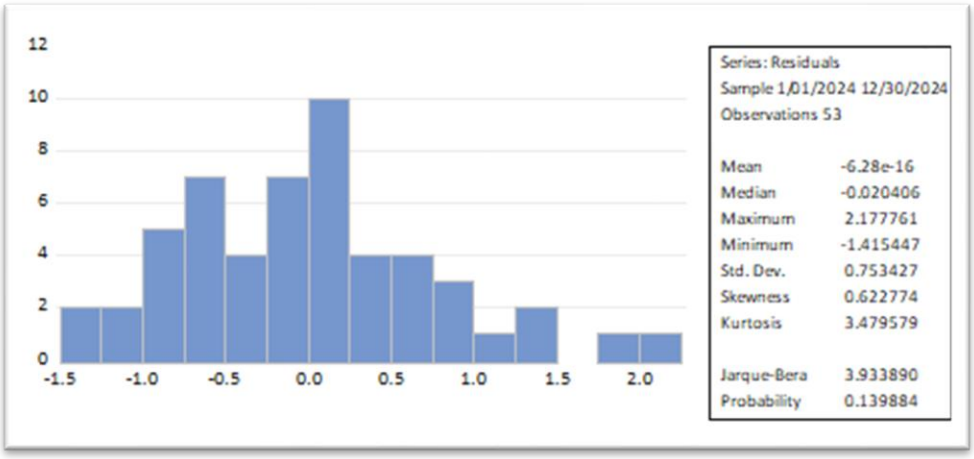
$$ExRetBBCA\text{E}(\text{R}i) = -0.004392 + 0.930425 ExRetIDX + e$$

To ensure the model is appropriate, several classical assumption tests are required. These tests include normality, heteroscedasticity, and linearity tests.

Normality Test

Normality testing is used to determine if the data used in the model is normally distributed. The following results were obtained using a histogram.

Picture 1. Normality Test



The normality test is indicated by the Jarque-Bera p-value of 0.139884, which is greater than 0.05. This means that the data in the model meets the normality assumption, i.e., that it is normally distributed.

Homoscedasticity Test

A homoscedasticity test was conducted to confirm the assumption that the residual variance (error) remains constant across all predictor values (independent variables). The White Test was used to examine interactions between non-linear variables. The results are as follows:

Table 3. Homoscedasticity Test

F-statistic	**0.621064**	**Prob. F(7.45)**	**0.6148**
Obs*R-squared	**4.669232**	**Prob. Chi-Square(7)**	**0.6024**
Scaled explained SS	**4.948047**	**Prob. Chi-Square(7)**	**0.7086**

The homoscedasticity test result in the above table is 0.6024, or a p-value greater than 0.05. This indicates that there is no heteroscedasticity problem with the model and that the model meets the homoscedasticity assumption.

Linearity test

The next step is the linearity assumption test, which determines whether the relationship between the independent and dependent variables is linear. Conducting the linearity test is hoped to result in a regression model with good prediction accuracy, correct model specifications, and validated linear regression. The results obtained through the Ramsey Reset Test are as follows.

Table 4. Linearity Test

	Value	Probability
t-statistic	1.754241	0.0858
F-statistic	3.077360	0.0858
Likelihood ratio	3.293438	0.0696

Based on Table 4, the p-value is 0.0858, which is greater than 0.05. This suggests a linear relationship between the dependent and independent variables in the BBCA Stock CAPM model.

CAPM (Capital Asset Pricing Model) of Bitcoin

The Capital Asset Pricing Model (CAPM) is used to calculate Bitcoin's beta value, which is influenced by the excess return of the Indonesia Stock Exchange Composite or local market conditions. The results are summarized in Table 5 below.

Table 5. Result of Bitcoin and IDX

Variable	Coefficient	Std. Error	*t-Statistic*	*Prob*
C	-6.395771	1.684753	-3.796267	0.0004
ExRetIDX	-0.103462	0.289471	-0.357418	0.7223

As shown in Table 5, the ExRetIDX (Excess Return IDX) variable does not affect the excess return of Bitcoin, as indicated by a probability level greater than 0.05 (0.7223). The beta in the model is -0.103462, meaning that beta is less than 1. This indicates that, if the BI Rate macro variable affecting the Indonesia Stock Exchange Composite changes by one unit, the price of Bitcoin will change by 10.3 percent. A low beta value indicates that Bitcoin is less sensitive to Indonesian market conditions and is less risky in the event of market volatility in Indonesia. Therefore, in the CAPM, Bitcoin prices support hypothesis H02. The low beta value indicates that Bitcoin is less volatile than local market conditions in Indonesia. The obtained R-squared value is 0.022010, meaning 2.2% of Bitcoin's return variation is explained by market or independent variables. The CAPM model can be formulated as follows:

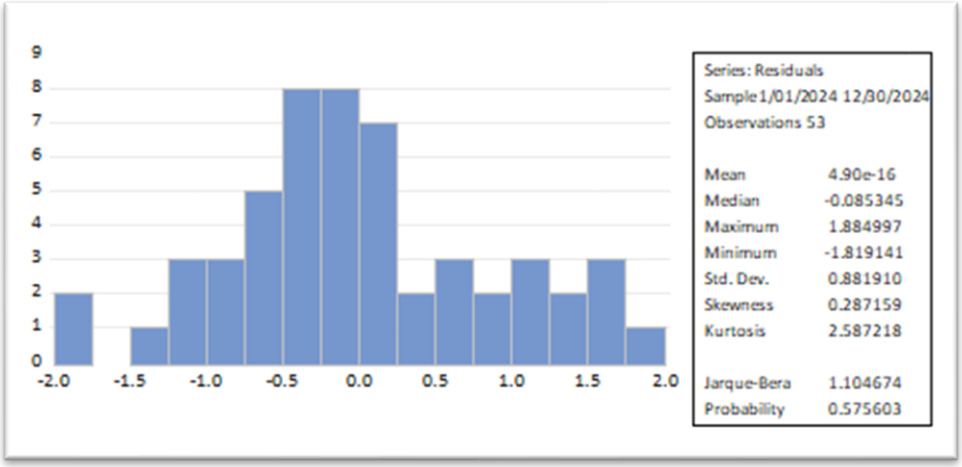
$$ExRetBTC\text{E}(\text{R}i) = -6.395771 - 0.103462 ExRetIDX + e$$

To ensure the model is appropriate, several classical assumption tests are required. These tests include normality, heteroscedasticity, and linearity tests.

Normality Test

Normality testing is used to determine if the data used in the model is normally distributed. The following results were obtained using a histogram.

Picture 2. Normality Test



The normality test is indicated by the Jarque-Bera p-value of 0.575603, which is greater than 0.05. This means that the data in the model meets the normality assumption and is normally distributed.

Homoscedasticity Test

A homoscedasticity test was conducted to confirm the assumption that the residual variance (error) remains constant across all predictor values (independent variables). The White Test was used to examine interactions between non-linear variables. The results are as follows:

Table 6. Homoscedasticity Test

F-statistic	**0.669459**	**Prob. F(7.45)**	**0.6485**
Obs*R-squared	**3.523660**	**Prob. Chi-Square(7)**	**0.6198**
Scaled explained SS	**2.293672**	**Prob. Chi-Square(7)**	**0.8072**

The homoscedasticity test result in the above table is 0.6198, or a p-value greater than 0.05. This indicates that there is no heteroscedasticity problem with the model and that the model meets the homoscedasticity assumption

Linearity test

The next step is the linearity assumption test, which determines whether the relationship between the independent and dependent variables is linear. Conducting the linearity test is hoped to result in a regression model with good prediction accuracy, correct model specifications, and validated linear regression. The results obtained through the Ramsey Reset Test are as follows.

Table 7. Linearity Test

	Value	**Probability**
t-statistic	1.244463	0.2195
F-statistic	1.548689	0.2195
Likelihood ratio	1.718238	0.1899

According to Table 7, the p-value is 0.2195, greater than 0.05. This suggests a linear relationship between the dependent and independent variables in the Bitcoin CAPM model.

CAPM (Capital Asset Pricing Model) of Bitcoin On Nasdaq Criptocurrency Index

The CAPM (Capital Asset Pricing Model) calculation on Bitcoin on the Nasdaq Cryptocurrency Index was used to expand the research results based on the finding that Bitcoin is not influenced by the local Indonesian market. Next, we examined the influence of the

global market on Bitcoin volatility in the same year through the Nasdaq Cryptocurrency Index (CCI). The results are shown in Table 5 below.

Table 8. Result of Bitcoin and CCI

Variable	Coefficient	Std. Error	*t-Statistic*	*Prob*
C	-0.000887	0.001365	-0.649893	0.5187
RetCCI	0.447626	0.061287	7.303778	0.0000

As shown in Table 8, the RetCCI (Excess Return Cryptocurrency Index) variable significantly affects the excess return of Bitcoin, as indicated by a probability level of less than 0.05 (0.0000). The model's beta is 0.447626, or 44.76%, meaning that beta is less than 1. This indicates that if there is a one-unit change in global macroeconomic variables affecting the Nasdaq Cryptocurrency Index, the price of Bitcoin will change by 44.76 percent. A low beta value indicates that Bitcoin is less sensitive to Indonesian market conditions, but more sensitive to global market volatility. This means that Bitcoin is less risky in the event of market turmoil in Indonesia, but more vulnerable to global markets. Therefore, in the CAPM, Bitcoin prices support hypothesis H02. The low beta value indicates that Bitcoin has low volatility in response to global market conditions. The R-squared value is 0.410178, meaning 41.02% of Bitcoin's return variation is explained by market or independent variables. The CAPM model can be formulated as follows:

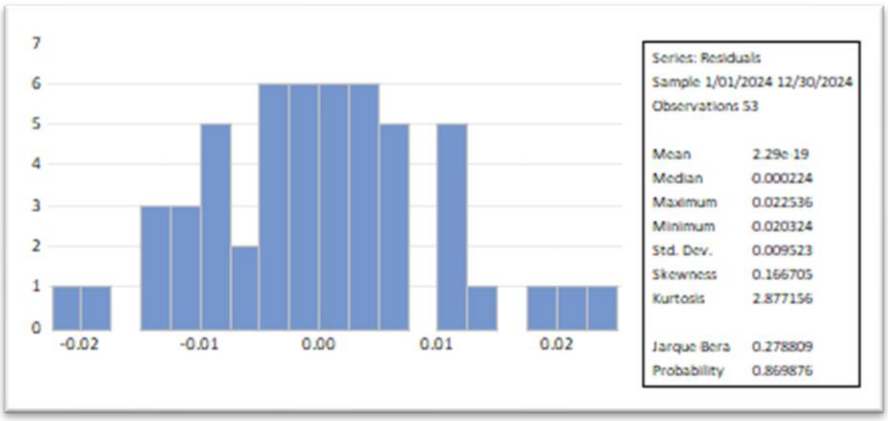
$$ExRetBTCE(Ri) = -6.395771 - 0.103462ExRetCCI + e$$

To ensure the model is appropriate, several classical assumption tests are required. These tests include normality, heteroscedasticity, and linearity tests.

Normality Test

Normality testing is used to determine if the data used in the model is normally distributed. The following results were obtained using a histogram.

Picture 3. Normality Test



The normality test is indicated by the Jarque-Bera p-value of 0.869876, which is greater than 0.05. This means that the data in the model meets the normality assumption, i.e., that it is normally distributed.

Homoscedasticity Test

A homoscedasticity test was conducted to confirm the assumption that the residual variance (error) remains constant across all predictor values (independent variables). The results are as follows:

Table 9. Homoscedasticity Test

F-statistic	**0.318547**	**Prob. F(2.50)**	**0.7287**
Obs*R-squared	**0.666823**	**Prob. Chi-**	**0.7165**
	1.634476	**Square(2)**	**0.4416**

Scaled explained SS	Prob. Chi-Square(2)

The homoscedasticity test result in the above table is 0.7287, or a p-value greater than 0.05. This indicates that there is no heteroscedasticity problem with the model and that the model meets the homoscedasticity assumption.

Linearity test

The next step is the linearity assumption test, which determines whether the relationship between the independent and dependent variables is linear. The results obtained through the Ramsey Reset Test are as follows:

Table 10. Linearity Test

	Value	Probability
t-statistic	1.067862	0.2908
F-statistic	1.140328	0.2908
Likelihood ratio	1.219283	0.2695

Based on Table 7, the p-value is 0.2908, greater than the critical value of 0.05. This suggests a linear relationship between the dependent and independent variables in the Bitcoin CAPM on CCI model.

Discussion

Based on the results obtained, there is a significant difference between Bitcoin and financial sector stocks on the Indonesia Stock Exchange Composite Index. The beta value generated through the Capital Asset Pricing Model (CAPM) shows that financial sector stocks are more vulnerable to domestic market volatility, which is mainly influenced by Bank Indonesia's interest rates. These rates, in turn, affect the Indonesia Stock Exchange Composite.

Table 11. Bitcoin vs Financial Sector Stock: A Systematic Risk Comparison

	Bitcoin	Financial Sector Stock (BBCA)
Beta (ß)	-0.103462	0.930425
R-Squared	0.022010	0.417168
p-value	0.7223	0.0000

Table 11 shows that the beta value for financial sector stocks is greater than that of bitcoin, with a value close to one. This indicates that financial sector stocks are more susceptible to local market volatility. This aligns with the observed market phenomenon where systemic risk resulting from changes in interest rates (BI Rate) significantly impacts the financial sector, affecting the performance of stocks. Financial sector stocks have a P-value of less than 0.05 (specifically, 0.000), indicating that changes in macroeconomic variables, particularly interest rates, significantly impact the volatility of BBCA stock prices. Therefore, systemic risk resulting from local market volatility is more likely to affect BBCA stock prices.

Conversely, Bitcoin's beta value is smaller than BBCA's at -0.103462, and the p-value is greater than 0.05 at 0.7233. This indicates that domestic macroeconomic volatility does not significantly impact Bitcoin prices in the market. Therefore, systemic risk on Bitcoin assets resulting from changes in economic policies and domestic market volatility does not occur, making Bitcoin risk lower than that of financial sector stocks. This phenomenon was observed during the 2020 pandemic, when stock markets worldwide fluctuated, yet Bitcoin prices moved differently. Similarly, when interest rates in Indonesia changed and consumer purchasing power weakened, the price of Bitcoin remained stable while the price of financial sector stocks on the Indonesia Stock Exchange Composite Index declined, including the price of BBCA shares, the highest priced shares in the financial sector.

To capture broader phenomena related to Bitcoin price movements, this study included the CCI (Cryptocurrency Index) variable, which represents the return on cryptocurrencies on the Nasdaq Cryptocurrency Index. This variable was included to observe the impact of changes in global economic conditions with a systemic effect on the cryptocurrency market. This could indicate systemic risk to Bitcoin due to global economic turmoil.

Based on Table 8, the p-value is less than 0.05 (specifically, 0.000), indicating that CCI significantly affects Bitcoin volatility. With a beta value of 0.447626 for CCI on Bitcoin, we can conclude that Bitcoin price performance is more susceptible to the impact of global economic turmoil than to local Indonesian market factors. The comparison shows that the beta value of CCI on Bitcoin is greater than the beta value of IDX on Bitcoin. Therefore, Bitcoin is more susceptible to systemic risk in the event of global market volatility.

However, when comparing the performance of BBCA shares against local market returns versus Bitcoin prices against the cryptocurrency index, the beta value of BBCA shares is greater than that of Bitcoin against the global market. This shows that financial sector stocks are more vulnerable to systemic risk than bitcoin.

5. Conclussion

This study aimed to compare the systemic risk of Bitcoin assets and financial sector stocks on the Indonesia Stock Exchange Composite. Based on the results, it can be concluded that Bitcoin has lower systemic risk than financial sector stocks. Therefore, Bitcoin is a safer asset against market volatility in Indonesia and in the global market. Therefore, investors can diversify into alternative assets, such as Bitcoin, rather than financial sector stocks.

Various global and local economic phenomena influence the volatility of financial sector stocks in Indonesia. However, this does not occur with Bitcoin, whose price remains more stable during economic volatility. Investors can use these insights to optimize their portfolios by combining Bitcoin's low beta for stability with financial sector stocks' high beta for growth while considering regulatory and macroeconomic risks.
